

AMC1305x-Q1

高精度、增强隔离式 Δ - Σ 调制器

1 特性

- 汽车电子 应用认证
- 具有符合 AEC-Q100 的下列结果：
 - 温度等级 1: -40°C 至 $+125^{\circ}\text{C}$
 - 人体放电模式 (HBM) 静电放电 (ESD) 分类等级 2
 - 组件充电模式 (CDM) ESD 分类等级 C6
- 与以下器件引脚兼容的系列：
 - 输入电压范围为 $\pm 50\text{mV}$ 或 $\pm 250\text{mV}$
 - 互补金属氧化物半导体 (CMOS) 或低压差分信号 (LVDS) 数字接口选项
- 出色的直流性能：
 - 偏移误差: $\pm 50\mu\text{V}$ 或 $\pm 150\mu\text{V}$ (最大值)
 - 偏移漂移: $1.3\mu\text{V}/^{\circ}\text{C}$ (最大值)
 - 增益误差: $\pm 0.3\%$ (最大值)
 - 增益漂移: $\pm 40\text{ppm}/^{\circ}\text{C}$ (最大值)
- 安全相关认证：
 - 7000 V_{PK} 增强型隔离, 符合 DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12 标准
 - 符合 UL 1577 标准且长达 1 分钟的 5000 V_{RMS} 隔离
 - CAN/CSA No. 5A 组件验收服务通知
- 瞬态抗扰度: $15\text{kV}/\mu\text{s}$ (最小值)
- 高电磁场抗扰度 (请参见应用手册 [SLLA181A](#))
- 5MHz 至 20MHz 外部时钟输入

2 应用

- 基于分流的电流感测或基于电阻分压器的电压感测输入：
 - 牵引逆变器
 - 板载充电器 (OBC)
 - 直流-直流转换器
 - 电池管理系统 (BMS)

3 说明

AMC1305-Q1 器件是一款高精度 Δ - Σ ($\Delta\Sigma$) 调制器, 通过磁场抗扰度较高的电容式双隔离栅隔离输出与输入电路。根据 DIN V VDE V 0884-10、UL1577 和 CSA 标准, 该隔离栅经认证可提供高达 7000 $\text{V}_{\text{峰值}}$ 的增强型隔离。当与隔离电源配合使用时, 该器件可防止共模高电压线路上的噪声电流进入本地系统接地, 从而干扰或损害低电压电路。

AMC1305-Q1 针对直接连接分流电阻器或其它低电压等级信号源进行了优化, 同时具有出色的直流和交流性能。分流电阻通常用于感测牵引逆变器、车载充电器或类似汽车应用中的电流。通过使用适当的数字滤波器 (即, 集成于 [TMS320F2837x](#)) 来抽取位流, 该器件可在 78kSPS 数据速率下实现 85dB (13.8 ENOB) 动态范围的 16 位分辨率。

在高侧, 调制器由 5V (AVDD) 标称电压供电, 而隔离数字接口则由 3.3V 或 5V 电源 (DVDD) 供电。

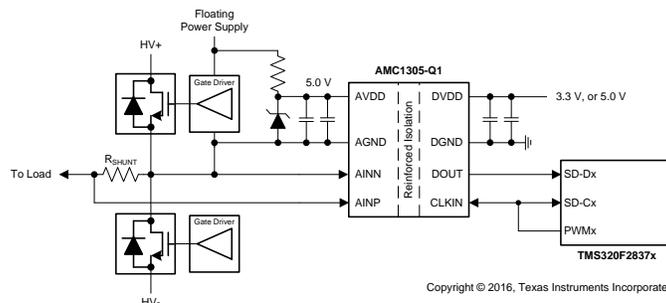

AMC1305-Q1 采用宽体小外形尺寸集成电路 (SOIC)-16 (DW) 封装。

器件信息⁽¹⁾

| 器件型号 | 封装 | 封装尺寸 (标称值) |
|-------------|-----------|------------------|
| AMC1305x-Q1 | SOIC (16) | 10.30mm x 7.50mm |

(1) 如需了解所有可用封装, 请参见数据表末尾的可订购产品附录。

6 Pin Configuration and Functions

Pin Functions

| PIN | | I/O | DESCRIPTION |
|---------|-----------|-----|---|
| NAME | NO. | | |
| AGND | 4 | — | This pin is internally connected to pin 8 and can be left unconnected or tied to high-side ground |
| | 8 | — | High-side ground reference |
| AINN | 3 | I | Inverting analog input |
| AINP | 2 | I | Noninverting analog input |
| AVDD | 7 | — | High-side power supply, 4.5 V to 5.5 V. See the Power-Supply Recommendations section for decoupling recommendations. |
| CLKIN | 13 | I | Modulator clock input, 5 MHz to 20.1 MHz |
| CLKIN_N | 12 | I | AMC1305L25-Q1 only: inverted modulator clock input |
| DGND | 9, 16 | — | Controller-side ground reference |
| DOUT | 11 | O | Modulator data output |
| DOUT_N | 10 | O | AMC1305L25-Q1 only: inverted modulator data output |
| DVDD | 14 | — | Controller-side power supply, 3.0 to 5.5 V |
| NC | 1 | — | This pin can be connected to AVDD or can be left unconnected |
| | 5 | — | This pin can be left unconnected or tied to AGND only |
| | 6, 10, 12 | — | These pins have no internal connection (pins 10 and 12 on the AMC1305Mx-Q1 only). |
| | 15 | — | This pin can be left unconnected or tied to DVDD only |

7 Specifications

7.1 Absolute Maximum Ratings

over the operating ambient temperature range (unless otherwise noted)⁽¹⁾

| | MIN | MAX | UNIT |
|--|------------|------------|------|
| Supply voltage, AVDD to AGND or DVDD to DGND | -0.3 | 6.5 | V |
| Analog input voltage at AINP, AINN | AGND – 6 | AVDD + 0.5 | V |
| Digital input voltage at CLKIN, CLKIN_N | DGND – 0.3 | DVDD + 0.3 | V |
| Input current to any pin except supply pins | -10 | 10 | mA |
| Maximum virtual junction temperature, T _J | | 150 | °C |
| Storage temperature, T _{stg} | -65 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

| | | VALUE | UNIT |
|--------------------|-------------------------|---|-------|
| V _(ESD) | Electrostatic discharge | Human body model (HBM), per AEC Q100-002 ⁽¹⁾ | ±2500 |
| | | Charged device model (CDM), per AEC Q100-011 | ±1000 |

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|----------------|--|-----|-----|-----|------|
| AVDD | High-side (analog) supply voltage | 4.5 | 5.0 | 5.5 | V |
| DVDD | Controller-side (digital) supply voltage | 3.0 | 3.3 | 5.5 | V |
| T _A | Operating ambient temperature range | -40 | | 125 | °C |

