ADC3664 14 位、125MSPS、低噪声、低功率双通道 ADC

1 特性

- 14 位 125MSPS ADC
- 本底噪声：-156.9dBFS/Hz
- 低功耗：100mW/ch
- 延迟：2 个时钟周期
- 电压基准：
  - 外部：65MSPS 至 125MSPS
  - 内部：100MSPS 至 125MSPS
- 保证 14 位，无丢码
- 输入带宽：1.4GHz (3dB)
- INL：±2.6LSB；DNL：±0.9LSB
- 工业温度范围：-40°C 至 +105°C
- 片上数字滤波器（可选）
  - 2 倍、4 倍、8 倍、16 倍、32 倍抽取率
  - 32 位 NCO
- 串行 LVDS 数字接口（2 线、1 线和 1/2 线）
- 小尺寸：40 引脚 VQFN (5mm × 5mm) 封装
- 频谱性能 (f_{IN} = 5MHz)：
  - SNR：77.5dBFS
  - SFDR：84dBc HD2、HD3
  - SFDR：92dBFS 最严重毛刺
- 频谱性能 (f_{IN} = 70MHz)：
  - SNR：75.5dBFS
  - SFDR：76dBc HD2、HD3
  - SFDR：84dBFS 最严重毛刺

2 应用

- 高速数据采集
- 软件定义无线电
- 通信基础设施
- 频谱分析仪
- OTDR
- 控制环路
- 源测量单元 (SMU)
- 仪表
- 光谱分析
- 雷达

3 说明

ADC3664 器件是一款低噪声、超低功耗、14 位、125MSPS 高速双通道 ADC。该器件可实现超低噪声性能和 -156.9dBFS/Hz 的噪声频谱密度，还具有出色的线性度和动态范围。ADC3664 可提供中频采样支持，使器件适合各种应用。高速控制环路受益于低至一个时钟周期的低延迟。该 ADC 在 125MSPS 下的功耗仅为每通道 100mW，其功耗随采样率减小而迅速降低。

ADC3664 使用串行 LVDS (SLVDS) 接口输出数据，可更大限度减少数字互连的次数。该器件提供双通道、单通道和半通道选项。ADC3664 与 16 位分辨率 ADC 系列实现了引脚对引脚兼容。该器件支持 –40ºC 至 +105ºC 的工业级工作温度范围。

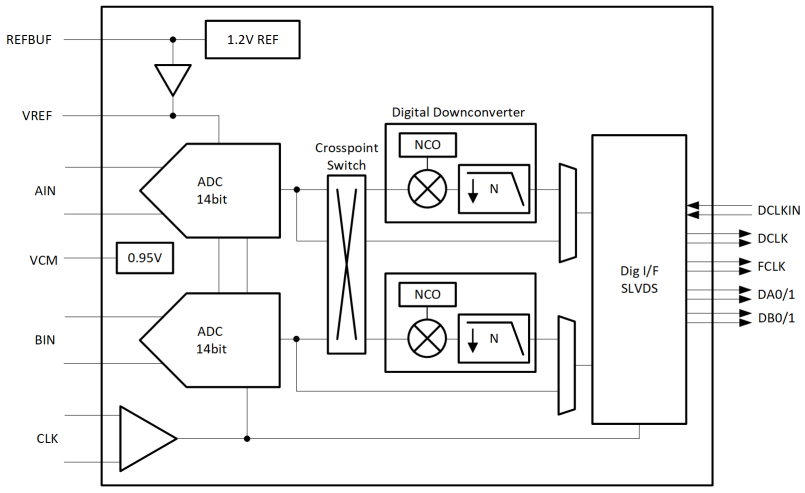
封装信息

器件型号	封装(1)	封装尺寸（标称值）
ADC3664	VQFN (40)	5.00 × 5.00mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

表 3-1. 器件比较

器件型号	分辨率	采样率
ADC3661	16 位	10MSPS
ADC3662	16 位	25MSPS
ADC3663	16 位	65MSPS
ADC3664	14 位	125MSPS



简化版方框图

Table of Contents

4 Revision History

注：以前版本的页码可能与当前版本的页码不同

Changes from Revision A (August 2021) to Revision B (July 2022)	Page
• Changed the output clock jitter unit from ps to ps pk-pk in the Timing Requirements	10
• Added GND symbol to REFGND pin for all voltage reference option diagrams	25
• Added the section Output Bit Mapper	37
• Added default power up configuration summary	42
• Updated power-up initialization diagram with correct indexing	61

Changes from Revision * (December 2020) to Revision A (August 2021)	Page
• All wake up time values moved from MAX to NOM	10
• Added condition to resynch during operation to the SYNC section	33

5 Pin Configuration and Functions

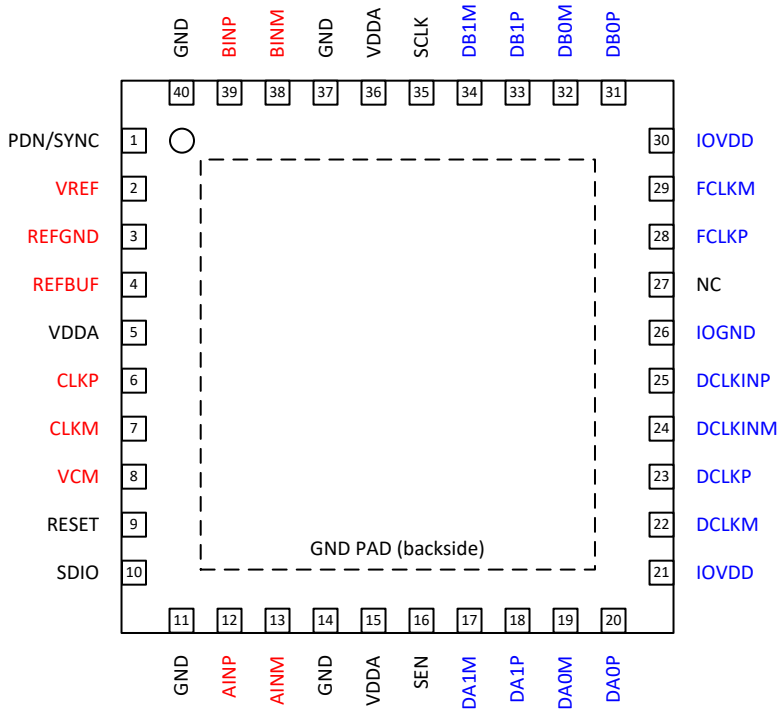


图 5-1. RSB (WQFN) Package, 40-Pin (Top View)

表 5-1. Pin Descriptions

PIN		I/O	DESCRIPTION
NAME	NO.		
INPUT/REFERENCE			
AINM	13	I	Negative analog input, channel A
AINP	12	I	Positive analog input, channel A
BINP	39	I	Positive analog input, channel B
BINM	38	I	Negative analog input, channel B
REFBUF	4	I	1.2 V external voltage reference input for use with internal reference buffer. Internal 100 kΩ pull-up resistor to AVDD. This pin is also used to configure default operating conditions.
REFGND	3	I	Reference ground input, 0 V
VCM	8	O	Common-mode voltage output for the analog inputs, 0.95V
VREF	2	I	External voltage reference input
CLOCK			
CLKM	7	I	Negative differential sampling clock input for the ADC
CLKP	6	I	Positive differential sampling clock input for the ADC
CONFIGURATION			
PDN/SYNC	1	I	Power down/Synchronization input. This pin can be configured via the SPI interface. Active high. This pin has an internal 21 kΩ pull-down resistor.

表 5-1. Pin Descriptions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
RESET	9	I	Hardware reset. Active high. This pin has an internal 21 kΩ pull-down resistor.
SCLK	35	I	Serial interface clock input. This pin has an internal 21 kΩ pull-down resistor.
SDIO	10	I	Serial interface data input and output. This pin has an internal 21 kΩ pull-down resistor.
SEN	16	I	Serial interface enable. Active low. This pin has an internal 21 kΩ pull-up resistor to AVDD.
NC	27	-	Do not connect
DIGITAL INTERFACE			
DA0P	20	O	Positive differential serial LVDS output for lane 0, channel A.
DA0M	19	O	Negative differential serial LVDS output for lane 0, channel A.
DA1P	18	O	Positive differential serial LVDS output for lane 1, channel A.
DA1M	17	O	Negative differential serial LVDS output for lane 1, channel A.
DB0P	31	O	Positive differential serial LVDS output for lane 0, channel B.
DB0M	32	O	Negative differential serial LVDS output for lane 0, channel B.
DB1P	33	O	Positive differential serial LVDS output for lane 1, channel B.
DB1M	34	O	Negative differential serial LVDS output for lane 1, channel B.
DCLKP	23	O	Positive differential serial LVDS bit clock output.
DCLKM	22	O	Negative differential serial LVDS bit clock output.
FCLKP	28	O	Positive differential serial LVDS frame clock output.
FCLKM	29	O	Negative differential serial LVDS frame clock output.
DCLKINP	25	I	Positive differential serial LVDS bit clock input. Internal 100 Ω differential termination.
DCLKINM	24	I	Negative differential serial LVDS bit clock input. Internal 100 Ω differential termination.
POWER SUPPLY			
AVDD	5,15,36	I	Analog 1.8-V power supply
GND	11,14,37,40, PowerPAD	I	Ground, 0 V
IOGND	26	I	Ground, 0 V for digital interface
IOVDD	21,30	I	1.8-V power supply for digital interface

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage range, AVDD, IOVDD		–0.3	2.1	V
Supply voltage range, GND, IOGND, REFGND		–0.3	0.3	V
Voltage applied to input pins	AINP/M, BINP/M, CLKP/M, DCLKINP/M, VREF, REFBUF	–0.3	2.1	V
	PDN/SYNC, RESET, SCLK, SEN, SDIO	–0.3	2.1	
Junction temperature, T_J			105	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Supply voltage range	AVDD(1)	1.75	1.8	1.85	V
	IOVDD(1)	1.75	1.8	1.85	V
T_A	Operating free-air temperature	–40		105	°C
T_J	Operating junction temperature			105(2)	°C

(1) Measured to GND.
(2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

6.4 Thermal Information

THERMAL METRIC(1)		ADC3664 RSB (QFN) 40 Pins	UNIT
$R_{\Theta JA}$	Junction-to-ambient thermal resistance	30.7	°C/W
$R_{\Theta JC(top)}$	Junction-to-case (top) thermal resistance	16.4	°C/W
$R_{\Theta JB}$	Junction-to-board thermal resistance	10.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	10.5	°C/W
$R_{\Theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.0	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics - Power Consumption

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, external 1.6V reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ADC3664: 125 MSPS						
I_{AVDD}	Analog supply current	External reference		64	80	mA
I_{IOVDD}	I/O supply current	SLVDS 2-wire		47	72	
P_{DIS}	Power dissipation	External reference, 2-wire		200	274	mW
I_{IOVDD}	I/O supply current	2-wire, 1/2-swing		35		mA
		4x real decimation, 16-bit, 1-wire		50		
		16x real decimation, 16-bit, 1-wire		45		
		16x real decimation, 16-bit, 1/2-wire		41		
		4x complex decimation, 16-bit, 1-wire		57		
		8x complex decimation, 16-bit, 1-wire		54		
		8x complex decimation, 16-bit, 1/2-wire		50		
		16x complex decimation, 16-bit, 1-wire		50		
		16x complex decimation, 16-bit, 1/2-wire		47		
		32x complex decimation, 16-bit, 1-wire		48		
		32x complex decimation, 16-bit, 1/2-wire		43		
MISCELLANOUS						
I_{AVDD}	Internal reference, additional analog supply current	Enabled via SPI		4		mA
	External 1.2V reference (REFBUF), additional analog supply current			0.5		
	Single ended clock input, reduces analog supply current by			1		
P_{DIS}	Power consumption in global power down mode	Default mask settings		12		mW

6.6 Electrical Characteristics - DC Specifications

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DC ACCURACY						
No missing codes			14			bits
PSRR		F_{IN} = 1 MHz		35		dB
DNL	Differential nonlinearity	F_{IN} = 5 MHz	-0.97	± 0.9	0.97	LSB
INL	Integral nonlinearity	F_{IN} = 5 MHz	-7.5	± 2.6	7.5	LSB
V_{OS_ERR}	Offset error		-55	± 30	55	LSB
V_{OS_DRIFT}	Offset drift over temperature			± 0.06		LSB/ºC
$GAIN_{ERR}$	Gain error	External 1.6V Reference		± 2		%FSR
$GAIN_{DRIFT}$	Gain drift over temperature	External 1.6V Reference		± 57		ppm/ºC
$GAIN_{ERR}$	Gain error	Internal Reference		± 3		%FSR
$GAIN_{DRIFT}$	Gain drift over temperature	Internal Reference		106		ppm/ºC
Transition Noise				0.7		LSB
ADC ANALOG INPUT (AINP/M, BINP/M)						
FS	Input full scale	Differential		3.2		Vpp
V_{CM}	Input common model voltage		0.9	0.95	1.0	V
R_{IN}	Input resistance	Differential at DC		8		kΩ
C_{IN}	Input Capacitance	Differential at DC		5.4		pF
V_{OCM}	Output common mode voltage			0.95		V
BW	Analog Input Bandwidth (-3dB)			1.4		GHz
Internal Voltage Reference						
V_{REF}	Internal reference voltage			1.6		V
V_{REF} Output Impedance				8		Ω
Reference Input Buffer (REFBUF)						
External reference voltage				1.2		V
External voltage reference (VREF)						
V_{REF}	External voltage reference			1.6		V
Input Current				1		mA
Input impedance				5.3		kΩ
Clock Input (CLKP/M)						
Input clock frequency		External reference	0.5		125	MHz
		Internal reference	100		125	MHz
V_{ID}	Differential input voltage			1	3.6	Vpp
V_{CM}	Input common mode voltage			0.9		V
R_{IN}	Single ended input resistance to common mode			5		kΩ
C_{IN}	Single ended input capacitance			1.5		pF
Clock duty cycle			45	50	60	%

6.6 Electrical Characteristics - DC Specifications (continued)

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Digital Inputs (RESET, PDN, SCLK, SEN, SDIO)						
V_{IH}	High level input voltage		1.4			V
V_{IL}	Low level input voltage				0.4	
I_{IH}	High level input current			90	150	uA
I_{IL}	Low level input current		-150	-90		uA
C_I	Input capacitance			1.5		pF
Digital Output (SDOUT)						
V_{OH}	High level output voltage	I_{LOAD} = -400 uA	IOVDD – 0.1	IOVDD		V
V_{OL}	Low level output voltage	I_{LOAD} = 400 uA			0.1	
SLVDS Interface						
V_{ID}	Differential input voltage	DCLKIN	200	350	650	mVpp
V_{CM}	Input common mode voltage		1	1.2	1.3	V
Output data rate		per differential SLVDS output			1	Gbps
V_{OD}	Differential output voltage		500	700	850	mVpp
V_{CM}	Output common mode voltage			1.0		V

