

## ADS1204 4 个 1 位、10MHz、2 阶、 $\Delta$ - $\Sigma$ 调制器

### 1 特性

- 16 位分辨率
- 14 位线性
- 分辨率与速度之间的折衷：  
10 位有效分辨率，信号延迟为 10 $\mu$ s（12 位时为 19 $\mu$ s）
- 2.5V 时输入范围为  $\pm 2.5V$
- 内部基准电压：2%
- 增益误差：0.5%
- 4 个独立的  $\Delta$ - $\Sigma$  调制器
- 4 个输入基准缓冲器
- 板载 20MHz 振荡器
- 可选择的内部或外部时钟
- 工作温度范围：  
-40°C 至 +105°C
- 封装：VQFN-32 (5mm x 5mm)

### 2 应用

- 电机控制
- 电流测量
- 工业过程控制
- 智能发送器
- 称重秤
- 压力传感器
- 便携式仪器
- 仪表

### 3 说明

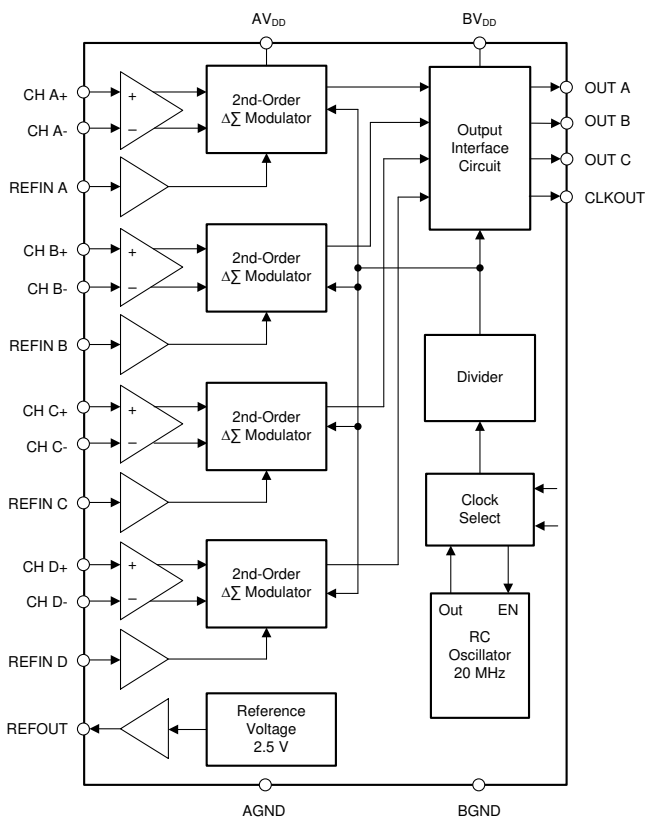

ADS1204 是一款四通道高性能器件，具有四个动态范围为 100dB 的  $\Delta$ - $\Sigma$  调制器，由 5V 单电源供电。差分输入非常适合直接连接到工业环境中的传感器。借助适当的数字滤波器和调制器速率，该器件可用于在无丢码的情况下实现 16 位模数 (A/D) 转换。在 10MHz 的调制器速率下，使用 160kHz 的数字滤波器数据速率可以获得 12 位的有效分辨率。ADS1204 专为中高分辨率测量应用而设计，这些应用包括电流测量、智能变送器、工业过程控制、称重秤、色谱分析和便携式仪器。该器件采用 VQFN-32 (5x5) 封装。

#### 器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸 (标称值)
ADS1204	VQFN (32)	5.00mm x 5.00mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision C (February 2009) to Revision D	Page
• 已添加 添加了器件信息表、第 1 页的图、ESD 额定值表、热性能信息表、概述部分、功能方框图部分、特性说明部分、器件功能模式部分、应用和实施部分、电源建议部分、器件和文档支持部分以及机械、封装和可订购信息部分 ...	1
• 已更改 通篇将 QFN 更改为 VQFN .....	1
• 已更改 更改了应用部分 .....	1
• Deleted <i>Ordering Information</i> table .....	5
• Changed <i>Power dissipation</i> to point to <i>Thermal Information</i> table instead, added unit .....	5
• Changed <i>External clock</i> maximum specification from 24 MHz to 32 MHz in <i>Recommended Operating Conditions</i> table ...	6
• Changed footnote in <i>Recommended Operating Conditions</i> table .....	6
• Deleted <i>Dissipation Ratings</i> table .....	6
• Changed <i>External clock frequency</i> maximum specification from 24 MHz to 32 MHz in <i>Electrical Characteristics</i> table .....	7
• Changed <i>CLKIN period</i> minimum specification from 41.6 ns to 31.25 ns in <i>Timing Requirements: 5.0 V</i> table .....	9
• Changed NOM column to MAX column in <i>Timing Requirements: 5.0 V</i> table .....	9
• Changed BV <sub>DD</sub> from 5 V to 3 V in <i>Timing Requirements: 3.0 V</i> test conditions .....	9
• Changed <i>CLKIN period</i> minimum specification from 41.6 ns to 31.25 ns in <i>Timing Requirements: 3.0 V</i> table .....	9
• Changed <i>Layout</i> section .....	22

