

BQ25601 用于高输入电压和 NVDC 电源路径管理的 I²C 控制型单节电池 3A 降压电池充电器

1 特性

- 高效 1.5MHz 同步开关模式降压充电器
 - 在 2A 电流 (5V 输入) 下具有 92% 的充电效率
 - 针对 USB 电压输入 (5V) 进行了优化
 - 用于轻负载运行的可选低功耗脉冲频率调制 (PFM) 模式
- 支持 USB On-The-Go (OTG)
 - 具有高达 1.2A 输出的升压转换器
 - 在 1A 输出下具有 92% 的升压效率
 - 精确的恒定电流 (CC) 限制
 - 高达 500 μ F 容性负载的软启动
 - 输出短路保护
 - 低功耗 PFM 模式, 适合轻载运行
- 单个输入, 支持 USB 输入和高电压适配器
 - 支持 3.9V 至 13.5V 输入电压范围, 绝对最大输入电压额定值为 22V
 - 可编程输入电流限制 (100mA 至 3.2A, 分辨率为 100mA), 支持 USB2.0、USB3.0 标准和高电压适配器 (IINDPM)
 - 通过高达 5.4V 的输入电压限制 (VINDPM) 进行最大功率跟踪
 - VINDPM 阈值自动跟踪电池电压
 - 自动检测 USB SDP、DCP 以及非标准适配器
- 高电池放电效率, 电池放电 MOSFET 为 19.5m Ω
- 窄 VDC (NVDC) 电源路径管理
 - 无需电池或深度放电的电池即可瞬时启动
 - 电池充电模式下实现理想二极管运行
- BATFET 控制, 支持运输模式、唤醒和完全系统复位
- 灵活的自主和 I²C 模式, 可实现最优系统性能
- 高集成度, 包括所有 MOSFET、电流检测和环路补偿
- 高精度
 - 充电电压调节范围为 $\pm 0.5\%$
 - $\pm 5\%$ 1.5A 充电电流调节
- 安全及管理批准:
 - IEC 62368-1 终端设备标准

2 应用

- 智能手机
- 手机附件
- 医疗设备

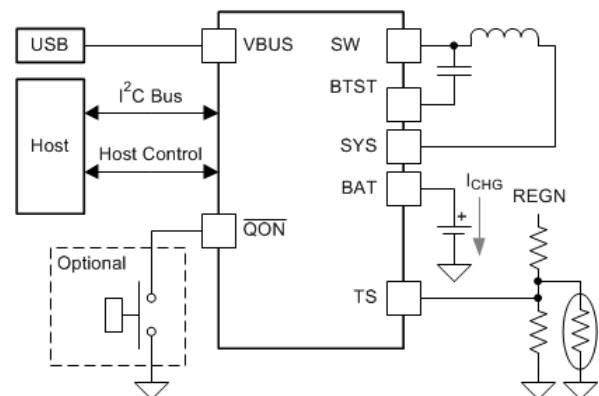

3 说明

BQ25601 是一款高度集成的 3A 开关模式电池充电管理和系统电源路径管理器件, 适用于单节锂离子和锂聚合物电池。其低阻抗电源路径对开关模式运行效率进行了优化、缩短了电池充电时间并延长了放电阶段的电池使用寿命。具有充电和系统设置的 I²C 串行接口使得此器件成为一种真正灵活的解决方案。

器件信息

器件型号	封装 ⁽¹⁾	封装尺寸 (标称值)
BQ25601	WQFN (24)	4.00mm x 4.00mm

- (1) 如需了解所有可用封装, 请参阅数据表末尾的可订购产品附录。

4 Revision History

Changes from Revision * (March 2017) to Revision A (March 2023)	Page
• 添加了 IEC 62368-1 特性.....	1
• 删除了整个数据表中的 WEBENCH.....	1
• Added 节 6.....	4
• Deleted OVPFET_DIS = 1 from Quiescent Currents I _{BAT} and I _{VBUS_HIZ} Test Conditions in 节 8.5.....	8
• Deleted V _{REGN} MAX values in 节 8.5.....	8
• Deleted 节 8.5 table note.....	8
• Added 节 8.6.....	13
• Added last sentence to 节 9.3.3.5.....	19
• Changed 图 9-3.....	23
• Changed 图 9-4.....	23
• Added 图 9-5.....	23
• Added Charge termination is disabled for cool and warm conditions. to third paragraph in 节 9.3.7.5.....	23
• Changed 图 9-6.....	24
• Changed "fault" to "the timer" in last paragraph of 节 9.3.7.7.....	24
• Added 节 9.4.....	26
• Changed 图 9-7.....	26
• Changed first sentence in 节 9.4.3.....	27
• Added 节 9.5.....	30
• Changed inclusive terminology throughout document.....	30
• Changed 010 to 011 in Description in 表 9-13.....	42
• Changed Power Path Management Application schematic.....	46
• Added 节 10.2.1.....	46
• Changed > to ≤ in last paragraph in 节 10.2.2.3.....	47
• Added 节 10.2.3.....	48
• Added 节 13.2.1.....	55

5 说明 (续)

BQ25601 可为智能手机、平板电脑和便携式设备提供快速充电功能和高输入电压支持。其输入电压和电流调节可以为电池提供最大的充电功率。它还集成了自举二极管以进行高侧栅极驱动，从而简化系统设计。I²C 串行接口与充电和系统设置使该器件成为一款真正灵活的解决方案。

该器件支持多种输入源，包括标准 USB 主机端口、USB 充电端口以及兼容 USB 的高电压适配器。该器件根据内置 USB 接口设置默认输入电流限值。为了设置默认输入电流限值，该器件从系统检测电路（如 USB PHY 器件）中获取结果。该器件符合 USB 2.0 和 USB 3.0 电源规范，具有输入电流和电压调节功能。该器件还具有高达 1.2A 的恒定电流限制能力，能够为 VBUS 提供 5.15V 的电压，符合 USB On-the-Go (OTG) 运行功率等级规格。

电源路径管理将系统电压调节至稍高于电池电压的水平，但是不会下降至 3.5V 最小系统电压（可编程）以下。借助于这个特性，即使在电池电量完全耗尽或者电池被拆除时，系统也能保持运行。当达到输入电流限值或电压限值时，电源路径管理自动将充电电流减少为 0。随着系统负载持续增加，电源路径将使电池放电，直到满足系统电源需求。这种补充模式可防止输入源过载。

此器件无需软件控制即可启动并完成一个充电周期。它可感测电池电压并分三个阶段为电池充电：预充电、恒定电流和恒定电压。在充电周期结束时，当充电电流低于预设限值并且电池电压高于再充电阈值时，充电器自动终止。如果充满电的电池降至再充电阈值以下，则充电器自动开启另一个充电周期。

此充电器提供针对电池充电和系统运行的多种安全特性，其中包括电池负温度系数热敏电阻监视、充电安全性计时器和过压/过流保护。当结温超过 110°C（可编程）时，热调节会减小充电电流。STAT 输出报告充电状态和任何故障状况。其他安全特性包括针对充电和升压模式的电池温度感应、热调节和热关断以及输入 UVLO 和过压保护。VBUS_GD 位指示电源是否正常。当故障发生时， $\overline{\text{INT}}$ 输出会立即通知主机。

该器件还提供用于 BATFET 使能和复位控制的 $\overline{\text{QON}}$ 引脚，以退出低功耗运输模式或完全系统复位功能。

该器件采用 24 引脚 4mm × 4mm × 0.75mm 薄型 WQFN 封装。

6 Device Comparison Table

	BQ25601	BQ25601D	BQ25611D
Programmable charge voltage	3.856 - 4.624 V, 32 mV per step	3.856 - 4.624 V, 32 mV per step	3.5 - 4.3 V (100 mV per step); 4.3 - 4.52 V (10 mV per step)
D+/D- USB detection	No	Yes	Yes
Default I _{CHG}	2.04 A	2.04 A	1 A
Default V _{ACOV}	6.4 V	6.4 V	14.2 V
VBUS OVP reaction time	200 ns	200 ns	130 ns
Battery remote sensing with open/ short detection	No	No	Yes
TS profile	JEITA, with fixed temperature thresholds	JEITA, with fixed temperature thresholds	JEITA, with adjustable temperature thresholds
TS ignore bit	No	No	Yes
Charge safety timer	5 hr, 10 hr (default)	5 hr, 10 hr (default)	20 hr, 10 hr (default)
Allow $\overline{\text{QON}}$ fire when adapter is present	No	No	Yes
Deglitch time for charge termination	250 ms	250 ms	50 ms