6.7 Electrical Characteristics - AC Specifications

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
NSD	Noise Spectral Density	f_{IN} = 5 MHz, A_{IN} = -20 dBFS		-156.9		dBFS/Hz
SNR	Signal to noise ratio	f_{IN} = 5 MHz	72	77.5		dBFS
		f_{IN} = 5 MHz, A_{IN} = -20 dBFS		78.9		dBFS
		f_{IN} = 10 MHz		77.6		
		f_{IN} = 40 MHz		76.9		
		f_{IN} = 70 MHz		75.5		
		f_{IN} = 100 MHz		74.1		
SINAD	Signal to noise and distortion ratio	f_{IN} = 5 MHz		75.7		dBFS
		f_{IN} = 10 MHz		74.2		
		f_{IN} = 40 MHz		72.6		
		f_{IN} = 70 MHz		71.3		
		f_{IN} = 100 MHz		72.4		
ENOB	Effective number of bits	f_{IN} = 5 MHz		12.6		bit
		f_{IN} = 10 MHz		12.6		
		f_{IN} = 40 MHz		12.5		
		f_{IN} = 70 MHz		12.3		
		f_{IN} = 100 MHz		12.0		
THD	Total Harmonic Distortion (First five harmonics)	f_{IN} = 5 MHz	71.5	80		dBc
		f_{IN} = 10 MHz		76		
		f_{IN} = 40 MHz		74		
		f_{IN} = 70 MHz		72		
		f_{IN} = 100 MHz		76		
HD2	Second Harmonic Distortion	f_{IN} = 5 MHz	77	84		dBc
		f_{IN} = 10 MHz		78		
		f_{IN} = 40 MHz		75		
		f_{IN} = 70 MHz		77		
		f_{IN} = 100 MHz		79		
HD3	Third Harmonic Distortion	f_{IN} = 5 MHz	73.5	84		dBc
		f_{IN} = 10 MHz		81		
		f_{IN} = 40 MHz		88		
		f_{IN} = 70 MHz		76		
		f_{IN} = 100 MHz		81		
Non HD2,3	Spur free dynamic range (excluding HD2 and HD3)	f_{IN} = 5 MHz	84	92		dBFS
		f_{IN} = 10 MHz		93		
		f_{IN} = 40 MHz		89		
		f_{IN} = 70 MHz		84		
		f_{IN} = 100 MHz		86		
IMD3	Two tone inter-modulation distortion	f_1 = 10 MHz, f_2 = 12 MHz, A_{IN} = -7 dBFS/tone		88		dBc

6.8 Timing Requirements

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
ADC Timing Specifications						
t_{AD}	Aperture Delay			0.85		ns
t_A	Aperture Jitter	square wave clock with fast edges		250		fs
t_J	Jitter on DCLKIN				± 50	ps pk-pk
Recory time from +6 dB overload condition		SNR within 1 dB of expected value		1		Clock cycle
t_{ACQ}	Signal acquisition period	referenced to sampling clock falling edge		$-T_S/4$		Sampling clock period
t_{CONV}	Signal conversion period			6		ns
Wake up time	Time to valid data after coming out of power down. Internal reference.	Bandgap reference enabled, single ended clock		13		us
		Bandgap reference enabled, differential clock		15		
		Bandgap reference disabled, single ended clock		2.4		ms
		Bandgap reference disabled, differential clock		2.3		
	Time to valid data after coming out of power down. External 1.6V reference.	Bandgap reference enabled, single ended clock		13		us
		Bandgap reference enabled, differential clock		14		
		Bandgap reference disabled, single ended clock		2.0		ms
		Bandgap reference disabled, differential clock		2.2		
$t_{S,SYNC}$	Setup time for SYNC input signal	Referenced to sampling clock rising edge	500			ps
$t_{H,SYNC}$	Hold time for SYNC input signal		600			
ADC Latency	Signal input to data output	1/2-wire SLVDS		1		Clock cycles
		1-wire SLVDS		1		
		2-wire SLVDS		2		
Add. Latency	Real decimation by 2			21		Output clock cycles
	Complex decimation by 2			22		
	Real or complex decimation by 4, 8, 16, 32			23		
Interface Timing: Serial LVDS Interface						
t_{PD}	Propagation delay: sampling clock falling edge to DCLK rising edge	Delay between sampling clock falling edge to DCLKIN falling edge < 2.5ns. T_{DCLK} = DCLK period t_{CDCLK} = Sampling clock falling edge to DCLKIN falling edge	2 + T_{DCLK} + t_{CDCLK}	3 + T_{DCLK} + t_{CDCLK}	4 + T_{DCLK} + t_{CDCLK}	ns
		Delay between sampling clock falling edge to DCLKIN falling edge >= 2.5ns. T_{DCLK} = DCLK period t_{CDCLK} = Sampling clock falling edge to DCLKIN falling edge	2 + t_{CDCLK}	3 + t_{CDCLK}	4 + t_{CDCLK}	

6.8 Timing Requirements (continued)

Typical values are over the operating free-air temperature range, at T_A = 25°C, full temperature range is T_{MIN} = –40°C to T_{MAX} = 105°C, ADC sampling rate = 125 MSPS, 50% clock duty cycle, AVDD = IOVDD = 1.8 V, 1.6 V external reference, and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	NOM	MAX	UNIT
t_{CD}	DCLK rising edge to output data delay, 2-wire SLVDS, 14-bit	Fout = 65 MSPS, DA/B0,1 = 455 MBPS	0	0.1		ns

8 Detailed Description

8.1 Overview

The ADC3664 is a low noise, ultra-low power 14-bit high-speed dual channel ADC supporting sampling rates up to 125 MSPS. It offers very good DC precision together with IF sampling support which makes it ideally suited for a wide range of applications. The ADC3664 is equipped with an on-chip internal reference option but it also supports the use of an external, high precision 1.6V voltage reference or an external 1.2V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after as low as one clock cycle on the digital output interface.

备注

The ADC3664 supports the following sampling rates:

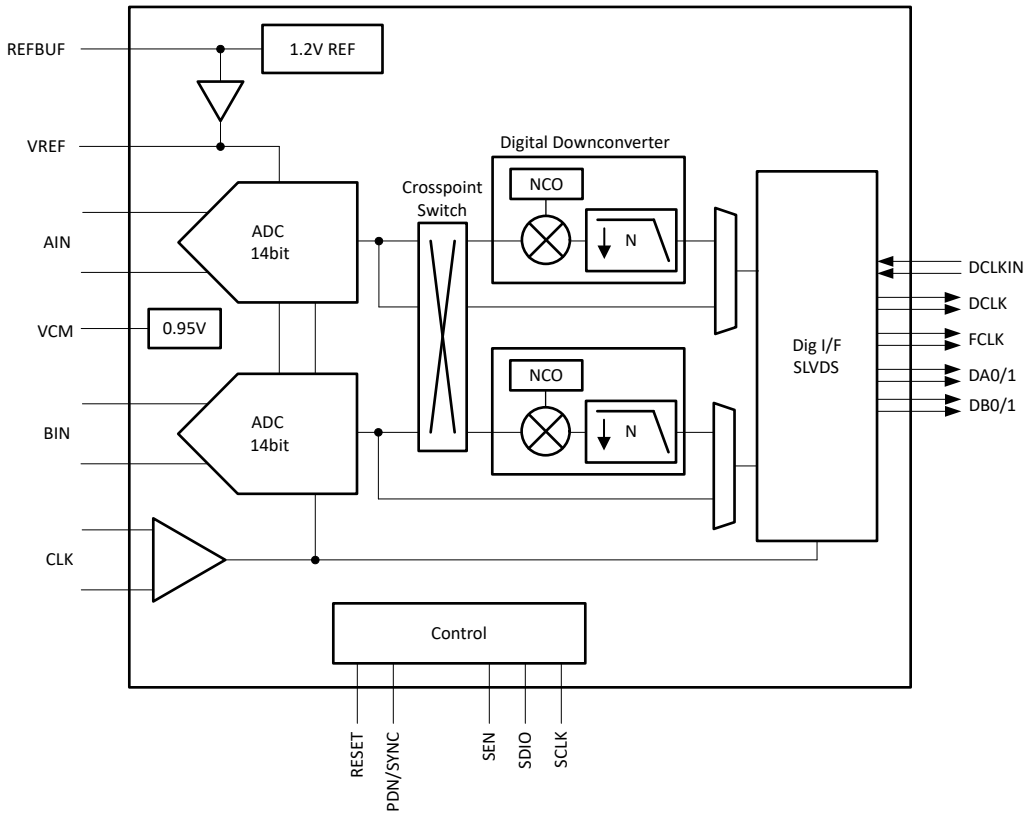
- External Reference: 65 to 125 MSPS
- Internal Reference: 100 to 125 MSPS

An optional programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation.

The ADC3664 uses a serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports a two-lane (2-wire), a one-lane (1-wire) and a half-lane (1/2-wire) option. The ADC3664 includes a digital output formatter which supports output resolutions from 14 to 20-bit.

The device features and control options can be set up either through pin configurations or via SPI register writes.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Analog Input

The analog inputs of ADC3664 are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95 V which must be provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in 图 8-1. All four sampling switches, on-resistance shown in red are in same position (open or closed) simultaneously.

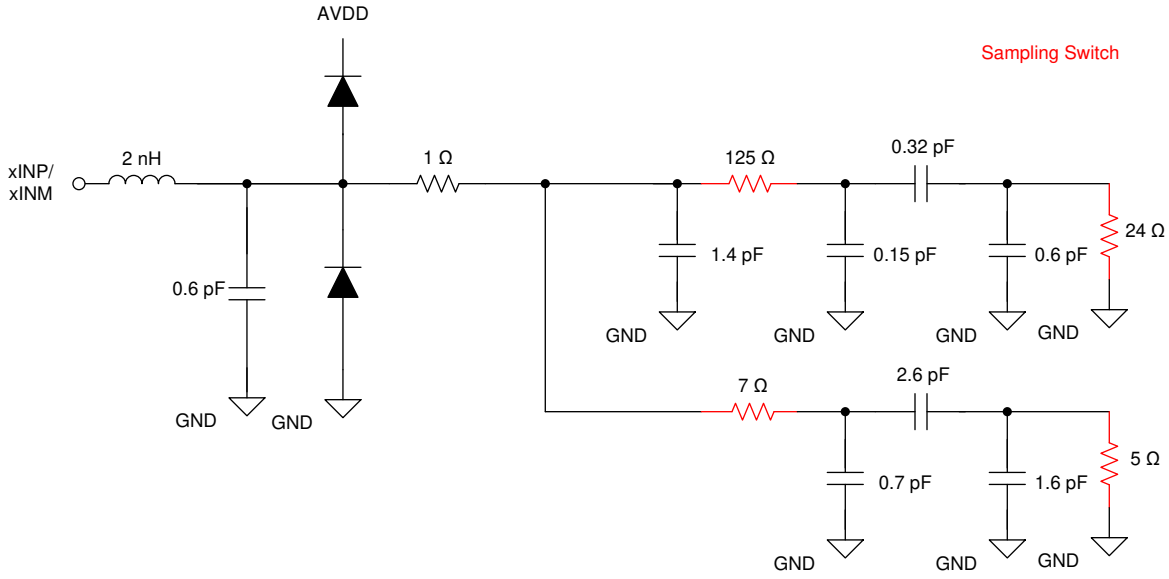


图 8-1. Equivalent Input Network

8.3.1.1 Analog Input Bandwidth

图 8-2 shows the analog full power input bandwidth of the ADC3664 with a 50 Ω differential termination. The -3 dB bandwidth is approximately 1.4 GHz and the useful input bandwidth with good AC performance is approximately 200 MHz.

The equivalent differential input resistance R_{IN} and input capacitance C_{IN} vs frequency are shown in 图 8-3.

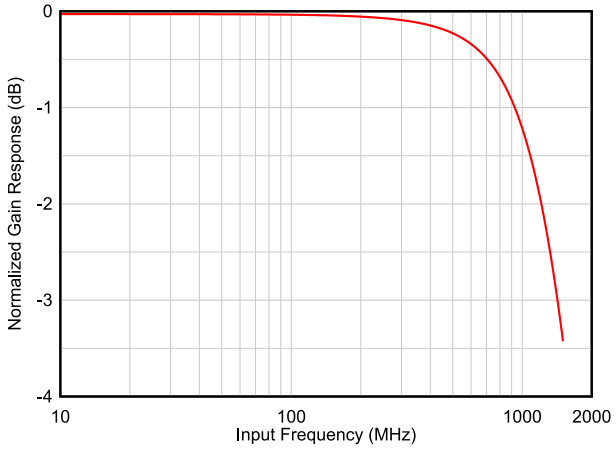

图 8-2. ADC Analog Input bandwidth response

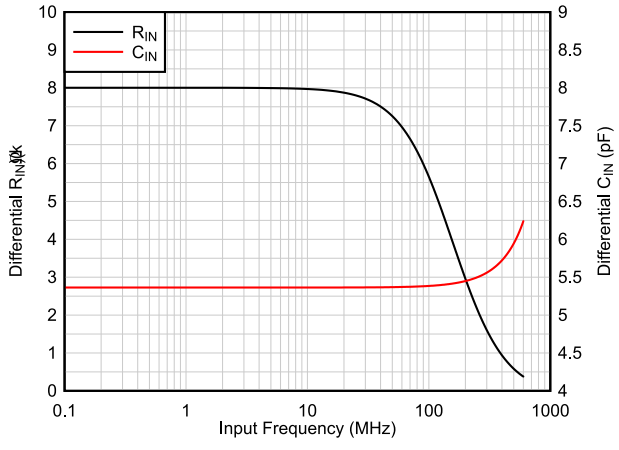

图 8-3. Equivalent R_{IN}/C_{IN} vs Input Frequency

8.3.1.2 Analog Front End Design

The ADC3664 is an unbuffered ADC and thus a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network may be needed. Additionally a passive DC bias circuit is needed in AC-coupled applications which can be combined with the termination network.

8.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency and therefore the following filter designs are recommended for different input frequency ranges as shown in 图 8-4 and 图 8-5 (assuming 50 Ω source impedance).