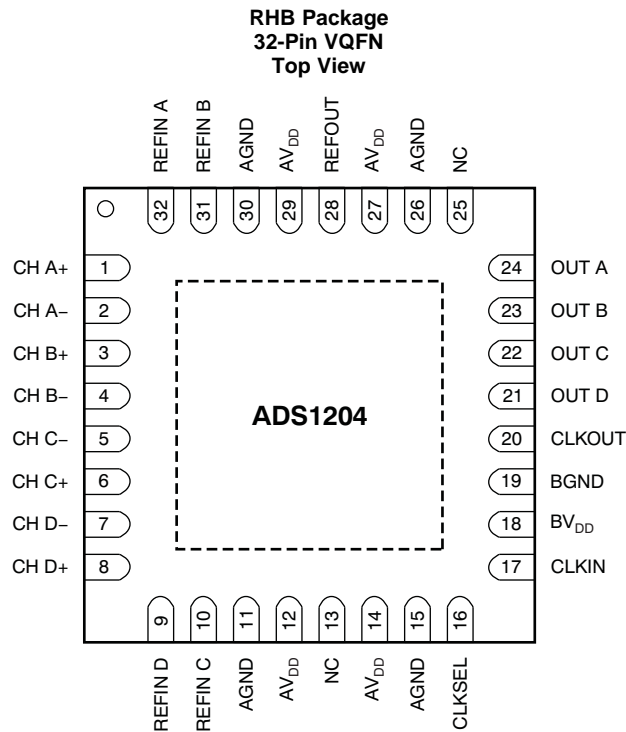

Changes from Revision B (August 2007) to Revision C	Page
• 更新了文档格式 .....	1
• 通篇将工作温度范围从 +85°C 扩展为 +105°C .....	1
• Deleted operating free-air temperature range row from <i>Absolute Maximum Ratings</i> table .....	5
• Added free-air temperature range ratings to <i>Recommended Operating Conditions</i> table .....	6
• Changed <i>Dissipation Ratings</i> table .....	6
• Changed typical specification in <i>Input capacitance</i> row of <i>Analog Input</i> section of <i>Electrical Characteristics</i> table .....	6
• Added additional specification for Total Harmonic Distortion in <i>AC Accuracy</i> section of <i>Electrical Characteristics</i> table .....	6
• Deleted test condition of V <sub>OUT</sub> row in <i>Voltage Reference Output</i> section of <i>Electrical Characteristics</i> table .....	6

- 
- Updated typical characteristic graphs to reflect extended temperature range ..... 10
- 

**Changes from Revision A (June 2004) to Revision B****Page**

- 
- Added note to QFN package ..... 4
-

## 5 Pin Configuration and Functions

NOTE: The thermal pad is internally connected to the substrate. This pad can be connected to the analog ground or left floating. Keep the thermal pad separate from the digital ground, if possible.

### Pin Functions

PIN		I/O <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
CH A+	1	AI	Analog input of channel A: noninverting input
CH A-	2	AI	Analog input of channel A: inverting input
CH B+	3	AI	Analog input of channel B: noninverting input
CH B-	4	AI	Analog input of channel B: inverting input
CH C-	5	AI	Analog input of channel C: inverting input
CH C+	6	AI	Analog input of channel C: noninverting input
CH D-	7	AI	Analog input of channel D: inverting input
CH D+	8	AI	Analog input of channel D: noninverting input
REFIN D	9	AI	Reference voltage input of channel D: pin for external reference voltage
REFIN C	10	AI	Reference voltage input of channel C: pin for external reference voltage
AGND	11	—	Analog ground
AVDD	12	P	Analog power supply; nominal 5 V
NC	13	—	No connection; this pin is left unconnected
AV <sub>DD</sub>	14	P	Analog power supply; nominal 5 V
AGND	15	—	Analog ground
CLKSEL	16	I	Clock select between internal clock (CLKSEL = 1) or external clock (CLKSEL = 0)
CLKIN	17	I	External clock input
BV <sub>DD</sub>	18	P	Digital interface power supply; from 2.7 V to 5.5 V
BGND	19	—	Interface ground
CLKOUT	20	O	System clock output

(1) AI = analog input; AO = analog output; I = input; O = output; P = power supply.

### Pin Functions (continued)

PIN		I/O <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
OUT D	21	O	Bit stream from channel D modulator
OUT C	22	O	Bit stream from channel C modulator
OUT B	23	O	Bit stream from channel B modulator
OUT A	24	O	Bit stream from channel A modulator
NC	25	—	No connection; this pin is left unconnected
AGND	26	—	Analog ground
AV <sub>DD</sub>	27	P	Analog power supply; nominal 5 V
REFOUT	28	AO	Reference voltage output: output pin of the internal reference source; nominal 2.5 V
AV <sub>DD</sub>	29	P	Analog power supply; nominal 5 V
AGND	30	—	Analog ground
REFIN B	31	AI	Reference voltage input of channel B: pin for external reference voltage
REFIN A	32	AI	Reference voltage input of channel A: pin for external reference voltage

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	AV <sub>DD</sub> to AGND	−0.3	6	V
	BV <sub>DD</sub> to BGND	−0.3	6	
Analog input voltage with respect to AGND		AGND − 0.3	AV <sub>DD</sub> + 0.3	V
Reference input voltage with respect to AGND		AGND − 0.3	AV <sub>DD</sub> + 0.3	V
Digital input voltage with respect to BGND		BGND − 0.3	BV <sub>DD</sub> + 0.3	V
Ground voltage difference, AGND to BGND			±0.3	V
Voltage differences, BV <sub>DD</sub> to AGND		−0.3	6	V
Input current to any pin except supply			±10	mA
Power dissipation		See the <a href="#">Thermal Information</a>		A
Temperature	Operating virtual junction, T <sub>J</sub>	−40	+150	°C
	Storage, T <sub>stg</sub>	−65	+150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Supply voltage, AVDD to AGND		4.75	5	5.25	V
Supply voltage, BVDD to BGND	Low-voltage levels	2.7		3.6	V
	5V logic levels	4.5	5	5.5	V
Reference input voltage		0.5	2.5	2.6	V
Operating common-mode signal		0		AV <sub>DD</sub>	V
Analog inputs	+IN – (–IN)	0		±REFIN	V
External clock <sup>(1)</sup>		16	20	32	MHz
Operating free-air temperature range, T <sub>A</sub>		–40		+125	°C
Specified free-air temperature range, T <sub>A</sub>		–40		+105	°C

(1) Analog performance is degraded at clock frequencies > 20 MHz; see the [Typical Characteristics](#) section for details.

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		ADS1204	UNIT
		RHB (VQFN)	
		32 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	28.6	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	17.0	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	9.7	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	9.7	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	0.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC package thermal metrics application report](#).

