

INA293-Q1 符合 AEC-Q100 标准的 -4V 至 110V、1.3MHz 超精密电流检测放大器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准
 - 温度等级 1 : -40°C 至 +125°C, T_A
- 提供功能安全
 - 可帮助进行功能安全系统设计的文档
- 宽共模电压 :
 - 工作电压 : -4 V 至 +110 V
 - 可承受电压 : -20 V 至 +120 V
- 出色的共模抑制比 (CMRR) :
 - 160dB 直流 CMRR
 - 85dB 交流 CMRR (50kHz 时)
- 精度 :
 - 增益 :
 - 增益误差 : $\pm 0.15\%$ (最大值)
 - 增益漂移 : $\pm 10\text{ppm}/^\circ\text{C}$ (最大值)
 - 失调电压 :
 - 失调电压 : $\pm 15\mu\text{V}$ (典型值)
 - 温漂 : $\pm 0.05\mu\text{V}/^\circ\text{C}$ (典型值)
- 可用增益 :
 - INA293A1-Q1、INA293B1-Q1 : 20V/V
 - INA293A2-Q1、INA293B2-Q1 : 50V/V
 - INA293A3-Q1、INA293B3-Q1 : 100V/V
 - INA293A4-Q1、INA293B4-Q1 : 200V/V
 - INA293A5-Q1、INA293B5-Q1 : 500V/V
- 高带宽 : 1.3 MHz
- 压摆率 : 2.5 V/ μs
- 静态电流 : 1.5mA

2 应用

- 48V 汽车
- 螺线管控制
- 48V 直流/直流转换器
- 阀门控制

3 说明

INA293-Q1 是一款超精密电流检测放大器,可在 -4V 至 110V 的宽共模范围内测量分流电阻器上的压降。负共模电压允许器件的工作电压低于接地电压,从而可在半桥应用中精确测量再循环电流。低失调电压、小增益误差和高直流 CMRR 的组合可实现高精度的电流测量。INA293-Q1 不仅适用于直流电流测量,还适用于高速应用(例如快速过流保护),此类应用具有 1.3MHz 的高带宽和 85dB 交流 CMRR (50kHz 时)。

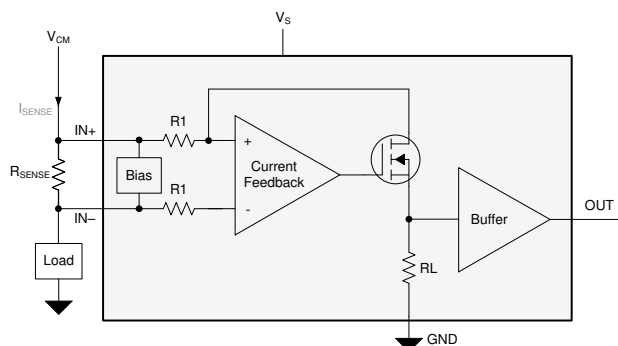

INA293-Q1 由 2.7V 至 20V 的单电源供电,电源电流为 1.5mA。INA293-Q1 提供五个增益选项:20V/V、50V/V、100V/V、200V/V 和 500V/V。这些增益选项可以满足宽动态范围电流检测应用。

INA293-Q1 的额定工作温度范围为 -40 °C 至 +125 °C,并且采用节省空间且配备两种引脚型号的 SOT-23 封装。

器件信息(1)

器件型号	封装	封装尺寸 (标称值)
INA293-Q1	SOT-23 (5)	2.90mm × 1.60mm

(1) 如需了解所有可用封装,请参阅数据表末尾的封装选项附录。

7 Detailed Description

7.1 Overview

The INA293-Q1 is a high- or low-side current-sense amplifier that offers a wide common-mode range, precision zero-drift topology, excellent common-mode rejection ratio (CMRR), high bandwidth and fast slew rate. Different gain versions are available to optimize the output dynamic range based on the application. The INA293-Q1 is designed using a transconductance architecture with a current-feedback amplifier that enables low bias currents of 20 μ A with a common-mode voltage of 110 V.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Amplifier Input Common-Mode Signal

The INA293-Q1 supports large input common-mode voltages from -4 V to $+110$ V. Because of the internal topology, the common-mode range is not restricted by the power-supply voltage (V_S). This allows for the INA293-Q1 to be used for both low and high side current-sensing applications.

7.3.1.1 Input-Signal Bandwidth

The INA293-Q1 -3 -dB bandwidth is gain dependent, with several gain options of 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V. The unique multistage design enables the amplifier to achieve high bandwidth at all gains. This high bandwidth provides the throughput and fast response that is required for the rapid detection and processing of overcurrent events.