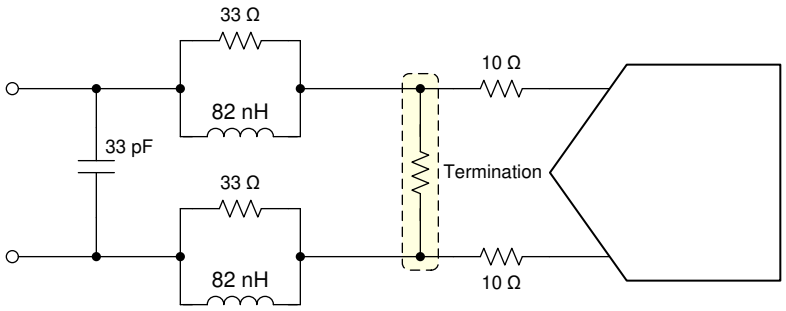

图 8-4. Sampling glitch filter example for input frequencies from DC to 60 MHz

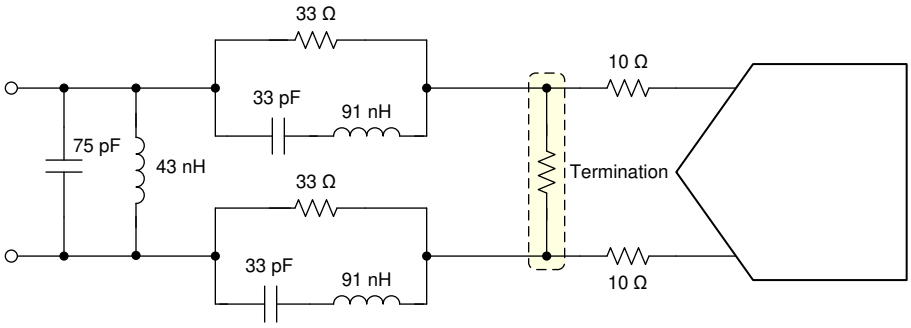

图 8-5. Sampling glitch filter example for input frequencies from 60 to 120 MHz

8.3.1.2.2 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

8.3.1.2.2.1 AC-Coupling

The ADC3664 requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in 图 8-6. The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance can be adjusted to optimize the amplifier performance.

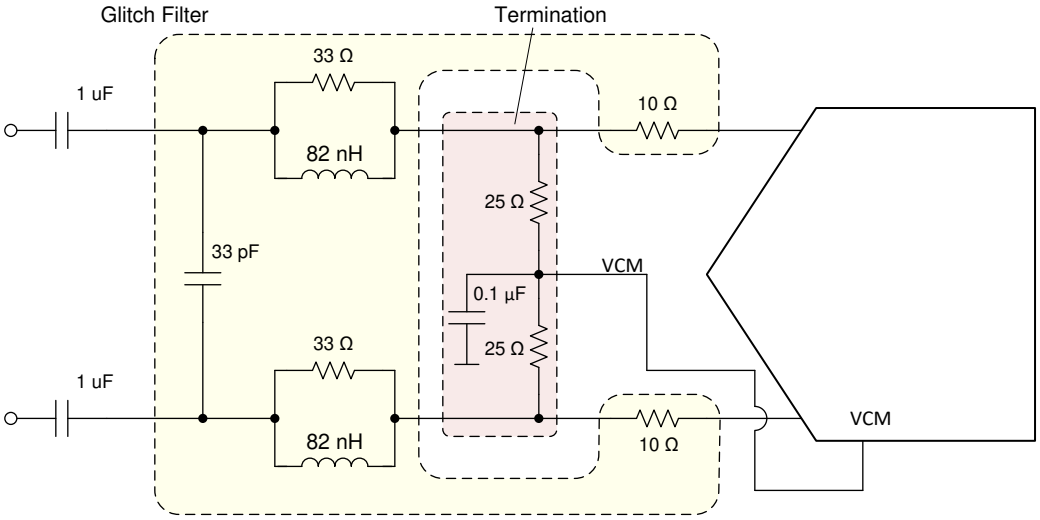

图 8-6. AC-Coupling: termination network provides DC bias (glitch filter example for up to 60 MHz)

8.3.1.2.2.2 DC-Coupling

In DC coupled applications the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in 图 8-7. The glitch filter in this case is located between the anti-alias filter and the ADC. No termination may be needed if amplifier is located close to the ADC or if the termination is part of the anti-alias filter.

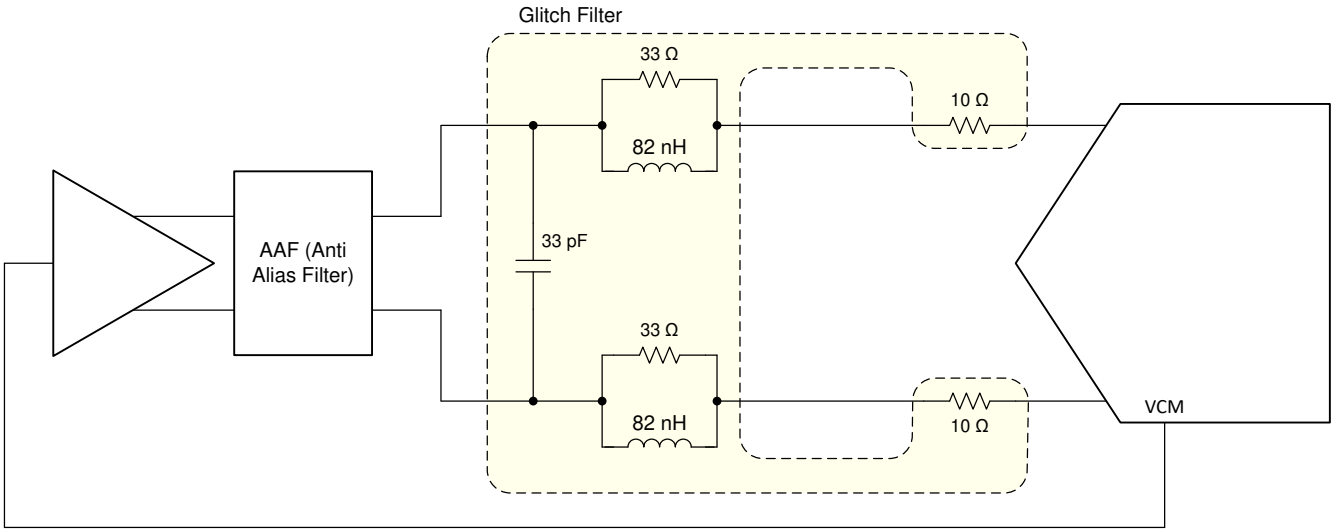

图 8-7. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 60 MHz)

8.3.2 Clock Input

In order to maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications (图 8-8 and 图 8-9). For less jitter sensitive applications, the ADC3664 provides the option to operate with single ended signaling which saves additional power consumption.

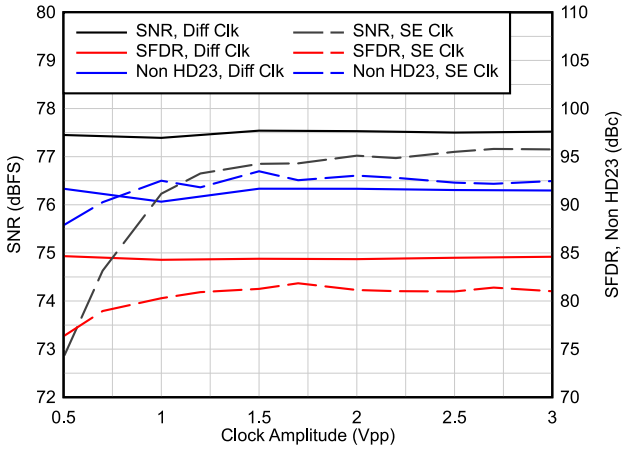

图 8-8. AC Performance vs Clock Amplitude for F_{IN} = 5 MHz

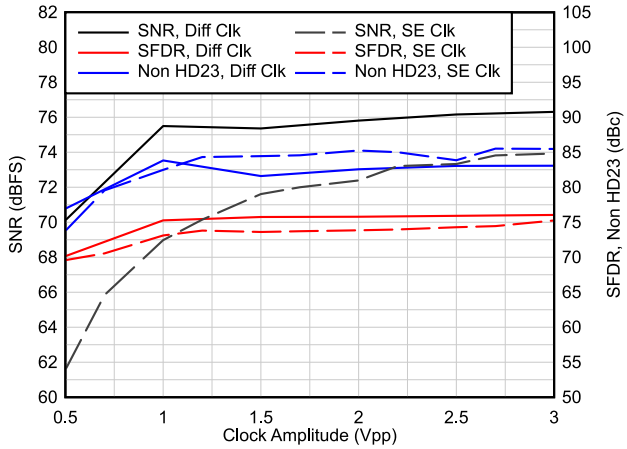

图 8-9. AC Performance vs Clock Amplitude for F_{IN} = 70 MHz

8.3.2.1 Single Ended vs Differential Clock Input

The ADC3664 can be operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input can be AC coupled externally. The ADC3664 provides internal biasing for that use case.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF pin. In this mode there is no internal clock biasing and thus the clock input needs to be DC coupled around a 0.9V center. The unused input needs to be AC coupled to ground.

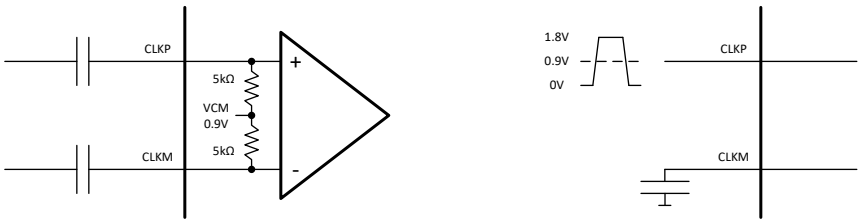

图 8-10. External and internal connection using differential (left) and single ended (right) clock input

8.3.3 Voltage Reference

The ADC3664 provides three different options for supplying the voltage reference to the ADC. An external 1.6V reference can be directly connected to the VREF input; a voltage 1.2V reference can be connected to the REFBUF input using the internal gain buffer or the internal 1.2V reference can be enabled to generate a 1.6V reference voltage. For best performance, the reference noise should be filtered by connecting a 10 uF and a 0.1 uF ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC3664 is shown in 图 8-11.

备注

The voltage reference mode can be selected using SPI writes or by using the REFBUF pin (default) as a control pin (节 8.5.1). If the REFBUF pin is not used for configuration, the REFBUF pin should be connected to AVDD (even though the REFBUF pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.

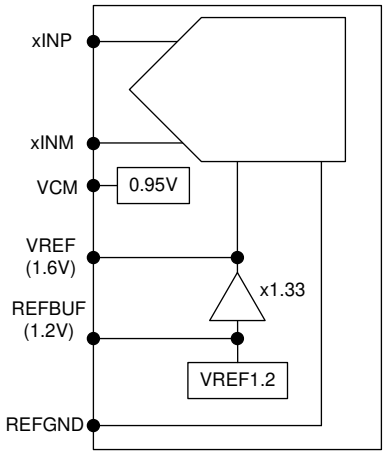

图 8-11. Different voltage reference options for ADC3664

8.3.3.1 Internal voltage reference

The 1.6V reference for the ADC can be generated internal using the on-chip 1.2V reference along with the internal gain buffer. A 10 uF and a 0.1 uF ceramic bypass capacitor (C_{VREF}) should be connected between the VREF and REFGND pins as close to the pins as possible.

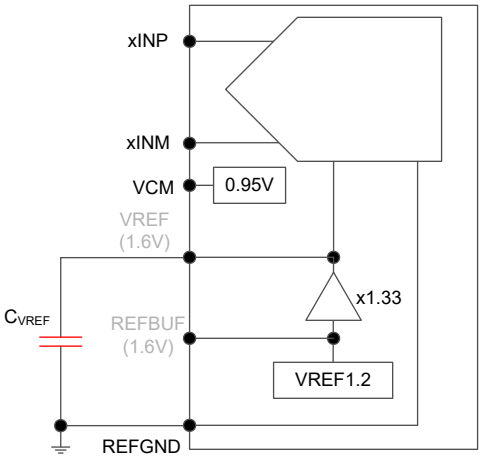

图 8-12. Internal reference

8.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, the VREF input can be directly connected to an external 1.6V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor (C_{VREF}) should be connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1mA.

Note: The internal reference is also used for other functions inside the device, therefore the reference amplifier should only be powered down in power down state but not during normal operation.

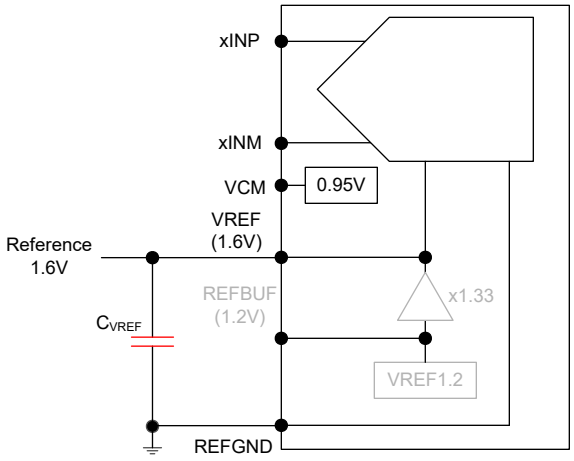

图 8-13. External 1.6V reference

8.3.3.3 External voltage reference with internal buffer (REFBUF)

The ADC3664 is equipped with an on-chip reference buffer that also includes gain to generate the 1.6V reference voltage from an external 1.2V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor (C_{VREF}) between the VREF and REFGND pins and a 10 uF and a 0.1 uF ceramic bypass capacitor between the REFBUF and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100uA.

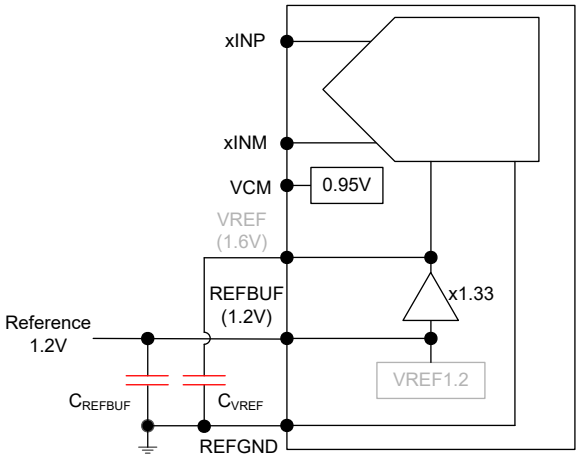

图 8-14. External 1.2V reference using internal reference buffer

8.3.4 Digital Down Converter

The ADC3664 includes an optional on-chip digital down conversion (DDC) decimation filter that can be enabled via SPI register settings. It supports complex decimation by 2, 4, 8, 16 and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in 图 8-15. Furthermore it supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.

Internally the decimation filter calculations are performed with a 20-bit resolution in order to avoid any SNR degradation due to quantization noise limitation. The Output Formatter truncates to the selected resolution prior to outputting the data on the digital interface.