### 6.5 Electrical Characteristics

over recommended operating free-air temperature range at –40°C to +105°C, AV<sub>DD</sub> = 5 V, BV<sub>DD</sub> = 3 V, CH x+ = 0.5 V to 4.5 V, CH x– = 2.5 V, REFIN = REFOUT = internal 2.5 V, CLKIN = 20 MHz, and 16-bit sinc<sup>3</sup> filter with decimation by 256 (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
<b>RESOLUTION</b>						
	Resolution		16			Bits
<b>DC ACCURACY</b>						
INL	Integral linearity error <sup>(2)</sup>			±1	±3	LSB
				±0.001	±0.005	% FSR
	Integral linearity match				±6	LSB
					±0.009	% FSR
DNL	Differential nonlinearity <sup>(3)</sup>				±1	LSB
V <sub>OS</sub>	Input offset error			–1.4	±3	mV
	Input offset error match				±2	mV
TCV <sub>OS</sub>	Input offset error drift			±2	±8	μV/°C
G <sub>ERR</sub>	Gain error <sup>(4)</sup>	Referenced to V <sub>REF</sub>		±0.08	±0.5	% FSR
	Gain error match			±0.185	±0.5	% FSR
TCG <sub>ERR</sub>	Gain error drift			±2		ppm/°C
PSRR	Power-supply rejection ratio	4.75 V < AV <sub>DD</sub> < 5.25 V		78		dB

(1) All typical values are at T<sub>A</sub> = +25°C.

(2) Integral nonlinearity is defined as the maximum deviation of the line through the end points of the specified input range of the transfer curve for CH x+ = –2 V to +2 V at 2.5 V, expressed either as the number of LSBs or as a percent of measured input range (4 V).

(3) Specified by design.

(4) Maximum values, including temperature drift, are specified over the full specified temperature range.

**Electrical Characteristics (continued)**

over recommended operating free-air temperature range at  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ ,  $\text{AV}_{\text{DD}} = 5\text{ V}$ ,  $\text{BV}_{\text{DD}} = 3\text{ V}$ ,  $\text{CH x+} = 0.5\text{ V}$  to  $4.5\text{ V}$ ,  $\text{CH x-} = 2.5\text{ V}$ ,  $\text{REFIN} = \text{REFOUT} = \text{internal } 2.5\text{ V}$ ,  $\text{CLKIN} = 20\text{ MHz}$ , and 16-bit sinc<sup>3</sup> filter with decimation by 256 (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
<b>ANALOG INPUT</b>						
FSR	Full-scale differential range	(CH x+) – (CH x–); CH x– = 2.5 V			±2.5	V
	Specified differential range	(CH x+) – (CH x–); CH x– = 2.5 V			±2	V
	Maximum operating input range <sup>(3)</sup>		0		$\text{AV}_{\text{DD}}$	V
	Input capacitance	Common-mode		1.5		pF
	Input leakage current	CLK turned off			±1	nA
	Differential input resistance			100		kΩ
	Differential input capacitance			2.5		pF
CMRR	Common-mode rejection ratio	At DC		100		dB
		$V_{\text{IN}} = \pm 1.25 V_{\text{PP}}$ at 40 kHz		110		
BW	Bandwidth	FS sine wave, –3 dB		50		MHz
<b>SAMPLING DYNAMICS</b>						
	Internal clock frequency	CLKSEL = 1	8	10	12	MHz
CLKIN	External clock frequency	CLKSEL = 0	1	20	32	MHz
<b>AC ACCURACY</b>						
THD	Total harmonic distortion	$V_{\text{IN}} = \pm 2 V_{\text{PP}}$ at 5 kHz; $-40^{\circ}\text{C} \leq T_{\text{A}} \leq +85^{\circ}\text{C}$		–96	–88	dB
		$V_{\text{IN}} = \pm 2 V_{\text{PP}}$ at 5 kHz; $-40^{\circ}\text{C} \leq T_{\text{A}} \leq +105^{\circ}\text{C}$		–96	–87	
SFDR	Spurious-free dynamic range	$V_{\text{IN}} = \pm 2 V_{\text{PP}}$ at 5 kHz	92	100		dB
SNR	Signal-to-noise ratio	$V_{\text{IN}} = \pm 2 V_{\text{PP}}$ at 5 kHz	86	89		dB
SINAD	Signal-to-noise + distortion	$V_{\text{IN}} = \pm 2 V_{\text{PP}}$ at 5 kHz	85	89		dB
	Channel-to-channel isolation <sup>(3)</sup>	$V_{\text{IN}} = \pm 2 V_{\text{PP}}$ at 50 kHz		85		dB
ENOB	Effective number of bits		14	14.5		Bits
<b>VOLTAGE REFERENCE OUTPUT</b>						
$V_{\text{OUT}}$	Reference voltage output		2.450	2.5	2.550	V
$dV_{\text{OUT}}/dT$	Output voltage temperature drift			±20		ppm/°C
	Output voltage noise	$f = 0.1\text{ Hz to } 10\text{ Hz}$ , $C_{\text{L}} = 10\text{ }\mu\text{F}$		10		$\mu\text{Vrms}$
		$f = 10\text{ Hz to } 10\text{ kHz}$ , $C_{\text{L}} = 10\text{ }\mu\text{F}$		12		
PSRR	Power-supply rejection ratio			60		dB
$I_{\text{OUT}}$	Output current			10		$\mu\text{A}$
$I_{\text{SC}}$	Short-circuit current			0.5		mA
	Turn-on settling time	To 0.1% at $C_{\text{L}} = 0$		100		$\mu\text{s}$
<b>VOLTAGE REFERENCE INPUT</b>						
$V_{\text{IN}}$	Reference voltage input		0.5	2.5	2.6	V
	Reference input resistance			100		MΩ
	Reference input capacitance			5		pF
	Reference input current				1	$\mu\text{A}$
<b>DIGITAL INPUTS<sup>(5)</sup></b>						
	Logic family		CMOS with Schmitt Trigger			
$V_{\text{IH}}$	High-level input voltage		$0.7 \times \text{BV}_{\text{DD}}$		$\text{BV}_{\text{DD}} + 0.3$	V
$V_{\text{IL}}$	Low-level input voltage		–0.3		$0.3 \times \text{BV}_{\text{DD}}$	V
$I_{\text{IN}}$	Input current	$V_{\text{I}} = \text{BV}_{\text{DD}}$ or GND			±50	nA
$C_{\text{I}}$	Input capacitance			5		pF

(5) Applicable for 5.0-V nominal supply:  $\text{BV}_{\text{DD}}$  (min) = 4.5 V and  $\text{BV}_{\text{DD}}$  (max) = 5.5 V.