7 Pin Configuration and Functions

图 7-1. RTW Package 24-Pin WQFN Top View

表 7-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
BAT	13	P	Battery connection point to the positive terminal of the battery pack. The internal BATFET and current sensing is connected between SYS and BAT. Connect a 10 μ F close to the BAT pin.
	14		
BTST	21	P	PWM high side driver positive supply. Internally, the BTST pin is connected to the cathode of the boost-strap diode. Connect the 0.047- μ F bootstrap capacitor from SW to BTST.
\overline{CE}	9	DI	Charge enable pin. When this pin is driven low, battery charging is enabled.
GND	17	P	Ground.
	18		
\overline{INT}	7	DO	Open-drain interrupt Output. Connect the INT to a logic rail through 10-k Ω resistor. The \overline{INT} pin sends an active low, 256- μ s pulse to host to report charger device status and fault.
NC	8	—	No Connect. Keep the pins float.
	10		
\overline{PG}	3	DO	Open drain active low power good indicator. Connect to the pull up rail through 10-k Ω resistor. LOW indicates a good input source if the input voltage is between UVLO and ACOV, above SLEEP mode threshold, and current limit is above 30 mA.
PMID	23	DO	Connected to the drain of the reverse blocking MOSFET (RBFET) and the drain of HSFET. Put 10 μ F ceramic capacitor on PMID to GND.
PSEL	2	DI	Power source selection input. Set 500 mA input current limit by pulling this pin high and set 2.4A input current limit by pulling this pin low. Once the device gets into host mode, the host can program different input current limits to IINDPDM register.
\overline{QON}	12	DI	BATFET enable/reset control input. When BATFET is in ship mode, a logic low of $t_{SHIPMODE}$ duration turns on BATFET to exit shipping mode. When VBUS is not plugged in, a logic low of t_{QON_RST} (minimum 8 s) duration resets SYS (system power) by turning BATFET off for t_{BATFET_RST} (minimum 250 ms) and then re-enable BATFET to provide full system power reset. The pin contains an internal 200-k Ω pull-up to maintain default high logic.
REGN	22	P	LSFET driver and internal supply output. Internally, REGN is connected to the anode of the boost-strap diode. Connect a 4.7- μ F (10-V rating) ceramic capacitor from REGN to GND. The capacitor should be placed close to the IC.
SCL	5	DI	I ² C interface clock. Connect SCL to the logic rail through a 10-k Ω resistor.
SDA	6	DIO	I ² C interface data. Connect SDA to the logic rail through a 10-k Ω resistor.

表 7-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
STAT	4	DO	Open-drain charge status output. Connect the STAT pin to a logic rail via 10-k Ω resistor. The STAT pin indicates charger status. Collect a current limit resistor and a LED from a rail to this pin. Charge in progress: LOW Charge complete or charger in SLEEP mode: HIGH Charge suspend (fault response): 1-Hz, 50% duty cycle Pulses This pin can be disabled via EN_ICHG_MON[1:0] register bits.
SW	19	P	Switching node output. Connected to output inductor. Connect the 0.047- μ F bootstrap capacitor from SW to BTST.
	20		
SYS	15	P	Converter output connection point. The internal current sensing network is connected between SYS and BAT. Connect a 20 μ F capacitor close to the SYS pin.
	16		
TS	11	AI	Temperature qualification voltage input to support JEITA profile. Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from REGN to TS to GND. Charge suspends when TS pin is out of range. When TS pin is not used, connect a 10-k Ω resistor from REGN to TS and connect a 10-k Ω resistor from TS to GND. It is recommended to use a 103AT-2 thermistor.
VAC	1	AI	Charge input voltage sense. This pin must be connected to VBUS pin.
VBUS	24	P	Charger input. The internal n-channel reverse block MOSFET (RBFET) is connected between VBUS and PMID pins. Place a 1- μ F ceramic capacitor from VBUS to GND close to device.
Thermal Pad	—	P	Thermal pad and ground reference. This pad is ground reference for the device and it is also the thermal pad used to conduct heat from the device. This pad should be tied externally to a ground plane through PCB vias under the pad.

(1) AI = Analog input, AO = Analog Output, AIO = Analog input Output, DI = Digital input, DO = Digital Output, DIO = Digital input Output, P = Power

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage Range (with respect to GND)	VAC, VBUS (converter not switching) ⁽²⁾	- 2	22	V
Voltage Range (with respect to GND)	BTST, PMID (converter not switching) ⁽²⁾	- 0.3	22	V
Voltage Range (with respect to GND)	SW	- 2	16	V
Voltage Range (with respect to GND)	BTST to SW	- 0.3	7	V
Voltage Range (with respect to GND)	PSEL	- 0.3	7	V
Voltage Range (with respect to GND)	REGN, TS, CE, PG, BAT, SYS (converter not switching)	- 0.3	7	V
Output Sink Current	STAT		6	mA
Voltage Range (with respect to GND)	SDA, SCL, INT, QON, STAT	- 0.3	7	V
Voltage Range (with respect to GND)	PGND to GND (QFN package only)	- 0.3	0.3	V
Output Sink Current	INT		6	mA
Operating junction temperature, T _J		- 40	150	°C
Storage temperature, T _{stg}		- 65	150	°C

- (1) Stresses beyond those listed under Absolute maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability. All voltage values are with respect to the network ground terminal unless otherwise noted.
- (2) VBUS is specified up to 22 V for a maximum of one hour at room temperature

8.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{BUS}	Input voltage	3.9		13.5 ⁽¹⁾	V
I _{in}	Input current (VBUS)			3.25	A
I _{SWOP}	Output current (SW)			3.25	A
V _{BATOP}	Battery voltage			4.624	V
I _{BATOP}	Fast charging current			3.0	A
I _{BATOP}	Discharging current (continuous)			6	A

8.3 Recommended Operating Conditions (continued)

		MIN	NOM	MAX	UNIT
T_A	Operating ambient temperature	- 40		85	°C

- (1) The inherent switching noise voltage spikes should not exceed the absolute maximum voltage rating on either the BTST or SW pins. A tight layout minimizes switching noise.

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		BQ25601	UNIT
		RTW (WQFN)	
		24 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	35.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	22.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	11.9	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.2	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	12	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.6	°C/W

- (1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report, SPRA953.

8.5 Electrical Characteristics

$V_{VAC_UVLOZ} < V_{VAC} < V_{VAC_OV}$ and $V_{VAC} > V_{BAT} + V_{SLEEP}$, $T_J = -40^{\circ}\text{C}$ to 125°C and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
QUIESCENT CURRENTS					
I_{BUS}	Battery discharge current (BAT, SW, SYS) in buck mode	$V_{BAT} = 4.5\text{ V}$, $V_{BUS} < V_{VAC_UVLOZ}$, leakage between BAT and VBUS, $T_J < 85^{\circ}\text{C}$		5	μA
I_{BAT}	Battery discharge current (BAT) in buck mode	$V_{BAT} = 4.5\text{ V}$, HIZ Mode or No VBUS, I2C disabled, BATFET Disabled. $T_J < 85^{\circ}\text{C}$	17	33	μA
I_{BAT}	Battery discharge current (BAT, SW, SYS)	$V_{BAT} = 4.5\text{ V}$, HIZ Mode or No VBUS, I2C Disabled, BATFET Enabled. $T_J < 85^{\circ}\text{C}$	58	85	μA
I_{VBUS_HIZ}	Input supply current (VBUS) in buck mode	$V_{VBUS} = 5\text{ V}$, High-Z Mode, No battery	37	50	μA
I_{VBUS_HIZ}	Input supply current (VBUS) in buck mode	$V_{VBUS} = 12\text{ V}$, High-Z Mode, No battery	68	90	μA
I_{VBUS}	Input supply current (VBUS) in buck mode	$V_{VBUS} = 12\text{ V}$, $V_{VBUS} > V_{VBAT}$, converter not switching	1.5	3	mA
I_{VBUS}	Input supply current (VBUS) in buck mode	$V_{VBUS} > V_{UVLO}$, $V_{VBUS} > V_{VBAT}$, converter switching, $V_{BAT} = 3.8\text{ V}$, $I_{SYS} = 0\text{ A}$	3		mA
I_{BOOST}	Battery Discharge Current in boost mode	$V_{BAT} = 4.2\text{ V}$, boost mode, $I_{VBUS} = 0\text{ A}$, converter switching	3		mA
VBUS, VAC AND BAT PIN POWER-UP					
V_{BUS_OP}	VBUS operating range	V_{VBUS} rising	3.9	13.5	V
V_{VAC_UVLOZ}	VBUS for active I ² C, no battery Sense VAC pin voltage	V_{VAC} rising	3.3	3.6	V
$V_{VAC_UVLOZ_HYS}$	I ² C active hysteresis	V_{AC} falling from above V_{VAC_UVLOZ}	300		mV
$V_{VAC_PRESENT}$	One of the conditions to turn on REGN	V_{VAC} rising	3.65	3.9	V

