DLP470NE 0.47 英寸 1080P 数字微镜器件

1 特性

- 0.47 英寸对角线微镜阵列
  - 全高清/1080P (1920 × 1080)
  - 5.4 微米微镜间距
  - ±17° 微镜倾斜度（相对于平坦表面）
  - 底部照明
- 2xLVDS 输入数据总线
- DLP470NE 芯片组包括:
  - DLP470NE DMD
  - DLPC4420 控制器
  - DLPA100 控制器电源管理和电机驱动器 IC

2 应用

- 全高清 (1080P) 显示
- 激光电视
- 移动智能电视
- 数字标牌
- 游戏
- 家庭影院

3 说明

TI DLP® DLP470NE 数字微镜器件 (DMD) 是一款数控微机电系统 (MEMS) 空间光调制器 (SLM)，可用于实现高亮的全高清显示系统。DLP470NE DMD 通过与 DLPC4420 显示控制器、DLPA100 控制器电源和电机驱动器配合使用，可提供实现高性能系统的能力，是需要在更小封装中实现高分辨率及 16:9 纵横比、高亮度和系统简单性的显示应用的理想之选。DLP470NE DMD 还可以使用 DLPC4430 作为显示控制器。
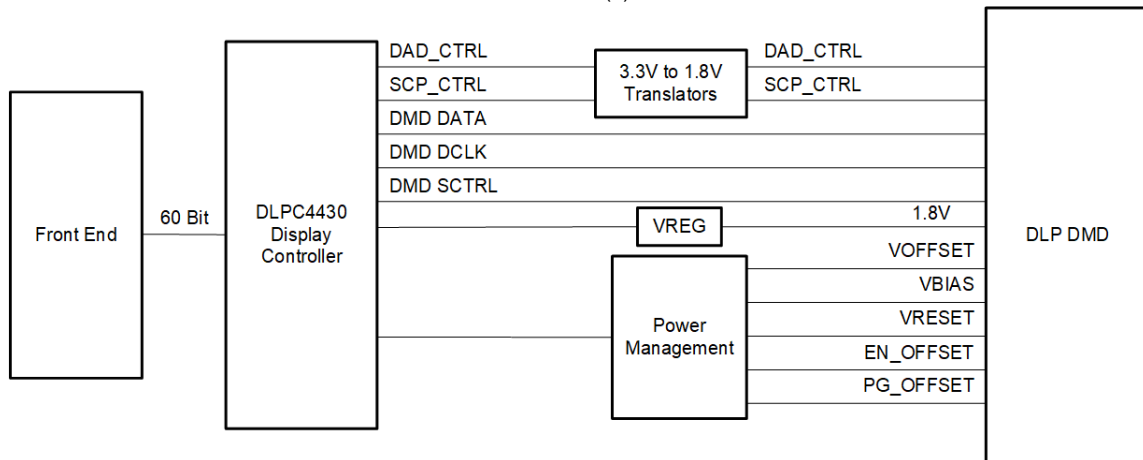

DMD 生态系统提供现成的资源以帮助用户缩短设计周期，请访问 DLP® 产品第三方搜索工具，查找获得批准的光学模块制造商和第三方提供商。

访问 TI DLP 显示技术入门，了解有关使用 DMD 开始设计的更多信息。

器件信息

器件型号	封装[1]	封装尺寸
DLP470NE	FXH (257)	33.2mm × 22.3mm

4 Pin Configuration and Functions

图 **4-1. Series 410 257-pin FXH Bottom View**

> **小心**
>
> To ensure reliable, long-term operation of the .47-inch 1080P s410 DMD, it is critical to properly manage the layout and operation of the signals identified in the table below. For specific details and guidelines, refer to the *PCB Design Requirements for TI DLP Standard TRP Digital Micromirror Devices* application report before designing the board.

5 Specifications

5.1 Absolute Maximum Ratings

		MIN	MAX	UNIT
SUPPLY VOLTAGES				
V_{CC}	Supply voltage for LVCMOS core logic[1]	−0.5	2.3	V
V_{OFFSET}	Supply voltage for HVCMOS and micromirror electrode[1] [2]	−0.5	11	V
V_{BIAS}	Supply voltage for micromirror electrode[1]	−0.5	19	V
V_{RESET}	Supply voltage for micromirror electrode[1]	−15	−0.3	V
$|V_{BIAS} − V_{OFFSET}|$	Supply voltage difference (absolute value)[3]		11	V
$|V_{BIAS} − V_{RESET}|$	Supply voltage difference (absolute value)[4]		34	V
INPUT VOLTAGES				
	Input voltage for all other LVCMOS input pins[1]	−0.5	V_{CC} + 0.5	V
$|V_{ID}|$	Input differential voltage (absolute value)[5]		500	mV
I_{ID}	Input differential current[6]		6.3	mA
Clocks				
f_{CLOCK}	Clock frequency for LVDS interface, DCLK_C		400	MHz
f_{CLOCK}	Clock frequency for LVDS interface, DCLK_D		400	MHz
ENVIRONMENTAL				
T_{ARRAY} and T_{WINDOW}	Temperature, operating[7]	0	90	°C
	Temperature, non‑operating[7]	−40	90	°C
$|T_{DELTA}|$	Absolute temperature delta between any point on the window edge and the ceramic test point TP1 [8]		30	°C
T_{DP}	Dew point temperature, operating and non‑operating (noncondensing)		81	°C

(1) All voltages are referenced to common ground V_{SS}. V_{BIAS}, V_{CC}, V_{OFFSET}, and V_{RESET} power supplies are all required for proper DMD operation. V_{SS} must also be connected.
(2) V_{OFFSET} supply transients must fall within specified voltages.
(3) Exceeding the recommended allowable voltage difference between V_{BIAS} and V_{OFFSET} may result in excessive current draw.
(4) Exceeding the recommended allowable voltage difference between V_{BIAS} and V_{RESET} may result in excessive current draw.
(5) This maximum LVDS input voltage rating applies when each input of a differential pair is at the same voltage potential.
(6) LVDS differential inputs must not exceed the specified limit or damage may result to the internal termination resistors.
(7) The highest temperature of the active array (as calculated using Micromirror Array Temperature Calculation) or of any point along the window edge as defined in 图 6-2. The locations of thermal test points TP2, TP3, TP4 and TP5 in 图 6-2 are intended to measure the highest window edge temperature. If a particular application causes another point on the window edge to be at a higher temperature, use that point.
(8) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge as shown in 图 6-2. The window test points TP2, TP3, TP4, and TP5 shown in 图 6-2 are intended to result in the worst case delta. If a particular application causes another point on the window edge to result in a larger delta temperature, use that point.