7.4 Thermal Information

| THERMAL METRIC ⁽¹⁾ | | AMC1305x-Q1 | UNIT |
|-------------------------------|--|-------------|------|
| | | DW (SOIC) | |
| | | 16 PINS | |
| R _{θJA} | Junction-to-ambient thermal resistance | 80.2 | °C/W |
| R _{θJC(top)} | Junction-to-case (top) thermal resistance | 40.5 | °C/W |
| R _{θJB} | Junction-to-board thermal resistance | 45.1 | °C/W |
| ψ _{JT} | Junction-to-top characterization parameter | 11.9 | °C/W |
| ψ _{JB} | Junction-to-board characterization parameter | 44.5 | °C/W |
| R _{θJC(bot)} | Junction-to-case (bottom) thermal resistance | n/a | °C/W |

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Power Ratings

| PARAMETER | TEST CONDITIONS | VALUE | UNIT |
|-----------------|--|---|------|
| P _D | Maximum power dissipation (both sides) | AVDD = 5.5 V, DVDD = 5.5 V, LVDS, R _{LOAD} = 100 Ω | 89.1 |
| P _{D1} | Maximum power dissipation (high-side supply) | AVDD = 5.5 V | 45.1 |
| P _{D2} | Maximum power dissipation (low-side supply) | DVDD = 5.5 V, LVDS, R _{LOAD} = 100 Ω | 44 |

7.6 Insulation Specifications

| PARAMETER | | TEST CONDITIONS | VALUE | UNIT |
|---|---|---|-------------------|------------------|
| GENERAL | | | | |
| CLR | Minimum air gap (clearance) ⁽¹⁾ | Shortest pin-to-pin distance through air | ≥ 8 | mm |
| CPG | Minimum external tracking (creepage) ⁽¹⁾ | Shortest pin-to-pin distance across the package surface | ≥ 8 | mm |
| DTI | Distance through insulation | Minimum internal gap (internal clearance) of the double insulation (2 × 0.0135 mm) | 0.027 | mm |
| CTI | Comparative tracking index | DIN EN 60112 (VDE 0303-11); IEC 60112 | ≥ 600 | V |
| | Material group | According to IEC 60664-1 | I | |
| | Overvoltage category per IEC 60664-1 | Rated mains voltage ≤ 300 V _{RMS} | I-IV | |
| | | Rated mains voltage ≤ 600 V _{RMS} | I-III | |
| | | Rated mains voltage ≤ 1000 V _{RMS} | I-II | |
| DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12⁽²⁾ | | | | |
| V _{IORM} | Maximum repetitive peak isolation voltage | At ac voltage (bipolar or unipolar) | 1414 | V _{PK} |
| V _{IOWM} | Maximum-rated isolation working voltage | At ac voltage (sine wave) | 1000 | V _{RMS} |
| | | At dc voltage | 1500 | V _{DC} |
| V _{IOTM} | Maximum transient isolation voltage | V _{TEST} = V _{IOTM} , t = 60 s (qualification test) | 7000 | V _{PK} |
| | | V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test) | 8400 | |
| V _{IOSM} | Maximum surge isolation voltage ⁽³⁾ | Test method per IEC 60065, 1.2/50-μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 10000 V _{PK} (qualification) | 6250 | V _{PK} |
| q _{pd} | Apparent charge ⁽⁴⁾ | Method a, after input/output safety test subgroup 2 / 3, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.2 × V _{IORM} = 1697 V _{PK} , t _m = 10 s | ≤ 5 | pC |
| | | Method a, after environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.6 × V _{IORM} = 2263 V _{PK} , t _m = 10 s | ≤ 5 | pC |
| | | Method b1, at routine test (100% production) and preconditioning (type test), V _{ini} = V _{IOTM} , t _{ini} = 1 s, V _{pd(m)} = 1.875 × V _{IORM} = 2652 V _{PK} , t _m = 1 s | ≤ 5 | pC |
| C _{IO} | Barrier capacitance, input to output ⁽⁵⁾ | V _{IO} = 0.5 V _{PP} at 1 MHz | 1.2 | pF |
| R _{IO} | Insulation resistance, input to output ⁽⁵⁾ | V _{IO} = 500 V at T _S = 150°C | > 10 ⁹ | Ω |
| | Pollution degree | | 2 | |
| | Climatic category | | 40/125/21 | |
| UL1577 | | | | |
| V _{ISO} | Withstand isolation voltage | V _{TEST} = V _{ISO} = 5000 V _{RMS} or 7000 V _{DC} , t = 60 s (qualification test), V _{TEST} = 1.2 × V _{ISO} = 6000 V _{RMS} , t = 1 s (100% production test) | 5000 | V _{RMS} |

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves or ribs on the PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier are tied together, creating a two-pin device.

7.7 Safety-Related Certifications

| VDE | UL |
|--|--|
| Certified according to DIN V VDE V 0884-10 (VDE V 0884-10): 2006-12, DIN EN 60950-1 (VDE 0805 Teil 1): 2014-08, and DIN EN 60095 (VDE 0860): 2005-11 | Recognized under UL1577 component recognition and CSA component acceptance NO 5 programs |
| Reinforced insulation | Single protection |
| File number: 40040142 | File number: E181974 |

7.8 Safety Limiting Values

Safety limiting intends to prevent potential damage to the isolation barrier upon failure of input or output (I/O) circuitry. A failure of the I/O circuitry may allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|--|---|-----|-----|---------------------|------|
| I _S Safety input, output, or supply current | $\theta_{JA} = 80.2^{\circ}\text{C/W}$, AVDD = DVDD = 5.5 V, T _J = 150°C, T _A = 25°C, see Figure 3 | | | 283 | mA |
| | $\theta_{JA} = 80.2^{\circ}\text{C/W}$, AVDD = DVDD = 3.6 V, T _J = 150°C, T _A = 25°C, see Figure 3 | | | 432 | mA |
| P _S Safety input, output, or total power | $\theta_{JA} = 80.2^{\circ}\text{C/W}$, T _J = 150°C, T _A = 25°C, see Figure 4 | | | 1558 ⁽¹⁾ | mW |
| T _S Maximum safety temperature | | | | 150 | °C |

(1) Input, output, or the sum of input and output power must not exceed this value.