8.5 Electrical Characteristics (continued)

$V_{VAC_UVLOZ} < V_{VAC} < V_{VAC_OV}$ and $V_{VAC} > V_{BAT} + V_{SLEEP}$, $T_J = -40^{\circ}\text{C}$ to 125°C and $T_J = 25^{\circ}\text{C}$ for typical values (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
$V_{VAC_PRESENT_HYS}$	One of the conditions to turn on REGN	V_{VAC} falling	500		mV	
V_{SLEEP}	Sleep mode falling threshold	$(V_{VAC} - V_{VBAT}), V_{BUSMIN_FALL} \leq V_{BAT} \leq V_{REG}, V_{VAC}$ falling	15	60	110	mV
V_{SLEEPZ}	Sleep mode rising threshold	$(V_{VAC} - V_{VBAT}), V_{BUSMIN_FALL} \leq V_{BAT} \leq V_{REG}, V_{VAC}$ rising	115	220	340	mV

图 8-9. Charge Current vs. Junction Temperature

9 Detailed Description

9.1 Overview

The BQ25601 is a highly integrated 3.0-A switch-mode battery charger for single cell Li-ion and Li-polymer batteries. It includes an input reverse-blocking FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET, Q4), and bootstrap diode for the high-side gate drive.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Power-On-Reset (POR)

The device powers internal bias circuits from the higher voltage of VBUS and BAT. When VBUS rises above V_{VBUS_UVLOZ} or BAT rises above V_{BAT_UVLOZ} , the sleep comparator, battery depletion comparator and BATFET driver are active. I²C interface is ready for communication and all the registers are reset to default value. The host can access all the registers after POR.

9.3.2 Device Power Up from Battery without Input Source

If only battery is present and the voltage is above depletion threshold ($V_{BAT_DPL_RISE}$), the BATFET turns on and connects battery to system. The REGN stays off to minimize the quiescent current. The low RDSON of BATFET and the low quiescent current on BAT minimize the conduction loss and maximize the battery run time.

The device always monitors the discharge current through BATFET (Supplement Mode). When the system is overloaded or shorted ($I_{BAT} > I_{BATFET_OCP}$), the device turns off BATFET immediately and set BATFET_DIS bit to indicate BATFET is disabled until the input source plugs in again or one of the methods described in BATFET Enable (Exit Shipping Mode) is applied to re-enable BATFET.

9.3.3 Power Up from Input Source

When an input source is plugged in, the device checks the input source voltage to turn on REGN LDO and all the bias circuits. It detects and sets the input current limit before the buck converter is started. The power-up sequence from input source is as listed:

1. Power up REGN LDO
2. Poor source qualification
3. Input source type detection is based on or PSEL to set default input current limit (IINDPM) register or input source type.
4. Input voltage limit threshold setting (VINDPM threshold)
5. Converter power up

9.3.3.1 Power Up REGN Regulation

The REGN LDO supplies internal bias circuits as well as the HSFET and LSFET gate drive. The REGN also provides bias rail to TS external resistors. The pull-up rail of STAT can be connected to REGN as well. The REGN is enabled when all the below conditions are valid:

- V_{VAC} above $V_{VAC_PRESENT}$
- V_{VAC} above $V_{BAT} + V_{SLEEPZ}$ in buck mode or VBUS below $V_{BAT} + V_{SLEEP}$ in boost mode
- After 220-ms delay is completed

If any one of the above conditions is not valid, the device is in high impedance mode (HIZ) with REGN LDO off. The device draws less than I_{VBUS_HIZ} from VBUS during HIZ state. The battery powers up the system when the device is in HIZ.

9.3.3.2 Poor Source Qualification

After REGN LDO powers up, the device confirms the current capability of the input source. The input source must meet both of the following requirements in order to start the buck converter.

- VBUS voltage below V_{VAC_OV}
- VBUS voltage above $V_{VBUSMIN}$ when pulling I_{BADSRC} (typical 30 mA)

Once the input source passes all the conditions above, the status register bit VBUS_GD is set high and the INT pin is pulsed to signal to the host. If the device fails the poor source detection, it repeats poor source qualification every 2 seconds.

9.3.3.3 Input Source Type Detection

After the VBUS_GD bit is set and REGN LDO is powered, the device runs input source detection through the PSEL pin. The BQ25601 sets input current limit through PSEL pins.

After input source type detection is completed, an INT pulse is asserted to the host. In addition, the following registers and pin are changed:

1. Input Current Limit (IINDPM) register is changed to set current limit
2. PG_STAT bit is set
3. VBUS_STAT bit is updated to indicate USB or other input source

The host can overwrite IINDPM register to change the input current limit if needed. The charger input current is always limited by the IINDPM register.

9.3.3.3.1 PSEL Pins Sets Input Current Limit in BQ25601

The BQ25601 has PSEL pin for input current limit setting to interface with USB PHY. It directly takes the USB PHY device output to decide whether the input is USB host or charging port. When the device operates in host-control mode, the host needs to IINDET_EN bit to read the PSEL value and update the IINDPM register. When the device is in default mode, PSEL value updates IINDPM in real time.

表 9-1. Input Current Limit Setting from PSEL

INPUT DETECTION	PSEL PIN	INPUT CURRENT LIMIT (ILIM)	VBUS_STAT
USB SDP	High	500 mA	001
Adapter	Low	2.4A	011

9.3.3.4 Input Voltage Limit Threshold Setting (VINDPM Threshold)

The device supports wide range of input voltage limit (3.9 V to 5.4 V) for USB. The device VINDPM is set at 4.5 V. The device supports dynamic VINDPM tracking settings which tracks the battery voltage. This function can be enabled via the VDPM_BAT_TRACK[1:0] register bits. When enabled, the actual input voltage limit will be the higher of the VINDPM register and VBAT + VDPM_BAT_TRACK offset.

9.3.3.5 Converter Power Up

After the input current limit is set, the converter is enabled and the HSFET and LSFET start switching. If battery charging is disabled, BATFET turns off. Otherwise, BATFET stays on to charge the battery.

The device provides soft start when system rail is ramped up. When the system rail is below 2.2 V, the input current is limited to the lower of 200 mA or IINDPM register setting. After the system rises above 2.2 V, the device limits input current to the value set by IINDPM register.

As a battery charger, the device deploys a highly efficient 1.5 MHz step-down switching regulator. The fixed frequency oscillator keeps tight control of the switching frequency under all conditions of input voltage, battery voltage, charge current and temperature, simplifying output filter design.

The device switches to PFM control at light load or when battery is below minimum system voltage setting or charging is disabled. The PFM_DIS bit can be used to prevent PFM operation in either buck or boost configuration. PFM mode is only enabled when IINDPM is set \geq 500 mA. When IINDPM is set \leq 400 mA, PFM mode is disabled.