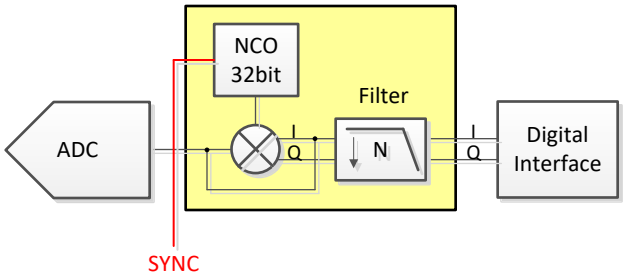

图 8-15. Internal Digital Decimation Filter

8.3.4.1 DDC MUX

The ADC3664 contains a MUX in front of the digital decimation filter which allows the ADC channel A input to be connected to the DDC of channel B and vice versa.

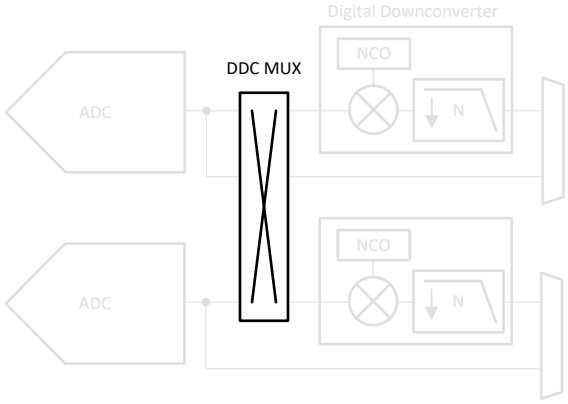

图 8-16. DDC MUX

8.3.4.2 Digital Filter Operation

The complex decimation operation is illustrated with an example in 图 8-17. First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz) and the output data rate is decimated - in this example the output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$. During the complex mixing the spectrum (signal and noise) is split into real and complex parts and thus the amplitude is reduced by 6-dB. In order to compensate this loss, there is a 6-dB digital gain option in the decimation filter block that can be enabled via SPI write.

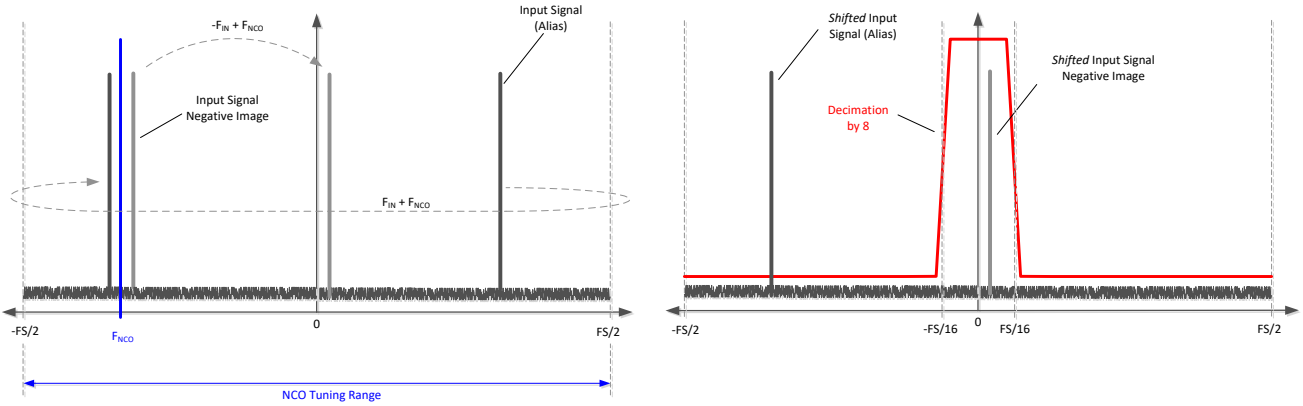

图 8-17. Complex decimation illustration

The real decimation operation is illustrated with an example in 图 8-18. There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated - a decimation of 8 would result in an output data rate $F_{S,OUT} = F_S/8$ with a Nyquist zone of $F_S/16$.

During the real mixing the spectrum (signal and noise) amplitude is reduced by 3-dB. In order to compensate this loss, there is a 3-dB digital gain option in the decimation filter block that can be enabled via SPI write.

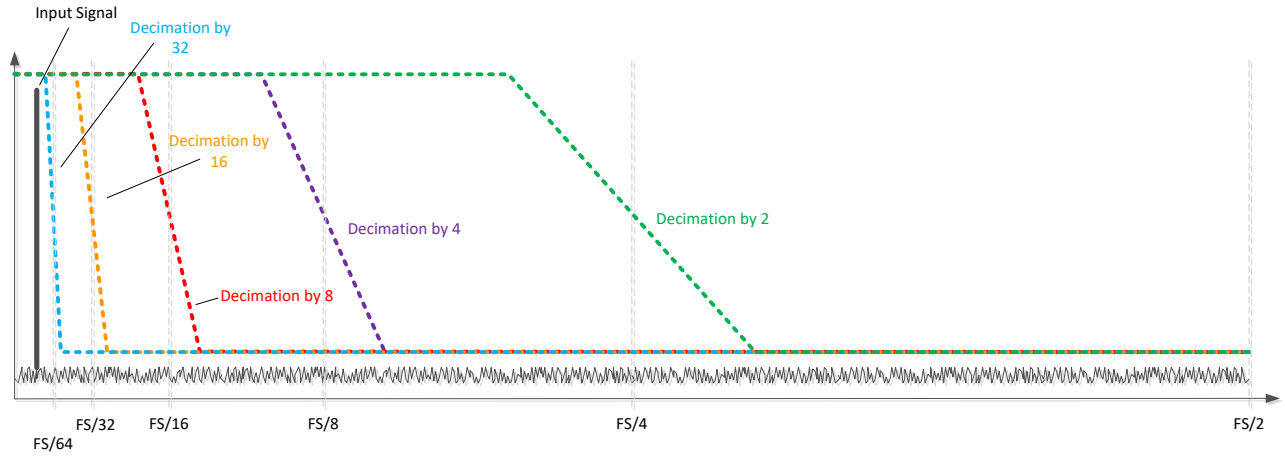

图 8-18. Real decimation illustration

8.3.4.3 FS/4 Mixing with Real Output

In this mode, the output after complex decimation gets mixed with FS/4 (FS = output data rate in this case). Instead of a complex output with the input signal centered around 0 Hz, the output is transmitted as a real output at twice the data rate and the signal is centered around FS/4 (Fout/4) as illustrated in 图 8-19.

In this example, complex decimation by 8 is used. The output data is transmitted as a real output with an output rate of Fout = FS'/4 (FS' = ADC sampling rate). The input signal is now centered around FS/4 (Fout/4) or FS'/16.

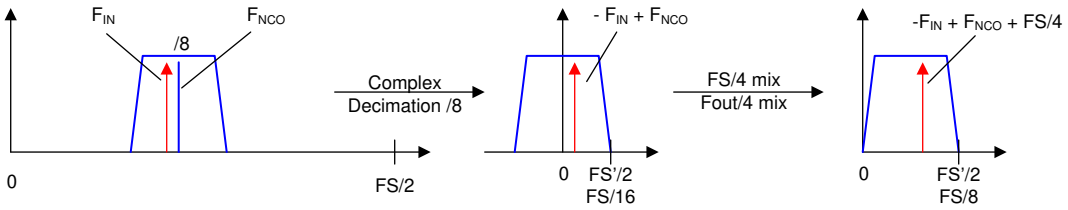

图 8-19. FS/4 Mixing with real output

8.3.4.4 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32-bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:

$e^{j\omega n}$ (default) or $e^{-j\omega n}$

where: frequency (ω) is specified as a signed number by the 32-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to $f_{IN} + f_{NCO}$. The NCO frequency can be tuned from $-F_S/2$ to $+F_S/2$ and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally the ADC3664 provides the option via SPI to invert the mixer phase.

The NCO frequency setting is set by the 32-bit register value given and calculated as:

NCO frequency = 0 to + $F_S/2$: NCO = $f_{NCO} \times 2^{32} / F_S$

NCO frequency = $-F_S/2$ to 0: NCO = $(f_{NCO} + F_S) \times 2^{32} / F_S$

where:

- NCO = NCO register setting (decimal value)
- f_{NCO} = Desired NCO frequency (MHz)
- F_S = ADC sampling rate (MSPS)

The NCO programming is further illustrated with this example:

- ADC sampling rate F_S = 125 MSPS
- Input signal f_{IN} = 10 MHz
- Desired output frequency f_{OUT} = 0 MHz

For this example there are actually four ways to program the NCO and achieve the desired output frequency as shown in 表 8-1.

表 8-1. NCO value calculations example

Alias or negative image	f_{NCO}	NCO Value	Mixer Phase	Frequency translation for f_{OUT}
f_{IN} = – 10 MHz	f_{NCO} = 10 MHz	343597384	as is	$f_{OUT} = f_{IN} + f_{NCO}$ = – 10 MHz +10 MHz = 0 MHz
f_{IN} = 10 MHz	f_{NCO} = – 10 MHz	4638564680		$f_{OUT} = f_{IN} + f_{NCO}$ = 10 MHz + (– 10 MHz) = 0 MHz

表 8-1. NCO value calculations example (continued)

Alias or negative image	f_{NCO}	NCO Value	Mixer Phase	Frequency translation for f_{OUT}
f_{IN} = 10 MHz	f_{NCO} = 10 MHz	343597384	inverted	$f_{OUT} = f_{IN} - f_{NCO}$ = 10 MHz – 10 MHz = 0 MHz
f_{IN} = – 10 MHz	f_{NCO} = – 10 MHz	4638564680		$f_{OUT} = f_{IN} - f_{NCO}$ = – 10 MHz – (– 10 MHz) = 0 MHz

8.3.4.5 Decimation Filter

The ADC3664 supports complex decimation by 2, 4, 8, 16 and 32 with a pass-band bandwidth of ~ 80% and a stopband rejection of at least 85 dB. 表 8-2 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate F_S. In real decimation mode the output bandwidth is half of the complex bandwidth.

表 8-2. Decimation Filter Summary and Maximum Available Output Bandwidth

REAL/COMPLEX DECIMATION	DECIMATION SETTING N	OUTPUT RATE	OUTPUT BANDWIDTH	OUTPUT RATE (F_S = 125 MSPS)	OUTPUT BANDWIDTH (F_S = 125 MSPS)
Complex	2	F_S / 2 complex	0.8 × F_S / 2	62.5 MSPS complex	50 MHz
	4	F_S / 4 complex	0.8 × F_S / 4	31.25 MSPS complex	25 MHz
	8	F_S / 8 complex	0.8 × F_S / 8	15.625 MSPS complex	12.5 MHz
	16	F_S / 16 complex	0.8 × F_S / 16	7.8125 MSPS complex	6.25 MHz
	32	F_S / 32 complex	0.8 × F_S / 32	3.90625 MSPS complex	3.125 MHz
Real	2	F_S / 2 real	0.4 × F_S / 2	62.5 MSPS	25 MHz
	4	F_S / 4 real	0.4 × F_S / 4	31.25 MSPS	12.5 MHz
	8	F_S / 8 real	0.4 × F_S / 8	15.625 MSPS	6.25 MHz
	16	F_S / 16 real	0.4 × F_S / 16	7.8125 MSPS	3.125 MHz
	32	F_S / 32 real	0.4 × F_S / 32	3.90625 MSPS	1.5625 MHz

The decimation filter responses normalized tot he ADC sampling clock frequency are illustrated in 图 8-21 to 图 8-30. They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in 图 8-20. The x-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate F_S.

For example, in the divide-by-4 complex setup, the output data rate is F_S / 4 complex with a Nyquist zone of F_S / 8 or 0.125 × F_S. The transition band (colored in blue) is centered around 0.125 × F_S and the alias transition band is centered at 0.375 × F_S. The stop-bands (colored in red), which alias on top of the pass-band, are centered at 0.25 × F_S and 0.5 × F_S. The stop-band attenuation is greater than 85 dB.

图 8-30. Decimation by 32 complex passband ripple response

8.3.4.6 SYNC

The PDN/SYNC pin can be used to synchronize multiple devices using an external SYNC signal. The PDN/SYNC pin can be configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in 图 8-31.

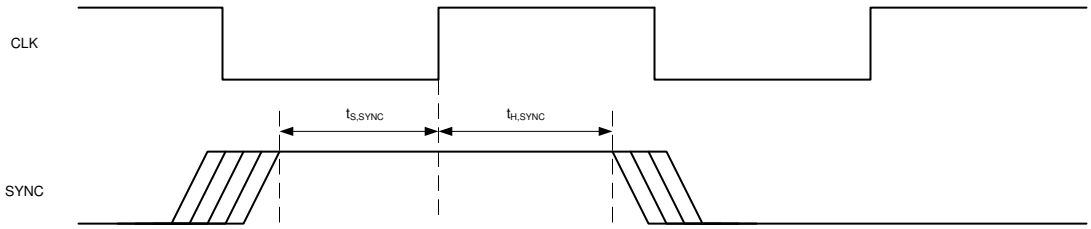

图 8-31. External SYNC timing diagram

The synchronization signal is only required when using the decimation filter - either using the SPI SYNC register or the PDN/SYNC pin. It resets internal clock dividers used in the decimation filter and aligns the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given, the internal clock dividers is not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).

When trying to resynchronize during operation, the SYNC toggle should occur at 64*K clock cycles, where K is an integer. This provides the phase continuity of the clock divider.

8.3.4.7 Output Formatting with Decimation

When using decimation, the output data is formatted as shown in 图 8-32 and 图 8-33. The examples are shown for 16-bit output for 2-wire (8x serialization), 1-wire (16x serialization) and 1/2-wire (32x serialization).