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7.9 Electrical Characteristics: AMC1305M05-Q1

All minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $AVDD = 4.5\text{ V}$ to 5.5 V , $DVDD = 3.0\text{ V}$ to 5.5 V , $AINP = -50\text{ mV}$ to 50 mV , $AINN = 0\text{ V}$, and sinc³ filter with OSR = 256, unless otherwise noted. Typical values are at $T_A = 25^\circ\text{C}$, $CLKIN = 20\text{ MHz}$, $AVDD = 5.0\text{ V}$, and $DVDD = 3.3\text{ V}$.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|--|---|-------------------|--------|-------------------|--------|
| ANALOG INPUTS | | | | | | |
| V_{Clipping} | Maximum differential voltage input range (AINP-AINN) | | | ±62.5 | | mV |
| FSR | Specified linear full-scale range (AINP-AINN) | | -50 | | 50 | mV |
| V_{CM} | Operating common-mode input range | | -0.032 | | $AVDD - 2$ | V |
| C_{ID} | Differential input capacitance | | | 2 | | pF |
| I_{IB} | Input current | Inputs shorted to AGND | -97 | -72 | -57 | µA |

| Duty _{CLKIN} | Duty cycle | $5\text{ MHz} \leq f_{\text{CLKIN}} \leq 20.1\text{ MHz}$ | 40% | 50% | 60% | |
| CMOS Logic Family, CMOS with Schmitt-Trigger | | | | | | |
| I_{IN} | Input current | $DGND \leq V_{\text{IN}} \leq DVDD$ | -1 | | 1 | µA |
| C_{IN} | Input capacitance | | | 5 | | pF |
| V_{IH} | High-level input voltage | | $0.7 \times DVDD$ | | $DVDD + 0.3$ | V |
| V_{IL} | Low-level input voltage | | -0.3 | | $0.3 \times DVDD$ | V |
| C_{LOAD} | Output load capacitance | $f_{\text{CLKIN}} = 20\text{ MHz}$ | | 30 | | pF |
| V_{OH} | High-level output voltage | $I_{\text{OH}} = -20\text{ µA}$ | $DVDD - 0.1$ | | | V |
| | | $I_{\text{OH}} = -4\text{ mA}$ | $DVDD - 0.4$ | | | |
| V_{OL} | Low-level output voltage | $I_{\text{OL}} = 20\text{ µA}$ | | | 0.1 | V |
| | | $I_{\text{OL}} = 4\text{ mA}$ | | | 0.4 | |

(1) Integral nonlinearity is defined as the maximum deviation from a straight line passing through the end-points of the ideal ADC transfer function expressed as number of LSBs or as a percent of the specified linear full-scale range FSR.

(2) Offset error drift is calculated using the box method as described by the following equation:

$$TCE_{\text{O}} = \frac{\text{value}_{\text{MAX}} - \text{value}_{\text{MIN}}}{\text{TempRange}}$$

(3) Gain error drift is calculated using the box method as described by the following equation:

$$TCE_{\text{G}} (\text{ppm}) = \left(\frac{\text{value}_{\text{MAX}} - \text{value}_{\text{MIN}}}{\text{value} \times \text{TempRange}} \right) \times 10^6$$

Electrical Characteristics: AMC1305M05-Q1 (continued)

All minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $AVDD = 4.5\text{ V}$ to 5.5 V , $DVDD = 3.0\text{ V}$ to 5.5 V , $A_{INP} = -50\text{ mV}$ to 50 mV , $A_{INN} = 0\text{ V}$, and sinc³ filter with $OSR = 256$, unless otherwise noted. Typical values are at $T_A = 25^\circ\text{C}$, $CLKIN = 20\text{ MHz}$, $AVDD = 5.0\text{ V}$, and $DVDD = 3.3\text{ V}$.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---------------------|-----------------------------------|----------------------|-----|------|------|------|
| POWER SUPPLY | | | | | | |
| AVDD | High-side supply voltage | | 4.5 | 5.0 | 5.5 | V |
| I _{AVDD} | High-side supply current | | | 6.5 | 8.2 | mA |
| P _{AVDD} | High-side power dissipation | | | 32.5 | 45.1 | mW |
| DVDD | Controller-side supply voltage | | 3.0 | 3.3 | 5.5 | V |
| I _{DVDD} | Controller-side supply current | 3.0 V ≤ DVDD ≤ 3.6 V | | 2.7 | 4.0 | mA |
| | | 4.5 V ≤ DVDD ≤ 5.5 V | | 3.2 | 5.5 | |
| P _{DVDD} | Controller-side power dissipation | 3.0 V ≤ DVDD ≤ 3.6 V | | 8.9 | 14.4 | mW |
| | | 4.5 V ≤ DVDD ≤ 5.5 V | | 16.0 | 30.3 | |

7.10 Electrical Characteristics: AMC1305x25-Q1

All minimum and maximum specifications at $T_A = -40^\circ\text{C}$ to 125°C , $AVDD = 4.5\text{ V}$ to 5.5 V , $DVDD = 3.0\text{ V}$ to 5.5 V , $AINP = -250\text{ mV}$ to 250 mV , $AINN = 0\text{ V}$, and sinc³ filter with $OSR = 256$, unless otherwise noted. Typical values are at $T_A = 25^\circ\text{C}$, $CLKIN = 20\text{ MHz}$, $AVDD = 5.0\text{ V}$, and $DVDD = 3.3\text{ V}$.

(1) Integral nonlinearity is defined as the maximum deviation from a straight line passing through the end-points of the ideal ADC transfer function expressed as the number of LSBs or as a percent of the specified linear full-scale range FSR.

(2) Offset error drift is calculated using the box method as described by the following equation:

$$TCE_O = \frac{value_{MAX} - value_{MIN}}{TempRange}$$

(3) Gain error drift is calculated using the box method as described by the following equation:

$$TCE_G (ppm) = \left(\frac{value_{MAX} - value_{MIN}}{value \times TempRange} \right) \times 10^6$$

8 Detailed Description

8.1 Overview

The differential analog input (AINP and AINN) of the AMC1305-Q1 is a fully-differential amplifier feeding the switched-capacitor input of a second-order delta-sigma ($\Delta\Sigma$) modulator stage that digitizes the input signal into a 1-bit output stream. The isolated data output (DOUT) of the converter provides a stream of digital ones and zeros synchronous to the externally-provided clock source at the CLKIN pin with a frequency in the range of 5 MHz to 20.1 MHz. The time average of this serial bit-stream output is proportional to the analog input voltage.

The [Functional Block Diagram](#) section shows a detailed block diagram of the AMC1305-Q1. The analog input range is tailored to directly accommodate a voltage drop across a shunt resistor used for current sensing. The SiO₂-based capacitive isolation barrier supports a high level of magnetic field immunity as described in the application report [ISO72x Digital Isolator Magnetic-Field Immunity](#) (SLLA181A), available for download at www.ti.com. The external clock input simplifies the synchronization of multiple current-sense channels on the system level. The extended frequency range of up to 20.1 MHz supports higher performance levels compared to other solutions available on the market.

8.3 Feature Description

8.3.1 Analog Input

The AMC1305-Q1 incorporates front-end circuitry that contains a differential amplifier and sampling stage, followed by a $\Delta\Sigma$ modulator. The gain of the differential amplifier is set by internal precision resistors to a factor of 4 for devices with a specified input voltage range of ± 250 mV (for the AMC1305x25-Q1), or to a factor of 20 for devices with a ± 50 -mV input voltage range (for the AMC1305M05-Q1), resulting in a differential input impedance of 5 k Ω (for the AMC1305M05-Q1) or 25 k Ω (for the AMC1305x25-Q1).

