

BQ25170: 适用于单节锂离子和磷酸铁锂电池的 800mA 线性电池充电器

1 特性

- 可承受高达 30V 的输入电压
- 自动睡眠模式，可降低功耗
 - 350nA 电池泄漏电流
 - 禁用充电时，输入泄漏电流为 85μA
- 支持单节锂离子、锂聚合物和磷酸铁锂电池
- 操作可使用外部电阻器进行编程
 - VSET 用于设置电池稳压电压：
 - 锂离子电池：4.05V、4.1V、4.2V、4.35V、4.4V
 - 磷酸铁锂电池：3.5V、3.6V、3.7V
 - ISET 用于设置 10mA 至 800mA 的充电电流
- 高精度
 - 充电电压精度为 ±0.5%
 - 充电电流精度为 ±10%
- 充电特性
 - 预充电电流为 20% ISET
 - 终止电流为 10% ISET
 - NTC 热敏电阻输入用于监控电池温度
 - TS 引脚用于充电功能控制
 - 开漏输出用于状态和故障指示
 - 用于电源正常指示的开漏输出
- 集成故障保护
 - 6.6V 输入过压保护
 - 基于 VSET 的输出过压保护
 - 1000mA 过流保护
 - 125°C 热调节；150°C 热关断保护
 - OUT 短路保护
 - VSET、ISET 引脚短路/开路保护

2 应用

- 真正无线耳机
- 可穿戴附件、智能手环
- 美容美发
- 电动牙刷
- 车队管理、资产跟踪

3 说明

BQ25170 是一款集成式 800mA 线性充电器，适用于面向空间受限便携式应用的单节锂离子、锂聚合物和磷酸铁锂电池。该器件具有为电池充电的单电源输出。只要安全计时器期间内平均系统负载不会妨碍电池充满电，就可以使系统负载与电池并联。当系统负载与电池并联时，充电电流会由系统和电池共享。

该器件分三个阶段为锂离子电池充电：对完全放电电池进行恢复性充电的预充电阶段，为电池充上大部分电量的恒流快速充电阶段，以及使电池电量充满的电压调节阶段。

在所有充电阶段，内部控制环路都会监控 IC 结温，当其超过内部温度阈值 T_{REG} 时，它会减少充电电流。

充电器功率级和充电电流检测功能均完全集成。该充电器具有高精度电流和电压调节环路功能、充电状态显示和自动充电终止功能。充电电压和快速充电电流可通过外部电阻编程设定。预充电和终止电流阈值由快速充电电流设置决定。