9.3.4 Boost Mode Operation From Battery

The device supports boost converter operation to deliver power from the battery to other portable devices through USB port. The boost mode output current rating meets the USB On-The-Go 500 mA output requirement. The maximum output current is up to 1.2 A. The boost operation can be enabled if the conditions are valid:

1. BAT above V_{OTG_BAT}
2. VBUS less than $BAT + V_{SLEEP}$ (in sleep mode)
3. Boost mode operation is enabled (OTG_CONFIG bit = 1)
4. Voltage at TS (thermistor) pin as a percentage of V_{REGN} is within acceptable range ($V_{BHOT} < V_{TS} < V_{BCOLD}$)
5. After 30-ms delay from boost mode enable

During boost mode, the status register VBUS_STAT bits is set to 111, the VBUS output is 5.15 V and the output current can reach up to 1.2 A, selected through I²C (BOOST_LIM bit). The boost output is maintained when BAT is above V_{OTG_BAT} threshold.

When OTG is enabled, the device starts up with PFM and later transits to PWM to minimize the overshoot. The PFM_DIS bit can be used to prevent PFM operation in either buck or boost configuration.

9.3.5 Host Mode and Standalone Power Management

9.3.5.1 Host Mode and Default Mode in BQ25601

The BQ25601 is a host controlled charger, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous charger with no host or while host is in sleep mode. When the charger is in default mode, WATCHDOG_FAULT bit is HIGH. When the charger is in host mode, WATCHDOG_FAULT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired, or default mode. All the registers are in the default settings. During default mode, any change on PSEL pin will make real time IINDPM register changes.

In default mode, the device keeps charging the battery with default 10-hour fast charging safety timer. At the end of the 10-hour, the charging is stopped and the buck converter continues to operate to supply system load.

Writing a 1 to the WD_RST bit transitions the charger from default mode to host mode. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD_RST bit before the watchdog timer expires (WATCHDOG_FAULT bit is set), or disable watchdog timer by setting WATCHDOG bits = 00.

When the watchdog timer expires (WATCHDOG_FAULT bit = 1), the device returns to default mode and all registers are reset to default values except IINDPM, VINDPM, BATFET_RST_EN, BATFET_DLY, and BATFET_DIS bits.

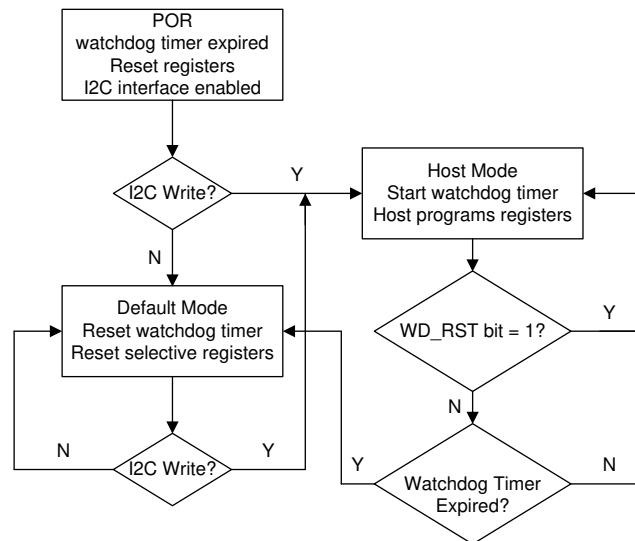

图 9-1. Watchdog Timer Flow Chart

9.3.6 Power Path Management

The device accommodates a wide range of input sources from USB, wall adapter, to car charger. The device provides automatic power path selection to supply the system (SYS) from input source (VBUS), battery (BAT), or both.

9.3.7 Battery Charging Management

The device charges 1-cell Li-Ion battery with up to 3.0-A charge current for high capacity tablet battery. The 19.5-m Ω BATFET improves charging efficiency and minimize the voltage drop during discharging.

9.3.7.1 Autonomous Charging Cycle

With battery charging enabled (CHG_CONFIG bit = 1 and \overline{CE} pin is LOW), the device autonomously completes a charging cycle without host involvement. The device default charging parameters are listed in 表 9-2. The host can always control the charging operations and optimize the charging parameters by writing to the corresponding registers through I²C.

表 9-2. Charging Parameter Default Setting

DEFAULT MODE	BQ25601
Charging voltage	4.208V
Charging current	2.048 A
Precharge current	180 mA
Termination current	180 mA
Temperature profile	JEITA
Safety timer	10 hours

A new charge cycle starts when the following conditions are valid:

- Converter starts
- Battery charging is enabled (CHG_CONFIG bit = 1 and I_{CHG} register is not 0 mA and \overline{CE} is low)
- No thermistor fault on TS
- No safety timer fault
- BATFET is not forced to turn off (BATFET_DIS bit = 0)

The charger device automatically terminates the charging cycle when the charging current is below termination threshold, battery voltage is above recharge threshold, and device not is in DPM mode or thermal regulation. When a fully charged battery is discharged below recharge threshold (selectable through VRECHG bit), the device automatically starts a new charging cycle. After the charge is done, toggle \overline{CE} pin or CHG_CONFIG bit can initiate a new charging cycle.

The STAT output indicates the charging status: charging (LOW), charging complete or charge disable (HIGH) or charging fault (blinking). The STAT output can be disabled by setting EN_I_{CHG}_MON bits = 11. in addition, the status register (CHRG_STAT) indicates the different charging phases: 00-charging disable, 01-precharge, 10-fast charge (constant current) and constant voltage mode, 11-charging done. Once a charging cycle is completed, an INT is asserted to notify the host.

9.3.7.2 Battery Charging Profile

The device charges the battery in five phases: battery short, preconditioning, constant current, constant voltage and top-off trickle charging (optional). At the beginning of a charging cycle, the device checks the battery voltage and regulates current and voltage accordingly.

表 9-3. Charging Current Setting

V _{BAT}	CHARGING CURRENT	REGISTER DEFAULT SETTING	CHRG_STAT
< 2.2 V	I _{SHORT}	100 mA	01
2.2 V to 3 V	I _{PRECHG}	180 mA	01
> 3 V	I _{CHG}	2.048 A	10

If the charger device is in DPM regulation or thermal regulation during charging, the actual charging current will be less than the programmed value. In this case, termination is temporarily disabled and the charging safety timer is counted at half the clock rate.

图 9-2. Battery Charging Profile

9.3.7.3 Charging Termination

The device terminates a charge cycle when the battery voltage is above recharge threshold, and the current is below termination current. After the charging cycle is completed, the BATFET turns off. The converter keeps running to power the system, and BATFET can turn on again to engage Supplement Mode.

When termination occurs, the status register `CHRG_STAT` is set to 11, and an INT pulse is asserted to the host. Termination is temporarily disabled when the charger device is in input current, voltage, or thermal regulation. Termination can be disabled by writing 0 to `EN_TERM` bit prior to charge termination.

At low termination currents, due to the comparator offset, the actual termination current may be 10 mA-20 mA higher than the termination target. In order to compensate for comparator offset, a programmable top-off timer can be applied after termination is detected. The termination timer will follow safety timer constraints, such that if safety timer is suspended, so will the termination timer. Similarly, if safety timer is doubled, so will the termination timer. `TOPOFF_ACTIVE` bit reports whether the top off timer is active or not. The host can read `CHRG_STAT` and `TOPOFF_ACTIVE` to find out the termination status.

Top off timer gets reset at one of the following conditions:

1. Charge disable to enable
2. Termination status low to high
3. `REG_RST` register bit is set

The top-off timer settings are read in once termination is detected by the charger. Programming a top-off timer value after termination will have no effect unless a recharge cycle is initiated. An INT is asserted to the host when entering top-off timer segment as well as when top-off timer expires.

9.3.7.4 Thermistor Qualification

The charger device provides a single thermistor input for battery temperature monitor.

9.3.7.5 JEITA Guideline Compliance During Charging Mode

To improve the safety of charging Li-ion batteries, JEITA guideline was released on April 20, 2007. The guideline emphasized the importance of avoiding a high charge current and high charge voltage at certain low and high temperature ranges.

To initiate a charge cycle, the voltage on TS pin must be within the VT1 to VT5 thresholds. If TS voltage exceeds the T1-T5 range, the controller suspends charging and waits until the battery temperature is within the T1 to T5 range.

At cool temperature (T1-T2), JEITA recommends the charge current to be reduced to half of the charge current or lower. At warm temperature (T3-T5), JEITA recommends charge voltage less than 4.1 V. Charge termination is disabled for cool and warm conditions.