5.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system.

		MIN	MAX	UNIT
T_{DMD}	DMD storage temperature	−40	80	°C
T_{DP-AVG}	Average dew point temperature, (non-condensing) [1]		28	°C
T_{DP-ELR}	Elevated dew point temperature range , (non-condensing) [2]	28	36	°C
CT_{ELR}	Cumulative time in elevated dew point temperature range		24	Months

(1) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.
(2) Limit the exposure to dew point temperatures in the elevated range during storage and operation to less than a total cumulative time of CT_{ELR}.

Product Folder Links: *DLP470NE*

English Data Sheet: DLPS159

5.3 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1)   JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
(2)   JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

5.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT
VOLTAGE SUPPLY					
V_{CC}	LVCMOS logic supply voltage[1]	1.65	1.8	1.95	V
V_{OFFSET}	Mirror electrode and HVCMOS voltage[1] [2]	9.5	10	10.5	V
V_{BIAS}	Mirror electrode voltage[1]	17.5	18	18.5	V
V_{RESET}	Mirror electrode voltage[1]	−14.5	−14	−13.5	V
$\|V_{BIAS} - V_{OFFSET}\|$	Supply voltage difference (absolute value)[3]			10.5	V
$\|V_{BIAS} - V_{RESET}\|$	Supply voltage difference (absolute value)[4]			33	V
LVCMOS INTERFACE					
$V_{IH(DC)}$	DC input high voltage[5]	$0.7 \times V_{CC}$		$V_{CC} + 0.3$	V
$V_{IL(DC)}$	DC input low voltage[5]	−0.3		$0.3 \times V_{CC}$	V
$V_{IH(AC)}$	AC input high voltage[5]	$0.8 \times V_{CC}$		$V_{CC} + 0.3$	V
$V_{IL(AC)}$	AC input low voltage[5]	−0.3		$0.2 \times V_{CC}$	V
t_{PWRDNZ}	PWRDNZ pulse duration[6]	10			ns
SCP INTERFACE					
f_{SCPCLK}	SCP clock frequency[7]			500	kHz
t_{SCP_PD}	Propagation delay, Clock to Q, from rising – edge of SCPCLK to valid SCPDO[8]	0		900	ns
$t_{SCP\_NEG\_ENZ}$	Time between falling-edge of SCPENZ and the first rising- edge of SCPCLK	1			µs
$t_{SCP\_POS\_ENZ}$	Time between falling-edge of SCPCLK and the rising-edge of SCPENZ	1			µs
t_{SCP_DS}	SCPDI Clock setup time (before SCPCLK falling edge)[8]	800			ns
t_{SCP_DH}	SCPDI Hold time (after SCPCLK falling edge)[8]	900			ns
$t_{SCP\_PW\_ENZ}$	SCPENZ inactive pulse duration (high level)	2			µs

5.4 Recommended Operating Conditions（续）

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT
LVDS INTERFACE					
f_{CLOCK}	Clock frequency for LVDS interface (all channels), DCLK[9]			400	MHz
$|V_{ID}|$	Input differential voltage (absolute value)[10]	150	300	440	mV
V_{CM}	Common mode voltage[10]	1100	1200	1300	mV
V_{LVDS}	LVDS voltage[10]	880		1520	mV
t_{LVDS_RSTZ}	Time required for LVDS receivers to recover from PWRDNZ			2000	ns
Z_{IN}	Internal differential termination resistance	80	100	120	Ω
Z_{LINE}	Line differential impedance (PWB/trace)	90	100	110	Ω
ENVIRONMENTAL					
T_{ARRAY}	Array temperature, long‑term operational[11] [12] [13]	10		40 to 70[14]	°C
	Array temperature, short‑term operational, 500-hour max[12] [15]	0		10	°C
T_{WINDOW}	Window temperature – operational[16] [22]			85	°C
$|T_{DELTA}|$	Absolute temperature delta between any point on the window edge and the ceramic test point TP1[17]			14	°C
$T_{DP\text{-}AVG}$	Average dew point temperature (non-condensing)[18]			28	°C
$T_{DP\text{-}ELR}$	Elevated dew point temperature range (non-condensing)[19]	28		36	°C
CT_{ELR}	Cumulative time in elevated dew point temperature range			24	Months
ILL_θ	Illumination marginal ray angle[22]			55	degrees
SOLID STATE ILLUMINATION					
ILL_{UV}	Illumination power at wavelengths < 410nm[11] [21]			10	mW/cm2
ILL_{VIS}	Illumination power at wavelengths ⩾ 410nm and ⩽ 800nm[20] [21]			44.9	W/cm2
ILL_{IR}	Illumination power at wavelengths > 800nm[21]			10	mW/cm2
ILL_{BLU}	Illumination power at wavelengths ⩾ 410nm and ⩽ 475nm[20] [21]			14.3	W/cm2
ILL_{BLU1}	Illumination power at wavelengths ⩾ 410nm and ⩽ 440nm [20] [21]			2.3	W/cm2
LAMP ILLUMINATION					
ILL_{UV}	Illumination power at wavelengths < 395nm[11] [21]			2.0	mW/cm2
ILL_{VIS}	Illumination power at wavelengths ⩾ 395nm and ⩽ 800nm[20] [21]			36.8	W/cm2
ILL_{IR}	Illumination power at wavelengths > 800nm[21]			10	mW/cm2

(1)　All voltages are referenced to common ground V_{SS}. V_{BIAS}, V_{CC}, V_{OFFSET}, and V_{RESET} power supplies are all required for proper DMD operation. V_{SS} must also be connected.

(2)　V_{OFFSET} supply transients must fall within specified max voltages.

(3)　To prevent excess current, the supply voltage delta $|V_{BIAS} – V_{OFFSET}|$ must be less than specified limit. See 节 8, 图 8-1, 表 8-1.

(4)　To prevent excess current, the supply voltage delta $|V_{BIAS} – V_{RESET}|$ must be less than specified limit. See 节 8, 图 8-1, 表 8-1.

(5)　Low-speed interface is LPSDR and adheres to the Electrical Characteristics and AC/DC Operating Conditions table in JEDEC Standard No. 209B，"Low-Power Double Data Rate (LPDDR)" JESD209B.Tester Conditions for VIH and VIL.

　　　• 　Frequency = 60MHz. Maximum Rise Time = 2.5ns @ (20% – 80%)

　　　• 　Frequency = 60MHz. Maximum Fall Time = 2.5ns @ (80% – 20%)

(6)　PWRDNZ input pin resets the SCP and disables the LVDS receivers. PWRDNZ input pin overrides SCPENZ input pin and tristates the SCPDO output pin.