器件信息

5 Pin Configuration and Functions

图 5-1. WSON Package 8-Pin Top View

表 5-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NUMBER		
IN	1	P	Input power, connected to external DC supply. Bypass IN with at least 1- μ F capacitor to GND, placed close to the IC.
ISET	2	I	Programs the device fast-charge current. External resistor from ISET to GND defines fast charge current value. Expected range is 30 k Ω (10 mA) to 375 Ω (800 mA). $ICHG = K_{ISET} / R_{ISET}$. Precharge current is defined as 20% of ICHG. Termination current is defined as 10% of ICHG.
TS	3	I	Temperature Qualification Voltage Input. Connect a negative temperature coefficient (NTC) thermistor directly from TS to GND (AT103-2 recommended). Charge suspends when the TS pin voltage is out of range. If TS function is not needed, connect an external 10-k Ω resistor from this pin to GND. Pulling TS < V_{TS_ENZ} will disable the charger.
GND	4	-	Ground pin
STAT	5	O	Open drain charger status indication output. Connect to pull-up rail via 10-k Ω resistor. LOW indicates charge in progress. HIGH indicates charge complete or charge disabled. When a fault condition is detected STAT pin blinks at 1 Hz.
PG	6	O	Open drain charge power good indication output. Connect to pull-up rail via 10-k Ω resistor. PG pulls low when $V_{IN} > V_{IN_LOWV}$ and $V_{OUT} + V_{SLEEPZ} < V_{IN} < V_{IN_OV}$.
VSET	7	I	Programs the regulation voltage for OUT pin with a pull-down resistor. Valid resistor range is 18 k Ω to 100 k Ω , values outside this range will suspend charge. Refer to 节 7.3.1.2 for voltage level details. Recommend using $\pm 1\%$ tolerance resistor with <200 ppm/ $^{\circ}$ C temperature coefficient.
OUT	8	P	Battery Connection. System Load may be connected in parallel to battery. Bypass OUT with at least 1- μ F capacitor to GND, placed close to the IC.
Thermal Pad	—	—	Exposed pad beneath the IC for heat dissipation. Solder thermal pad to the board with vias connecting to solid GND plane.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	IN	- 0.3	30	V
Voltage	OUT	- 0.3	13	V
Voltage	ISET, PG, STAT, TS, VSET	- 0.3	5.5	V
Output Sink Current	PG, STAT		5	mA
T _J	Junction temperature	- 40	150	°C
T _{stg}	Storage temperature	- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ⁽¹⁾	±2500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	3.0		6.6	V
V _{OUT}	Output voltage			4.4	V
I _{OUT}	Output current			0.8	A
T _J	Junction temperature	- 40		125	°C
C _{IN}	IN capacitor	1			μF
C _{OUT}	OUT capacitor	1			μF
R _{VSET}	VSET resistor	18		100	kΩ
R _{VSET_TOL}	Tolerance for VSET resistor	-1		1	%
R _{VSET_TEMP}	Temperature coefficient for VSET resistor			200	ppm/°C
R _{ISET}	ISET resistor	0.375		30	kΩ
R _{TS}	TS thermistor resistor (recommend 103AT-2)		10		kΩ

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		BQ25170	
		DSG	
		8 PINS	
			UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance (EVM ⁽²⁾)	37	°C/W
$R_{\theta JA}$	Junction-to-ambient thermal resistance (JEDEC ⁽¹⁾)	75.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	93.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	41.8	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	3.8	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	41.7	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	17.0	°C/W