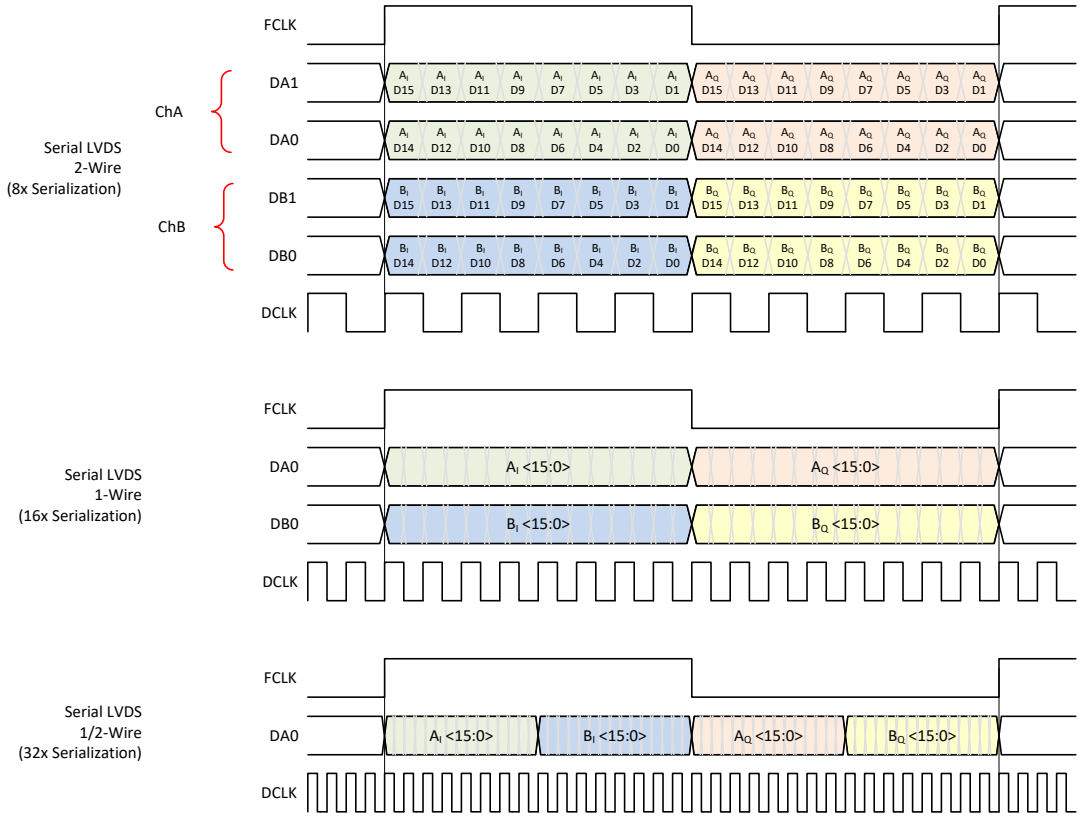

图 8-32. Output Data Format in Complex Decimation

表 8-3 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and complex decimation setting (N).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and complex decimation by 4.

表 8-3. Serial LVDS Lane Rate Examples with Complex Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DA/B0,1
N	F_S	R	L	F_S / N	[DA/B0,1] / 2	F_S x 2 x R / L / N
4	125 MSPS	16	2	31.25 MHz	250 MHz	500 MHz
			1		500 MHz	1000 MHz
	55 MSPS		1/2	15.625 MHz	500 MHz	1000 MHz

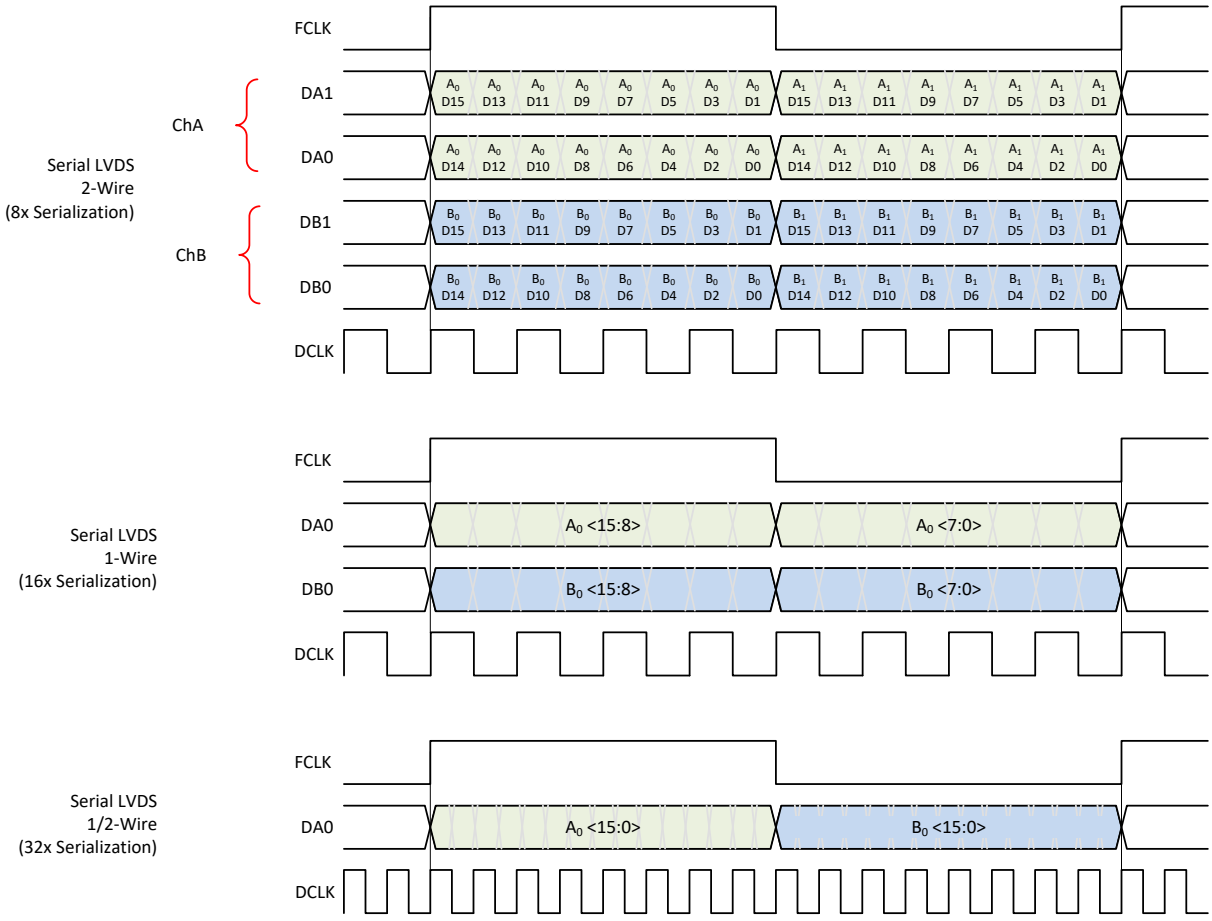

图 8-33. Output Data Format in Real Decimation

表 8-4 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and real decimation setting (M).

Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16-bit output resolution and real decimation by 4.

表 8-4. Serial LVDS Lane Rate Examples with Real Decimation and 16-bit Output Resolution

DECIMATION SETTING	ADC SAMPLING RATE	OUTPUT RESOLUTION	# of WIRES	FCLK	DCLKIN, DCLK	DA/B0,1
M	F_S	R	L	F_S / M / 2 (L = 2) F_S / M (L = 1, 1/2)	[DA/B0,1] / 2	F_S x R / L / M
4	125 MSPS	16	2	15.625 MHz	125 MHz	250 MHz
			1	31.25 MHz	250 MHz	500 MHz
			1/2		500 MHz	1000 MHz

8.3.5 Digital Interface

The serial LVDS interface supports the data output with 2-wire, 1-wire and 1/2-wire operation. The actual data output rate depends on the output resolution and number of lanes used.

The ADC3664 requires an external serial LVDS clock input (DCLKIN), which is used to transmit the data out of the ADC along with the data clock (DCLK). The phase relationship between DCLKIN and the sampling clock is irrelevant but both clocks need to be frequency locked. The SLVDS interface is configured using SPI register writes.

8.3.5.1 Output Formatter

The digital output interface utilizes a flexible output bit mapper (图 8-34). The bit mapper takes the 14-bit output directly from the ADC or from digital filter block and reformats it to a resolution of 14, 16, 18 or 20-bit. The output serialization factor gets adjusted accordingly for 2-, 1- and 1/2-wire interface mode. The maximum output data rate can not be exceeded independently of output resolution and serialization factor.

When using 16-bit or higher output resolution in non-decimation mode, the 2 LSBs are set to 0.

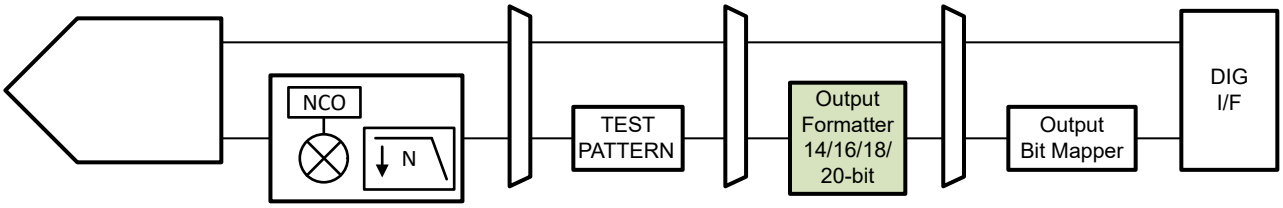

图 8-34. Interface output bit mapper

表 8-5 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note that the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example would result in DCLKIN = F_S * 4 instead of * 3.5.

The output bit mapper can be used for bypass and decimation filter.

表 8-5. Serialization factor vs output resolution for different output modes

OUTPUT RESOLUTION	Interface	SERIALIZATION	FCLK	DCLKIN	DCLK	D0/D1
14-bit (default)	2-Wire	7x	F_S/2	F_S* 3.5	F_S* 3.5	F_S* 7
	1-Wire	14x	F_S	F_S* 7	F_S* 7	F_S* 14
	1/2-Wire	28x	F_S	F_S* 14	F_S* 14	F_S* 28
16-bit	2-Wire	8x	F_S/2	F_S* 4	F_S* 4	F_S* 8
	1-Wire	16x	F_S	F_S* 8	F_S* 8	F_S* 16
	1/2-Wire	32x	F_S	F_S* 16	F_S* 16	F_S* 32
18-bit	2-Wire	9x	F_S/2	F_S* 4.5	F_S* 4.5	F_S* 9
	1-Wire	18x	F_S	F_S* 9	F_S* 9	F_S* 18
	1/2-Wire	36x	F_S	F_S* 18	F_S* 18	F_S* 36
20-bit	2-Wire	10x	F_S/2	F_S* 5	F_S* 5	F_S* 10
	1-Wire	20x	F_S	F_S* 10	F_S* 10	F_S* 20
	1/2-Wire	40x	F_S	F_S* 20	F_S* 20	F_S* 40

The programming sequence to change the output interface and/or resolution from default settings is shown in Output Interface/Mode Configuration.

8.3.5.2 Output Bit Mapper

The output bit mapper allows change to the output bit order for any selected interface mode.

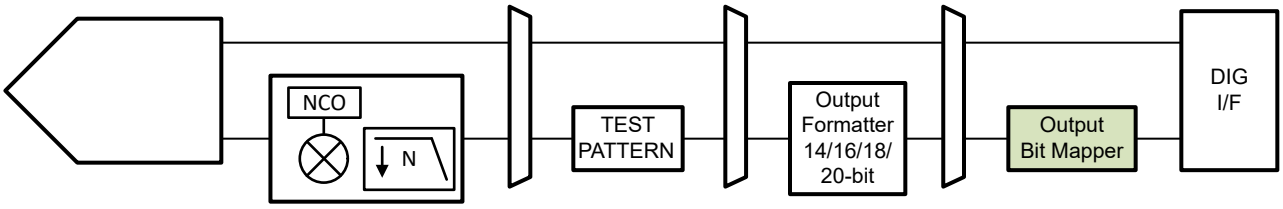

图 8-35. Output Bit Mapper

It is a two step process to change the output bit mapping and assemble the output data bus:

1. Both output channel A and B can have up to 20-bit output. Each output bit of either channel has a unique identifier bit as shown in 表 8-6. The MSB starts with bit D19 – depending on output resolution chosen the LSB would be D6 (14-bit) to D0 (20-bit). The ‘previous sample’ is only needed in 2-w mode.
2. The bit mapper is then used to assemble the output sample. The following sections detail how to remap the serial output format.

表 8-6. Unique identifier of each data bit

Bit	Channel A		Channel B	
	Previous sample (2w only)	Current sample	Previous sample (2w only)	Current sample
D19 (MSB)	0x2D	0x6D	0x29	0x69

D0 (LSB)	0x06	0x46	0x02	0x42

In the serial output mode, a data bit (with unique identifier) needs to be assigned to each location within the serial output stream. There are a total of 40 addresses available per channel. Channel A spans from address 0x39 to 0x60 and channel B from address 0x61 to 0x88. When using complex decimation, the output bit mapper is applied to both the “I” and the “Q” sample.

2-wire mode: in this mode both the current and the previous sample have to be used in the address space as shown in 图 8-36. The address order is different for 14/18-bit and 16/20-bit. Note: there are unused addresses between samples for resolution less than 20-bit (grey back ground), which can be skipped if not used.

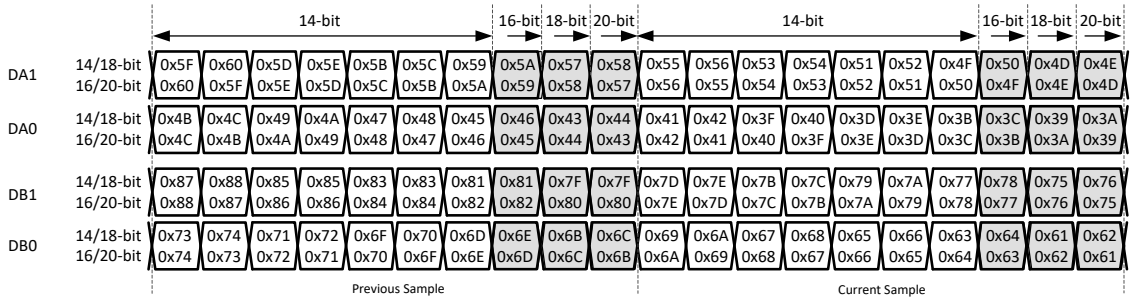

图 8-36. 2-wire output bit mapper

In the following example (图 8-37), the 16-bit 2-wire serial output is reordered to where lane DA1/DB1 carries the 8 MSB and lane DA0/DB0 carries 8 LSBs.

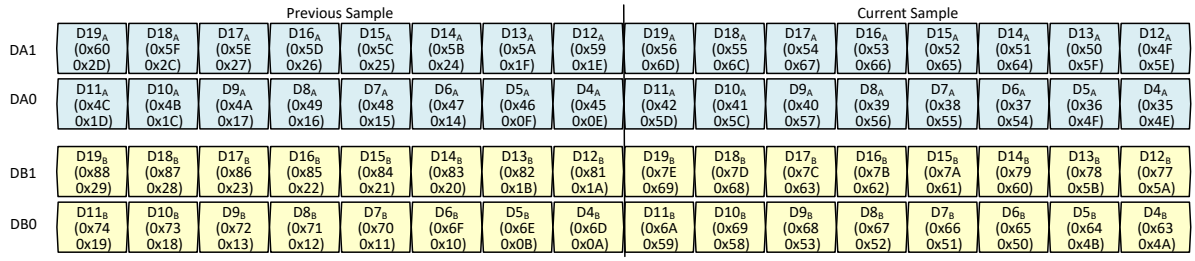

图 8-37. Example: 2-wire output bit mapping

1-wire mode: Only the ‘current’ sample needs to programmed in the address space. If desired, it can be duplicated on DA1/DB1 as well (using addresses shown below) in order to have a redundant output. Lane DA1/DB1 needs to be powered up in that case.