The bandwidth of the device also depends on the applied V_{SENSE} voltage. [图 7-1](#) shows the bandwidth performance profile of the device over frequency as output voltage increases for each gain variation. As shown in [图 7-1](#), the device exhibits the highest bandwidth with higher V_{SENSE} voltages, and the bandwidth is higher with lower device gain options. Individual requirements determine the acceptable limits of error for high frequency current-sensing applications. Testing and evaluation in the end application or circuit is required to determine the acceptance criteria, and to validate that the performance levels meet the system specifications.

图 7-1. Bandwidth vs Output Voltage

7.3.1.2 Low Input Bias Current

The INA293-Q1 inputs draw a 20- μ A (typical) bias current at a common-mode voltage as high as 110 V, which enables precision current sensing on applications that require lower current leakage.

7.3.1.3 Low V_{SENSE} Operation

The INA293-Q1 operates with high performance across the entire valid V_{SENSE} range. The zero-drift input architecture of the INA293-Q1 provides the low offset voltage and low offset drift needed to measure low V_{SENSE} levels accurately across the wide operating temperature of $-40\text{ }^{\circ}\text{C}$ to $+125\text{ }^{\circ}\text{C}$. Low V_{SENSE} operation is particularly beneficial when using low ohmic shunts for low current measurements, as power losses across the shunt are significantly reduced.

7.3.1.4 Wide Fixed Gain Output

The INA293-Q1 gain error is $< 0.15\%$ at room temperature, with a maximum drift of 10 ppm/ $^{\circ}\text{C}$ over the full temperature range of $-40\text{ }^{\circ}\text{C}$ to $+125\text{ }^{\circ}\text{C}$. The INA293-Q1 is available in multiple gain options of 20 V/V, 50 V/V, 100 V/V, 200 V/V, and 500 V/V, which the system designer should select based on their desired signal-to-noise ratio and other system requirements.

The INA293-Q1 closed-loop gain is set by a precision, low drift internal resistor network. The ratio of these resistors are excellently matched, while the absolute values may vary significantly. Adding additional resistance around the INA293-Q1 to change the effective gain is not recommended, however, because of this variation. The typical values of the gain resistors are described in 表 7-1.

表 7-1. Fixed Gain Resistor

GAIN	R1	RL
20 (V/V)	25 k Ω	500 k Ω
50 (V/V)	10 k Ω	500 k Ω
100 (V/V)	10 k Ω	1000 k Ω
200 (V/V)	5 k Ω	1000 k Ω
500 (V/V)	2 k Ω	1000 k Ω

7.3.1.5 Wide Supply Range

The INA293-Q1 operates with a wide supply range from 2.7 V to 20 V. The output stage supports a wide output range while INA293-Q1x1 (gain of 20 V/V) at a supply voltage of 20 V allows a maximum acceptable differential input of 1 V. When paired with the small input offset voltage of the INA293-Q1, systems with very wide dynamic range of current measurement can be supported.

7.4 Device Functional Modes

7.4.1 Unidirectional Operation

The INA293-Q1 measures the differential voltage developed by current flowing through a resistor, commonly referred to as a current-sensing resistor or a current-shunt resistor. The INA293-Q1 operates in unidirectional mode only, meaning it only senses current sourced from a power supply to a system load as shown in 图 7-2.

图 7-2. Unidirectional Application

The linear range of the output stage is limited to how close the output voltage can approach ground under zero-input conditions. The zero current output voltage of the INA293-Q1 is very small, with a maximum of GND + 20 mV. Make sure to apply a differential input voltage of (20 mV / Gain) or greater to keep the INA293-Q1 output in the linear region of operation.

7.4.2 High Signal Throughput

With a bandwidth of 1.3 MHz at a gain of 20 V/V and a slew rate of 2.5 V/ μ s, the INA293-Q1 is specifically designed for detecting and protecting applications from fast inrush currents. As shown in 表 7-2, the INA293-Q1 responds in less than 2 μ s for a system measuring a 75-A threshold on a 2-m Ω shunt.

表 7-2. Response Time

PARAMETER		EQUATION	INA293-Q1 AT $V_S = 5\text{ V}$
G	Gain		20 V/V
I_{MAX}	Maximum current		100 A
$I_{Threshold}$	Threshold current		75 A
R_{SENSE}	Current sense resistor value		2 m Ω
V_{OUT_MAX}	Output voltage at maximum current	$V_{OUT_MAX} = I_{MAX} \times R_{SENSE} \times G$	4 V
V_{OUT_THR}	Output voltage at threshold current	$V_{OUT_THR} = I_{THR} \times R_{SENSE} \times G$	3 V
SR	Slew rate		2.5 V/ μ s
	Output response time	$T_{response} = V_{OUT_THR} / SR$	< 2 μ s

8 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

8.1 Application Information

The INA293-Q1 amplifies the voltage developed across a current-sensing resistor as current flows through the resistor to the load. The wide input common-mode voltage range and high common-mode rejection of the INA293-Q1 make it usable over a wide range of voltage rails while still maintaining an accurate current measurement.