6.5 Electrical Characteristics

$3.0V < V_{IN} < V_{IN_OV}$ and $V_{IN} > V_{OUT} + V_{SLEEP}$, $T_J = -40^{\circ}C$ to $+125^{\circ}C$, and $T_J = 25^{\circ}C$ for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
QUIESCENT CURRENTS						
I_{Q_OUT}	Quiescent output current (OUT)	OUT = 4.2V, IN floating or IN = 0V - 5V, Charge Disabled, $T_J = 25^{\circ}C$		0.350	0.6	μA
		OUT = 4.2V, IN floating or IN = 0V - 5V, Charge Disabled, $T_J < 105^{\circ}C$		0.350	0.8	μA
$I_{SD_IN_TS}$	Shutdown input current (IN) with charge disabled via TS pin	IN = 5V, Charge Disabled ($V_{TS} < V_{TS_ENZ}$), no battery		80	110	μA
$I_{STANDBY_IN}$	Standby input current (IN) with charge terminated	IN = 5V, Charge Enabled, charge terminated		190		μA
I_{Q_IN}	Quiescent input current (IN)	IN = 5V, OUT = 3.8V, Charge Enabled, ICHG = 0A		0.45	0.6	mA
INPUT						
V_{IN_OP}	IN operating range		3.0		6.6	V
V_{IN_LOWV}	IN voltage to start charging	IN rising	3.05	3.09	3.15	V
V_{IN_LOWV}	IN voltage to stop charging	IN falling	2.80	2.95	3.10	V
V_{SLEEPZ}	Exit sleep mode threshold	IN rising, $V_{IN} - V_{OUT}$, OUT = 4V	95	135	175	mV
V_{SLEEP}	Sleep mode threshold hysteresis	IN falling, $V_{IN} - V_{OUT}$, OUT = 4V		80		mV
V_{IN_OV}	VIN overvoltage rising threshold	IN rising	6.60	6.75	6.90	V
V_{IN_OVZ}	VIN overvoltage falling threshold	IN falling		6.63		V
CONFIGURATION PINS SHORT/OPEN PROTECTION						
R_{ISET_SHORT}	Highest resistor value considered short	R_{ISET} below this at startup, charger does not initiate charge, power cycle or TS toggle to reset			350	Ω
R_{VSET_SHORT}	Highest resistor value considered short	R_{VSET} below this at startup, charger does not initiate charge, power cycle or TS toggle to reset			2.8	k Ω
R_{VSET_OPEN}	Lowest resistor value considered open	R_{VSET} above this at startup, charger does not initiate charge, power cycle or TS toggle to reset	120			k Ω
BATTERY CHARGER						
V_{DO}	Dropout voltage ($V_{IN} - V_{OUT}$)	VIN falling, VOUT = 4.35V, IOU = 500mA		425		mV
V_{REG_ACC}	OUT charge voltage regulation accuracy	$T_J = 25^{\circ}C$, all VSET settings	-0.5		0.5	%
		$T_J = -40^{\circ}C$ to $125^{\circ}C$, all VSET settings	-0.8		0.8	%
I_{CHG_RANGE}	Typical charge current regulation range	$V_{OUT} > V_{BAT_LOWV}$	10		800	mA
K_{ISET}	Charge current setting factor, $I_{CHG} = K_{ISET} / R_{ISET}$	10mA < ICHG < 800mA	270	300	330	A Ω
I_{CHG_ACC}	Charge current accuracy	$R_{ISET} = 375\Omega$, OUT = 3.8V	720	800	880	mA
		$R_{ISET} = 600\Omega$, OUT = 3.8V	450	500	550	mA
		$R_{ISET} = 3.0k\Omega$, OUT = 3.8V	90	100	110	mA
		$R_{ISET} = 30k\Omega$, OUT = 3.8V	9	10	11	mA
I_{PRECHG}	Typical pre-charge current, as percentage of ICHG	$V_{OUT} < V_{BAT_LOWV}$		20		%
I_{PRECHG_ACC}	Precharge current accuracy	$R_{ISET} = 375\Omega$, OUT = 2.5V	144	160	176	mA
		$R_{ISET} = 600\Omega$, OUT = 2.5V	85	100	110	mA
		$R_{ISET} = 3.0k\Omega$, OUT = 2.5V	18	20	22	mA
		$R_{ISET} = 30k\Omega$, OUT = 2.5V	1.4	2	2.6	mA

6.5 Electrical Characteristics (continued)

$3.0V < V_{IN} < V_{IN_OV}$ and $V_{IN} > V_{OUT} + V_{SLEEP}$, $T_J = -40^{\circ}C$ to $+125^{\circ}C$, and $T_J = 25^{\circ}C$ for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{TERM}	Typical termination current, as percentage of ICHG	$V_{OUT} = V_{REG}$		10		%
I_{TERM_ACC}	Termination current accuracy	$R_{ISET} = 600\ \Omega$, $OUT = V_{REG} = 4.2V$	45	50	55	mA

7 Detailed Description

7.1 Overview

The BQ25170 is an integrated 800-mA linear charger for 1-cell Li-Ion, Li-Polymer, and LiFePO₄ batteries. The device has a single power output that charges the battery. The system load can be placed in parallel with the battery, as long as the average system load does not prevent the battery from charging fully within the safety timer duration. When the system load is placed in parallel with the battery, the input current is shared between the system and the battery.

The device has three phases for charging a Li-Ion battery: precharge to recover a fully discharged battery, fast-charge constant current to supply the bulk of the charge, and voltage regulation to reach full capacity.

The charger includes flexibility in programming of the fast-charge current and regulation voltage. This charger is designed to work with a standard USB connection or dedicated charging adapter (DC output).

The charger also comes with a full set of safety features: battery temperature monitoring, overvoltage protection, charge safety timers, and configuration pin (VSET, ISET) short and open protection. All of these features and more are described in detail below.