**Electrical Characteristics (continued)**

over recommended operating free-air temperature range at  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ ,  $\text{AV}_{\text{DD}} = 5\text{ V}$ ,  $\text{BV}_{\text{DD}} = 3\text{ V}$ ,  $\text{CH}_{\text{x}+} = 0.5\text{ V}$  to  $4.5\text{ V}$ ,  $\text{CH}_{\text{x}-} = 2.5\text{ V}$ ,  $\text{REFIN} = \text{REFOUT} = \text{internal } 2.5\text{ V}$ ,  $\text{CLKIN} = 20\text{ MHz}$ , and 16-bit sinc<sup>3</sup> filter with decimation by 256 (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
<b>DIGITAL OUTPUTS<sup>(5)</sup></b>						
	Logic family		CMOS			
$V_{\text{OH}}$	High-level output voltage	$\text{BV}_{\text{DD}} = 4.5\text{ V}$ , $I_{\text{OH}} = -100\ \mu\text{A}$	4.44			V
$V_{\text{OL}}$	Low-level output voltage	$\text{BV}_{\text{DD}} = 4.5\text{ V}$ , $I_{\text{OL}} = 100\ \mu\text{A}$			0.5	V
$C_{\text{O}}$	Output capacitance			5		pF
$C_{\text{L}}$	Load capacitance				30	pF
	Data format		Bit stream			
<b>DIGITAL INPUTS<sup>(6)</sup></b>						
	Logic family		LVCMOS			
$V_{\text{IH}}$	High-level input voltage	$\text{BV}_{\text{DD}} = 3.6\text{ V}$	2		$\text{BV}_{\text{DD}} + 0.3$	V
$V_{\text{IL}}$	Low-level input voltage	$\text{BV}_{\text{DD}} = 2.7\text{ V}$	-0.3		0.8	V
$I_{\text{IN}}$	Input current	$V_{\text{I}} = \text{BV}_{\text{DD}}$ or GND			$\pm 50$	nA
$C_{\text{I}}$	Input capacitance			5		pF
<b>DIGITAL OUTPUTS<sup>(6)</sup></b>

$V_{\text{OL}}$	Low-level output voltage	$\text{BV}_{\text{DD}} = 2.7\text{ V}$ , $I_{\text{OL}} = 100\ \mu\text{A}$			0.2	V
$C_{\text{O}}$	Output capacitance			5		pF
$C_{\text{L}}$	Load capacitance				30	pF
	Data format		Bit stream			
<b>POWER SUPPLY</b>						
$\text{AV}_{\text{DD}}$	Analog supply voltage		4.5		5.5	V
$\text{BV}_{\text{DD}}$	Buffer I/O supply voltage	Low-voltage levels	2.7		3.6	V
		5-V logic levels	4.5		5.5	
$\text{AI}_{\text{DD}}$	Analog operating supply current	$\text{CLKSEL} = 1$		22.5	30	mA
		$\text{CLKSEL} = 0$		22.4	29	
$\text{BI}_{\text{DD}}$	Buffer I/O operating supply current	$\text{BV}_{\text{DD}} = 3\text{ V}$ , $\text{CLKOUT} = 10\text{ MHz}$			4	mA
		$\text{BV}_{\text{DD}} = 5\text{ V}$ , $\text{CLKOUT} = 10\text{ MHz}$			4	
	Power dissipation	$\text{CLKSEL} = 0$		122	145	mW
		$\text{CLKSEL} = 1$		112.5	150	

(6) Applicable for 3.0-V nominal supply:  $\text{BV}_{\text{DD}}$  (min) = 2.7 V and  $\text{BV}_{\text{DD}}$  (max) = 3.6 V.

### 6.6 Timing Requirements: 5.0 V<sup>(1)</sup>

over recommended operating free-air temperature range at  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ ,  $\text{AV}_{\text{DD}} = 5\text{ V}$ , and  $\text{BV}_{\text{DD}} = 5\text{ V}$  (unless otherwise noted)

		MIN	MAX	UNIT
$t_{\text{C1}}$	CLKIN period	31.25	1000	ns
$t_{\text{W1}}$	CLKIN high time	10	$t_{\text{C1}} - 10$	ns
$t_{\text{C2}}$	CLKOUT period using internal oscillator (CLKSEL = 1)	83	125	ns
	CLKOUT period using external clock (CLKSEL = 0)	$2 \times t_{\text{C1}}$		ns
$t_{\text{W2}}$	CLKOUT high time	$(t_{\text{C2}} / 2) - 5$	$(t_{\text{C2}} / 2) + 5$	ns
$t_{\text{D1}}$	CLKOUT rising edge delay after CLKIN rising edge	0	10	ns
$t_{\text{D2}}$	CLKOUT falling edge delay after CLKIN rising edge	0	10	ns
$t_{\text{D3}}$	Data valid delay after rising edge of CLKOUT (CLKSEL = 1)	$(t_{\text{C2}} / 4) - 8$	$(t_{\text{C2}} / 4) + 8$	ns
$t_{\text{D4}}$	Data valid delay after rising edge of CLKOUT (CLKSEL = 0)	$t_{\text{W1}} - 3$	$t_{\text{W1}} + 7$	ns

(1) Applicable for 5.0-V nominal supply:  $\text{BV}_{\text{DD}}(\text{min}) = 4.5\text{ V}$  and  $\text{BV}_{\text{DD}}(\text{max}) = 5.5\text{ V}$ . All input signals are specified with  $t_{\text{R}} = t_{\text{F}} = 5\text{ ns}$  (10% to 90% of  $\text{BV}_{\text{DD}}$ ) and timed from a voltage level of  $(V_{\text{IL}} + V_{\text{IH}}) / 2$ . See Figure 1.