(7)　The SCP clock is a gated clock. Duty cycle shall be 50% ± 10%. SCP parameter is related to the frequency of DCLK.

(8)　See 图 5-2

(9)　See LVDS Timing Requirements in 节 5.8 and 图 5-6.

(10)　Refer to 图 5-5.

(11)　Simultaneous exposure of the DMD to the maximum 节 5.4 for temperature and UV illumination reduces device lifetime.

(12)　The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1) shown in 图 6-2 and the package 节 5.5 using the calculation in 节 6.6.

Product Folder Links: *DLP470NE*

English Data Sheet: DLPS159

(13) Long-term is defined as the usable life of the device.

(14) Per 图 5-1, the maximum operational array temperature should be derated based on the micromirror landed duty cycle that the DMD experiences in the end application. See 节 6.8 for a definition of micromirror landed duty cycle.

(15) Short-term is defined as cumulative time over the usable life of the device.

(16) The locations of thermal test points TP2, TP3, TP4, and TP5 in 图 6-2 are intended to measure the highest window edge temperature. For most applications, the locations shown are representative of the highest window edge temperature. If a particular application causes additional points on the window edge to be at a higher temperature, test points should be added to those locations.

(17) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge as shown in 图 6-2. The window test points TP2, TP3, TP4, and TP5 shown in 图 6-2 are intended to result in the worst-case delta temperature. If a particular application causes another point on the window edge to result in a larger delta in temperature, that point should be used.

(18) The average over time (including storage and operating) that the device is not in the "elevated dew point temperature range."

(19) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

(20) The maximum allowable optical power incident on the DMD is limited by the maximum optical power density for each wavelength range specified and the micromirror array temperature (T_{ARRAY}).

(21) To calculate see 节 6.7.

(22) The maximum marginal ray angle of the incoming illumination light at any point in the micromirror array, including pond of micromirrors (POM), should not exceed 55 degrees from the normal to the device array plane. The device window aperture has not necessarily been designed to allow incoming light at higher maximum angles to pass to the micromirrors, and the device performance has not been tested nor qualified at angles exceeding this. Illumination light exceeding this angle outside the micromirror array (including POM) will contribute to thermal limitations described in this document, and may negatively affect lifetime.

图 5-1. Maximum Recommended Array Temperature—Derating Curve

5.5 Thermal Information

THERMAL METRIC	DLP470NE	UNIT
	FXH Package	
	257 PINS	
Thermal resistance, active area to test point 1 (TP1)[1]	0.90	°C/W

(1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the package within the temperature range specified in the *Recommended Operating Conditions*.
The total heat load on the DMD is largely driven by the incident light absorbed by the active area; although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array.
Optical systems must be designed to minimize the light energy falling outside the window's clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

5.6 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT[1]
V_{OH}	High level output voltage	V_{CC} = 1.8V, I_{OH} = –2mA	$0.8 \times V_{CC}$			V
V_{OL}	Low level output voltage	V_{CC} = 1.95V, I_{OL} = 2mA			$0.2 \times V_{CC}$	V
I_{OZ}	High impedance output current	V_{CC} = 1.95V	–40		25	µA
I_{IL}	Low level input current	V_{CC} = 1.95V, V_I = 0	–1			µA
I_{IH}	High level input current[2][3]	V_{CC} = 1.95V, V_I = V_{CC}			110	µA
I_{CC}	Supply current VCC	V_{CC} = 1.95V			715	mA
I_{OFFSET}	Supply current VOFFSET[3]	V_{OFFSET} = 10.5V			7	mA
I_{BIAS}	Supply current VBIAS[3][4]	V_{BIAS} = 18.5V			2.75	mA
I_{RESET}	Supply current VRESET[4]	V_{RESET} = –14.5V			-5	mA
P_{CC}	Supply power dissipation V_{CC}	V_{CC} = 1.95V			1394.25	mW
P_{OFFSET}	Supply power dissipation V_{OFFSET} [3]	V_{OFFSET} = 10.5V			73.50	mW
P_{BIAS}	Supply power dissipation V_{BIAS} [3][4]	V_{BIAS} = 18.5V			50.87	mW
P_{RESET}	Supply power dissipation V_{RESET} [4]	V_{RESET} = 14.5V			72.5	mW
P_{TOTAL}	Supply power dissipation V_{TOTAL}				1591.12	mW

(1)   All voltage values are with respect to the ground pins (VSS).
(2)   Applies to LVCMOS pins only. Excludes LVDS pins and MBRST (15:0) pins.
(3)   To prevent excess current, the supply voltage difference |VBIAS – VOFFSET| must be less than the specified limits listed in the *Recommended Operating Conditions* table.
(4)   To prevent excess current, the supply voltage difference |VBIAS – VRESET| must be less than the specified limit in *Recommended Operating Conditions*.

5.7 Capacitance at Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
C_{I_lvds}	LVDS input capacitance 2xLVDS	f = 1MHz			20	pF
$C_{I\_nonlvds}$	Non-LVDS input capacitance 2xLVDS	f = 1MHz			20	pF
C_{I_tdiode}	Temperature diode input capacitance 2xLVDS	f = 1MHz			30	pF
C_O	Output capacitance	f = 1MHz			20	pF

5.11 Micromirror Array Optical Characteristics

PARAMETER		TEST CONDITION	MIN	NOM	MAX	UNIT
Micromirror tilt angle, variation device to device [2] [3] [4] [5]		Landed State[1]	15.6	17	18.4	degrees
Image performance[6]	Bright pixel(s) in active area[7]	Gray 10 screen[10]			0	micromirrors
	Bright pixel(s) in the POM[7] [9]	Gray 10 screen[10]			1	
	Dark pixel(s) in the active area[8]	White screen[11]			4	
	Adjacent pixel(s)[12]	Any screen			0	
	Unstable pixel(s) in active area[13]	Any screen			0	

(1)   Measured relative to the plane formed by the overall micromirror array.

(2)   Additional variation exists between the micromirror array and the package datums.

(3)   This represents the variation that can occur between any two individual micromirrors, locaed on the same device or located on different devices.

(4)   For some applications it is critical to account for the micromirror tilt angle variation in the overall system optical design. With some system optical designs the micromirror tilt angle variations within a device may result in perceivable non-uniformities in the light field reflected from the micromirror array. With some system optical designs the micromirror tilt angle variation between devices may result in colorimetry variations, system efficiency variations, or system contrast variations.

(5)   See figure 图 5-9.