The charger is designed for a single path from the input to the output to charge the battery. Upon application of a valid input power source, the configuration pins are checked for short/open circuit.

If the Li-Ion battery voltage is below the V_{BAT_LOWV} threshold, the battery is considered discharged and a preconditioning cycle begins. The amount of precharge current is 20% of the programmed fast-charge current via ISET pin. The t_{PRECHG} safety timer is active, and stops charging after expiration if battery voltage fails to rise above V_{BAT_LOWV} .

Once the battery has charged to the V_{BAT_LOWV} threshold, Fast Charge Mode is initiated, applying the fast charge current and starting the t_{SAFETY} timer. The fast charge constant current is programmed using the ISET pin. The constant current phase provides the bulk of the charge. Power dissipation in the IC is greatest in fast charge with a lower battery voltage. If the IC temperature reaches T_{REG} , the IC enters thermal regulation, slows the timer clock by half, and reduces the charge current as needed to keep the temperature from rising any further. [图 7-1](#) shows the typical Lithium battery charging profile with thermal regulation. Under normal operating conditions, the IC's junction temperature is less than T_{REG} and thermal regulation is not entered.

Once the battery has charged to the regulation voltage, the voltage loop takes control and holds the battery at the regulation voltage until the current tapers to the termination threshold. The termination threshold is 10% of the programmed fast-charge current.

Further details are described in [节 7.3](#).

图 7-1. Lithium-Ion Battery Charging Profile with Thermal Regulation

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Device Power Up from Input Source

When an input source is plugged in and charge is enabled, the device checks the input source voltage to turn on all the bias circuits. It detects and sets the charge current and charge voltage limits before the linear regulator is started. The power up sequence from input source is as listed:

1. ISET pin detection
2. VSET pin detection to select charge voltage
3. Charger power up

7.3.1.1 ISET Pin Detection

After a valid VIN is plugged in, the device checks the resistor on the ISET pin for a short circuit ($R_{ISET} < R_{ISET_SHORT}$). If a short condition is detected, the charger remains in the FAULT state until the input or TS pin is toggled. If the ISET pin is open-circuit, the charger proceeds through pin detection and starts the charger with no charge current. This pin is monitored while charging and changes in R_{ISET} while the charger is operating will immediately translate to changes in charge current.

An external pull-down resistor ($\pm 1\%$ or better recommended to minimize charge current error) from ISET pin to GND sets the charge current as:

$$I_{CHG} = \frac{K_{ISET}}{R_{ISET}} \quad (1)$$

where

- I_{CHG} is the desired fast-charge current
- K_{ISET} is a gain factor found in the electrical specifications
- R_{ISET} is the pull-down resistor from ISET pin to GND

For charge currents below 50 mA, an extra RC circuit is recommended on ISET to achieve more stable current signal. For greater accuracy at lower currents, part of the current-sensing FET is disabled to give better resolution.

7.3.1.2 VSET Pin Detection

VSET pin is used to program the device regulation voltage at end-of-charge using a $\pm 1\%$ pull-down resistor. The available pull-down resistor and corresponding charging levels are:

表 7-1. VSET pin resistor value table

RESISTOR	CHARGE VOLTAGE (V)
> 150 k Ω	No Charge (open-circuit)
100 k Ω	1-cell LiFePO ₄ : 3.50 V
82 k Ω	1-cell LiFePO ₄ : 3.60 V
62 k Ω	1-cell LiFePO ₄ : 3.70 V
47 k Ω	1-cell Lilon: 4.05 V
36 k Ω	1-cell Lilon: 4.10 V
27 k Ω	1-cell Lilon: 4.20 V
24 k Ω	1-cell Lilon: 4.35 V
18 k Ω	1-cell Lilon: 4.40 V
< 3.0 k Ω	No Charge (short-circuit)

If either a short- or open-circuit condition is detected, charger stops operation and remains in the FAULT state until the input or TS pin is toggled.

Once a valid resistor value has been detected, the corresponding charge voltage is latched in and the pin is not continuously monitored during operation. A change in this pin will not be acknowledged by the IC until the input supply or TS pin is toggled.