The charger provides flexible voltage/current settings beyond the JEITA requirement. The voltage setting at warm temperature (T3-T5) can be VREG or 4.1V (configured by JEITA_VSET). The current setting at cool temperature (T1-T2) can be further reduced to 20% of fast charge current (JEITA_ISET).

图 9-3. JEITA Profile: Charging Current

图 9-4. JEITA Profile: Charging Voltage

图 9-5. TS Resistor Network

方程式 1 through 方程式 2 describe updates to the resistor bias network.

$$RT2 = \frac{V_{REGN} \times RTH_{COLD} \times RTH_{HOT} \times \left(\frac{1}{VT1} - \frac{1}{VT5} \right)}{RTH_{HOT} \times \left(\frac{V_{REGN}}{VT5} - 1 \right) - RTH_{COLD} \times \left(\frac{V_{REGN}}{VT1} - 1 \right)} \quad (1)$$

$$RT1 = \frac{\left(\left(\frac{V_{REGN}}{VT1} \right) - 1 \right)}{\left(\frac{1}{RT2} \right) + \left(\frac{1}{RTH_{COLD}} \right)} \quad (2)$$

Select 0°C to 60°C range for Li-ion or Li-polymer battery:

- $RTH_{COLD} = 27.28 \text{ K } \Omega$
- $RTH_{HOT} = 3.02 \text{ K } \Omega$
- $RT1 = 5.23 \text{ K } \Omega$
- $RT2 = 30.9 \text{ K } \Omega$

9.3.7.6 Boost Mode Thermistor Monitor During Battery Discharge Mode

For battery protection during boost mode, the device monitors the battery temperature to be within the V_{BCOLD} to V_{BHOT} thresholds. When temperature is outside of the temperature thresholds, the boost mode is suspended. In addition, $VBUS_STAT$ bits are set to 000 and NTC_FAULT is reported. Once temperature returns within thresholds, the boost mode is recovered and NTC_FAULT is cleared.

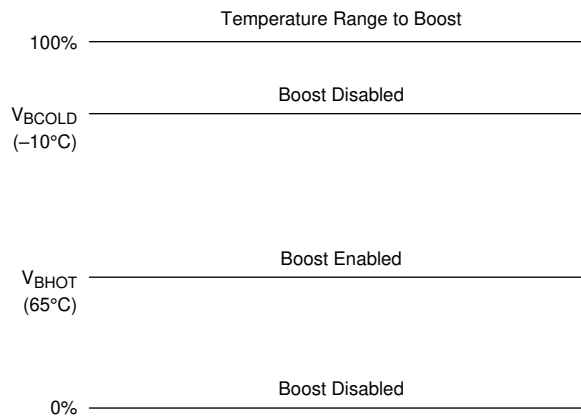

图 9-6. TS Pin Thermistor Sense Threshold in Boost Mode

9.3.7.7 Charging Safety Timer

The device has built-in safety timer to prevent extended charging cycle due to abnormal battery conditions. The safety timer is two hours when the battery is below $V_{BATLOWV}$ threshold and 10 hours when the battery is higher than $V_{BATLOWV}$ threshold.

The user can program fast charge safety timer through I²C (CHG_TIMER bits). When safety timer expires, the fault register $CHRG_FAULT$ bits are set to 11 and an INT is asserted to the host. The safety timer feature can be disabled through I²C by setting EN_TIMER bit.

During input voltage, current, JEITA cool or thermal regulation, the safety timer counts at half clock rate as the actual charge current is likely to be below the register setting. For example, if the charger is in input current regulation ($IDPM_STAT = 1$) throughout the whole charging cycle, and the safety time is set to five hours, the safety timer will expire in 10 hours. This half clock rate feature can be disabled by writing 0 to TMR2X_EN bit.

During the fault, timer is suspended. Once the fault goes away, the timer resumes counting. If user stops the current charging cycle, and start again, timer gets reset (toggle CE pin or $CHRG_CONFIG$ bit).

9.3.8 Protections

9.3.8.1 Voltage and Current Monitoring in Converter Operation

The device closely monitors the input and system voltage, as well as internal FET currents for safe buck and boost mode operation.

9.3.8.1.1 Voltage and Current Monitoring in Buck Mode

9.3.8.1.1.1 Input Overvoltage (ACOV)

If VBUS voltage exceeds V_{VAC_OV} (programmable via OVP[2:0] bits), the device stops switching immediately.

During input overvoltage event (ACOV), the fault register CHRG_FAULT bits are set to 01. An INT pulse is asserted to the host. The device will automatically resume normal operation once the input voltage drops back below the OVP threshold.

9.3.8.1.1.2 System Overvoltage Protection (SYSOVP)

The charger device clamps the system voltage during load transient so that the components connect to system would not be damaged due to high voltage. SYSOVP threshold is 350 mV above minimum system regulation voltage when the system is regulate at V_{SYS_MIN} . Upon SYSOVP, converter stops switching immediately to clamp the overshoot. The charger provides 30-mA discharge current ($I_{SYSLOAD}$) to bring down the system voltage.

9.3.8.2 Voltage and Current Monitoring in Boost Mode

The device closely monitors the VBUS voltage, as well as RBFET and LSFET current to ensure safe boost mode operation.

9.3.8.2.1 VBUS Soft Start

When the boost function is enabled, the device soft-starts boost mode to avoid inrush current.

9.3.8.2.2 VBUS Output Protection

The device monitors boost output voltage and other conditions to provide output short circuit and overvoltage protection. The boost build in accurate constant current regulation to allow OTG to adapt to various types of load. If a short circuit is detected on VBUS, boost turns off and retries 7 times. If retries are not successful, OTG is disabled with OTG_CONFIG bit cleared. In addition, the BOOST_FAULT bit is set and \overline{INT} pulse is generated. The BOOST_FAULT bit can be cleared by host by reenabling boost mode

9.3.8.2.3 Boost Mode Overvoltage Protection

When the VBUS voltage rises above regulation target and exceeds VOTG_OVP, the device enters overvoltage protection which stops switching, clears OTG_CONFIG bit and exits boost mode. At Boost overvoltage duration, the fault register bit (BOOST_FAULT) is set high to indicate fault in boost operation. An INT is also asserted to the host.

9.3.8.3 Thermal Regulation and Thermal Shutdown

9.3.8.3.1 Thermal Protection in Buck Mode

The BQ25601 monitors the internal junction temperature T_J to avoid overheat of the chip and limits the IC surface temperature in buck mode. When the internal junction temperature exceeds thermal regulation limit (110°C), the device lowers down the charge current. During thermal regulation, the actual charging current is usually below the programmed battery charging current. Therefore, termination is disabled, the safety timer runs at half the clock rate, and the status register THERM_STAT bit goes high.

Additionally, the device has thermal shutdown to turn off the converter and BATFET when IC surface temperature exceeds T_{SHUT} (160°C). The fault register CHRG_FAULT is set to 1 and an \overline{INT} is asserted to the host. The BATFET and converter is enabled to recover when IC temperature is T_{SHUT_HYS} (30°C) below T_{SHUT} (160°C).

9.3.8.3.2 Thermal Protection in Boost Mode

The device monitors the internal junction temperature to provide thermal shutdown during boost mode. When IC junction temperature exceeds T_{SHUT} (160°C), the boost mode is disabled by setting OTG_CONFIG bit low and BATFET is turned off. When IC junction temperature is below $T_{SHUT}(160^{\circ}\text{C}) - T_{SHUT_HYS}$ (30°C), the BATFET is enabled automatically to allow system to restore and the host can re-enable OTG_CONFIG bit to recover.

9.3.8.4 Battery Protection

9.3.8.4.1 Battery Overvoltage Protection (BATOVP)

The battery overvoltage limit is clamped at 4% above the battery regulation voltage. When battery over voltage occurs, the charger device immediately disables charging. The fault register BAT_FAULT bit goes high and an INT is asserted to the host.

9.3.8.4.2 Battery Overdischarge Protection

When battery is discharged below $V_{BAT_DPL_FALL}$, the BATFET is turned off to protect battery from overdischarge. To recover from overdischarge latch-off, an input source plug-in is required at VBUS. The battery is charged with I_{SHORT} (typically 100 mA) current when the $V_{BAT} < V_{SHORT}$, or precharge current as set in IPRECHG register when the battery voltage is between V_{SHORTZ} and V_{BAT_LOWV} .