(6)   Conditions of acceptance. All DMD image performance returns are evaluated using the following projected image test conditions:

- Test set degamma shall be linear.
- Test set brightness and contrast shall be set to nominal.
- The diagonal size of the projected image shall be a minimum of 60 inches.
- The projections screen shall be a 1× gain.
- The projected image shall be inspected from an 8-foot minimum viewing distance.
- The image shall be in focus during all image performance tests.

(7)   Bright pixel definition: a single pixel or mirror that is stuck in the ON position and is visibly brighter than the surrounding pixels.

(8)   Dark pixel definition: a single pixel or mirror that is stuck in the OFF position and is visibly darker than the surrounding pixels.

(9)   POM definition: The rectangular border of off-state mirrors surrounding the active area.

(10) Gray 10 screen definition: A full screen with RGB values set to R=10/255, G=10/255, B=10/255.

(11) White screen definition: A full screen with RGB values set to R=255/255, G=255/255, B=255/255.

(12) Adjacent pixel definition: Two or more stuck pixels sharing a common border or common point. Also referred to as a cluster.

(13) Unstable pixel definition: A single pixel or mirror that does not operate in sequence with parameters loaded into memory. The unstable pixel appears to be flickering asynchronously with the image.

5.12 Window Characteristics

表 5-3. DMD Window Characteristics

DESCRIPTION	MIN	NOM
Window Material		Corning Eagle XG
Window Refractive Index at 546.1nm		1.5119
Window Transmittance, minimum within the wavelength range between 420nm and 680nm. Applies to all angles between 0° – 30° AOI. [1] [2]	97%	
Window Transmittance, average over the wavelength range 420nm and 680nm. Applies to all angles 30° – 45° AOI. [1] [2]	97%	

(1)　Single-pass through both surfaces and glass.
(2)　The angle of incidence (AOI) is the angle between an incident ray and the normal to a reflecting or refracting surface.

5.13 Chipset Component Usage Specification

The DLP470NE DMD's reliable function and operation require that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology is the TI technology and devices for operating or controlling a DLP DMD.

6 Detailed Description

6.1 Overview

The DMD is a 0.47-inch diagonal spatial light modulator that consists of an array of highly reflective aluminum micromirrors. The DMD is an electrical input, optical output micro-electrical-mechanical system (MEMS). The electrical interface is Low Voltage Differential Signaling (LVDS). The DMD consists of a two-dimensional array of 1-bit CMOS memory cells. The array is organized in a grid of M memory cell columns by N memory cell rows. Refer to the 节 6.2. The positive or negative deflection angle of the micromirrors can be individually controlled by changing the address voltage of underlying CMOS addressing circuitry and micromirror reset signals (MBRST).

The DLP470NE DMD is part of the chipset comprising of the DLP470NE DMD, the DLPC4420 display controller, and the DLPA100 power and motor driver. To ensure reliable operation, the DLP470NE DMD must always be used with the DLPC4420 display controller and the DLPA100 power and motor driver.

6.2 Functional Block Diagram
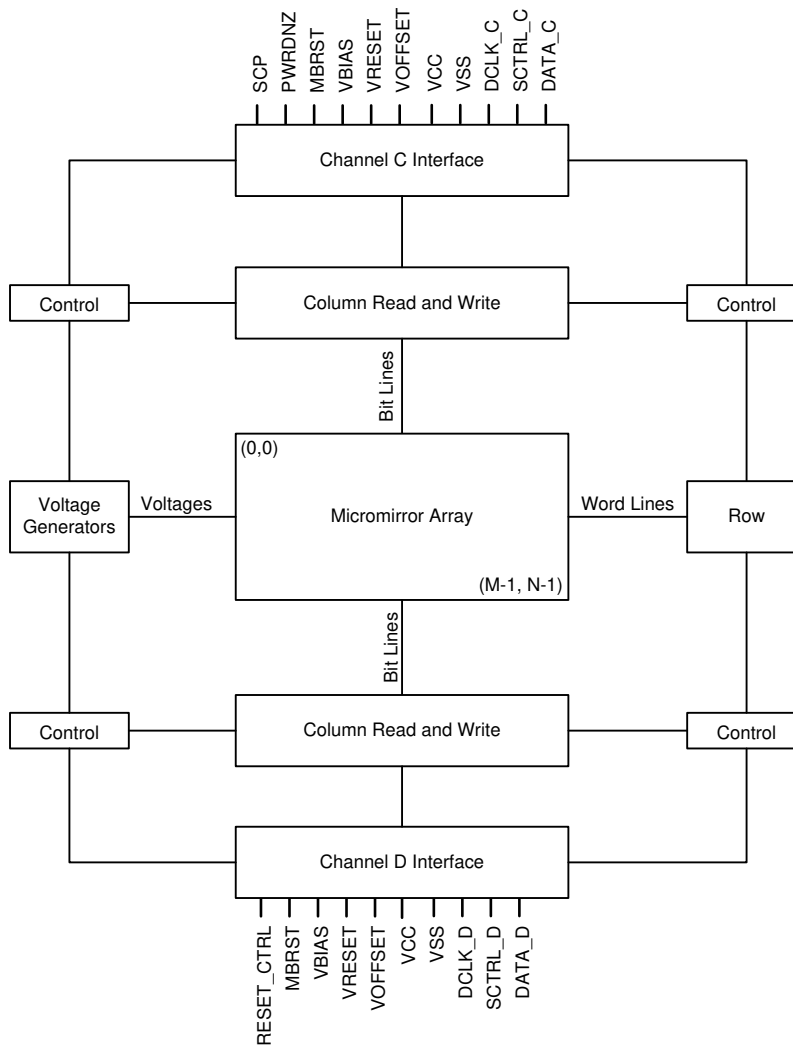

Copyright © 2017, Texas Instruments Incorporated

For pin details on Channels C, and D, refer to Pin Configuration and Functions and LVDS Interface section of 节 5.8. RESET_CTRL is used in applications when an external reset signal is required.

图 **6-1. Functional Block Diagram**

6.3 Feature Description

6.3.1 Power Interface

The DMD requires five DC voltages: DMD_P3P3V, DMD_P1P8V, VOFFSET, VRESET, and VBIAS. DMD_P3P3V is created by the DLPA100 power and motor driver and is used on the DMD board to create the other four DMD voltages, as well as powering various peripherals (TMP411, I2C, and TI level translators). DMD_P1P8V is created by the TI PMIC LP38513S and provides the VCC voltage required by the DMD. VOFFSET (10V), VRESET (-14V), and VBIAS (18V) are made by the TI PMIC TPS65145 and are supplied to the DMD to control the micromirrors.

