

## LM117QML-SP RHA 4.25V 至 41.25-V 3 端可调稳压器

### 1 特性

- 耐辐射加固保障 (RHA) 高达 100krad(Si) 总电离剂量 (TID)
  - 具有高剂量率 (HDR) : 50 - 300rad(Si)/s
  - 具有低剂量率 (LDR) : 10mrad(Si)/s
- 指定的 0.5A 或 1.5A 输出电流选项
- 低至 1.2V 的可调节输出
- 电流限制在各种温度下保持恒定
- 输出受到短路保护

### 2 应用

- 卫星电力系统 (EPS)
- PWM 控制器的辅助电源

### 3 说明

LM117QML-SP 3 端子正电压线性稳压器能够在 1.2V 至 37V 输出范围内提供 0.5A 或 1.5A 的电流。它简单易用，并且仅需要 2 个外部电阻器即可设置输出电压。

该稳压器是浮动的并且仅检测输入到输出差分电压，因此，只要不超过最大输入到输出差分电压，就可以调节几百伏特的电源电压。

经飞行验证的 LM117QML-SP 可提供电流限制、热过载保护和安全区保护等完整的过载保护功能。它用途广泛，还可用作可调节开关稳压器、可编程输出稳压器和精密电流调节器等。

典型电路原理图

对于高电压应用，LM117HVQML-SP 是一款引脚对引脚可直接替代器件，适合不超过 60V 的电压。有关 LM117QML-SP 负电压稳压器，请参阅 LM137QML-SP。

#### 器件信息

器件型号 <sup>(1)</sup>	等级 <sup>(2)</sup>	封装 <sup>(3)</sup>
LM117GWRQLMLV	LDR	CFP SOIC (NAC) 16 引脚 6.35mm × 9.91mm 质量 = 0.467g <sup>(5)</sup>
5962R9951707VZA	飞行等级 QMLV RHA 100krad(Si)	
LM117GWRQMLV	HDR	TO-39 (NDT) 3 引脚 8.26mm × 8.26mm 质量 = 1.036g <sup>(5)</sup>
5962R9951706VZA	飞行等级 QMLV RHA 100krad(Si)	
LM117HRLQMLV	LDR	TO-3 (K) 2 引脚 25.4mm × 38.94mm 质量 = 12.291g <sup>(5)</sup>
5962R9951705VXA	飞行等级 QMLV RHA 100krad(Si)	
LM117HRQMLV	HDR	裸片 2.18mm × 2.36mm
5962R9951703VXA	飞行等级 QMLV RHA 100krad(Si)

LM117K/EM	工程样片 <sup>(4)</sup>	
LM117H MDE	LDR	
5962R9951705V9A	飞行等级 QMLV RHA 100krad(Si)	
LM117H MDR	HDR	
5962R9951703V9A	飞行等级 QMLV RHA 100krad(Si)	

- 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。
- 有关器件等级的其他信息，请查看 [SLYB235](#)。
- 有关更多的封装详细信息，请参考 [TI 封装](#) 页面。
- 这些器件仅适用于工程评估，按照不合规的流程进行加工处理。不适用于鉴定、量产、辐射测试或飞行用途。无法在完整 MIL 额定温度范围 ( - 55°C 至 125°C ) 内或使用寿命期间保证其性能。
- 质量误差在 ±10% 以内。

Top View

表 6-1. Pin Functions

NAME	PIN			I/O	DESCRIPTION
	TO-3	TO-39	CFP SOIC		
ADJ	1	2	3	—	Adjust pin
$V_{IN}$	2	1	5	I	Input voltage pin for the regulator
$V_{OUT}$	CASE	3, CASE	12	O	Output voltage pin for the regulator
OUTPUT/SENSE	—	—	13	—	Used to sense the output voltage. Must be connected to $V_{OUT}$ for proper operation.
N/C	—	—	1, 2, 4, 6, 7, 8, 9, 10, 11, 14, 15, 16	—	No connection. These pins have no internal connections and may be grounded or left floating. They may also be connected to the board heatsink and used for thermal dissipation.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
	Power dissipation <sup>(2)</sup>	Internally limited		
	Input-output voltage differential	- 0.3	40	V
T <sub>stg</sub>	Storage temperature	- 65	150	°C
T <sub>Jmax</sub>	Maximum junction temperature		150	°C
	Lead temperature metal package		300	°C