7.3.1.3 Charger Power Up

After VSET, ISET pin resistor values have been validated, the device proceeds to enable the charger. The device automatically begins operation at the correct stage of battery charging depending on the OUT voltage.

7.3.2 Battery Charging Features

When charge is enabled, the device automatically completes a charging cycle according to the settings on VSET, ISET pins without any intervention. The lithium-based charging cycle is automatically terminated when the charging current is below termination threshold, charge voltage is above recharge threshold, and device is not in thermal regulation (TREG). When a full battery is discharged below the recharge threshold (V_{RECHG}), the device automatically starts a new charging cycle. After charge is done, toggling the input supply or the TS pin can initiate a new charging cycle.

7.3.2.1 Lithium-Ion Battery Charging Profile

The device charges a lithium based battery in four phases: trickle charge, precharge, constant current and constant voltage. At the beginning of a charging cycle, the device checks the battery voltage and regulates current and voltage accordingly.

If the charger is in thermal regulation during charging, the actual charging current will be less than the programmed value. In this case, termination is temporarily disabled and the charging safety timer is counted at half the clock rate. For more information, refer to 节 7.3.2.3.

图 7-2. Battery Charging Profile

7.3.2.2 Charge Termination and Battery Recharge

The device terminates a charge cycle when the OUT pin voltage is above the recharge threshold (V_{RECHG}), and the current is below the termination threshold (I_{TERM}). Termination is temporarily disabled when the charger

device is in thermal regulation. After charge termination is detected, the linear regulator turns off and the device enters STANDBY state. Once the OUT pin drops below the V_{RECHG} threshold, a new charge cycle is automatically initiated.

7.3.2.3 Charging Safety Timers

The device has built-in safety timers to prevent an extended charging cycle due to abnormal battery conditions. The precharge timer is fixed at 30 minutes. The fast-charge safety timer is fixed at 10 hours. When safety timer expires, the charge cycle ends. A toggle on the input supply or TS pin is required to restart a charge cycle after the safety timer has expired.

During thermal regulation, the safety timer counts at half clock rate as the actual charge current is likely to be below the ISET setting. For example, if the charger is in thermal regulation throughout the whole charging cycle, and the safety timer is 10 hours, then the timer will expire in 20 hours.

During faults which disable charging, such as VIN OVP, BAT OVP, TSHUT or TS faults, the timer is suspended. Once the fault goes away, charging and the safety timer resumes. If the charging cycle is stopped and started again, the timer gets reset (toggle TS pin restarts the timer).

The safety timer restarts counting for the following events:

1. Charging cycle stop and restart (toggle TS pin, charged battery falls below recharge threshold, or toggle input supply)
2. OUT pin voltage crosses the V_{BAT_LOWV} threshold in either direction

The precharge safety timer (fixed counter that runs when $V_{OUT} < V_{BAT_LOWV}$), follows the same rules as the fast-charge safety timer in terms of getting suspended, reset, and counting at half-rate.

7.3.2.4 Battery Cold, Hot Temperature Qualification (TS Pin)

While charging, the device continuously monitors battery temperature by sensing the voltage at the TS pin. A negative temperature coefficient (NTC) thermistor should be connected between the TS and GND pins (recommend: 103AT-2). If temperature sensing is not required in the application, connect a fixed 10-k Ω resistor from TS to GND to allow normal operation. Battery charging is allowed when the TS pin voltage falls between V_{COLD} and V_{HOT} thresholds (typically 0°C - 45°C). The temperature corresponding to these voltage thresholds can be modified by adding resistors in parallel and in series with the thermistor, as shown in [图 7-3](#). If the TS pin indicates battery temperature is outside this range, the device stops charging, enters the STANDBY state, and blinks the STAT pin. Once battery temperature returns to normal conditions, charging resumes automatically.