6.3.2 Timing

The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. 图 5-4 shows an equivalent test load circuit for the output under test. Timing reference loads are not intended as a precise representation of any particular system environment or depiction of the actual load presented by a production test. System designers: Use IBIS or other simulation tools to correlate the timing reference load to a system environment. The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

6.4 Device Functional Modes

DMD functional modes are controlled by the DLPC4420 display controller. See the *DLPC4420 Display Controller Data Sheet* or contact a TI applications engineer.

6.5 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. System optical performance and image quality strongly relate to optical system design parameter trade-offs. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance are contingent on compliance with the optical system operating conditions described in the following sections.

6.5.1 Numerical Aperture and Stray Light Control

The angle defined by the numerical aperture of the illumination and projection optics at the DMD optical area needs to be the same. This angle should not exceed the nominal device micromirror tilt angle unless appropriate apertures are added in the illumination and projection pupils to block out flat-state and stray light from the projection lens. The micromirror tilt angle defines DMD capability to separate the "ON" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the micromirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle, contrast degradation and objectionable artifacts may occur in the display border or active area.

6.5.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display border and active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

6.5.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. Design the illumination optical

system to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the average flux level in the active area. Depending on the particular system's optical architecture, overfill light may have to be further reduced below the suggested 10% level to be acceptable.

## 6.6 Micromirror Array Temperature Calculation

图 6-2. DMD Thermal Test Points

Micromirror array temperature cannot be measured directly, therefore it must be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The following equations show the relationship between array temperature and the reference ceramic temperature, thermal test TP1 图 6-2 shown above:

$$T_{ARRAY} = T_{CERAMIC} + (Q_{ARRAY} \times R_{ARRAY\text{-}TO\text{-}CERAMIC})$$

$$Q_{ARRAY} = Q_{ELECTRICAL} + (Q_{ILLUMINATION})$$

where

- T_{ARRAY} = Computed array temperature (°C)
- $T_{CERAMIC}$ = Measured ceramic temperature (°C), TP1 图 6-2
- $R_{ARRAY\text{-}TO\text{-}CERAMIC}$ = Thermal resistance of package specified in 节 5.5 from array to ceramic TP1 图 6-2 (°C/W).
- Q_{ARRAY} = Total DMD Power (electrical + absorbed) on the array (W)
- $Q_{ELECTRICAL}$ = Nominal electrical power (W)

Product Folder Links: *DLP470NE*

English Data Sheet: *DLPS159*

- $Q_{INCIDENT}$ = Incident illumination optical power (W)
- $Q_{ILLUMINATION}$ = (DMD average thermal absorptivity × $Q_{INCIDENT}$ (W)
- DMD average thermal absorptivity = 0.41

The electrical power dissipation of the DMD is variable and depends on the voltages, data rates, and operating frequencies. A nominal electrical power dissipation to use when calculating array temperature is 0.9W. The absorbed optical power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. The equations shown above are valid for a single chip or multichip DMD system. It assumes an illumination distribution of 83.7% on the active array and 16.3% on the array border.

The sample calculation for a typical projection application is as follows:

$Q_{INCIDENT}$ = 31W (measured)

$T_{CERAMIC}$= 55.0° (measured)

$Q_{ELECTRICAL}$ = 0.9W

Q_{ARRAY} = 0.9W + (0.41 × 31W) = 13.61W

T_{ARRAY} = 55.0°C + (13.61W × 0.90°C/W) = 67.2°C

6.7 Micromirror Power Density Calculation

The calculation of the optical power density of the illumination on the DMD in the different wavelength bands uses the total measured optical power on the DMD, percent illumination overfill, area of the active array, and the ratio of the spectrum in the wavelength band of interest to the total spectral optical power.

- ILL_{UV} = [$OP_{UV-RATIO}$ × $Q_{INCIDENT}$] × 1000mW/W ÷ A_{ILL} (mW/cm^2)

- ILL_{VIS} = [$OP_{VIS-RATIO}$ × $Q_{INCIDENT}$] ÷ A_{ILL} (W/cm^2)

- ILL_{IR} = [$OP_{IR-RATIO}$ × $Q_{INCIDENT}$] × 1000mW/W ÷ A_{ILL} (mW/cm^2)

- ILL_{BLU} = [$OP_{BLU-RATIO}$ × $Q_{INCIDENT}$] ÷ A_{ILL} (W/cm^2)

- ILL_{BLU1} = [$OP_{BLU1-RATIO}$ × $Q_{INCIDENT}$] ÷ A_{ILL} (W/cm^2)

- A_{ILL} = A_{ARRAY} ÷ (1 - OV_{ILL}) (cm^2)

where:

- ILL_{UV} = UV illumination power density on the DMD (mW/cm^2)

- ILL_{VIS} = VIS illumination power density on the DMD (W/cm^2)

- ILL_{IR} = IR illumination power density on the DMD (mW/cm^2)

- ILL_{BLU} = BLU illumination power density on the DMD (W/cm^2)

- ILL_{BLU1} = BLU1 illumination power density on the DMD (W/cm^2)

- A_{ILL} = illumination area on the DMD (cm^2)

- $Q_{INCIDENT}$ = total incident optical power on DMD (W) (measured)

- A_{ARRAY} = area of the array (cm ^{2}) (data sheet)

- OV_{ILL} = percent of total illumination on the DMD outside the array (%) (optical model)

Product Folder Links: *DLP470NE*

English Data Sheet: *DLPS159*

- $OP_{UV-RATIO}$ = ratio of the optical power for wavelengths <410nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{VIS-RATIO}$ = ratio of the optical power for wavelengths ⩾410 and ⩽800nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{IR-RATIO}$ = ratio of the optical power for wavelengths >800nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{BLU-RATIO}$ = ratio of the optical power for wavelengths ⩾410nm and ⩽475nm to the total optical power in the illumination spectrum (spectral measurement)

- $OP_{BLU1-RATIO}$ = ratio of the optical power for wavelengths ⩾410nm and ⩽440nm to the total optical power in the illumination spectrum (spectral measurement)

The illumination area varies and depends on the illumination overfill. The total illumination area on the DMD is the array area and the overfill area around the array. The optical model is used to determine the percent of the total illumination on the DMD that is outside the array (OV_{ILL}) and the percent of the total illumination that is on the active array. From these values, the illumination area (A_{ILL}) is calculated. The illumination is assumed to be uniform across the entire array.

From the measured illumination spectrum, the ratio of the optical power in the wavelength bands of interest to the total optical power is calculated.