Consider the input impedance of the AMC1305-Q1 in designs with high-impedance signal sources that can cause degradation of gain and offset specifications. The importance of this effect, however, depends on the desired system performance. Additionally, the input bias current caused by the internal common-mode voltage at the output of the differential amplifier causes an offset that depends on the actual amplitude of the input signal. See the [Isolated Voltage Sensing](#) section for more details on reducing these effects.

There are two restrictions on the analog input signals (AINP and AINN). First, if the input voltage exceeds the range of AGND – 6 V to AVDD + 0.5 V, the input current must be limited to 10 mA because the device input electrostatic discharge (ESD) protection diodes turn on. In addition, the linearity and noise performance of the device are ensured only when the differential analog input voltage remains within the specified linear full-scale range (FSR), that is ± 250 mV (for the AMC1305x25-Q1) or ± 50 mV (for the AMC1305M05-Q1), and within the specified input common-mode range.

8.3.2 Modulator

The modulator implemented in the AMC1305-Q1 is a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator, such as the one conceptualized in [Figure 48](#). The analog input voltage V_{IN} and the output V_5 of the 1-bit digital-to-analog converter (DAC) are differentiated, providing an analog voltage V_1 at the input of the first integrator stage. The output of the first integrator feeds the input of the second integrator stage, resulting in output voltage V_3 that is differentiated with the input signal V_{IN} and the output of the first integrator V_2 . Depending on the polarity of the resulting voltage V_4 , the output of the comparator is changed. In this case, the 1-bit DAC responds on the next clock pulse by changing its analog output voltage V_5 , causing the integrators to progress in the opposite direction while forcing the value of the integrator output to track the average value of the input.

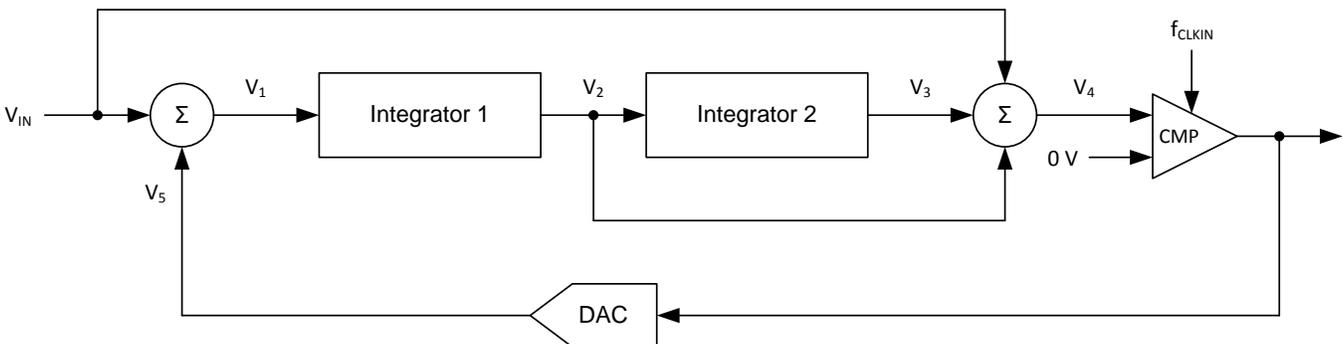

Figure 48. Block Diagram of a Second-Order Modulator

The modulator shifts the quantization noise to high frequencies; see [Figure 49](#). Therefore, use a low-pass digital filter at the output of the device to increase overall performance. This filter is also used to convert from the 1-bit data stream at a high sampling rate into a higher-bit data word at a lower rate (decimation). TI's microcontroller family [TMS320F2837x](#) offers a suitable programmable, hardwired filter structure termed a *sigma-delta filter module* (SDFM) optimized for usage with the AMC1305-Q1 family. Alternatively, a field-programmable gate array (FPGA) can be used to implement the digital filter.

Feature Description (continued)

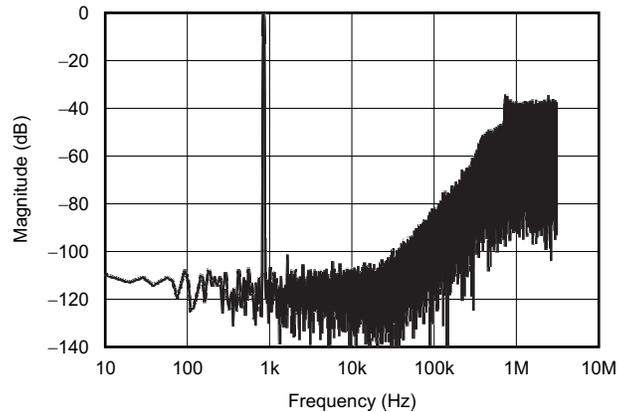

Figure 49. Quantization Noise Shaping

8.3.3 Digital Output

A differential input signal of 0 V ideally produces a stream of ones and zeros that are high 50% of the time. A differential input of 250 mV (for the AMC1305x25-Q1) or 50 mV (for the AMC1305M05-Q1) produces a stream of ones and zeros that are high 90% of the time. A differential input of –250 mV (–50 mV for the AMC1305M05-Q1) produces a stream of ones and zeros that are high 10% of the time. These input voltages are also the specified linear ranges of the different AMC1305-Q1 versions with performance as specified in this document. If the input voltage value exceeds these ranges, the output of the modulator shows non-linear behavior while the quantization noise increases. The output of the modulator would clip with a stream of only zeros with an input less than or equal to –312.5 mV (–62.5 mV for the AMC1305M05-Q1) or with a stream of only ones with an input greater than or equal to 312.5 mV (62.5 mV for the AMC1305M05-Q1). In this case, however, the AMC1305-Q1 generates a single 1 (if the input is at negative full-scale) or 0 every 128 clock cycles to indicate proper device function (see the [Fail-Safe Output](#) section for more details). The input voltage versus the output modulator signal is shown in [Figure 50](#).

The density of ones in the output bit-stream for any input voltage value (with the exception of a full-scale input signal as described in [Output Behavior in Case of Full-Scale Input](#)) can be calculated using [Equation 1](#):

$$\frac{V_{IN} + V_{Clipping}}{2 * V_{Clipping}} \tag{1}$$

The AMC1305-Q1 system clock is typically 20 MHz and is provided externally at the CLKIN pin. Data are synchronously provided at 20 MHz at the DOUT pin. Data change at the CLKIN falling edge. For more details, see the [Switching Characteristics](#) table.