图 7-3. TS Resistor Network For Modified Temperature Charging Window

表 7-2. Recommended Resistor Values for Different Temperature Charging Windows

TEMPERATURE CHARGING WINDOW	R_S	R_P
0°C to 60°C	1.9 k Ω	400 k Ω
-10°C to 60°C	2.3 k Ω	70 k Ω
-10°C to 50°C	1.1 k Ω	70 k Ω

In addition to battery temperature sensing, the TS pin can be used to disable the charger at any time by pulling TS voltage below V_{TS_ENZ} . The device disables the charger and consumes $I_{SD_IN_TS}$ from the input supply. In order to minimize quiescent current, the TS current source (I_{TS_BIAS}) is duty-cycled, with an on-time of $t_{TS_DUTY_ON}$ and an off time of $t_{TS_DUTY_OFF}$. After the TS pin pull-down is released, the device may take up to $t_{TS_DUTY_OFF}$ to turn the I_{TS_BIAS} back on. After the source is turned on, the TS pin voltage will go above V_{TS_EN} , and re-enable the charger operation. The device treats this TS pin toggle as an input supply toggle, triggering Device Power Up From Input Source (节 7.3.1).

7.3.3 Status Outputs (\overline{PG} , STAT)

7.3.3.1 Power Good Indicator (\overline{PG} Pin)

This open-drain pin pulls LOW to indicate a good input source when:

1. V_{IN} above V_{IN_LOWV}
2. V_{IN} above $V_{OUT} + V_{SLEEPZ}$ (not in SLEEP)
3. V_{IN} below V_{IN_OV}

7.3.3.2 Charging Status Indicator (STAT)

The device indicates the charging state on the open-drain STAT pin. This pin can drive an LED.

表 7-3. STAT pin state

CHARGING STATE	STAT PIN STATE
Charge completed, charger in sleep mode or charge disabled ($V_{TS} < V_{TS_ENZ}$)	HIGH
Charge in progress (including automatic recharge)	LOW
Fault (V_{IN} OVP, BAT OVP, BAT OCP, TS HOT, TS COLD, TMR_EXP, VSET pin short/open or ISET pin short)	BLINK at 1Hz

7.3.4 Protection Features

The device closely monitors input and output voltage, as well as internal FET current and temperature for safe linear regulator operation.

7.3.4.1 Input Overvoltage Protection (V_{IN} OVP)

If the voltage at IN pin exceeds V_{IN_OV} , the device turns off after a deglitch, $t_{VIN_OV_DGL}$. The safety timer suspends count and device enters STANDBY mode. Once the IN voltage recovers to normal level, the charge cycle and the safety timer automatically resume operation.

7.3.4.2 Output Overvoltage Protection (BAT OVP)

If the voltage at OUT pin exceeds V_{OUT_OVP} , the device immediately stops charging. The safety timer suspends count and device enters STANDBY mode. Once the OUT voltage recovers to normal level, the charge cycle and the safety timer resume operation.

7.3.4.3 Output Overcurrent Protection (BAT OCP)

During normal operation, the OUT current should be regulated to ISET programmed value. However, if a short circuit occurs on ISET pin, the OUT current may rise to unintended level. If the current at OUT pin exceeds I_{OUT_OCP} , the device turns off after a deglitch, $t_{OUT_OCP_DGL}$. The safety timer resets the count, and device remains latched off. An input supply or TS pin toggle is required to restart operation.

图 7-4. Overcurrent Protection

7.3.4.4 Thermal Regulation and Thermal Shutdown (TREG and TSHUT)

The device monitors its internal junction temperature (T_J) to avoid overheating and to limit the IC surface temperature. When the internal junction temperature exceeds the thermal regulation limit, the device automatically reduces the charge current to maintain the junction temperature at the thermal regulation limit (TREG). During thermal regulation, the actual charging current is usually below the programmed value on the ISET pin. Therefore, the termination comparator for the Lithium-Ion battery is disabled, and the safety timer runs at half the clock rate.

Additionally, the device has thermal shutdown to turn off the linear regulator when the IC junction temperature exceeds the TSHUT threshold. The charger resumes operation when the IC die temperature decreases below the TSHUT falling threshold.