Sample calculation:

$Q_{INCIDENT}$ = 31W (measured)

A_{ARRAY} = (10.3680mm × 5.8320mm) ÷ 100mm^2/cm^2 = 0.6047cm^2 (data sheet)

OV_{ILL} = 16.3% (optical model)

$OP_{UV-RATIO}$ = 0.00017 (spectral measurement)

$OP_{VIS-RATIO}$ = 0.99977 (spectral measurement)

$OP_{IR-RATIO}$ = 0.00006 (spectral measurement)

$OP_{BLU-RATIO}$ = 0.28100 (spectral measurement)

$OP_{BLU1-RATIO}$ = 0.03200 (spectral measurement)

A_{ILL} = 0.6047cm^2 ÷ (1 - 0.163) = 0.7224cm^2

ILL_{UV} = [0.00017 × 31W] × 1000mW/W ÷ 0.7224cm^2 = 7.295mW/cm^2

ILL_{VIS} = [0.99977 × 31W] ÷ 0.7224cm^2 = 42.90W/cm^2

ILL_{IR} = [0.00006 × 31W] × 1000mW/W ÷ 0.7224cm^2 = 2.575mW/cm^2

ILL_{BLU} = [0.28100 × 31W] ÷ 0.7224cm^2 = 12.06W/cm^2

ILL_{BLU1} = [0.03200 × 31W] ÷ 0.7224cm^2 = 1.37W/cm^2

Product Folder Links: *DLP470NE*

English Data Sheet: DLPS159

6.8 Micromirror Landed-On/Landed-Off Duty Cycle

6.8.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the amount of time (as a percentage) that an individual micromirror is landed in the On state versus the amount of time the same micromirror is landed in the OFF state.

As an example, a landed duty cycle of 100/0 indicates that the referenced pixel is in the ON state 100% of the time (and in the Off state 0% of the time); whereas, 0/100 indicates that the pixel is in the OFF state 100% of the time. Likewise, 50/50 indicates that the pixel is ON for 50% of the time (and OFF for 50% of the time).

Note that when assessing the landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) always add to 100.

6.8.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD micromirror array (also called the active array) to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD usable life.

Note that it is the symmetry or asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

6.8.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD temperature and landed duty cycle interact to affect DMD usable life, and this interaction can be exploited to reduce the impact that an asymmetrical landed duty cycle has on the DMD usable life. This is quantified in the derating curve shown in 图 5-1. The importance of this curve is that:

- All points along this curve represent the same usable life.
- All points above this curve represent lower usable life (and the further away from the curve, the lower the usable life).
- All points below this curve represent higher usable life (and the further away from the curve, the higher the usable life).

In practice, this curve specifies the maximum operating DMD Temperature at a given long-term average Landed Duty Cycle.

6.8.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the Landed Duty Cycle of a given pixel follows from the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel operates under a 100/0 Landed Duty Cycle during that time period. Likewise, when displaying pure-black, the pixel operates under a 0/100 Landed Duty Cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the Landed Duty Cycle tracks one-to-one with the gray scale value, as shown in 表 6-1.

表 6-1. Grayscale Value and Landed Duty Cycle

GRAYSCALE VALUE	LANDED DUTY CYCLE
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20
90%	90/10
100%	100/0

Product Folder Links: *DLP470NE*

English Data Sheet: *DLPS159*

Accounting for color rendition (but still ignoring image processing) requires knowing both the color intensity (from 0% to 100%) for each constituent primary color (red, green, and blue) for the given pixel as well as the color cycle time for each primary color, where "color cycle time" is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

Use this equation to calculate the landed duty cycle of a given pixel during a given time period:

Landed Duty Cycle =

(Red_Cycle_% × Red_Scale_Value) +

(Green_Cycle_% × Green_Scale_Value) +

(Blue_Cycle_% × Blue_Scale_Value)

where

- Red_Cycle_%, represents the percentage of the frame time that red is displayed to achieve the desired white point
- Green_Cycle_% represents the percentage of the frame time that green is displayed to achieve the desired white point
- Blue_Cycle_%, represents the percentage of the frame time that blue is displayed to achieve the desired white point

For example, assume that the red, green and blue color cycle times are 50%, 20%, and 30% respectively (in order to achieve the desired white point), then the Landed Duty Cycle for various combinations of red, green, blue color intensities are as shown in 表 6-2 and 表 6-3.

表 6-2. Example Landed Duty Cycle for Full-Color, Color Percentage

CYCLE PERCENTAGE		
RED	**GREEN**	**BLUE**
50%	20%	30%

表 6-3. Example Landed Duty Cycle for Full-Color

SCALE VALUE			LANDED DUTY CYCLE
RED	**GREEN**	**BLUE**	
0%	0%	0%	0/100
100%	0%	0%	50/50
0%	100%	0%	20/80
0%	0%	100%	30/70
12%	0%	0%	6/94
0%	35%	0%	7/93
0%	0%	60%	18/82
100%	100%	0%	70/30
0%	100%	100%	50/50
100%	0%	100%	80/20
12%	35%	0%	13/87
0%	35%	60%	25/75
12%	0%	60%	24/76
100%	100%	100%	100/0

7 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Application Information

Texas Instruments DLP technology is a micro-electro-mechanical systems (MEMS) technology that modulates light using a digital micromirror device (DMD). The DMD is a spatial light modulator, which reflects incoming light from an illumination source in one of two directions, towards the projection optics or collection optics. Typical applications using the DLP470NE include home theater, digital signage, interactive displays, low-latency gaming displays, and portable smart displays.

The most recent class of chipsets from Texas Instruments is based on a breakthrough micromirror technology, called TRP. With a smaller pixel pitch of 5.4 μm and an increased tilt angle of 17 degrees, TRP chipsets enable higher resolution in a smaller form factor and enhanced image processing features while maintaining high optical efficiency. DLP chipsets are a great fit for any system that requires high-resolution and high-brightness displays.

The following orderables were replaced by the DLP470NE.

Device Information

PART NUMBER	PACKAGE	BODY SIZE (NOM)	Mechanical ICD
DLP470NETA	FXH (257)	33.2mm × 22.3mm	2516206
1910-5432B	FXH (257)	33.2mm × 22.3mm	2516206
1910-5437B	FXH (257)	33.2mm × 22.3mm	2516206
1910-543AB	FXH (257)	33.2mm × 22.3mm	2516206

7.2 Typical Application

The DLP470NE digital micromirror device (DMD), combined with a DLPC4420 (or DLPC4430) digital controller and DLPA100 power management device, provides full HD resolution for bright, colorful display applications. 图 7-1 shows a typical display system using the DLP470NE and additional system components.

Product Folder Links: *DLP470NE*
English Data Sheet: *DLPS159*
图 **7-1. Typical DLPC4430 Application (LED, Top; LPCW, Bottom)**

7.2.1 Design Requirements

A DLP470NE projection system is created by using the DMD chipset, including the DLP470NE, DLPC4420, and DLPA100. The DLP470NE is used as the core imaging device in the display system and contains a 0.47-inch array of micromirrors. The DLPC4420 controller is the digital interface between the DMD and the rest of the system, taking digital input from the front-end receiver and driving the DMD over a high-speed interface. The DLPA100 power management device provides voltage regulators for the DMD, controller, and illumination functionality.