9.3.8.4.3 System Overcurrent Protection

When the system is shorted or significantly overloaded ($I_{BAT} > I_{BATOP}$) and the current exceeds BATFET overcurrent limit, the BATFET latches off. Section BATFET Enable (Exit Shipping Mode) can reset the latch-off condition and turn on BATFET.

9.4 Device Functional Modes

9.4.1 Narrow VDC Architecture

The device deploys Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by SYS_MIN bits. Even with a fully depleted battery, the system is regulated above the minimum system voltage.

When the battery is below minimum system voltage setting, the BATFET operates in linear mode (LDO mode), and the system is typically 180 mV above the minimum system voltage setting. As the battery voltage rises above the minimum system voltage, BATFET is fully on and the voltage difference between the system and battery is the V_{DS} of BATFET.

When the battery charging is disabled and above minimum system voltage setting or charging is terminated, the system is always regulated at typically 50 mV above battery voltage. The status register VSYS_STAT bit goes high when the system is in minimum system voltage regulation.

图 9-7. System Voltage vs Battery Voltage

9.4.2 Dynamic Power Management

To meet maximum current limit in USB spec and avoid over loading the adapter, the device features Dynamic Power management (DPM), which continuously monitors the input current and input voltage. When input source is over-loaded, either the current exceeds the input current limit (IINDPM) or the voltage falls below the input voltage limit (VINDPM). The device then reduces the charge current until the input current falls below the input current limit and the input voltage rises above the input voltage limit.

When the charge current is reduced to zero, but the input source is still overloaded, the system voltage starts to drop. Once the system voltage falls below the battery voltage, the device automatically enters the supplement mode where the BATFET turns on and battery starts discharging so that the system is supported from both the input source and battery.

During DPM mode, the status register bits VDPM_STAT (VINDPM) or IDPM_STAT (IINDPM) goes high. 图 9-8 shows the DPM response with 9-V/1.2-A adapter, 3.2-V battery, 2.8-A charge current and 3.5-V minimum system voltage setting.

图 9-8. DPM Response

9.4.3 Supplement Mode

When the system voltage falls below the battery voltage, the BATFET turns on and the BATFET gate is regulated so that the minimum BATFET VDS stays at 30 mV when the current is low. This prevents oscillation from entering and exiting the supplement mode.

As the discharge current increases, the BATFET gate is regulated with a higher voltage to reduce $R_{DS(ON)}$ until the BATFET is in full conduction. At this point onwards, the BATFET V_{DS} linearly increases with discharge current. 图 9-9 shows the V-I curve of the BATFET gate regulation operation. BATFET turns off to exit supplement mode when the battery is below battery depletion threshold.

图 9-9. BAFET V-I Curve

9.4.4 Shipping Mode and \overline{QON} Pin

9.4.4.1 BAFET Disable Mode (Shipping Mode)

To extend battery life and minimize power when system is powered off during system idle, shipping, or storage, the device can turn off BAFET so that the system voltage is zero to minimize the battery leakage current. When the host set BAFET_DIS bit, the charger can turn off BAFET immediately or delay by t_{SM_DLY} as configured by BAFET_DLY bit.

9.4.4.2 BAFET Enable (Exit Shipping Mode)

When the BAFET is disabled (in shipping mode) and indicated by setting BAFET_DIS, one of the following events can enable BAFET to restore system power:

1. Plug in adapter
2. Clear BAFET_DIS bit
3. Set REG_RST bit to reset all registers including BAFET_DIS bit to default (0)
4. A logic high to low transition on \overline{QON} pin with $t_{SHIPMODE}$ deglitch time to enable BAFET to exit shipping mode

9.4.4.3 BAFET Full System Reset

The BAFET functions as a load switch between battery and system when input source is not plugged in. By changing the state of BAFET from on to off, systems connected to SYS can be effectively forced to have a power-on-reset. The \overline{QON} pin supports push-button interface to reset system power without host by changing the state of BAFET.

When the \overline{QON} pin is driven to logic low for t_{QON_RST} while input source is not plugged in and BAFET is enabled (BAFET_DIS = 0), the BAFET is turned off for t_{BAFET_RST} and then it is re-enabled to reset system power. This function can be disabled by setting BAFET_RST_EN bit to 0.

9.4.4.4 \overline{QON} Pin Operations

The \overline{QON} pin incorporates two functions to control BAFET. \overline{QON} is pulled up to V_{QON} by an internal 200-k Ω pull-up resistor.

1. BAFET Enable: A \overline{QON} logic transition from high to low with longer than $t_{SHIPMODE}$ deglitch turns on BAFET to exit shipping mode. When exiting shipping mode, HIZ is enabled (EN_HIZ = 1) as well. HIZ can be disabled (EN_HIZ = 0) by the host after exiting shipping mode. OTG cannot be enabled (OTG_CONFIG = 1) until HIZ is disabled.
2. BAFET Reset: When \overline{QON} is driven to logic low by at least t_{QON_RST} while adapter is not plugged in (and BAFET_DIS = 0), the BAFET is turned off for t_{BAFET_RST} . The BAFET is re-enabled after t_{BAFET_RST}

duration. This function allows systems connected to SYS to have power-on-reset. This function can be disabled by setting BATFET_RST_EN bit to 0.

图 9-10 shows the sample external configurations for each.

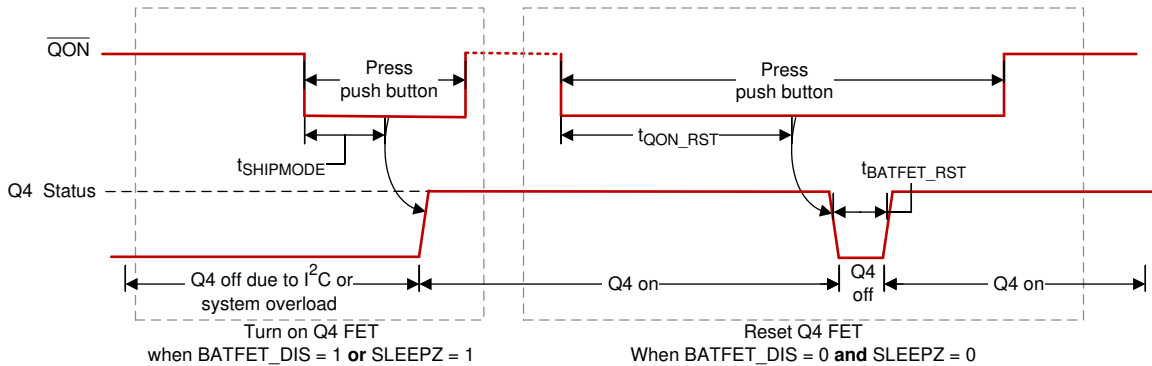

图 9-10. QON Timing

图 9-11. QON Circuit

9.4.5 Status Outputs (\overline{PG} , STAT, \overline{INT})

9.4.5.1 Power Good Indicator (\overline{PG} Pin and PG_STAT Bit)

The PG_STAT bit goes HIGH and \overline{PG} pin goes LOW to indicate a good input source when:

- VBUS above V_{VBUS_UVLO}
- VBUS above battery (not in sleep)
- VBUS below V_{VAC_OV} threshold
- VBUS above $V_{VBUSMin}$ (typical 3.8 V) when I_{BADSRC} (typical 30 mA) current is applied (not a poor source)
- Completed input Source Type Detection

9.4.5.2 Charging Status Indicator (STAT)

The device indicates charging state on the open drain STAT pin. The STAT pin can drive LED. The STAT pin function can be disabled by setting the EN_ICHG_MON bits = 11.

表 9-4. STAT Pin State

CHARGING STATE	STAT INDICATOR
Charging in progress (including recharge)	LOW
Charging complete	HIGH
Sleep mode, charge disable	HIGH

表 9-4. STAT Pin State (continued)

CHARGING STATE	STAT INDICATOR
Charge suspend (input overvoltage, TS fault, timer fault or system overvoltage) Boost Mode suspend (due to TS fault)	Blinking at 1 Hz

9.4.5.3 Interrupt to Host (\overline{INT})

In some applications, the host does not always monitor the charger operation. The INT pulse notifies the system on the device operation. The following events will generate 256- μ s INT pulse.