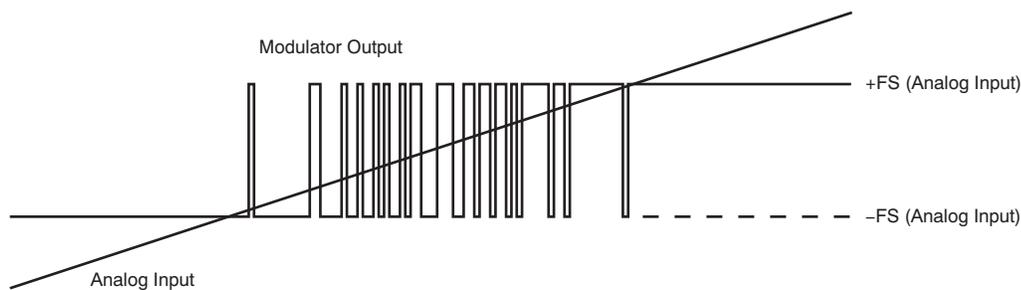

Figure 50. Analog Input versus AMC1305-Q1 Modulator Output

8.4 Device Functional Modes

8.4.1 Fail-Safe Output

In the case of a missing high-side supply voltage (AVDD), the output of a $\Delta\Sigma$ modulator is not defined and could cause a system malfunction. In systems with high safety requirements, this behavior is not acceptable. Therefore, the AMC1305-Q1 implements a fail-safe output function that ensures the device maintains its output level in case of a missing AVDD, as shown in Figure 51.

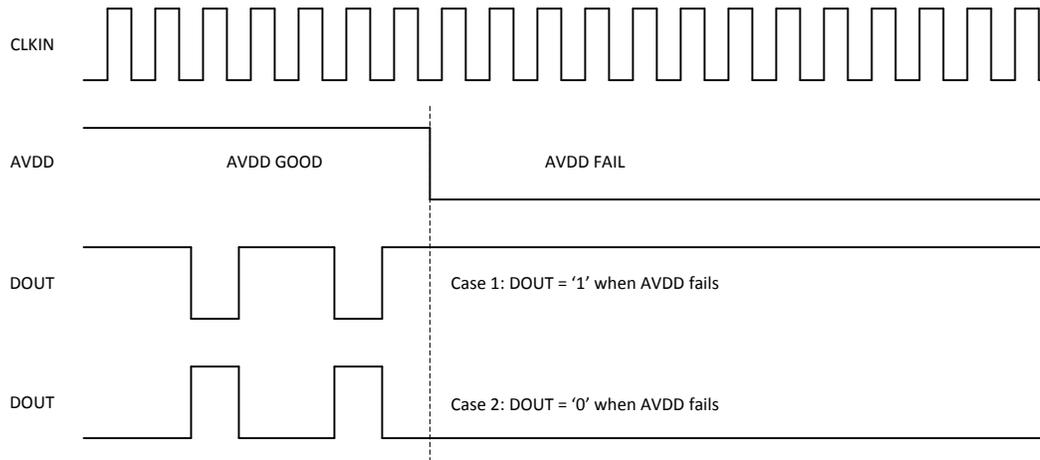

Figure 51. Fail-Safe Output of the AMC1305-Q1

8.4.2 Output Behavior in Case of Full-Scale Input

If a full-scale input signal is applied to the AMC1305-Q1 (that is, $V_{IN} \geq V_{Clipping}$), the device generates a single one or zero every 128 bits at DOUT, depending on the actual polarity of the signal being sensed, as shown in Figure 52.

In this way, differentiating between a missing AVDD and a full-scale input signal is possible on the system level.

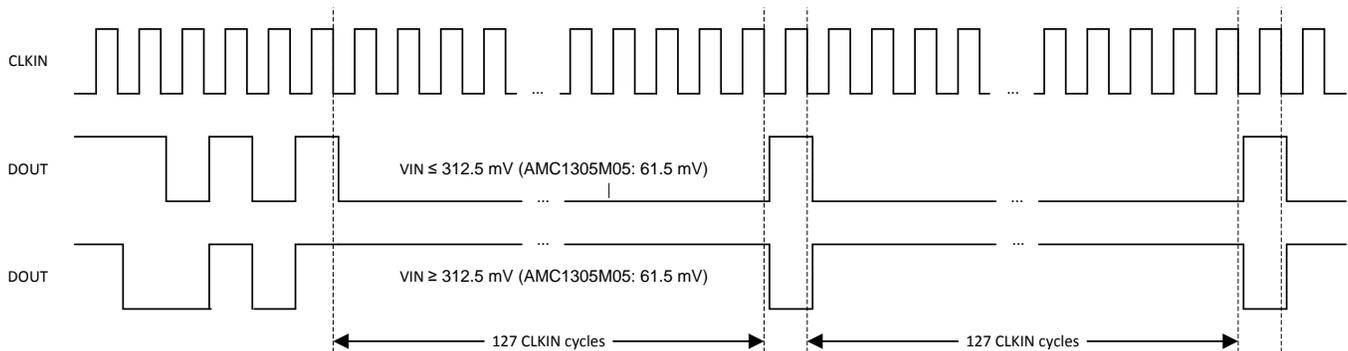

Figure 52. Overage Output of the AMC1305-Q1

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 Digital Filter Usage

The modulator generates a bit stream that is processed by a digital filter to obtain a digital word similar to a conversion result of a conventional analog-to-digital converter (ADC). A very simple filter, built with minimal effort and hardware, is a sinc³-type filter, as shown in [Equation 2](#):

$$H(z) = \left(\frac{1 - z^{-OSR}}{1 - z^{-1}} \right)^3 \quad (2)$$

This filter provides the best output performance at the lowest hardware size (count of digital gates) for a second-order modulator. All the characterization in this document is also done with a sinc³ filter with an over-sampling ratio (OSR) of 256 and an output word width of 16 bits.