8.1.1 R_{SENSE} and Device Gain Selection

The accuracy of any current-sense amplifier is maximized by choosing the current-sense resistor to be as large as possible. A large sense resistor maximizes the differential input signal for a given amount of current flow and reduces the error contribution of the offset voltage. However, there are practical limits as to how large the current-sense resistor can be in a given application because of the resistor size and maximum allowable power dissipation. [方程式 1](#) gives the maximum value for the current-sense resistor for a given power dissipation budget:

$$R_{\text{SENSE}} < \frac{PD_{\text{MAX}}}{I_{\text{MAX}}^2} \quad (1)$$

where:

- PD_{MAX} is the maximum allowable power dissipation in R_{SENSE}.
- I_{MAX} is the maximum current that will flow through R_{SENSE}.

An additional limitation on the size of the current-sense resistor and device gain is due to the power-supply voltage, V_S, and device swing-to-rail limitations. To make sure that the current-sense signal is properly passed to the output, both positive and negative output swing limitations must be examined. [方程式 2](#) provides the maximum values of R_{SENSE} and GAIN to keep the device from exceeding the positive swing limitation.

$$I_{\text{MAX}} \times R_{\text{SENSE}} \times \text{GAIN} < V_{\text{SP}} \quad (2)$$

where:

- I_{MAX} is the maximum current that will flow through R_{SENSE}.
- GAIN is the gain of the current-sense amplifier.
- V_{SP} is the positive output swing as specified in the data sheet.

To avoid positive output swing limitations when selecting the value of R_{SENSE}, there is always a trade-off between the value of the sense resistor and the gain of the device under consideration. If the sense resistor selected for the maximum power dissipation is too large, then it is possible to select a lower-gain device in order to avoid positive swing limitations.

The negative swing limitation places a limit on how small the sense resistor value can be for a given application. [方程式 3](#) provides the limit on the minimum value of the sense resistor.

$$I_{\text{MIN}} \times R_{\text{SENSE}} \times \text{GAIN} > V_{\text{SN}} \quad (3)$$

where:

- I_{MIN} is the minimum current that will flow through R_{SENSE}.
- GAIN is the gain of the current-sense amplifier.

- V_{SN} is the negative output swing of the device.

表 8-1 shows an example of the different results obtained from using five different gain versions of the INA293-Q1. From the table data, the highest gain device allows a smaller current-shunt resistor and decreased power dissipation in the element.

表 8-1. R_{SENSE} Selection and Power Dissipation⁽¹⁾

PARAMETER		EQUATION	RESULTS AT $V_S = 5\text{ V}$				
			A1, B1 DEVICES	A2, B2 DEVICES	A3, B3 DEVICES	A4, B4 DEVICES	A5, B5 DEVICES
G	Gain		20 V/V	50 V/V	100 V/V	200 V/V	500 V/V
V_{DIFF}	Ideal differential input voltage	$V_{DIFF} = V_{OUT} / G$	250 mV	100 mV	50 mV	25 mV	10 mV
R_{SENSE}	Current sense resistor value	$R_{SENSE} = V_{DIFF} / I_{MAX}$	25 m Ω	10 m Ω	5 m Ω	2.5 m Ω	1 m Ω
P_{SENSE}	Current-sense resistor power dissipation	$R_{SENSE} \times I_{MAX}^2$	2.5 W	1 W	0.5W	0.25 W	0.1 W

(1) Design example with 10-A full-scale current with maximum output voltage set to 5 V.

8.1.2 Input Filtering

备注

Input filters are not required for accurate measurements using the INA293-Q1, and use of filters in this location is not recommended. If filter components are used on the input of the amplifier, follow the guidelines in this section to minimize the effects on performance.

Based strictly on user design requirements, external filtering of the current signal may be desired. The initial location that can be considered for the filter is at the output of the current sense amplifier. Although placing the filter at the output satisfies the filtering requirements, this location changes the low output impedance measured by any circuitry connected to the output voltage pin. The other location for filter placement is at the current sense amplifier input pins. This location satisfies the filtering requirement also, however the components must be carefully selected to minimally impact device performance. 图 8-1 shows a filter placed at the input pins.