7.4 Device Functional Modes

7.4.1 Shutdown or Undervoltage Lockout (UVLO)

The device is in shutdown state if the IN pin voltage is less than V_{IN_LOWV} , or the TS pin is below V_{TS_ENZ} . The internal circuitry is powered down, all the pins are high impedance, and the device draws $I_{SD_IN_TS}$ from the input supply. Once the IN voltage rises above the V_{IN_LOW} threshold and the TS pin is above V_{TS_EN} , the IC will enter Sleep Mode or Active Mode depending on the OUT pin voltage.

7.4.2 Sleep Mode

The device is in Sleep Mode when $V_{IN_LOWV} < V_{IN} < V_{OUT} + V_{SLEEPZ}$. The device waits for the input voltage to rise above $V_{OUT} + V_{SLEEPZ}$ to start operation.

7.4.3 Active Mode

The device is powered up and charges the battery when the TS pin is above V_{TS_ENZ} and the IN voltage ramps above both V_{IN_LOWV} , and $V_{OUT} + V_{SLEEPZ}$. The device draws I_{Q_IN} from the supply to bias the internal circuitry. For details on device power-up sequence, refer to [节 7.3.1](#).

7.4.3.1 Standby Mode

The device is in Standby Mode if a valid input supply is present and charge is terminated or if a recoverable fault is detected. The internal circuitry is partially biased, and the device continues to monitor for either V_{OUT} to drop below V_{RECHG} , or the recoverable fault to be removed.

7.4.4 Fault Mode

The fault conditions are categorized into recoverable and nonrecoverable as follows:

- Recoverable, from which the device should automatically recover once the fault condition is removed:
 - VIN OVP
 - BAT OVP
 - TS HOT
 - TS COLD
- Nonrecoverable, requiring TS pin or input supply toggle to resume operation:
 - BAT OCP
 - ISET pin short detected
 - VSET pin short/open detected

8 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

8.1 Application Information

A typical application consists of the device configured as a standalone battery charger for single-cell Lithium-Ion, Li-Polymer, or LiFePO₄ chemistries. The charge voltage and number of cells is configured using a pull-down resistor on the VSET pin. The charge current is configured using a pull-down resistor on the ISET pin. A battery thermistor may be connected to the TS pin to allow the device to monitor battery temperature and control charging. Pulling the TS pin below V_{TS_ENZ} disables the charging function. The charger and input supply status is reported via the STAT and PG pins.

8.2 Typical Applications

8.2.1 Li-Ion Charger Design Example

图 8-1. BQ25170 Typical Application for Li-Ion Charging at 500 mA

8.2.1.1 Design Requirements

- Supply voltage = 5 V
- Battery is single-cell Li-Ion
- Fast charge current: I_{CHG} = 500 mA
- Charge Voltage: V_{REG} = 4.35 V
- Termination Current: I_{TERM} = 10% of I_{CHG} or 50 mA
- Pre-charge Current: I_{PRECHG} = 20% of I_{CHG} or 100 mA
- TS - Battery Temperature Sense = 10-kΩ NTC (103AT)
- TS pin can be pulled down to disable charging

8.2.1.2 Detailed Design Procedure

The regulation voltage is set via the VSET pin to 4.35 V, the input voltage is 5 V and the charge current is programmed via the ISET pin to 500 mA.

$$R_{ISET} = [K_{ISET} / I_{CHG}]$$

from electrical characteristics table. . . K_{ISET} = 300 AΩ

$$R_{ISET} = [300 \text{ A}\Omega / 0.5 \text{ A}] = 600 \Omega$$

Selecting the closest 1% resistor standard value, use a 604-Ω resistor between ISET and GND, for an expected I_{CHG} 497 mA.

8.2.1.2.1 TS Function

Use a 10-k Ω NTC thermistor in the battery pack (recommend: 103AT-2). The VCOLD and VHOT thresholds in the data sheet are designed to meet a charging window between 0°C and 45°C for a 10-k Ω NTC with $\beta = 3435\text{K}$. To disable the TS sense function, use a fixed 10-k Ω resistor between the TS and GND. The TS pin can be pulled down to disable charging.