### 6.7 Timing Requirements: 3.0 V<sup>(1)</sup>

over recommended operating free-air temperature range at  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ ,  $\text{AV}_{\text{DD}} = 5\text{ V}$ , and  $\text{BV}_{\text{DD}} = 3\text{ V}$  (unless otherwise noted)

		MIN	MAX	UNIT
$t_{\text{C1}}$	CLKIN period	31.25	1000	ns
$t_{\text{W1}}$	CLKIN high time	10	$t_{\text{C1}} - 10$	ns
$t_{\text{C2}}$	CLKOUT period using internal oscillator (CLKSEL = 1)	83	125	ns
	CLKOUT period using external clock (CLKSEL = 0)	$2 \times t_{\text{C1}}$		ns
$t_{\text{W2}}$	CLKOUT high time	$(t_{\text{C2}} / 2) - 5$	$(t_{\text{C2}} / 2) + 5$	ns
$t_{\text{D1}}$	CLKOUT rising edge delay after CLKIN rising edge	0	10	ns
$t_{\text{D2}}$	CLKOUT falling edge delay after CLKIN rising edge	0	10	ns
$t_{\text{D3}}$	Data valid delay after rising edge of CLKOUT (CLKSEL = 1)	$(t_{\text{C2}} / 4) - 8$	$(t_{\text{C2}} / 4) + 8$	ns
$t_{\text{D4}}$	Data valid delay after rising edge of CLKOUT (CLKSEL = 0)	$t_{\text{W1}} - 3$	$t_{\text{W1}} + 7$	ns

(1) Applicable for 3.0V nominal supply:  $\text{BV}_{\text{DD}}(\text{min}) = 2.7\text{ V}$  and  $\text{BV}_{\text{DD}}(\text{max}) = 3.6\text{ V}$ . All input signals are specified with  $t_{\text{R}} = t_{\text{F}} = 5\text{ ns}$  (10% to 90% of  $\text{BV}_{\text{DD}}$ ) and timed from a voltage level of  $(V_{\text{IL}} + V_{\text{IH}}) / 2$ . See Figure 1.

Figure 1. ADS1204 Timing Diagram

### 6.8 Typical Characteristics

$AV_{DD} = 5\text{ V}$ ,  $BV_{DD} = 3\text{ V}$ ,  $CH_{x+} = 0.5\text{ V to }4.5\text{ V}$ ,  $CH_{x-} = 2.5\text{ V}$ ,  $REFIN = \text{external}$ ,  $CLKSEL = 0$ , and 16-bit sinc<sup>3</sup> filter, with  $OSR = 256$  (unless otherwise noted)

## 7 Detailed Description

### 7.1 Overview

The ADS1204 is a four-channel, second-order, CMOS device with four delta-sigma ( $\Delta\Sigma$ ) modulators, designed for medium- to high-resolution A/D signal conversions from dc to 39 kHz (filter response  $-3$  dB) if an oversampling ratio (OSR) of 64 is chosen. The output of the converter (OUTX) provides a stream of digital ones and zeros. The time average of this serial output is proportional to the analog input voltage.

The modulator shifts the quantization noise to high frequencies. A low-pass digital filter should be used at the output of the  $\Delta\Sigma$  modulator. The filter serves two functions. First, it filters out high-frequency noise. Second, the filter converts the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation).

An application-specific integrated circuit (ASIC) or field-programmable gate array (FPGA) could be used to implement the digital filter. [Figure 26](#) and [Figure 27](#) illustrate typical application circuits with the ADS1204 connected to an FPGA.

The overall performance (that is, speed and accuracy) depends on the selection of an appropriate OSR and filter type. A higher OSR produces greater output accuracy while operating at a lower refresh rate. Alternatively, a lower OSR produces lower output accuracy, but operates at a higher refresh rate. This system allows flexibility with the digital filter design and is capable of A/D conversion results that have a dynamic range exceeding 100 dB with an OSR equal to 256.