$$SNR = 1.76dB + 6.02dB * ENOB \quad (3)$$

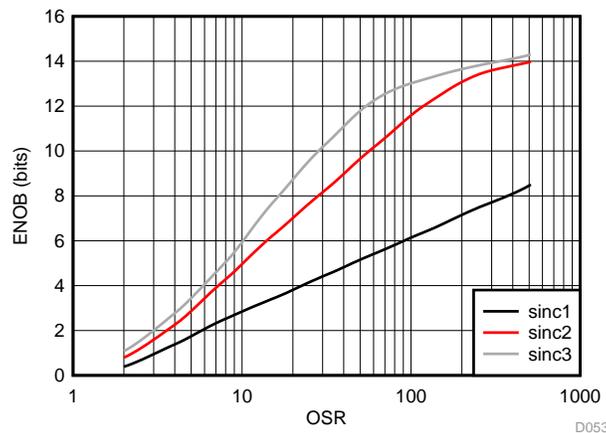

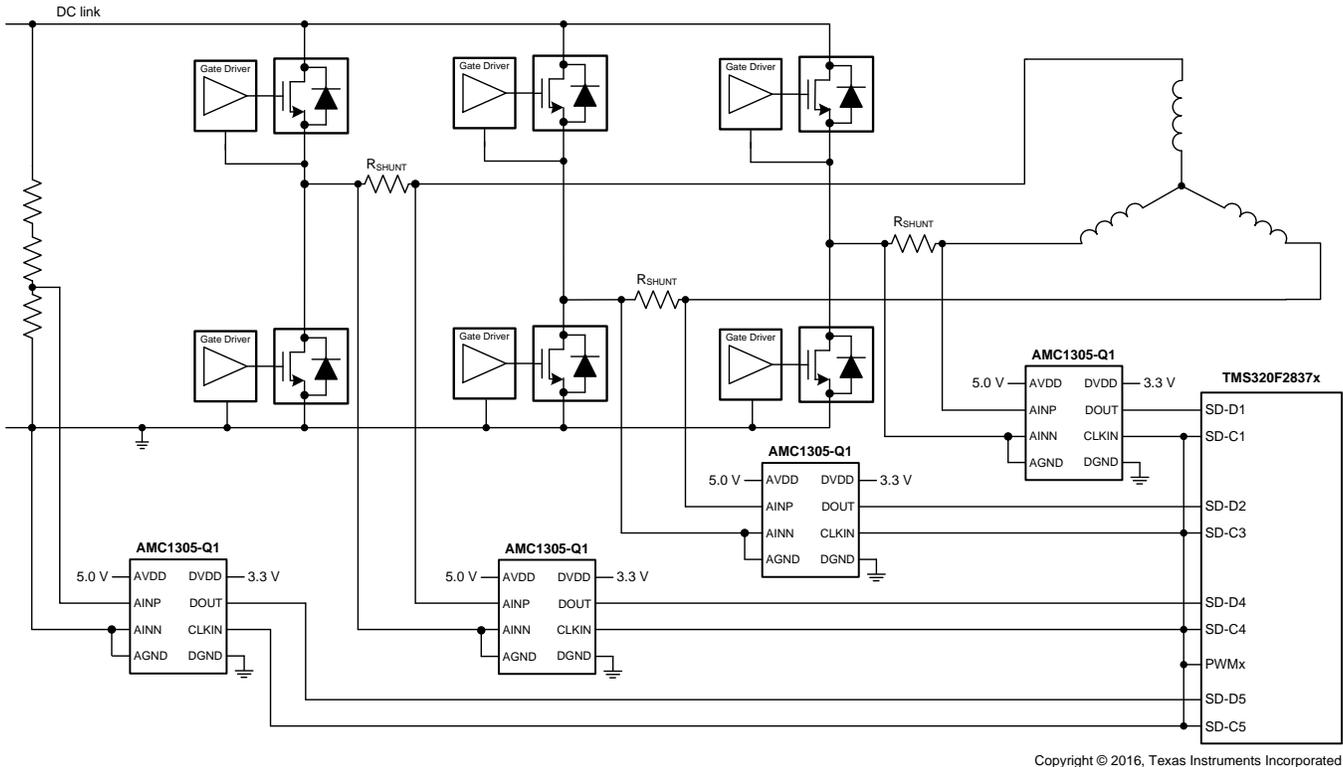

Figure 53. Measured Effective Number of Bits versus Oversampling Ratio

An example code for an implementation of a sinc³ filter in an FPGA, see the application note [Combining ADS1202 with FPGA Digital Filter for Current Measurement in Motor Control Applications \(SBAA094\)](#), available for download at www.ti.com.

9.2 Typical Applications

9.2.1 Traction Inverter Application

Because to their high ac and dc performance, isolated $\Delta\Sigma$ modulators are being widely used in new generation traction inverter designs. Traction inverters are critical parts of electrical and hybrid electrical vehicles. The input structure of the AMC1305-Q1 is optimized for use with low-impedance shunt resistors and is therefore tailored for isolated current sensing using shunts.

Copyright © 2016, Texas Instruments Incorporated

Figure 54. The AMC1305-Q1 in a Traction Inverter Application

9.2.1.1 Design Requirements

A typical operation of the device in a traction inverter application is shown in Figure 54. When the inverter stage is part of a motor drive system, measurement of the motor phase current is done via the shunt resistors (R_{SHUNT}). Depending on the system design, either all three or only two phase currents are sensed.

In this example, an additional fourth AMC1305-Q1 is used to support isolated voltage sensing of the dc link. This high voltage is reduced using a high-impedance resistive divider before being sensed by the device across a smaller resistor. The value of this resistor can degrade the performance of the measurement, as described in the [Isolated Voltage Sensing](#) section.

9.2.1.2 Detailed Design Procedure

The usually recommended RC filter in front of a $\Delta\Sigma$ modulator to improve signal-to-noise performance of the signal path, is not required for the AMC1305-Q1. By design, the input bandwidth of the analog front-end of the device is limited to 1 MHz.

For modulator output bit-stream filtering, a device from TI's [TMS320F2837x](#) family of dual-core MCUs is recommended. This family supports up to eight channels of dedicated hardwired filter structures that significantly simplify system level design by offering two filtering paths per channel: one providing high accuracy results for the control loop and one fast response path for overcurrent detection.

Typical Applications (continued)

9.2.1.3 Application Curve

In motor control applications, a very fast response time for overcurrent detection is required. The time for fully settling the filter in case of a step-signal at the input of the modulator depends on its order; that is, a sinc³ filter requires three data updates for full settling (with $f_{\text{DATA}} = f_{\text{CLK}} / \text{OSR}$). Therefore, for overcurrent protection, filter types other than sinc³ can be a better choice; an alternative is the sinc² filter. Figure 55 compares the settling times of different filter orders.

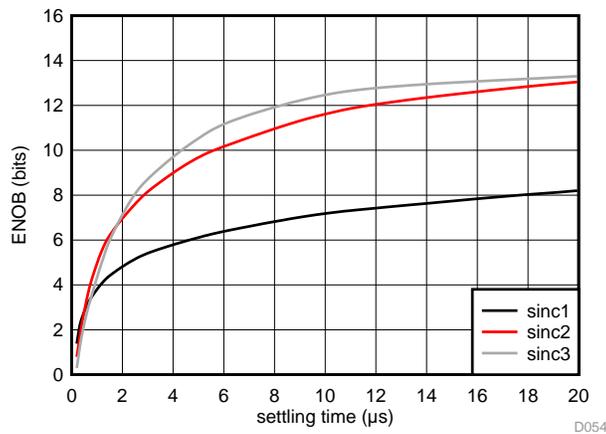

Figure 55. Measured Effective Number of Bits versus Settling Time

The delay time of the sinc filter with a continuous signal is half of its settling time.