Other core components of the display system include an illumination source, an optical engine for the illumination and projection optics, other electrical and mechanical components, and software. The illumination source options include lamp, LED, laser, or laser phosphor. The type of illumination used and desired brightness have a major effect on the overall system design and size.

7.2.2 Detailed Design Procedure

For connecting the DLPC4420 display controller and the DLP470NE DMD, see the reference design schematic. For a complete DLP system, an optical module or light engine is required that contains the DLP470NE DMD, associated illumination sources, optical elements, and necessary mechanical components.

To ensure reliable operation, the DLP470NE DMD must always be used with the DLPC4420 display controller and a DLPA100 PMIC driver. Refer to PCB Design Requirements for DLP Standard TRP Digital Micromirror Devices for the DMD board design and manufacturing handling of the DMD subassemblies.

7.2.3 Application Curves

When LED illumination is used, a typical LED-current-to-Luminance relationship is shown in 图 7-2.
图 **7-2. Luminance vs. Current**

7.3 DMD Die Temperature Sensing

The DMD features a built-in thermal diode that measures the temperature at one corner of the die outside the micromirror array. The thermal diode can be interfaced with the TMP411 temperature sensor, as shown in 图 7-3. The serial bus from the TMP411 can be connected to the DLPC4420 display controller to enable its temperature-sensing features. See the *DLPC4420 Programmers' Guide* for instructions on installing the DLPC4420 controller support firmware bundle and obtaining the temperature readings.

The software application contains functions to configure the TMP411 to read the DMD temperature sensor diode. This data can be leveraged to incorporate additional functionality in the overall system design such as adjusting illumination, fan speeds, and so forth. All communication between the TMP411 and the DLPC4420 controller is completed using the I^{2}C interface. The TMP411 connects to the DMD via pins B17 and B18, as outlined in 节 4.

Product Folder Links: *DLP470NE*

English Data Sheet: *DLPS159*
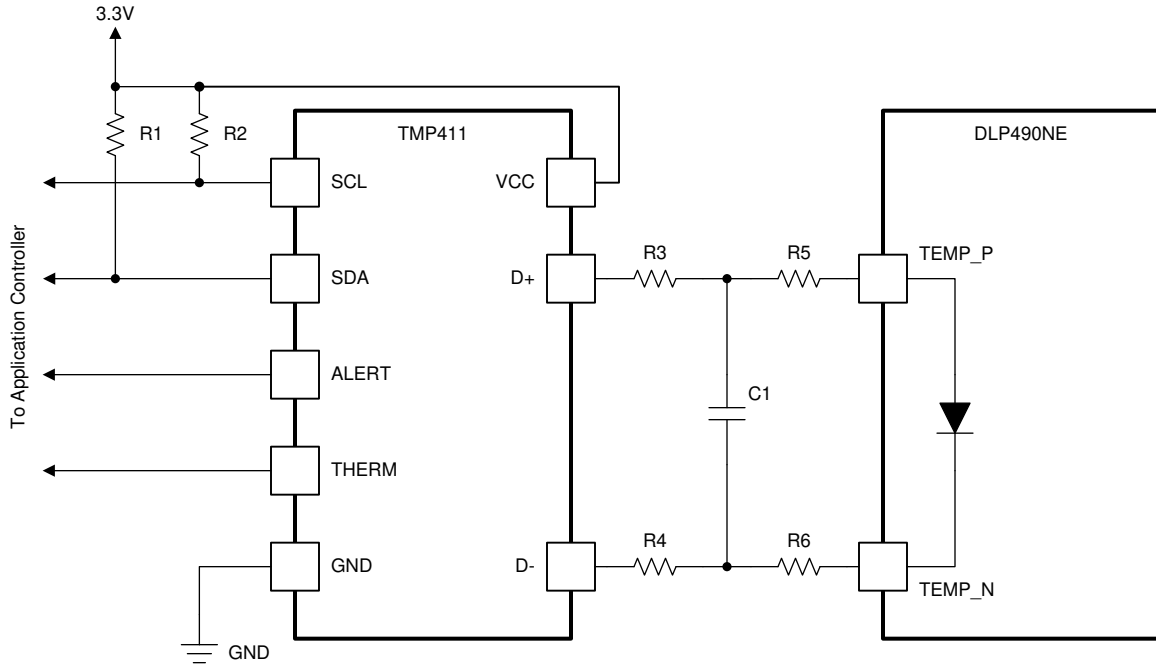

A. Details omitted for clarity, see the TI Reference Design for connections to the DLPC4420 controller.
B. See the TMP411 data sheet for system board layout recommendation.
C. See the TMP411 data sheet and the TI reference design for suggested component values for R1, R2, R3, R4, and C1.
D. R5 = 0 Ω. R6 = 0 Ω. Zero-ohm resistors need to be located close to the DMD package pins.

图 7-3. TMP411 Sample Schematic

8 Power Supply Recommendations

The following power supplies are all required to operate the DMD:

- VSS
- VBIAS
- VCC
- VOFFSET
- VRESET

DMD power-up and power-down sequencing is strictly controlled by the DLP display controller.

<div style="border:1px solid black; padding:10px; background:#e0e0e0">

小心

For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to any of the prescribed power-up and power-down requirements may affect device reliability. See 图 8-1 DMD Power Supply Sequencing Requirements.

VBIAS, VCC, VOFFSET, and VRESET power supplies must be coordinated during power-up and power-down operations. Failure to meet any of the below requirements will result in a significant reduction in the DMD reliability and lifetime. Common ground VSS must also be connected.

</div>

8.1 DMD Power Supply Power-Up Procedure

- During power-up, VCC must always start and settle before VOFFSET plus Delay1 specified in 表 8-1, VBIAS, and VRESET voltages are applied to the DMD.
- During power-up, it is a strict requirement that the voltage difference between VBIAS and VOFFSET must be within the specified limit shown in 节 5.4.
- During power-up, there is no requirement for the relative timing of VRESET with respect to VBIAS.
- Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements specified in 节 5.1, in 节 5.4, and in 图 8-1.
- During power-up, LVCMOS input pins must not be driven high until after VCC have settled at operating voltages listed in 节 5.4.