**Figure 26. Single-Ended Connection Diagram for the ADS1204  $\Delta\Sigma$  Modulator**

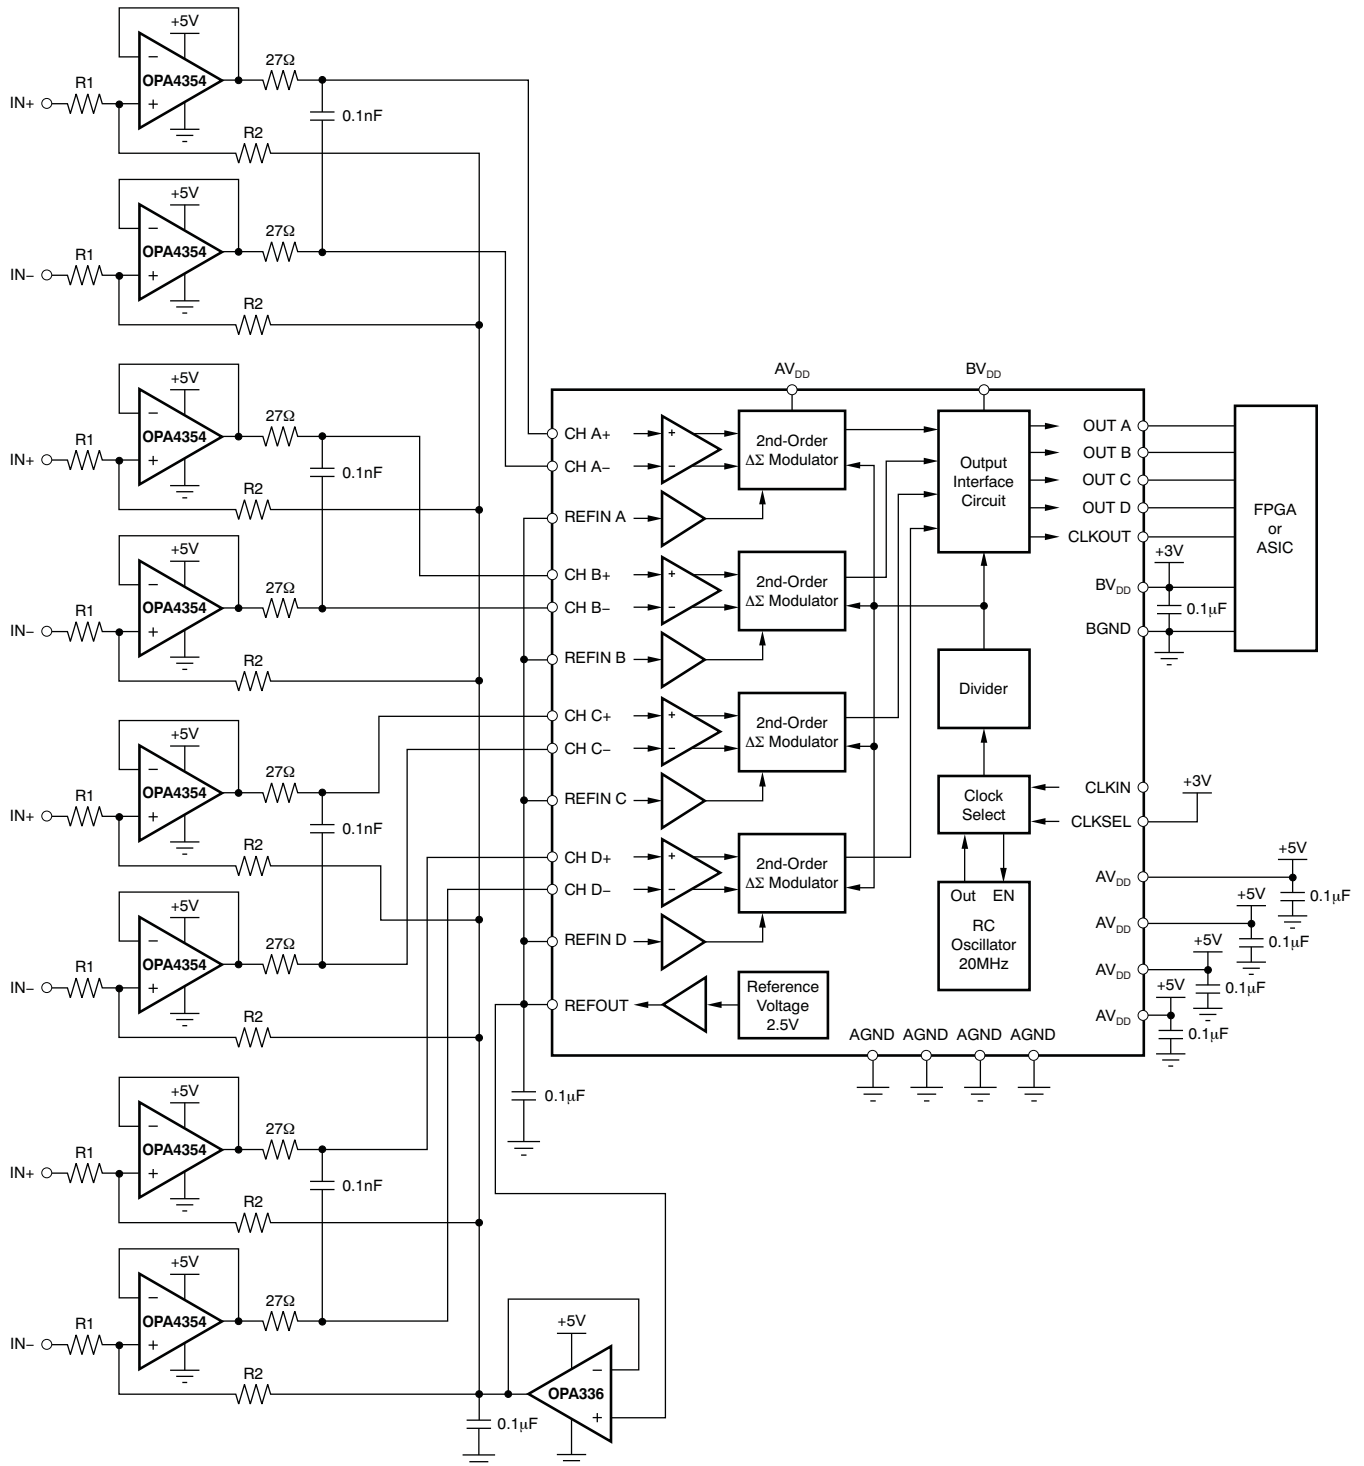

Figure 27. Differential Connection Diagram for the ADS1204  $\Delta\Sigma$  Modulator

## 7.2 Functional Block Diagram

## 7.3 Feature Description

The differential analog input of the ADS1204 is implemented with a switched-capacitor circuit. This circuit implements a second-order modulator stage, which digitizes the analog input signal into a 1-bit output stream. The clock source can be internal as well as external. Different frequencies for this clock allow for a variety of solutions and signal bandwidths. Every analog input signal is continuously sampled by the modulator and compared to a reference voltage that is applied to the REFINx pin. A digital stream, which accurately represents the analog input voltage over time, appears at the output of the corresponding converter.

## Feature Description (continued)

### 7.3.1 Analog Input Stage

#### 7.3.1.1 Analog Input

The topology of the analog inputs of ADS1204 is based on fully differential switched-capacitor architecture. This input stage provides the mechanism to achieve low system noise, high common-mode rejection (100 dB), and excellent power-supply rejection.