Typical Applications (continued)

9.2.2 Isolated Voltage Sensing

The AMC1305-Q1 is optimized for usage in current-sensing applications using low-impedance shunts. However, the device can also be used in isolated voltage-sensing applications if the impact of the (usually higher) impedance of the resistor used in this case is considered.

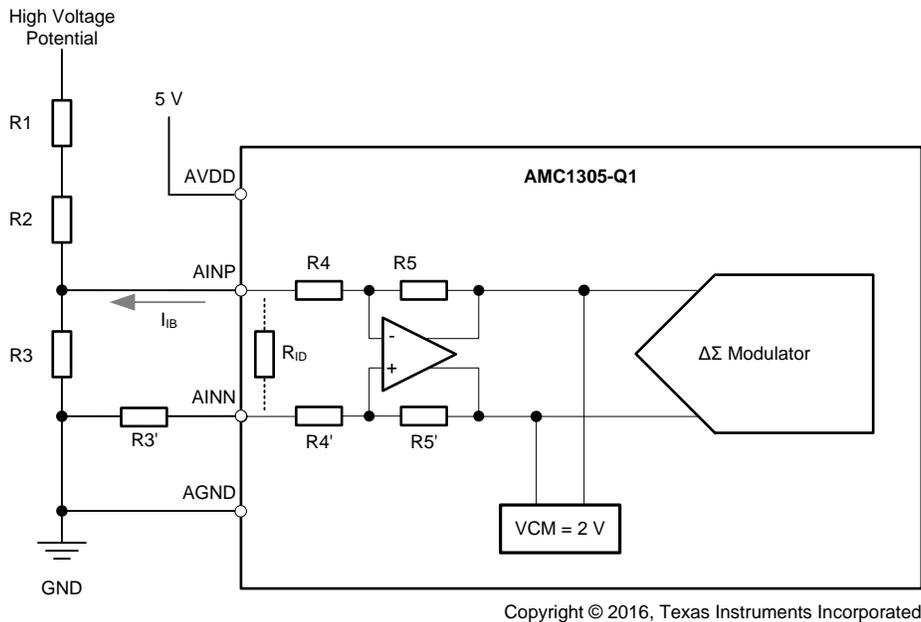

Figure 56. Using AMC1305-Q1 for Isolated Voltage Sensing

9.2.2.1 Design Requirements

Figure 56 shows a simplified circuit typically used in high-voltage sensing applications. The high impedance resistors (R1 and R2) are used as voltage dividers and dominate the current value definition. The resistance of the sensing resistor R3 is chosen to meet the input voltage range of the AMC1305-Q1. This resistor and the differential input impedance of the device (the AMC1305x25-Q1 is 25 kΩ, the AMC1305M05-Q1 is 5 kΩ) also create a voltage divider that results in an additional gain error. With the assumption of R1, R2, and R_{IN} having a considerably higher value than R3, the resulting total gain error can be estimated using Equation 4, with E_G being the gain error of the AMC1305-Q1.

$$|E_{G_{tot}}| = |E_G| + \frac{R_3}{R_{IN}} \quad (4)$$

This gain error can be easily minimized during the initial system level gain calibration procedure.

9.2.2.2 Detailed Design Procedure

As indicated in Figure 56, the output of the integrated differential amplifier is internally biased to a common-mode voltage of 2 V. This voltage results in a bias current I_{IB} through the resistive network R4 and R5 (or R4' and R5') used for setting the gain of the amplifier. The value range of this current is specified in the Electrical Characteristics table. This bias current generates additional offset error that depends on the value of the resistor R3. Because the value of this bias current depends on the actual common-mode amplitude of the input signal (as shown in Figure 57), the initial system offset calibration does not minimize its effect. Therefore, in systems with high accuracy requirements TI recommends using a series resistor at the negative input (AINN) of the AMC1305-Q1 with a value equal to the shunt resistor R3 (that is R3' = R3 in Figure 56) to eliminate the effect of the bias current.

Typical Applications (continued)

This additional series resistor ($R3'$) influences the gain error of the circuit. The effect can be calculated using Equation 5 with $R5 = R5' = 50 \text{ k}\Omega$ and $R4 = R4' = 2.5 \text{ k}\Omega$ (for the AMC1305M05-Q1) or $12.5 \text{ k}\Omega$ (for the AMC1305x25-Q1).

$$E_G(\%) = \left(1 - \frac{R4}{R4' + R3'} \right) * 100\% \quad (5)$$

9.2.2.3 Application Curve

Figure 57 shows the dependency of the input bias current on the common-mode voltage at the input of the AMC1305-Q1.

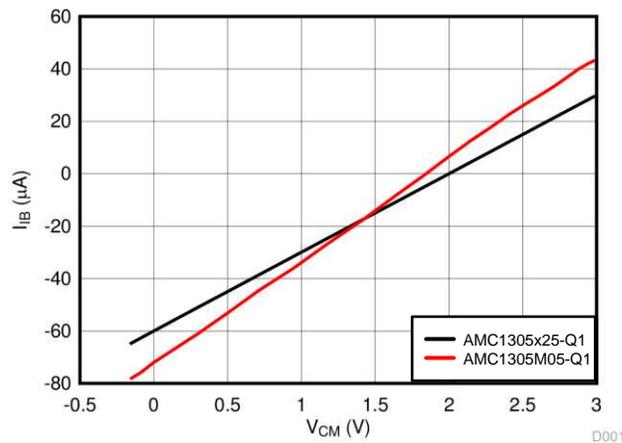

Figure 57. Input Current vs Input Common-Mode Voltage

10 Power-Supply Recommendations

In a typical traction inverter application, the high-side power supply (AVDD) for the device is derived from the floating power supply of the upper gate driver. For lowest cost, a Zener diode can be used to limit the voltage to $5\text{ V} \pm 10\%$. Alternatively a low-cost low-drop regulator (LDO), for example the [LP2951-xx-Q1](#), can be used to minimize noise on the power supply. A low-ESR decoupling capacitor of $0.1\ \mu\text{F}$ is recommended for filtering this power-supply path. Place this capacitor (C_2 in [Figure 58](#)) as close as possible to the AVDD pin of the AMC1305-Q1 for best performance. If better filtering is required, an additional $10\text{-}\mu\text{F}$ capacitor can be used. The floating ground reference (AGND) is derived from the end of the shunt resistor, which is connected to the negative input (AINN) of the device. If a four-pin shunt is used, the device inputs are connected to the inner leads, while AGND is connected to one of the outer leads of the shunt.

For decoupling of the digital power supply on controller side, TI recommends using a $0.1\text{-}\mu\text{F}$ capacitor assembled as close to the DVDD pin of the AMC1305-Q1 as possible, followed by an additional capacitor in the range of $1\ \mu\text{F}$ to $10\ \mu\text{F}$.