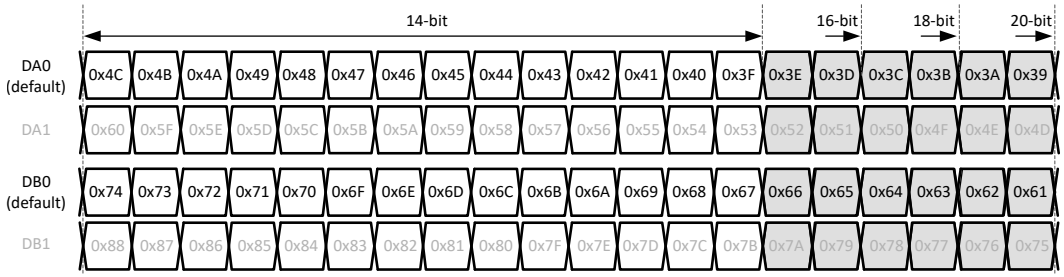

图 8-38. 1-wire output bit mapping

½-wire mode: The output is only lane DA0 and the sample order is programmed into the 40 addresses of chA (from 0x39 to 0x60). It covers 2 samples (one for chA, one for chB) as shown below. If desired, it can be duplicated on DB0 as well (using addresses shown 图 8-39) in order to have a redundant output. Lane DB0 needs to be powered up in that case.

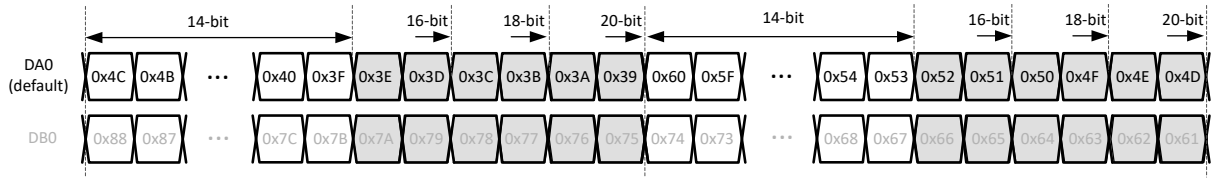

图 8-39. 1/2-wire output bit mapping

8.3.5.3 Output Interface/Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

表 8-7. Configuration steps for changing interface or decimation

STEP	FEATURE	ADDRESS	DESCRIPTION				
1	Output Interface	0x07	Select the output interface bit mapping depending on resolution and output interface.				
			Output Resolution	2-wire	1-wire	1/2-wire	
			14-bit	0x2B	0x6C	0x8D	
			16-bit	0x4B			
			18-bit	0x2B			
			20-bit	0x4B			
2		0x13	Load the output interface bit mapping using the E-fuse loader (0x13, D0). Program register 0x13 to 0x01, wait ~ 1ms so that bit mapping is loaded properly followed by 0x13 0x00.				
3		0x19	Configure the FCLK frequency based on bypass/decimation and number of lanes used.				
			Bypass/Dec	SLVDS	FCLK SRC (D7)	FCLK DIV (D4)	TOG FCLK (D0)
			Bypass/ Real Decimation	2-wire	0	1	0
				1-wire	0	0	0
				1/2-wire	0	0	0
			Complex Decimation	2-wire	1	0	0
				1-wire	1	0	0
				1/2-wire	0	0	1
4		0x1B	Select the output interface resolution using the bit mapper (D5-D3).				
5		0x20 0x21 0x22	Select the FCLK pattern for decimation for proper duty cycle output of the frame clock.				
				Output Resolution	2-wire	1-wire	1/2-wire
			Real Decimation	14-bit	use default	0xFE000	use default
				16-bit		0xFF000	
				18-bit		0xFF800	
				20-bit		0xFFC00	
			Complex Decimation	14-bit		0xFFFFF	0xFFFFF
				16-bit			
				18-bit			
				20-bit			
6		0x39..0x60 0x61..0x88	Change output bit mapping for chA and chB if desired. This works also with the default interface selection.				
7	Decimation Filter	0x24	Enable the decimation filter				
8		0x25	Configure the decimation filter				
9		0x2A/B/C/D 0x31/2/3/4	Program the NCO frequency for complex decimation (can be skipped for real decimation)				
10		0x27 0x2E	Configure the complex output data stream (set both bits to 0 for real decimation)				
			SLVDS		OP-Order (D4)	Q-Delay (D3)	
			2-wire		1	0	
			1-wire		0	1	
			1/2-wire		1	1	
11		0x26	Set the mixer gain and toggle the mixer reset bit to update the NCO frequency.				

8.3.5.3.1 Configuration Example

The following is a step by step programming example to configure the ADC3664 to complex decimation by 8 with 1-wire SLVDS and 16-bit output.

1. 0x07 (address) 0x6C (load bit mapper configuration for 16-bit output with 1-wire SLVDS)
2. 0x13 0x01, wait 1 ms, 0x13 0x00 (load e-fuse)
3. 0x19 0x80 (configure FCLK)
4. 0x1B 0x88 (select 16-bit output resolution)
5. 0x20 0xFF, 0x21 0xFF, 0x22 0x0F (configure FCLK pattern)
6. 0x24 0x06 (enable decimation filter)
7. 0x25 0x30 (configure complex decimation by 8)
8. 0x2A/B/C/D and 0x31/32/33/34 (program NCO frequency)
9. 0x27/0x2E 0x08 (configure Q-delay register bit)
10. 0x26 0xAA, 0x26 0x88 (set digital mixer gain to 6-dB and toggle the mixer update)

8.3.5.4 Output Data Format

The output data can be configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and 0x92). 表 8-8 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.

表 8-8. Overview of minimum and maximum output codes vs output resolution for different formatting

	Two's Complement (default)		Offset Binary	
RESOLUTION (BIT)	**14**	**16**	**14**	**16**
$V_{IN,MAX}$	0x1FFF	0x7FFF	0x3FFF	0xFFFF
0	0x0000		0x2000	0x8000
$V_{IN,MIN}$	0x2000	0x8000	0x0000	

8.3.6 Test Pattern

In order to enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes (0x14/0x15/0x16). The test pattern generator is located after the decimation filter as shown in 图 8-40. In decimation mode (real and complex), the test patterns replace the output data of the DDC - however channel A controls the test patterns for both channels.

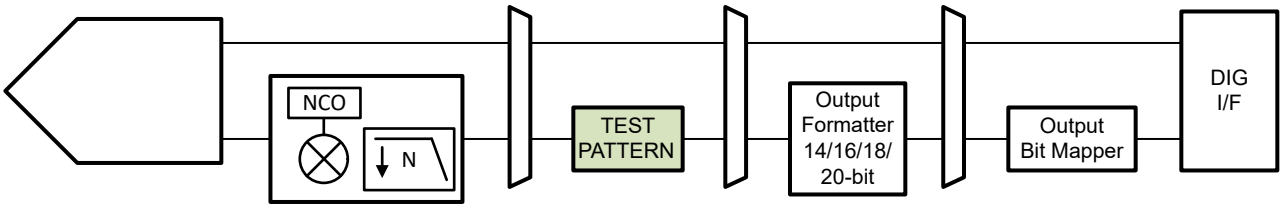

图 8-40. Test Pattern Generator

- RAMP Pattern: The step size needs to be configured in the CUSTOM PAT register according to the native resolution of the ADC. When selecting a higher output resolution then the additional LSBs will still be 0 in RAMP pattern mode.
  - 00001: 18-bit output resolution
  - 00100: 16-bit output resolution
  - 10000: 14-bit output resolution
- Custom Pattern: Configured in the CUSTOM PAT register

8.4 Device Functional Modes

8.4.1 Normal operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 14-bit resolution. The output is available in as little as 1 clock cycle on the digital outputs.

8.4.2 Power Down Options

A global power down mode can be enabled via SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down 21 kΩ resistor on the PDN/SYNC input pin and the pin is active high - so the pin needs to be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable/disable individual blocks directly or via PDN pin mask in order to trade off power consumption vs wake up time as shown in 表 8-9.

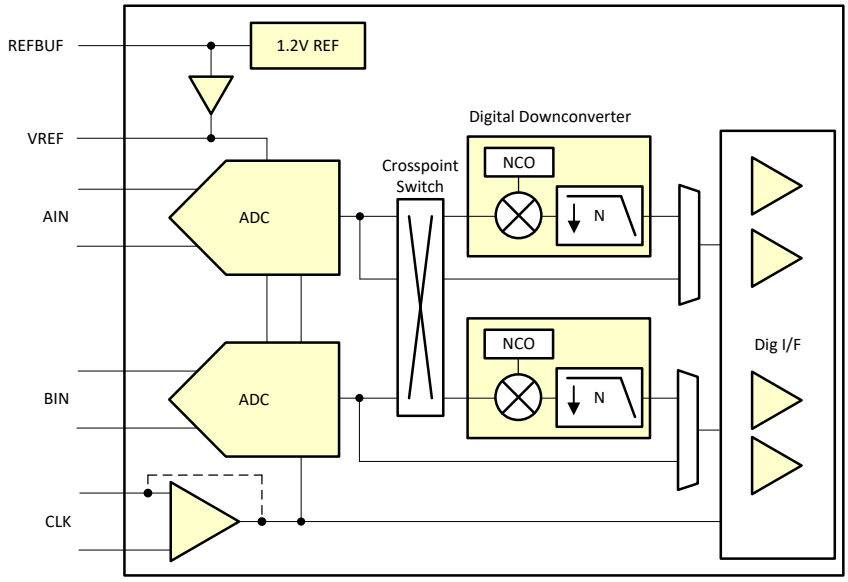

图 8-41. Power Down Configurations

表 8-9. Overview of Power Down Options

Function/ Register	PDN via SPI	Mask for Global PDN	Feature - Default	Power Impact	Wake-up time	Comment
ADC	Yes	-	Enabled			Both ADC channels are included in Global PDN automatically
Reference gain amplifier	Yes	Yes	Enabled	~ 0.4 mA	~3 us	Should only be powered down in power down state.
Internal 1.2V reference	Yes		External ref	~ 1-3.5 mA	~3 ms	Internal/external reference selection is available through SPI and REFBUF pin.
Clock buffer	Yes		Differential clock	~ 1 mA	n/a	Single ended clock input saves ~ 1mA compared to differential. Some programmability is available through the REFBUF pin.
Output interface drivers	Yes	-	Enabled	varies	n/a	Depending on output interface mode, unused output drivers can be powered down for maximum power savings
Decimation filter	Yes	-	Disabled	see electrical table	n/a	

8.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI) however it can operate in a default configuration without requiring the SPI interface. Furthermore the power down function as well as internal/external reference configuration is possible via pin control (PDN/SYNC and REFBUF pin).

备注

The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.

After initial power up, the default operating configuration is shown in 表 8-10.

表 8-10. Default device configuration after power up

FEATURE	DEFAULT
Signal Input	Differential
Clock Input	Differential
Reference	External
Decimation	DDC bypass
Interface	2-wire
Output Format	2s complement

8.5.1 Configuration using PINs only

The ADC voltage reference can be selected using the REFBUF pin. Even though there is an internal 100 kΩ pull-up resistor to AVDD, the REFBUF pin should be set to a voltage externally and not left floating. When using a voltage divider to set the REFBUF voltage (R1 and R2 in 图 8-42), resistor values < 5 kΩ should be used.

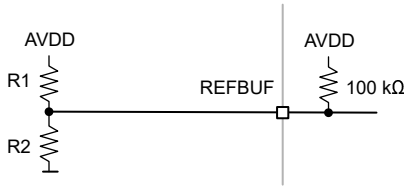

图 8-42. Configuration of external voltage on REFBUF pin

表 8-11. REFBUF voltage levels control voltage reference selection

REFBUF VOLTAGE	VOLTAGE REFERENCE OPTION	CLOCKING OPTION
> 1.7 V (Default)	External reference	Differential clock input
1.2 V (1.15-1.25V)	External 1.2V input on REFBUF pin using internal gain buffer	Differential clock input
0.5 - 0.7V	Internal reference	Differential clock input
< 0.1V	Internal reference	Single ended clock input

8.5.2 Configuration using the SPI interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12 MHz down to very low speeds (of a few hertz) and also with a non-50% SCLK duty cycle.

8.5.2.1 Register Write

The internal registers can be programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8-bit data that are latched in on the SCLK rising edges

图 8-43 shows the timing requirements for the serial register write operation.

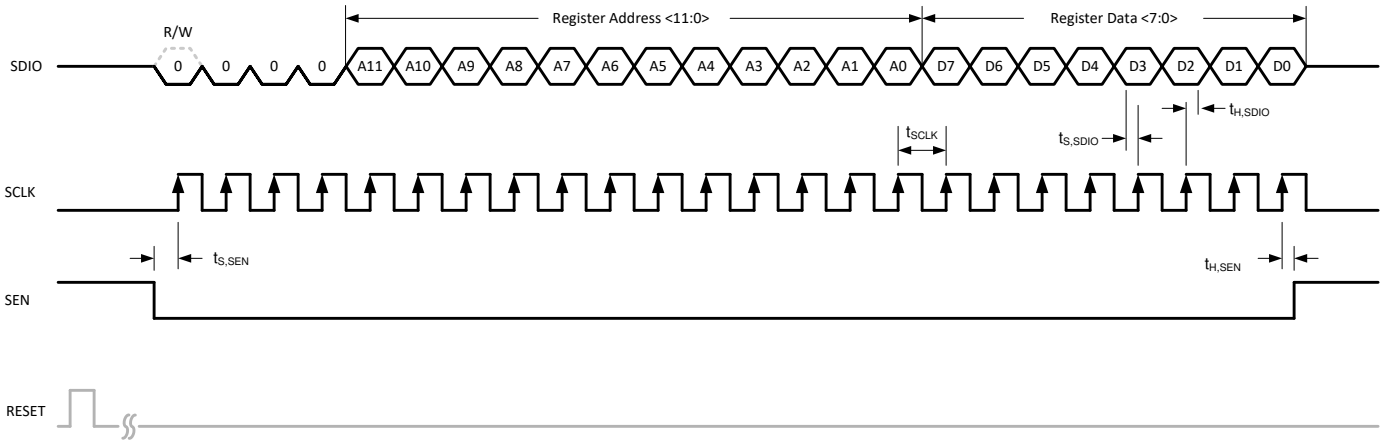

图 8-43. Serial Register Write Timing Diagram

8.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
4. The device launches the contents (D[7:0]) of the selected register on the SDIO pin on SCLK falling edge
5. The external controller can capture the contents on the SCLK rising edge

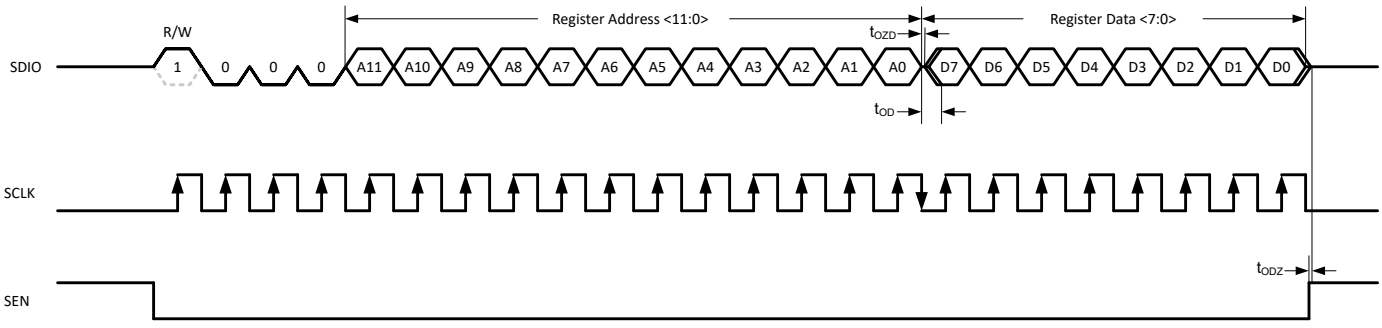

图 8-44. Serial Register Read Timing Diagram

8.6 Register Maps

表 8-12. Register Map Summary

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	RESET
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-13. Register 0x00 Field Descriptions

Bit	Field	Type	Reset	Description
7-1	0	R/W	0	Must write 0
0	RESET	R/W	0	This bit resets all internal registers to the default values and self clears to 0.