The input impedance of the analog input is dependent on the modulator clock frequency ( $f_{CLK}$ ), which is also the sampling frequency of the modulator. Figure 28 shows the basic input structure of one channel of the ADS1204. The relationship between the input impedance of the ADS1204 and the modulator clock frequency is shown in Equation 1:

$$Z_{IN} = \frac{100k\Omega}{f_{MOD}/10MHz} \quad (1)$$

The input impedance becomes a consideration in designs where the source impedance of the input signal is high. This high impedance may cause degradation in gain, linearity, and THD. The importance of this effect depends on the desired system performance. There are two restrictions on the analog input signals, CH x+ and CH x-. If the input voltage exceeds the range ( $GND - 0.3 V$ ) to ( $V_{DD} + 0.3 V$ ), the input current must be limited to 10 mA because the input protection diodes on the front end of the converter will begin to turn on. In addition, the linearity and the noise performance of the device are ensured only when the differential analog voltage resides within  $\pm 2 V$  (with  $V_{REF}$  as a midpoint); however, the FSR input voltage is  $\pm 2.5 V$ .

Figure 28. Input Impedance of the ADS1204

#### 7.3.1.2 Modulator

The ADS1204 can be operated in two modes. When  $CKLSEL = 1$ , the four modulators operate using the internal clock, which is fixed at 20 MHz. When  $CKLSEL = 0$ , the modulators operate using an external clock. In both modes, the clock is divided by two internally and functions as the modulator clock. The frequency of the external clock can vary from 1 MHz to 32 MHz to adjust for the clock requirements of the application.

The modulator topology is fundamentally a second-order, switched-capacitor,  $\Delta\Sigma$  modulator, such as the one conceptualized in Figure 29. The analog input voltage and the output of the 1-bit digital-to-analog converter (DAC) are differentiated, providing analog voltages at X2 and X3. The voltages at X2 and X3 are presented to their individual integrators. The output of these integrators progresses in a negative or positive direction. When the value of the signal at X4 equals the comparator reference voltage, the output of the comparator switches from negative to positive, or positive to negative, depending on its original state. When the output value of the comparator switches from high to low or vice versa, the 1-bit DAC responds on the next clock pulse by changing its analog output voltage at X6, causing the integrators to progress in the opposite direction. The feedback of the modulator to the front end of the integrators forces the value of the integrator output to track the average of the input.

Figure 29. Block Diagram of the Second-Order Modulator

### 7.3.2 Digital Output

A differential input signal of 0 V will ideally produce a stream of ones and zeros that are high 50% of the time and low 50% of the time. A differential input of 2 V produces a stream of ones and zeros that are high 80% of the time. A differential input of -2 V produces a stream of ones and zeros that are high 20% of the time. The input voltage versus the output modulator signal is shown in Figure 30.

Figure 30. Analog Input versus Modulator Output of the ADS1204

### 7.3.3 Equivalent Input Circuits

Figure 31 shows equivalent circuits for the analog input and digital outputs.

NOTE: The thermal pad is internally connected to the substrate. This pad can be connected to the analog ground or left floating. Keep the thermal pad separate from the digital ground, if possible.

Figure 31. Equivalent Input Circuits

## 7.4 Device Functional Modes

The system clock of the ADS1204 is 20 MHz by default. The system clock can be provided either from the internal 20MHz RC oscillator or from an external clock source. For this purpose, the CLKIN pin is provided; it is controlled by the mode setting, CLKSEL.

The system clock is divided by two for the modulator clock. Therefore, the default clock frequency of the modulator is 10MHz. With a possible external clock range of 1MHz to 32MHz, the modulator operates between 500 kHz and 16 MHz.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The analog signal connected to the input of the  $\Delta\Sigma$  modulator is converted using the clock signal applied to the modulator. The result of the conversion, or modulation, is generated and sent to the OUTx pin from the  $\Delta\Sigma$  modulator. In most applications where a direct connection is realized between the  $\Delta\Sigma$  modulator and an ASIC or FPGA (each with an implemented filter), the two standard signals per modulator (CLKOUT and OUTx) are provided from the modulator. The output clock signal is equal for all four modulators. If CLKSEL = 1, CLKIN must always be set either high or low.

#### 8.1.1 Filter Usage

The modulator generates only a bitstream, which does not output a digital word like an A/D converter. In order to output a digital word equivalent to the analog input voltage, the bitstream must be processed by a digital filter.

A very simple filter, built with minimal effort and hardware, is the sinc<sup>3</sup> filter shown in [Equation 2](#):

$$H(z) = \left( \frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^2 \quad (2)$$

This filter provides the best output performance at the lowest hardware size (for example, a count of digital gates). For oversampling ratios in the range of 16 to 256, this is a good choice. All the characterizations in the data sheet are also done using a sinc<sup>3</sup> filter with an oversampling ratio of OSR = 256 and an output word width of 16 bits.

In a sinc<sup>3</sup> filter response (see [Figure 32](#) and [Figure 33](#)), the location of the first notch occurs at the frequency of output data rate  $f_{DATA} = f_{CLK} / OSR$ . The -3-dB point is located at half the Nyquist frequency or  $f_{DATA} / 4$ . For some applications, it may be necessary to use another filter type for better frequency response.

**Application Information (continued)**

This performance can be improved, for example, by a cascaded filter structure. The first decimation stage can be a sinc<sup>3</sup> filter with a low OSR and the second stage a high-order filter.

For more information, see the [Combining the ADS1202 with an FPGA Digital Filter for Current Measurement in Motor Control Applications](#) application note, available for download at [www.ti.com](http://www.ti.com).