8.2 DMD Power Supply Power-Down Procedure

- During power-down, VCC must be supplied until after VBIAS, VRESET, and VOFFSET are discharged to within the specified limit of ground. See 表 8-1.
- During power-down, it is a strict requirement that the voltage difference between VBIAS and VOFFSET must be within the specified limit shown in 节 5.4.
- During power-down, there is no requirement for the relative timing of VRESET with respect to VBIAS.
- Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements specified in 节 5.1, in 节 5.4, and in 图 8-1.
- During power-down, LVCMOS input pins must be less than specified in 节 5.4.

Product Folder Links: *DLP470NE*

English Data Sheet: DLPS159
A. See 节 5.4 and Pin Configuration and Functions.
B. To prevent excess current, the supply voltage difference |VOFFSET – VBIAS| must be less than specified limit in 节 5.4.
C. To prevent excess current, the supply difference |VBIAS – VRESET| must be less than specified limit in 节 5.4.
D. VBIAS must power up after VOFFSET has powered up, per the Delay1 specification in 表 8-1.
E. PG_OFFSET must turn off after EN_OFFSET has turned off, per the Delay2 specification in 表 8-1.
F. DLP controller software enables the DMD power supplies to turn on after RESET_OEZ is at logic high.
G. DLP controller software initiates the global VBIAS command.
H. After the DMD micromirror park sequence is complete, the DLP controller software initiates a hardware power-down that activates PWRDNZ and disables VBIAS, VRESET and VOFFSET.
I. Under power-loss conditions where emergency DMD micromirror park procedures are being enacted by the DLP controller hardware, EN_OFFSET may turn off after PG_OFFSET has turned off. The OEZ signal goes high prior to PG_OFFSET turning off to indicate the DMD micromirror has completed the emergency park procedures.

图 8-1. DMD Power Supply Requirements

表 8-1. DMD Power-Supply Requirements

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
Delay1	Delay from VOFFSET settled at recommended operating voltage to VBIAS and VRESET power up	1	2		ms
Delay2	PG_OFFSET hold time after EN_OFFSET goes low	100			ns

9 Layout

9.1 Layout Guidelines

The DLP470NE DMD is part of a chipset controlled by the DLPC4420 display controller in conjunction with the DLPA100 power and motor driver. These guidelines help to design a PCB board with the DLP470NE DMD. The DLP470NE DMD board is a high-speed multilayer PCB, with primarily high-speed digital logic using dual-edge clock rates up to 400MHz for DMD LVDS signals. The remaining traces are comprised of low speed digital LVTTL signals. TI recommends that mini power planes are used for VOFFSET, VRESET, and VBIAS. Solid planes are required for DMD_P3P3V(3.3V), DMD_P1P8V and Ground. The target impedance for the PCB is 50Ω ±10% with the LVDS traces being 100Ω ±10% differential. Use an 8-layer stack-up, as described in 表 9-1.

9.2 Layout Example

9.2.1 Layers

The layer stack-up and copper weight for each layer are shown in 表 9-1 . Small subplanes are allowed on signal routing layers to connect components to major subplanes on top or bottom layers if necessary.

表 9-1. Layer Stack-Up

LAYER NO.	LAYER NAME	COPPER WT. (oz.)	COMMENTS
1	Side A - DMD only	1.5	DMD, escapes, low-frequency signals, power subplanes
2	Ground	1	Solid ground plane (net GND)
3	Signal	0.5	50Ω and 100Ω differential signals
4	Ground	1	Solid ground plane (net GND)
5	DMD_P3P3V	1	+3.3V power plane (net DMD_P3P3V)
6	Signal	0.5	50Ω and 100Ω differential signals
7	Ground	1	Solid ground plane (net GND)
8	Side B - All other Components	1.5	Discrete components, low-frequency signals, power subplanes

9.2.2 Impedance Requirements

TI recommends that the board has matched impedance of 50Ω ±10% for all signals. The exceptions are listed in 表 9-2.

表 9-2. Special Impedance Requirements

Signal Type	Signal Name	Impedance (ohms)
C channel LVDS differential pairs	DDCP(0:15), DDCN(0:15)	100 ±10% differential across each pair
	DCLKC_P, DCLKC_N	
	SCTRL_CP, SCTRL_CN	
D channel LVDS differential pairs	DDDP(0:15), DDDN(0:15)	100 ±10% differential across each pair
	DCLKD_P, DCLKD_N	
	SCTRL_DP, SCTRL_DN	

9.2.3 Trace Width, Spacing

Unless otherwise specified, TI recommends that all signals follow the 0.005-inch / 0.005-inch design rule. Minimum trace clearance from the ground ring around the PWB has a 0.1-inch minimum. An analysis of impedance and stack-up requirements determine the actual trace widths and clearances.

9.2.3.1 Voltage Signals

表 9-3. Special Trace Widths, Spacing Requirements

SIGNAL NAME	MINIMUM TRACE WIDTH TO PINS (MIL)	LAYOUT REQUIREMENT
GND	15	Maximize trace width to connecting pin
DMD_P3P3V	15	Maximize trace width to connecting pin
DMD_P1P8V	15	Maximize trace width to connecting pin
VOFFSET	15	Create mini plane from U2 to U3
VRESET	15	Create mini plane from U2 to U3
VBIAS	15	Create mini plane from U2 to U3
All U3 control connections	10	Use 10mil etch to connect all signals/voltages to DMD pads

10 Device and Documentation Support

10.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

10.2 Device Support

10.2.1 Device Nomenclature
图 10-1. Part Number Description

10.2.2 Device Markings

The device marking includes both human-readable information and a 2-dimensional matrix code. The human-readable information is described in 图 10-2. The 2-dimensional matrix code is an alpha-numeric character string that contains the DMD part number, part 1 of serial number, and part 2 of serial number.
图 10-2. DMD Marking Locations

10.3 Documentation Support

10.3.1 Related Documentation

The following documents contain additional information related to the chipset components used with the DLP470NE.

* *DLPC4430 Display Controller Data Sheet*
* *DLPC4420 Display Controller Data Sheet*
* *DLPA100 Power and Motor Driver Data Sheet*

10.4 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.5 支持资源

TI E2E™ 中文支持论坛是工程师的重要参考资料，可直接从专家处获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题，获得所需的快速设计帮助。

链接的内容由各个贡献者"按原样"提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的使用条款。

10.6 Trademarks

TI E2E™ is a trademark of Texas Instruments.
DLP® is a registered trademark of Texas Instruments.

10.7 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

10.8 术语表

TI 术语表　　　　　本术语表列出并解释了术语、首字母缩略词和定义。

11 Revision History

注：以前版本的页码可能与当前版本的页码不同

Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLP470NEAAFXH	ACTIVE	CLGA	FXH	257	33	RoHS & Green	Call TI	N / A for Pkg Type	0 to 70		Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