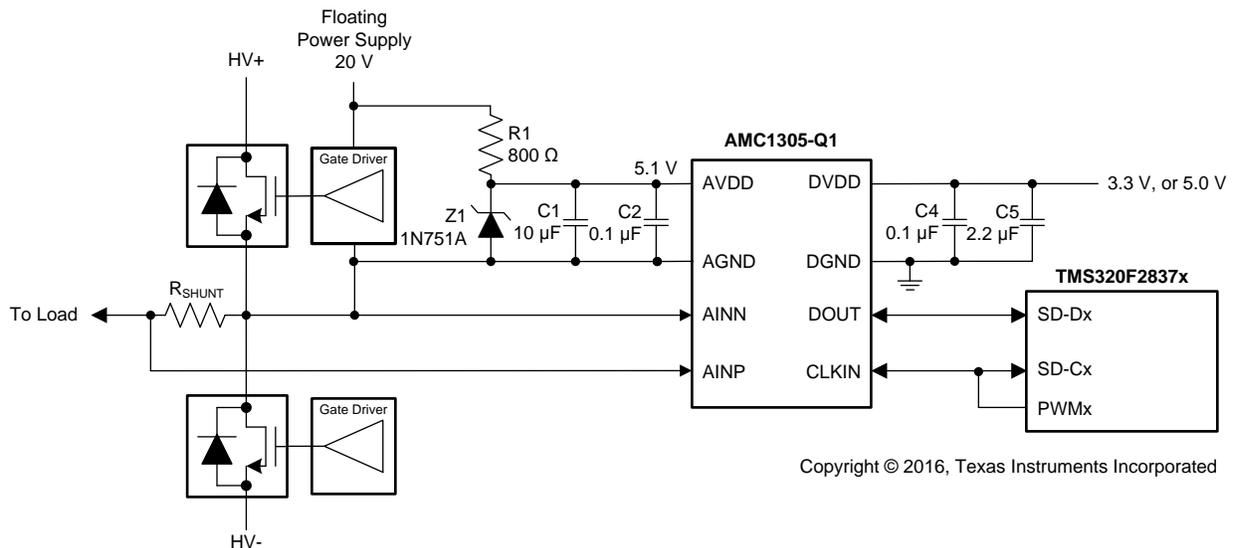

Figure 58. Zener-Diode-Based High-Side Power Supply

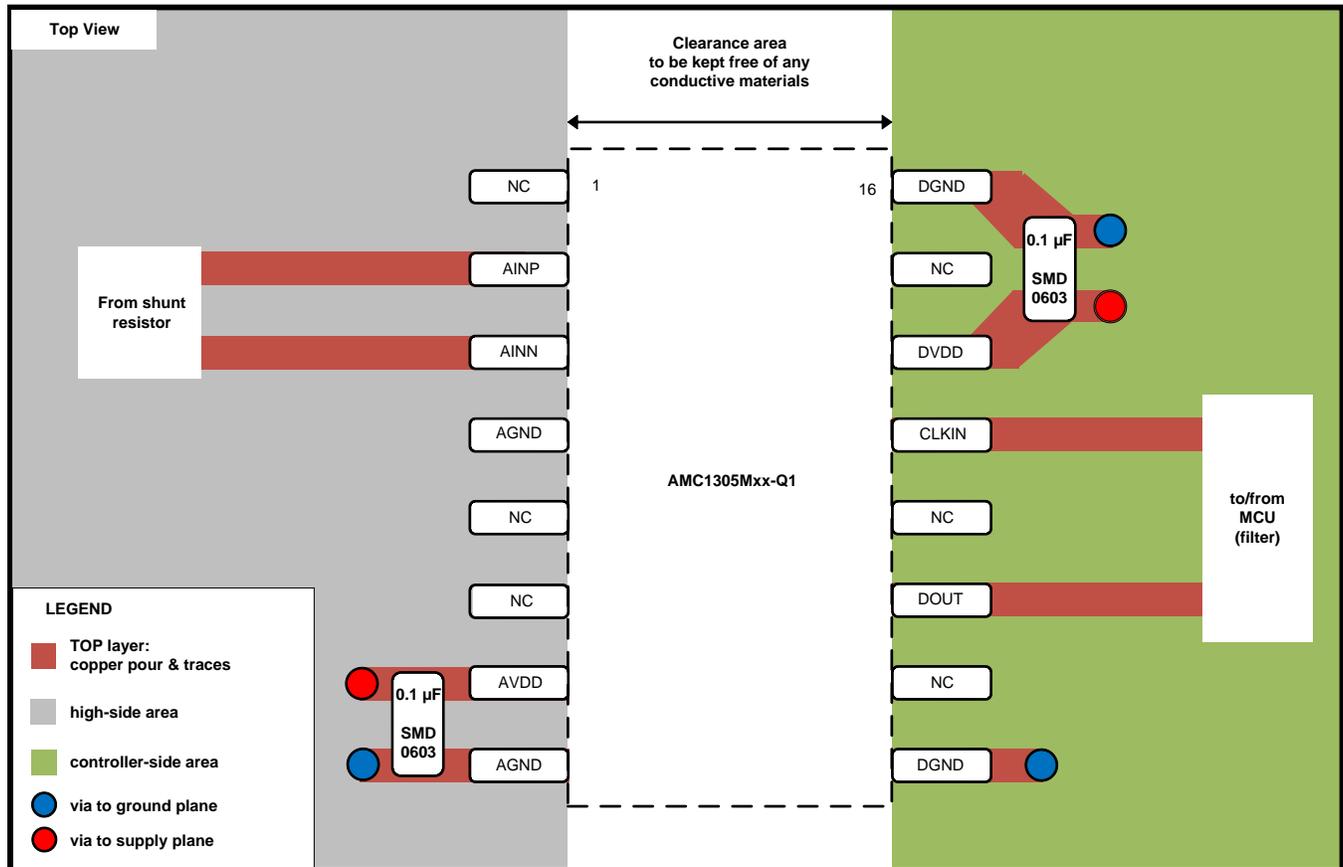

11 Layout

11.1 Layout Guidelines

A layout recommendation showing the critical placement of the decoupling capacitors (as close as possible to the AMC1305-Q1) and placement of the other components required by the device is shown in Figure 59.

For the AMC1305L25-Q1 version, place the 100-Ω termination resistor as close as possible to the CLKIN, CLKIN_N inputs of the device to achieve highest signal integrity. If not integrated, an additional termination resistor is required as close as possible to the LVDS data inputs of the MCU or filter device; see Figure 60.

12.3 接收文档更新通知

如需接收文档更新通知，请访问 www.ti.com.cn 网站上的器件产品文件夹。点击右上角的**提醒我 (Alert me)** 注册后，即可每周定期收到已更改的产品信息。有关更改的详细信息，请查阅已修订文档中包含的修订历史记录。

12.4 社区资源

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.5 商标

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

12.6 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

12.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