图 8-1. Filter at Input Pins

External series resistance provides a source of additional measurement error, so keep the value of these series resistors to 10 Ω or less to reduce loss of accuracy. The internal bias network shown in 图 8-1 creates a mismatch in input bias currents (see 图 6-15, 图 6-16 and 图 6-17) when a differential voltage is applied between the input pins. If additional external series filter resistors are added to the circuit, a mismatch is created in the voltage drop across the filter resistors. This voltage is a differential error voltage in the shunt resistor voltage. In addition to the absolute resistor value, mismatch resulting from resistor tolerance can significantly impact the error because this value is calculated based on the actual measured resistance.

The measurement error expected from the additional external filter resistors can be calculated using 方程式 4, where the gain error factor is calculated using 方程式 5.

$$\text{Gain Error (\%)} = 100 - (100 \times \text{Gain Error Factor}) \tag{4}$$

The gain error factor, shown in 方程式 4, can be calculated to determine the gain error introduced by the additional external series resistance. 方程式 4 calculates the deviation of the shunt voltage, resulting from the attenuation and imbalance created by the added external filter resistance. 表 8-2 provides the gain error factor and gain error for several resistor values.

$$\text{Gain Error Factor} = \frac{R_B \times R_1}{(R_B \times R_1) + (R_B \times R_{IN}) + (2 \times R_{IN} \times R_1)} \tag{5}$$

Where:

- R_{IN} is the external filter resistance value.
- R_1 is the INA293-Q1 input resistance value specified in 表 7-1.
- R_B is the internal bias resistance, which is $6600 \Omega \pm 20\%$.

表 8-2. Example Gain Error Factor and Gain Error for 10-Ω External Filter Input Resistors

DEVICE (GAIN)	GAIN ERROR FACTOR	GAIN ERROR (%)
INA293-Q1x1 (20)	0.997108386	-0.289161432
INA293-Q1x2 (50)	0.996512207	-0.348779273
INA293-Q1x3 (100)	0.996512207	-0.348779273
INA293-Q1x4 (200)	0.995520159	-0.447984072
INA293-Q1x5 (500)	0.992555831	-0.744416873

8.2 Typical Application

The INA293-Q1 is a unidirectional, current-sense amplifier capable of measuring currents through a resistive shunt with shunt common-mode voltages from - 4 V to +110 V.

图 8-2. Current Sensing in a Solenoid Application

8.2.1 Design Requirements

In this example application, the common-mode voltage ranges from 0 V to 24 V. The maximum sense current is 1.5 A, and a 5-V supply is available for the INA293-Q1. Following the design guidelines from the *R_{SENSE} and Device Gain Selection* section, a R_{SENSE} of 50 mΩ and a gain of 50 V/V are selected to provide good output dynamic range. 表 8-3 lists the design setup for this application.

表 8-3. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Power supply voltage	5 V
Common-mode voltage range	0 V to 24 V
Maximum sense current	1.5 A
R _{SENSE} resistor	50 mΩ
Gain option	50 V/V

8.2.2 Detailed Design Procedure

The INA293-Q1 is designed to measure current in a typical solenoid application. The INA293-Q1 measures current across the 50-mΩ shunt that is placed at the output of the half-bridge. The INA293-Q1 measures the differential voltage across the shunt resistor, and the signal is internally amplified with a gain of 50 V/V. The output of the INA293-Q1 is connected to the analog-to-digital converter (ADC) of an MCU to digitize the current measurements.

Solenoid loads are highly inductive and are often prone to failure. Solenoids are often used for position control, precise fluid control, and fluid regulation. Measuring real-time current on the solenoid continuously can indicate premature failure of the solenoid which can lead to a faulty control loop in the system. Measuring high-side current also indicates if there are any ground faults on the solenoid or the FETs that can be damaged in an application. The INA293-Q1, with high bandwidth and slew rate, can be used to detect fast overcurrent conditions to prevent the solenoid damage from short-to-ground faults.

8.2.2.1 Overload Recovery With Negative V_{SENSE}

The INA293-Q1 is a unidirectional current sense amplifier that is meant to operate with a positive differential input voltage (V_{SENSE}). If negative V_{SENSE} is applied, the device is placed in an overload condition and requires time to recover once V_{SENSE} returns positive. The required overload recovery time increases with more negative V_{SENSE}.

8.2.3 Application Curve

图 8-3 shows the output response of a solenoid.

图 8-3. Solenoid Control Current Response

8.3 Power Supply Recommendations

The INA293-Q1 power supply can be 5 V, whereas the input common-mode voltage can vary between -4 V to 110 V. The output voltage range of the OUT pin, however, is limited by the voltage on the power-supply pin.

8.4 Layout

8.4.1 Layout Guidelines

Attention to good layout practices is always recommended.

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique makes sure that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins.

Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.

- Place the power-supply bypass capacitor as close as possible to the device power supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

8.4.2 Layout Example

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