- USB/adaptor source identified (through PSEL pin)
- Good input source detected
 - VBUS above battery (not in sleep)
 - VBUS below V_{VAC_OV} threshold
 - VBUS above $V_{VBUSMin}$ (typical 3.8 V) when I_{BADSRC} (typical 30 mA) current is applied (not a poor source)
- Input removed
- Charge complete
- Any FAULT event in REG09
- VINDPM / IINDPM event detected (maskable)

When a fault occurs, the charger device sends out INT and keeps the fault state in REG09 until the host reads the fault register. Before the host reads REG09 and all the faults are cleared, the charger device would not send any INT upon new faults. To read the current fault status, the host has to read REG09 two times consecutively. The first read reports the pre-existing fault register status and the second read reports the current fault register status.

9.5 Programming

9.5.1 Serial Interface

The device uses I²C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I²C is a bi-directional 2-wire serial interface developed by Philips Semiconductor (now NXP Semiconductors). Only two bus lines are required: a serial data line (SDA) and a serial clock line (SCL). Devices can be considered as hosts or targets when performing data transfers. A host is the device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a target.

The device operates as a target device with address 6BH, receiving control inputs from the host device like a microcontroller or a digital signal processor through REG00-REG0B. A register read beyond REG0B (0x0B) returns 0xFF. The I²C interface supports both standard mode (up to 100 kbits), and fast mode (up to 400 kbits), connecting to the positive supply voltage via a current source or pull-up resistor. When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain.

9.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

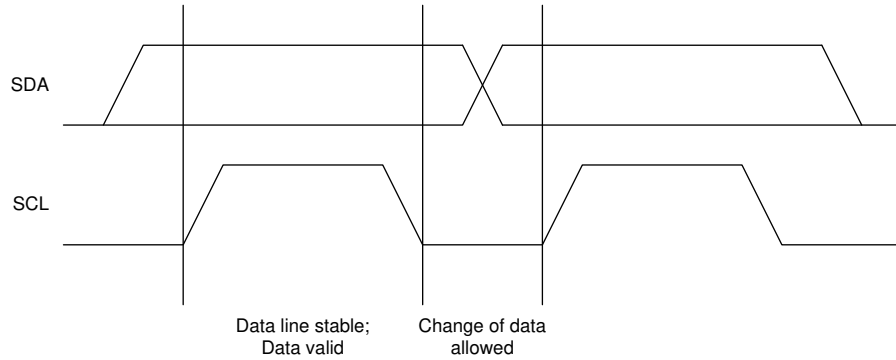

图 9-12. Bit Transfer on the I²C Bus

9.5.1.2 START and STOP Conditions

All transactions begin with a START (S) and can be terminated by a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition. START and STOP conditions are always generated by the host. The bus is considered busy after the START condition, and free after the STOP condition.

图 9-13. TS START and STOP conditions

9.5.1.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an Acknowledge bit. Data is transferred with the Most Significant Bit (MSB) first. If a target cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the clock line SCL low to force the host into a wait state (clock stretching). Data transfer then continues when the target is ready for another byte of data and release the clock line SCL.

图 9-14. Data Transfer on the I²C Bus

9.5.1.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The acknowledge takes place after every byte. The acknowledge bit allows the receiver to signal the transmitter that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge ninth clock pulse, are generated by the host. The transmitter releases the SDA line during the acknowledge clock pulse so the receiver can pull the SDA line LOW and it remains stable LOW during the HIGH period of this clock pulse.

When SDA remains HIGH during the ninth clock pulse, this is the Not Acknowledge signal. The host can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

9.5.1.5 Target Address and Data Direction Bit

After the START, a target address is sent. This address is 7 bits long followed by the eighth bit as a data direction bit (bit R/W). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ).

图 9-15. Complete Data Transfer

9.5.1.6 Single Read and Write

If the register address is not defined, the charger IC send back NACK and go back to the idle state.

图 9-16. Single Write

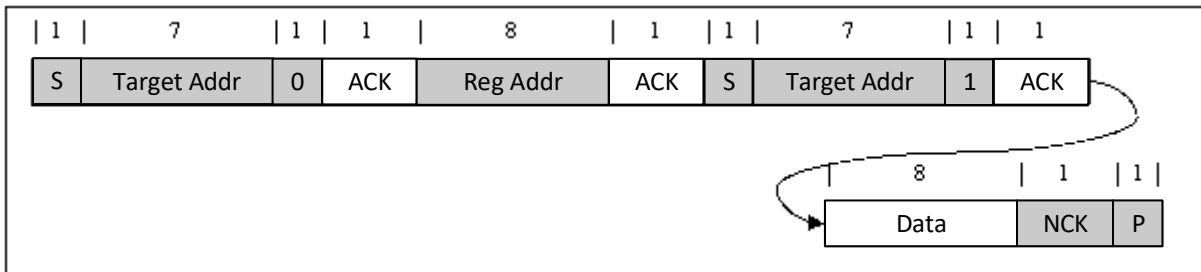

图 9-17. Single Read

9.5.1.7 Multi-Read and Multi-Write

The charger device supports multi-read and multi-write on REG00 through REG0B.

图 9-18. Multi-Write

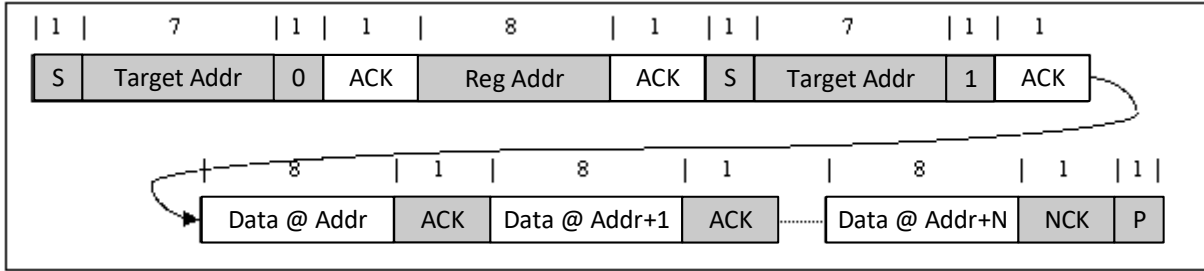

图 9-19. Multi-Read

REG09 is a fault register. It keeps all the fault information from last read until the host issues a new read. For example, if Charge Safety Timer Expiration fault occurs but recovers later, the fault register REG09 reports the fault when it is read the first time, but returns to normal when it is read the second time. In order to get the fault information at present, the host has to read REG09 for the second time. The only exception is NTC_FAULT which always reports the actual condition on the TS pin. In addition, REG09 does not support multi-read and multi-write.

10 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

10.1 Application Information

A typical application consists of the device configured as an I²C controlled power path management device and a single cell battery charger for Li-Ion and Li-polymer batteries used in a wide range of Smartphone and other portable devices. It integrates an input reverse-block FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET Q4) between the system and battery. The device also integrates a bootstrap diode for the high-side gate drive.