The effective number of bits (ENOB) can be used to compare the performance of A/D converters and ΔΣ modulators. Figure 34 shows the ENOB of the ADS1204 with different filter types. In this data sheet, the ENOB is calculated from the SNR as shown in Equation 3:

$$\text{SNR} = 1.76\text{dB} + 6.02\text{dB} \times \text{ENOB} \tag{3}$$

**Figure 34. Measured ENOB vs OSR**

In motor control applications, a very fast response time for overcurrent detection is required. There is a constraint between 1 μs and 5 μs with 3 bits to 7 bits resolution. The time for full settling is dependent on the filter order. Therefore, the full settling of the sinc<sup>3</sup> filter needs three data clocks and the sinc<sup>2</sup> filter needs two data clocks. The data clock is equal to the modulator clock divided by the OSR. For overcurrent protection, filter types other than sinc<sup>3</sup> might be a better choice. A simple example is a sinc<sup>2</sup> filter. Figure 35 compares the settling time of different filter types. The Sincfast is a modified sinc<sup>2</sup> filter as Equation 4 shows:

$$H(z) = \left( \frac{1 - z^{-\text{OSR}}}{1 - z^{-1}} \right)^2 (1 + z^{-2 \times \text{OSR}}) \tag{4}$$

## Application Information (continued)

Figure 35. Measured ENOB versus Settling Time

For more information, see the [Combining the ADS1202 with an FPGA Digital Filter for Current Measurement in Motor Control Applications](#) application note, available for download at [www.ti.com](http://www.ti.com).

## 9 Power Supply Recommendations

The ADS1204 requires two power supplies,  $AV_{DD}$  for analog, and  $BV_{DD}$  for digital. The analog supply is a fixed voltage of  $5\text{ V} \pm 5\%$ , whereas the digital supply can be set within a range of 2.7 V to 5.5 V.  $BV_{DD}$  determines the I/O voltage for the interface. If  $AV_{DD}$  equals  $BV_{DD}$ , the two supplies can be tied together.

### 9.1 Power-Supply Sequencing

The supplies can be sequenced in any order, but in no case must any analog or digital input exceed the respective analog or digital power-supply voltage and current limits. In particular, inputs to the ADS1204, such as CH x+, CH x–, and CLKIN, should not be present before the power supply is on. Violating this condition could cause latch-up. If these signals are present before the supply is on, series resistors should be used to limit the input current to a maximum of 10 mA.

Wait approximately 600  $\mu\text{s}$  after all power supplies are stabilized before communicating with the device to allow the power-on reset process to complete.

### 9.2 Power-Supply Decoupling

Good decoupling practices must be used for the ADS1204 and for all components in the design. All decoupling capacitors, specifically the 0.1- $\mu\text{F}$  ceramic capacitors, must be placed as close as possible to the pin being decoupled. A 1- $\mu\text{F}$  and 10- $\mu\text{F}$  capacitor, in parallel with the 0.1- $\mu\text{F}$  ceramic capacitor, can be used to decouple  $AV_{DD}$  to AGND as well as  $BV_{DD}$  to BGND. At least one 0.1- $\mu\text{F}$  ceramic capacitor must be used to decouple every  $AV_{DD}$  to AGND and  $BV_{DD}$  to BGND, as well as for the digital supply on each digital component.

In cases where both the analog and digital I/O supplies share the same supply source, an RC filter of 10  $\Omega$  and 0.1  $\mu\text{F}$  can be used to help reduce the noise in the analog supply.

## 10 Layout

### 10.1 Layout Guidelines

Employing best design practices is recommended when laying out a printed-circuit board (PCB) for both analog and digital components. This recommendation generally means that the layout separates analog components [such as ADCs, amplifiers, references, digital-to-analog converters (DACs), and analog MUXs] from digital components [such as microcontrollers, complex programmable logic devices (CPLDs), field-programmable gate arrays (FPGAs), radio frequency (RF) transceivers, universal serial bus (USB) transceivers, and switching regulators]. Figure 36 shows an example of good component placement. Although Figure 36 provides a good example of component placement, the best placement for each application is unique to the geometries, components, and PCB fabrication capabilities employed. That is, there is no single layout that is perfect for every design and careful consideration must always be used when designing with any analog component.

**Figure 36. System Component Placement**

The following basic recommendations for layout of the ADS1204 help achieve the best possible performance of the ADC.

- Separate analog and digital signals. To start, partition the board into analog and digital sections where the layout permits. Routing digital lines away from analog lines prevents digital noise from coupling back into analog signals.
- The ground plane can be split into an analog plane (AGND) and digital plane (DGND), but is not necessary. Place digital signals over the digital plane, and analog signals over the analog plane. As a final step in the layout, the split between the analog and digital grounds must be connected to together at the ADC.
- Fill void areas on signal layers with ground fill.
- Provide good ground return paths. Signal return currents flow on the path of least impedance. If the ground plane is cut or has other traces that block the current from flowing right next to the signal trace, another path must be found to return to the source and complete the circuit. If forced into a larger path, the chance that the signal radiates increases. Sensitive signals are more susceptible to EMI interference.
- Use bypass capacitors on supplies to reduce high-frequency noise. Do not place vias between bypass capacitors and the active device. Placing the bypass capacitors on the same layer as close to the active device yields the best results.
- Consider the resistance and inductance of the routing. Often, traces for the inputs have resistances that react with the input bias current and cause an added error voltage. Reducing the loop area enclosed by the source signal and the return current reduces the inductance in the path. Reducing the inductance reduces the EMI pickup and reduces the high-frequency impedance at the input of the device.
- Watch for parasitic thermocouples in the layout. Dissimilar metals going from each analog input to the sensor can create a parasitic thermocouple that can add an offset to the measurement. Differential inputs must be matched for both the inputs going to the measurement source.
- Analog inputs with differential connections must have a capacitor placed differentially across the inputs. Best input combinations for differential measurements use adjacent analog input lines (such as CH A+, CH A– through CH D+ and CH D–). The differential capacitors must be of high quality. The best ceramic chip capacitors are COG (NPO) that have stable properties and low noise characteristics.

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS1204IRHBR	ACTIVE	VQFN	RHB	32	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 105	ADS 1204I	
ADS1204IRHBT	ACTIVE	VQFN	RHB	32	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 105	ADS 1204I	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - Falls within JEDEC MO-220.

**THERMAL INFORMATION**

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.