图 8-46. Register 0x07

7	6	5	4	3	2	1	0
OP IF MAPPER			0	OP IF EN	OP IF SEL		
R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-14. Register 0x07 Field Descriptions

Bit	Field	Type	Reset	Description
7-5	OP IF MAPPER	R/W	000	Output interface mapper. This register contains the proper output interface bit mapping for the different interfaces. The interface bit mapping is internally loaded from e-fuses and also requires a fuse load command to go into effect (0x13, D0). Register 0x07 along with the E-Fuse Load (0x13, D0) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. After initial reset the default output interface variant is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 001: 2-wire, 18 and 14-bit 010: 2-wire, 16-bit 011: 1-wire 100: 0.5-wire others: not used
4	0	R/W	0	Must write 0
3	OP IF EN	R/W	0	Enables changing the default output interface mode (D2-D0).
2-0	OP IF SEL	R/W	000	Selection of the output interface mode. OP IF EN (D3) needs to be enabled also. After initial reset the default output interface is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. 011: 2-wire 100: 1-wire 101: 0.5-wire others: not used

表 8-18. Register 0x0E Field Descriptions

Bit	Field	Type	Reset	Description
7	SYNC PIN EN	R/W	0	This bit controls the functionality of the SYNC/PDN pin. 0: SYNC/PDN pin exercises global power down mode when pin is pulled high. 1: SYNC/PDN pin issues the SYNC command when pin is pulled high.
6	SPI SYNC	R/W	0	Toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0. 0: Normal operation 1: SYNC command issued.
5	SPI SYNC EN	R/W	0	This bit enables synchronization using SPI instead of the SYNC/PDN pin. 0: Synchronization using SPI register bit disabled. 1: Synchronization using SPI register bit enabled.
4	0	R/W	0	Must write 0
3	REF CTL	R/W	0	This bit determines if the REFBUF pin controls the voltage reference selection or the SPI register (D2-D1). 0: The REFBUF pin selects the voltage reference option. 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using D0.
2-1	REF SEL	R/W	00	Selects of the voltage reference option. REF CTRL (D3) must be set to 1. 00: Internal reference 01: External voltage reference (1.2V) using internal reference buffer (REFBUF) 10: External voltage reference 11: not used
0	SE CLK EN	R/W	0	Selects single ended clock input and powers down the differential sampling clock input buffer. REF CRTL (D3) must be set to 1. 0: Differential clock input 1: Single ended clock input

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0

表 8-22. Register 0x19 Field Descriptions

Bit	Field	Type	Reset	Description
7	FCLK SRC	R/W	0	User has to select if FCLK signal comes from ADC or from DDC block. Here real decimation is treated same as bypass mode 0: FCLK generated from ADC. FCLK SRC set to 0 for DDC bypass, real decimation mode and 1/2-w complex decimation mode. 1: FCLK generated from DDC block. In complex decimation mode only this bit needs to be set for 2-w and 1-w output interface mode but NOT for 1/2-w mode.
6-5	0	R/W	0	Must write 0
4	FCLK DIV	R/W	0	This bit needs to be set to 1 for 2-w output mode in bypass mode only (non decimation). 0: All output interface modes except 2-w bypass mode.. 1: 2-w output interface mode.
3-1	0	R/W	0	Must write 0
0	TOG FCLK	R/W	0	This bit adjusts the FCLK signal appropriately for 1/2-wire mode where FCLK is stretched to cover channel A and channel B. This bit ONLY needs to be set in 1/2-wire mode with complex decimation mode. 0: all other modes. 1: FCLK for 1/2-wire complex decimation mode.

9 Application Information Disclaimer

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

9.1 Typical Application

A spectrum analyzer is a typical frequency domain application for the ADC3664 and its front end circuitry is very similar to several other systems such as software defined radio (SDR), sonar, radar or communications. Some applications require frequency coverage including DC or near DC (such as: sonar) so it is included in this example.

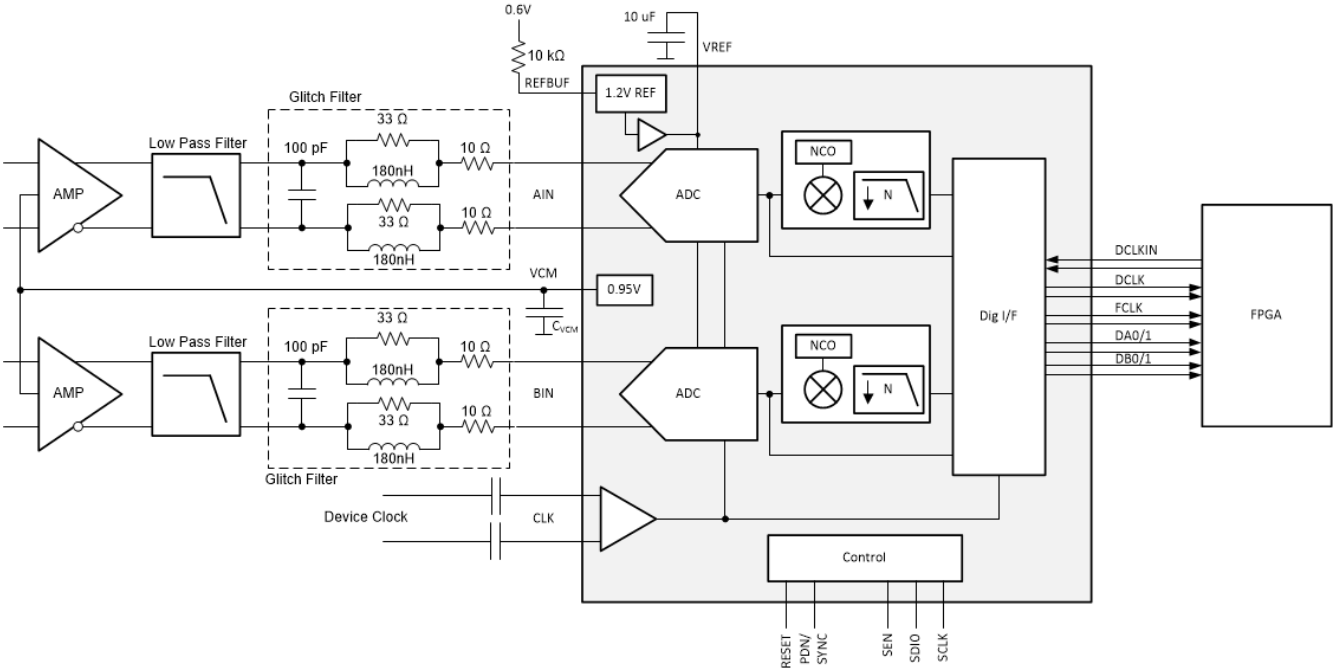

图 9-1. Typical configuration for a spectrum analyzer with DC support

9.1.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If very low input frequency is supported then the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed then AC coupling and use of a balun may be more suitable.

The internal reference is used since DC precision is not needed. However the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferers can be present then the ADC SFDR performance will be a key care about as well. A higher ADC sampling rate is desirable in order to relax the external anti-aliasing filter – an internal decimation filter can be used to reduce the digital output rate afterwards.

表 9-1. Design key care-abouts

FEATURE	DESCRIPTION
Signal Bandwidth	DC to 30 MHz
Input Driver	Single ended to differential signal conversion and DC coupling
Clock Source	External clock with low jitter

When designing the amplifier/filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC3664 input full-scale is 3.2Vpp. When factoring in ~ 1 dB for insertion loss of the filter, then the amplifier needs to deliver close to 3.6Vpp. The amplifier distortion performance will degrade with a larger output swing and considering the ADC common mode input voltage the amplifier may not be able to deliver the full swing. The ADC3664 provides an output common mode voltage of 0.95V and the THS4541 for example can only swing within 250 mV of its negative supply. A unipolar 3.3 V amplifier power supply will thus limit the maximum voltage swing to ~ 2.8Vpp. Hence if a larger output swing is required (factoring in filter insertion loss) then a negative supply for the amplifier is needed in order to eliminate that limitation. Additionally input voltage protection diodes may be needed to protect the ADC from over-voltage events.

表 9-2. Output voltage swing of THS4541 vs power supply

DEVICE	MIN OUTPUT VOLTAGE	MAX SWING WITH 3.3 V/ 0 V SUPPLY	MAX SWING WITH 3.3 V/ -1.0 V SUPPLY
THS4541	VS- + 250 mV	2.8 Vpp	6.8 Vpp

9.1.2 Detailed Design Procedure

9.1.2.1 Input Signal Path

The THS4541 provides a very good low power option to drive the ADC inputs. 表 9-3

provides an overview of the THS4541 with power consumption and usable frequency.

表 9-3. Fully Differential Amplifier Options

DEVICE	CURRENT (IQ) PER CHANNEL	USABLE FREQUENCY RANGE
THS4541	10 mA	< 70 MHz

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to added as well as shown in 节 8.3.1.2.1. In this example the DC - 30 MHz glitch filter is selected.

9.1.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 30 MHz) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (i.e. square wave vs sine wave). 表 9-4 provides an overview of the estimated SNR performance of the ADC3664 based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC3664 thermal noise of 77.5 dBFS and input signal at -1dBFS.

表 9-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter

INPUT FREQUENCY	$T_{J,EXT}$ = 100 fs	$T_{J,EXT}$ = 250 fs	$T_{J,EXT}$ = 500 fs	$T_{J,EXT}$ = 1 ps
10 MHz	77.4	77.4	77.3	76.8
20 MHz	77.3	77.2	76.7	75.1
30 MHz	77.1	76.8	75.8	73.2

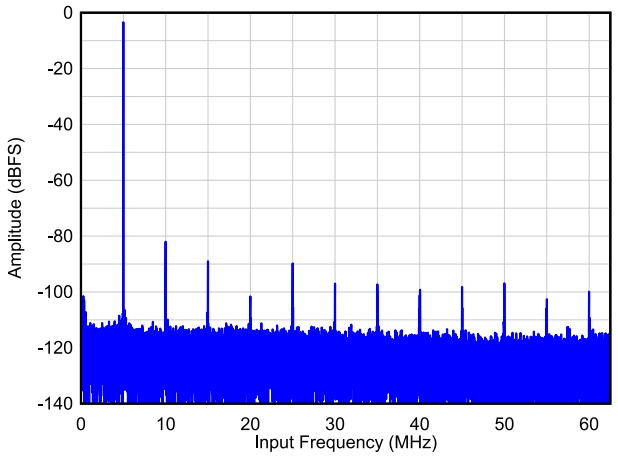
Termination of the clock input should be considered for long clock traces.

9.1.2.3 Voltage Reference

The ADC3664 is configured to internal reference operation by applying 0.6 V to the REFBUF pin.

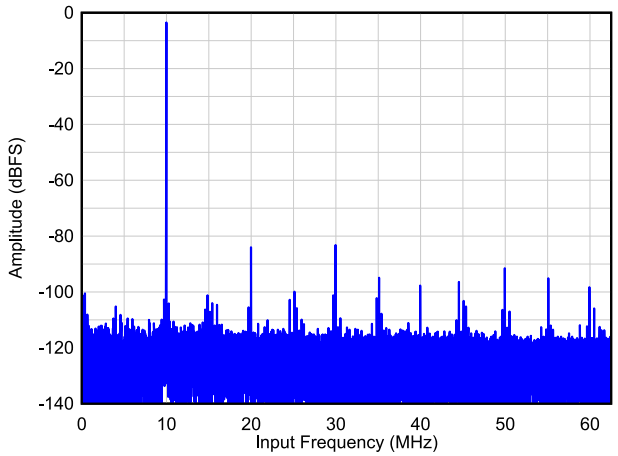
9.1.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC3664 operated at 125 MSPS with a full-scale input at -1 dBFS with input frequencies at 5, 10 and 20 MHz.