10.2 Typical Application

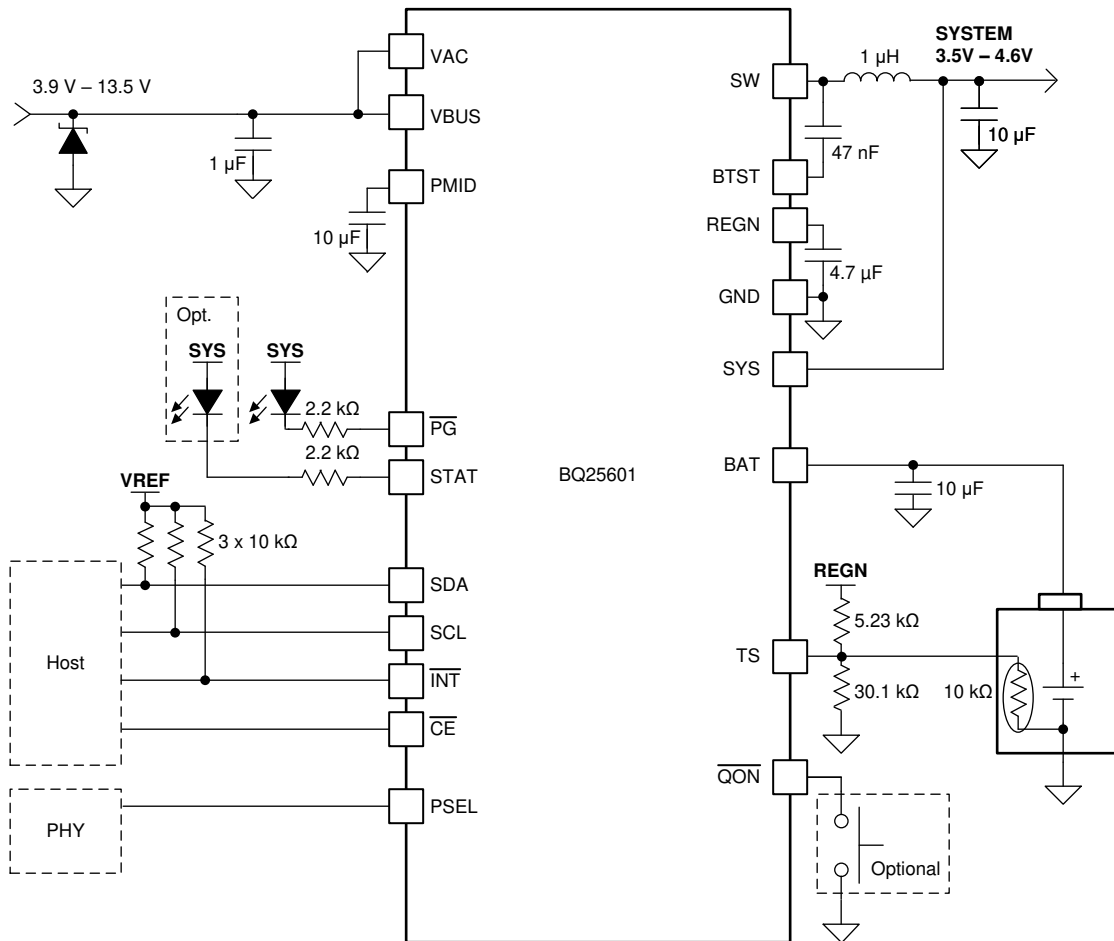

图 10-1. Power Path Management Application

10.2.1 Design Requirements

表 10-1. Design Parameters

PARAMETER	VALUE
V _{VBUS} voltage range	4 V to 13.5 V
Input current limit (REG00[4:0])	2.4 A
Fast charge current limit (REG02[5:0])	2.04 A
Minimum system voltage (REG01[3:1])	3.5 V
Battery regulation voltage (REG04[7:3])	4.2 V

10.2.2 Detailed Design Procedure

10.2.2.1 Inductor Selection

The 1.5-MHz switching frequency allows the use of small inductor and capacitor values to maintain an inductor saturation current higher than the charging current (I_{CHG}) plus half the ripple current (I_{RIPPLE}):

$$I_{SAT} \geq I_{CHG} + (1/2) I_{RIPPLE} \tag{3}$$

The inductor ripple current depends on the input voltage (V_{VBUS}), the duty cycle ($D = V_{BAT}/V_{VBUS}$), the switching frequency (f_S) and the inductance (L).

$$I_{\text{RIPPLE}} = \frac{V_{\text{IN}} \times D \times (1 - D)}{f_s \times L} \quad (4)$$

The maximum inductor ripple current occurs when the duty cycle (D) is 0.5 or approximately 0.5. Usually inductor ripple is designed in the range between 20% and 40% maximum charging current as a trade-off between inductor size and efficiency for a practical design.

10.2.2.2 Input Capacitor

Design input capacitance to provide enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current I_{CIN} occurs where the duty cycle is closest to 50% and can be estimated using [方程式 5](#).

$$I_{\text{CIN}} = I_{\text{CHG}} \times \sqrt{D \times (1 - D)} \quad (5)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed to the drain of the high-side MOSFET and source of the low-side MOSFET as close as possible. Voltage rating of the capacitor must be higher than normal input voltage level. A rating of 25 V or higher capacitor is preferred for 15-V input voltage. Capacitance of 22 μF is suggested for typical of 3-A charging current.

10.2.2.3 Output Capacitor

Ensure that the output capacitance has enough ripple current rating to absorb the output switching ripple current. [方程式 6](#) shows the output capacitor RMS current I_{COUT} calculation.

$$I_{\text{COUT}} = \frac{I_{\text{RIPPLE}}}{2 \times \sqrt{3}} \approx 0.29 \times I_{\text{RIPPLE}} \quad (6)$$

The output capacitor voltage ripple can be calculated as follows:

$$\Delta V_{\text{O}} = \frac{V_{\text{OUT}}}{8LCf_s^2} \left(1 - \frac{V_{\text{OUT}}}{V_{\text{IN}}} \right) \quad (7)$$

At certain input and output voltage and switching frequency, the voltage ripple can be reduced by increasing the output filter LC.

The charger device has internal loop compensation optimized for $\leq 20\text{-}\mu\text{F}$ ceramic output capacitance. The preferred ceramic capacitor is 10-V rating, X7R or X5R.

11 Power Supply Recommendations

In order to provide an output voltage on SYS, the BQ25601 device requires a power supply between 3.9-V and 13.5-V input with at least 100-mA current rating connected to VBUS and a single-cell Li-Ion battery with voltage $> V_{BATUVLO}$ connected to BAT. The source current rating needs to be at least 3 A in order for the buck converter of the charger to provide maximum output power to SYS.

12 Layout

12.1 Layout Guidelines

The switching node rise and fall times should be minimized for minimum switching loss. Proper layout of the components to minimize high frequency current path loop (see [图 12-1](#)) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Follow this specific order carefully to achieve the proper layout.

1. Place input capacitor as close as possible to PMID pin and GND pin connections and use shortest copper trace connection or GND plane.
2. Place inductor input pin to SW pin as close as possible. Minimize the copper area of this trace to lower electrical and magnetic field radiation but make the trace wide enough to carry the charging current. Do not use multiple layers in parallel for this connection. Minimize parasitic capacitance from this area to any other trace or plane.
3. Put output capacitor near to the inductor and the device. Ground connections need to be tied to the IC ground with a short copper trace connection or GND plane.
4. Route analog ground separately from power ground. Connect analog ground and connect power ground separately. Connect analog ground and power ground together using thermal pad as the single ground connection point. Or using a 0-Ω resistor to tie analog ground to power ground.
5. Use single ground connection to tie charger power ground to charger analog ground. Just beneath the device. Use ground copper pour but avoid power pins to reduce inductive and capacitive noise coupling.
6. Place decoupling capacitors next to the IC pins and make trace connection as short as possible.
7. It is critical that the exposed thermal pad on the backside of the device package be soldered to the PCB ground. Ensure that there are sufficient thermal vias directly under the IC, connecting to the ground plane on the other layers.
8. Ensure that the number and sizes of vias allow enough copper for a given current path.

Refer to the [BQ25601 and BQ25601D \(PWR877\) Evaluation Module User's Guide](#) for the recommended component placement with trace and via locations. For the VQFN information, refer to the [Quad Flatpack No-Lead Logic Packages Application Report](#) and [QFN and SON PCB Attachment Application Report](#).

[TI 术语表](#) 本术语表列出并解释了术语、首字母缩略词和定义。

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
BQ25601RTWR	ACTIVE	WQFN	RTW	24	3000	RoHS & Green	NIPDAU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 85	BQ25601	Samples
BQ25601RTWT	ACTIVE	WQFN	RTW	24	250	RoHS & Green	NIPDAU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 85	BQ25601	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
 - This drawing is subject to change without notice.
 - Quad Flatpack, No-Leads (QFN) package configuration.
 - The package thermal pad must be soldered to the board for thermal and mechanical performance.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-220.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他功能安全、信息安全、监管或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的应用。严禁对这些资源进行其他复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。您应全额赔偿因在这些资源的使用中对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，TI 对此概不负责。

TI 提供的产品受 [TI 的销售条款](#) 或 [ti.com](#) 上其他适用条款/TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