8.2.2 LiFePO₄ Charger Design Example

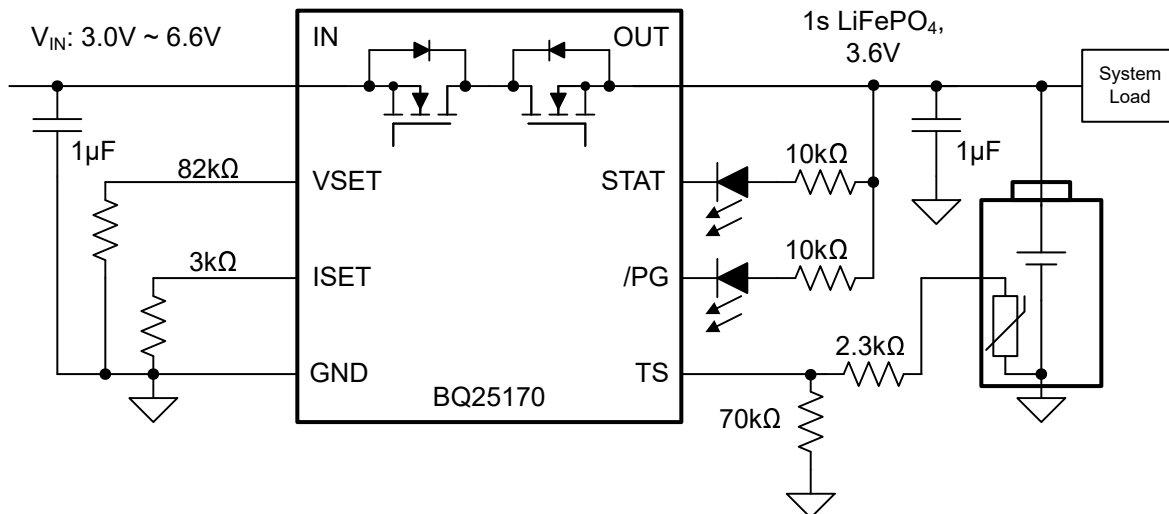

图 8-14. BQ25170 Typical Application for LiFePO₄ Charging at 100 mA

8.2.2.1 Design Requirements

The design requirements include the following:

- Input supply = 5 V
- Battery is 1-cell LiFePO₄
- Fast charge current: $I_{\text{CHG}} = 100 \text{ mA}$
- Charge voltage: $V_{\text{REG}} = 3.6 \text{ V}$
- Charge safety timer: $t_{\text{SAFETY}}: 10 \text{ hr}$
- Termination current: $I_{\text{TERM}} = 10\%$ of I_{CHG} or 10 mA
- Precharge current: $I_{\text{PRECHG}} = 20\%$ of I_{CHG} or 20 mA
- TS - Battery temperature sense = 10-k Ω NTC (103AT)
 - $R_{\text{S}} = 2.3 \text{ k}\Omega$ and $R_{\text{P}} = 70 \text{ k}\Omega$ added to modify battery charging temperature window to: -10°C to 60°C
- TS pin can be pulled down to disable charging

9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range between 3.0 V and 6.6 V (up to 30 V tolerant) and current capability of at least the maximum designed charge current. If located more than a few inches from the IN and GND pins, a larger capacitor is recommended.

10 Layout

10.1 Layout Guidelines

To obtain optimal performance, the decoupling capacitor from IN to GND and the output filter capacitor from OUT to GND should be placed as close as possible to the device, with short trace runs to both IN, OUT and GND.

- All low-current GND connections should be kept separate from the high-current charge or discharge paths from the battery. Use a single-point ground technique incorporating both the small signal ground path and the power ground path.
- The high current charge paths into IN pin and from the OUT pin must be sized appropriately for the maximum charge current in order to avoid voltage drops in these traces.