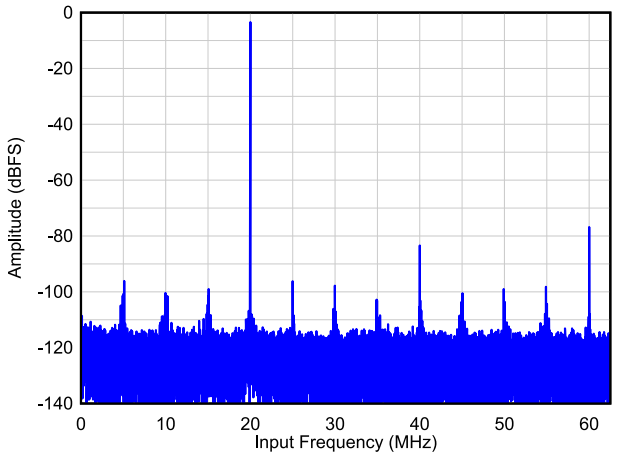
SNR = 76.4 dBFS, HD23 = 83 dBc, Non HD23 = 89 dBFS

图 9-2. Single Tone FFT at F_{IN} = 5 MHz



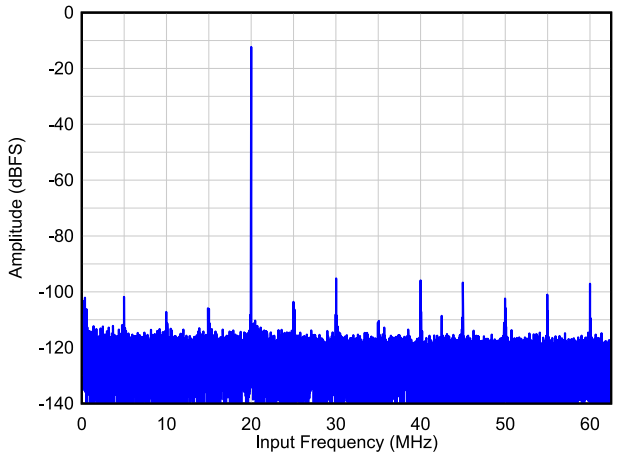
SNR = 75.8 dBFS, HD23 = 82 dBc, Non HD23 = 88 dBFS

图 9-3. Single Tone FFT at F_{IN} = 10 MHz



SNR = 75.6 dBFS, HD23 = 74 dBc, Non HD23 = 94 dBFS

图 9-4. Single Tone FFT at F_{IN} = 20 MHz



A_{IN} = -10 dBFS, SNR = 76.9 dBFS, HD23 = 83 dBc, Non HD23 = 93 dBFS

图 9-5. Single Tone FFT at F_{IN} = 20 MHz

9.2 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in 图 9-6.

1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied the internal bandgap reference will power up and settle out in ~ 2ms.
2. Configure REFBUF pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
4. Begin programming using SPI interface.

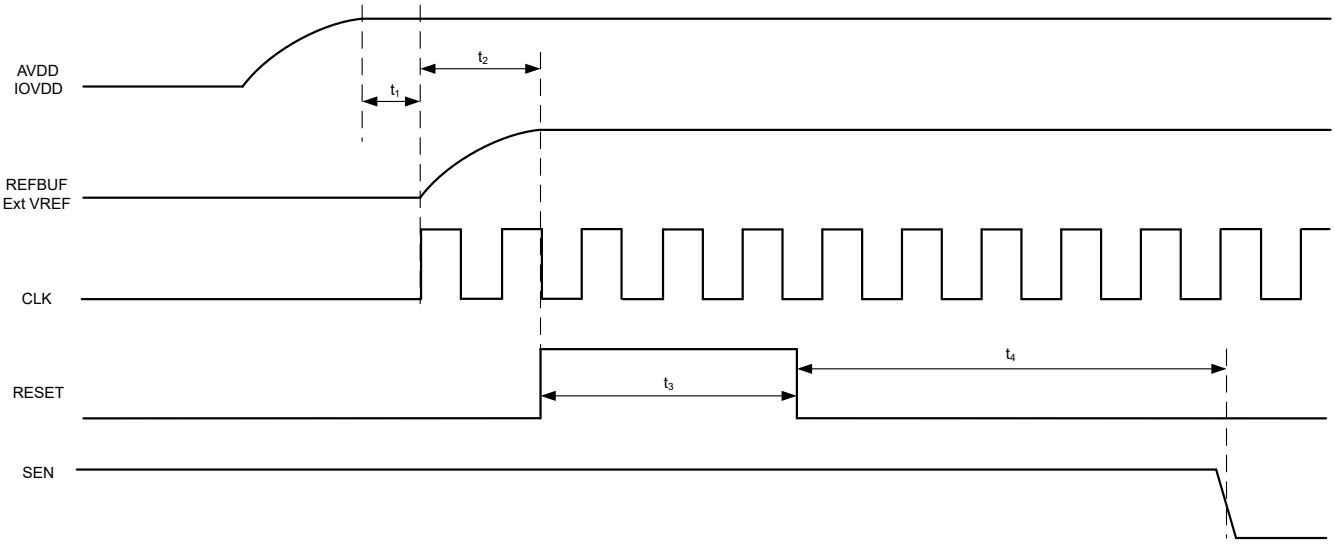


图 9-6. Initialization of serial registers after power up

表 9-5. Power-up timing

		MIN	TYP	MAX	UNIT
t_1	Power-on delay: delay from power up to logic level of REFBUF pin	2			ms
t_2	Delay from REFBUF pin logic level to RESET rising edge	100			ns
t_3	RESET pulse width	1			us
t_4	Delay from RESET disable to SEN active	~ 200000			clock cycles

9.2.1 Register Initialization During Operation

If required, the serial interface registers can be cleared and reset to default settings during operation either:

- through a hardware reset or
- by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

After hardware or software reset the wait time is also ~ 200000 clock cycles before the SPI registers can be programmed.

9.3 Power Supply Recommendations

The ADC3664 requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC itself while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.

The AVDD power supply must be low noise in order to achieve data sheet performance. In applications operating near DC, the 1/f noise contribution of the power supply needs to be considered as well. The ADC is designed for very good PSRR which aides with the power supply filter design.

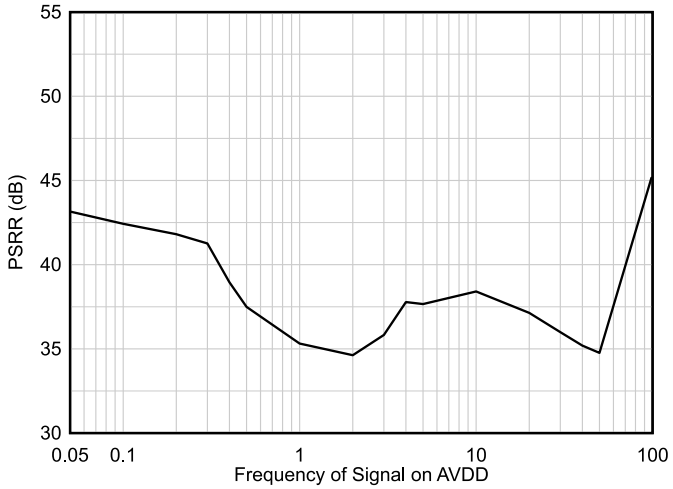

图 9-7. Power supply rejection ratio (PSRR) vs frequency

There are two recommended power-supply architectures:

1. 1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
2. 2. Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach provides the best efficiency, but care must be taken to ensure switching noise is minimized to prevent degraded ADC performance.

TI WEBENCH® Power Designer can be used to select and design the individual power-supply elements needed: see the WEBENCH® Power Designer

Recommended switching regulators for the first stage include the TPS62821, and similar devices.

Recommended low dropout (LDO) linear regulators include the TPS7A4701, TPS7A90, LP5901, and similar devices.

For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note the switching frequency reported from WEBENCH® and design the EMI filter and capacitor combination to have the notch frequency centered as needed. 图 9-8 and 图 9-9 illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared in order to prevent digital switching noise from coupling into the analog signal chain.

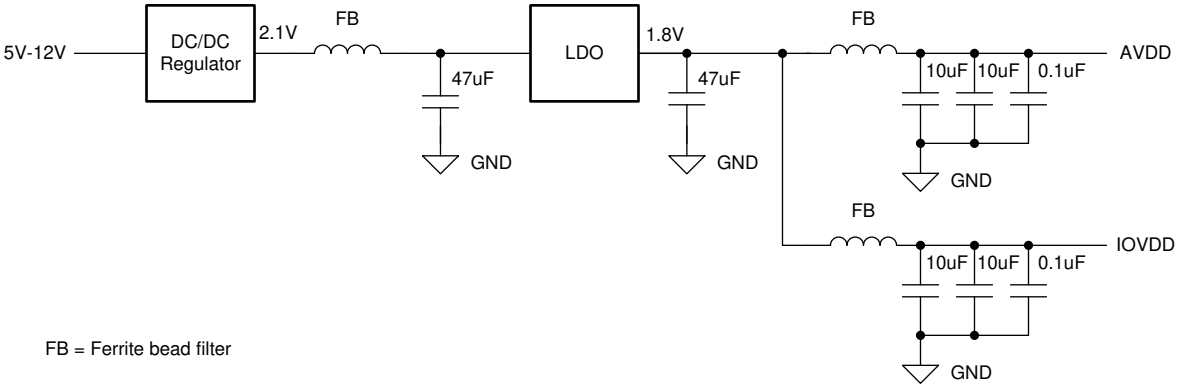

图 9-8. Example: LDO Linear Regulator Approach

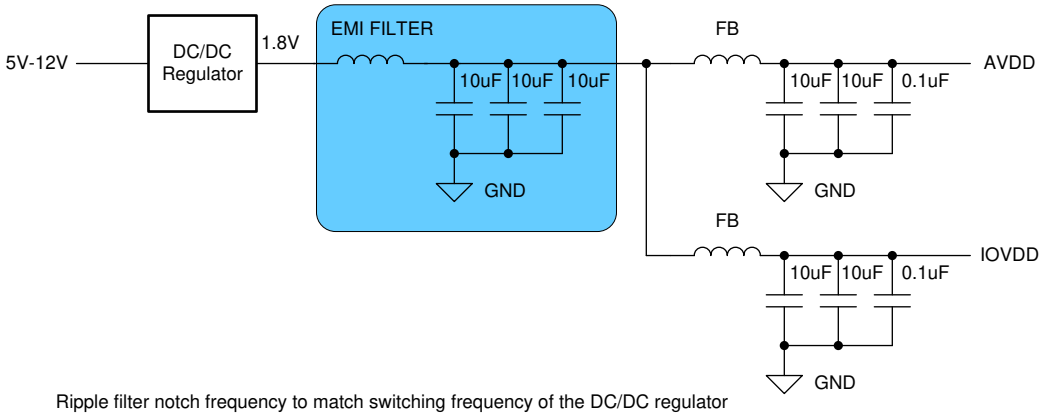

图 9-9. Example Switcher-Only Approach

9.4 Layout

9.4.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals
   - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
   - Traces should be routed using loosely coupled 100-Ω differential traces.
   - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.
2. Digital output interface
   - Traces should be routed using tightly coupled 100-Ω differential traces.
3. Voltage reference
   - The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND – on top layer avoiding vias.
   - Depending on configuration an additional bypass capacitor between REFBUF and REFGND may be recommended and should also be placed as close to pins as possible on top layer.
4. Power and ground connections
   - Provide low resistance connection paths to all power and ground pins.
   - Use power and ground planes instead of traces.
   - Avoid narrow, isolated paths which increase the connection resistance.

- Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

9.4.2 Layout Example

The following screen shot shows the top layer of the ADC366x EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- SLVDS output interface lanes are routed differential and length matched
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

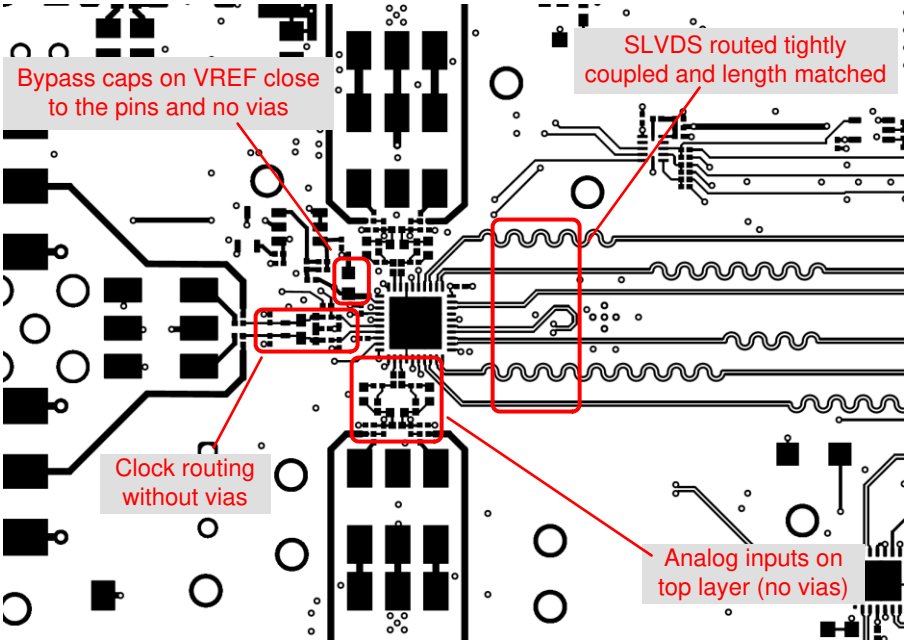

图 9-10. Layout example: top layer of ADC366x EVM

10 Device and Documentation Support

10.1 接收文档更新通知

要接收文档更新通知，请导航至 ti.com 上的器件产品文件夹。点击 *订阅更新* 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

10.2 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

10.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.
所有商标均为其各自所有者的财产。

10.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.5 术语表

TI 术语表　　本术语表列出并解释了术语、首字母缩略词和定义。

11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
ADC3664IRSBR	Active	Production	WQFN (RSB) | 40	3000 | LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	AZ3664
ADC3664IRSBR.A	Active	Production	WQFN (RSB) | 40	3000 | LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	AZ3664
ADC3664IRSBT	Active	Production	WQFN (RSB) | 40	250 | SMALL T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	AZ3664
ADC3664IRSBT.A	Active	Production	WQFN (RSB) | 40	250 | SMALL T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 105	AZ3664

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

OTHER QUALIFIED VERSIONS OF ADC3664 :

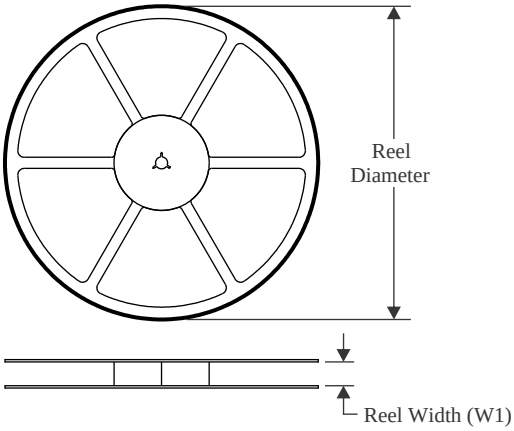
- Enhanced Product : ADC3664-EP
- Space : ADC3664-SP

NOTE: Qualified Version Definitions:

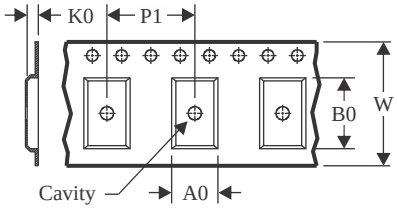
- Enhanced Product - Supports Defense, Aerospace and Medical Applications
- Space - Radiation tolerant, ceramic packaging and qualified for use in Space-based application

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers