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- The maximum power dissipation must be derated at elevated temperatures and is dictated by T<sub>Jmax</sub> (maximum junction temperature),  $\theta_{JA}$  (package junction to ambient thermal resistance), and T<sub>A</sub> (ambient temperature). The maximum allowable power dissipation at any temperature is  $P_{Dmax} = (T_{Jmax} - T_A) / \theta_{JA}$  or the number given in the Absolute Maximum Ratings, whichever is lower. Although power dissipation is internally limited, these specifications are applicable for power dissipations of 2 W for the TO-39 and CFP packages, and 20 W for the TO-3 package.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM) <sup>(1) (2)</sup>	±3000 V

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- Human body model, 100 pF discharged through a 1.5-k $\Omega$  resistor.

### 7.3 Recommended Operating Conditions

		MIN	MAX	UNIT
T <sub>A</sub>	Operating temperature	- 55	125	°C
V <sub>IN</sub>	Input voltage	4.25	41.25	V

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>			PACKAGE			UNIT
			TO-3 (K) 2 pin (LM117K)	TO-39 (NDT) 3 pin (LM117H)	CFP SOIC (NAC) 16 pin (LM117GW)	
R <sub><math>\theta_{JA}</math></sub>	Junction-to-ambient thermal resistance	Still air	39	186	130	°C/W
		500 LF/min air flow	14	64	80	
R <sub><math>\theta_{JC(bot)}</math></sub>	Junction-to-case (bottom) thermal resistance		1.9	21	7	°C/W

- For more information, see the [Semiconductor and IC package thermal metrics](#) application report.

## 7.5 Electrical Characteristics: 0.5 - A I<sub>OUT</sub> Devices (LM117H, LM117GW)

Over operating temperature range (T = -55°C to 125°C) unless otherwise noted.

PARAMETER		TEST CONDITIONS <sup>(1)</sup>		SUBGROUP <sup>(2)</sup>	MIN	MAX	UNIT

## 8 Detailed Description

### 8.1 Overview

The LM117QML-SP 3-terminal positive voltage linear regulator is capable of supplying either 0.5 A or 1.5 A over a 1.2-V to 37-V output range. It is simple to use and requires only two external resistors to set the output voltage. Further, both line and load regulation are better than standard fixed regulators.

The regulator is "floating" and sees only the input-to-output differential voltage, thus enabling supplies of several hundred volts to be regulated as long as the maximum input-to-output differential is not exceeded (i.e. don't short circuit the output).

The LM117QML-SP offers full overload protection such as current limit, thermal overload protection, and safe area protection. All overload protection circuitry remains fully functional even if the adjustment terminal is disconnected.

Typically, no capacitors are needed unless the device is situated more than 6 in from the input filter capacitors in which case an input bypass is needed. An optional output capacitor can be added to improve transient response. The adjustment terminal can be bypassed to achieve very high ripple rejection ratios which are difficult to achieve with standard 3-terminal regulators.

This device makes an especially simple adjustable switching regulator, a programmable output regulator, or by connecting a fixed resistor between the adjustment pin and output it can be used as a precision current regulator. Supplies with electronic shutdown can be achieved by clamping the adjustment terminal to ground which programs the output to 1.2 V where most loads draw little current.

### 8.2 Functional Block Diagram

图 8-1. Functional Block Diagram

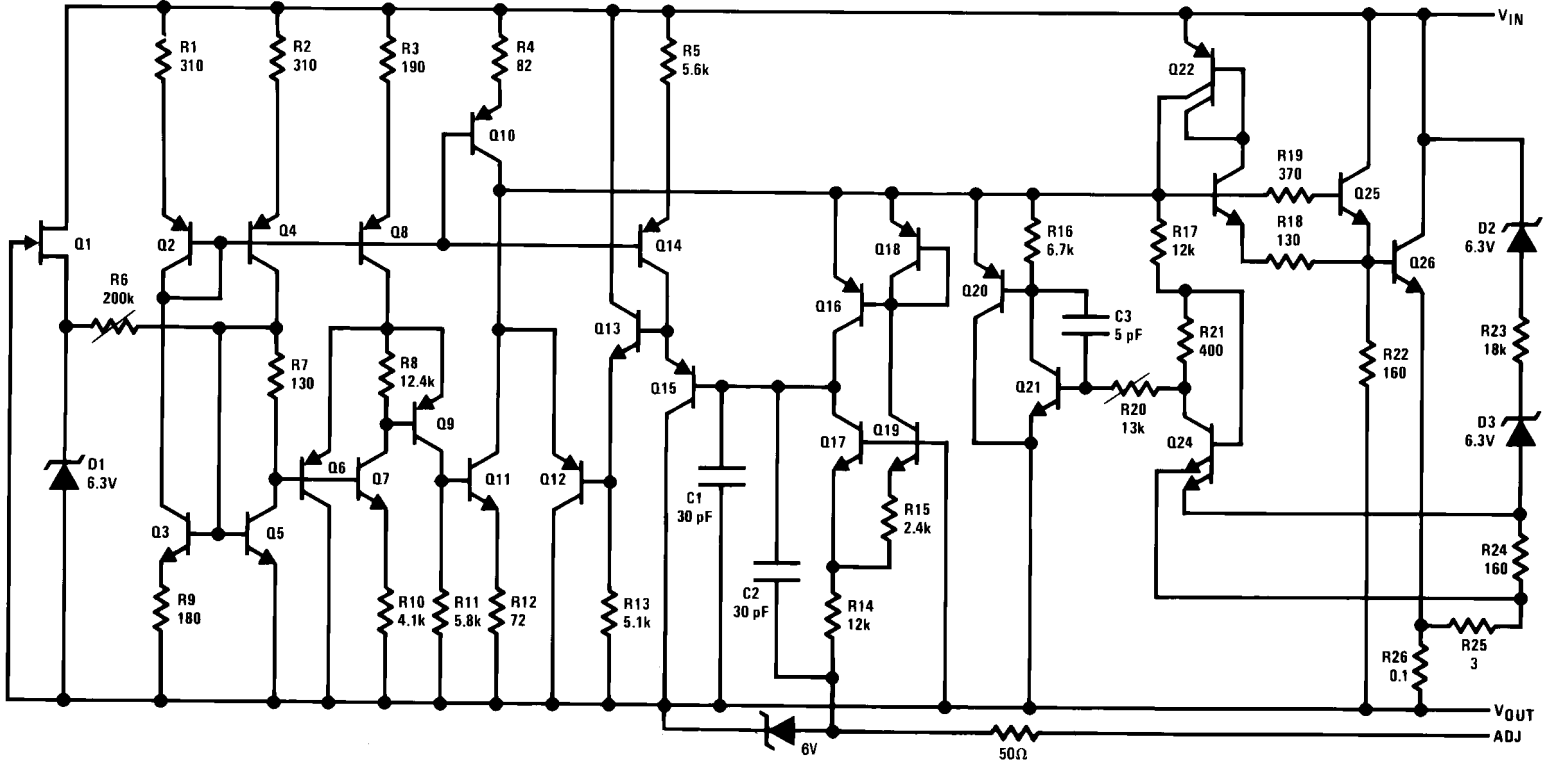

图 8-2. Simplified Device Schematic

### 8.3 Setting Output Voltage

In operation, the LM117 develops a nominal 1.25-V reference voltage,  $V_{REF}$ , between the output and adjustment terminal. The reference voltage is expressed across R1 and, since the voltage is constant, a constant current  $I_1$  then flows through R2, giving an output voltage found by using 方程式 1.

$$V_{OUT} = V_{REF} \left( 1 + \frac{R2}{R1} \right) + I_{ADJ}R2 \quad (1)$$

Since the 100- $\mu$ A current from the adjustment terminal represents an error term, the LM117 was designed to minimize  $I_{ADJ}$  and make it relatively constant with line and load changes. To do this, all quiescent operating current is returned to the output establishing a minimum load current requirement. If there is insufficient load on the output, the output will rise.

To mitigate the requirement for an added load to sink the required output current, the resistor divider may be selected so that it alone can sink the largest specified output load current of 5 mA. This has the additional benefit of minimizing the  $I_{ADJ}$  error term (which varies over temperature).

## 8.4 External Capacitors

An input bypass capacitor is recommended. A 0.1- $\mu$ F ceramic disc or 1- $\mu$ F solid tantalum on the input is suitable input bypassing for almost all applications. The device is more sensitive to the absence of input bypassing when adjustment or output capacitors are used but the above values will minimize the possibility of problems.

The adjustment terminal can be bypassed to ground on the LM117 to improve ripple rejection. This bypass capacitor prevents ripple from being amplified as the output voltage is increased. With a 10- $\mu$ F bypass capacitor 80-dB ripple rejection is obtainable at any output level. Increases over 10  $\mu$ F do not appreciably improve the ripple rejection at frequencies above 120 Hz. If the bypass capacitor is used, it is sometimes necessary to include protection diodes to prevent the capacitor from discharging through internal low current paths and damaging the device (see [§ 8.6](#)).

In general, the best type of capacitors to use are solid tantalum. Solid tantalum capacitors have low impedance even at high frequencies. Depending upon capacitor construction, it takes about 25  $\mu$ F in aluminum electrolytic to equal 1- $\mu$ F solid tantalum at high frequencies. Ceramic capacitors are also good at high frequencies; but some types have a large decrease in capacitance at frequencies around 0.5 MHz. For this reason, 0.01- $\mu$ F disc may seem to work better than a 0.1- $\mu$ F disc as a bypass.

Although the LM117 is stable with no output capacitors, like any feedback circuit, certain values of external capacitance can cause excessive ringing. This occurs with values between 500 pF and 5000 pF. A 1- $\mu$ F solid tantalum (or 25- $\mu$ F aluminum electrolytic) on the output swamps this effect and insures stability. Any increase of the load capacitance larger than 10  $\mu$ F will merely improve the loop stability and output impedance.

## 8.5 Load Regulation

The LM117 is capable of providing extremely good load regulation but a few precautions are needed to obtain maximum performance. The current set resistor connected between the adjustment terminal and the output terminal (usually 240  $\Omega$ ) should be tied directly to the output (case) of the regulator rather than near the load. This eliminates line drops from appearing effectively in series with the reference and degrading regulation. For example, a 15-V regulator with 0.05- $\Omega$  resistance between the regulator and load will have a load regulation due to line resistance of 0.05  $\Omega \times I_L$ . If the set resistor is connected near the load the effective line resistance will be 0.05  $\Omega (1 + R_2 / R_1)$  or in this case, 11.5 times worse.

[图 8-3](#) shows the effect of resistance between the regulator and 240- $\Omega$  set resistor.

**图 8-3. Regulator With Line Resistance in Output Lead**

With the TO-3 package, it is easy to minimize the resistance from the case to the set resistor, by using two separate leads to the case. However, with the TO-39 package, care should be taken to minimize the wire length of the output lead. The ground of R2 can be returned near the ground of the load to provide remote ground sensing and improve load regulation.

## 8.6 Protection Diodes

When external capacitors are used with an IC regulator, it is sometimes necessary to add protection diodes to prevent the capacitors from discharging through low current points into the regulator. Most 10- $\mu$ F capacitors have low enough internal series resistance to deliver 20-A spikes when shorted. Although the surge is short, there is enough energy to damage parts of the IC.

When an output capacitor is connected to a regulator and the input is shorted, the output capacitor will discharge into the output of the regulator. The discharge current depends on the value of the capacitor, the output voltage of the regulator, and the rate of decrease of  $V_{IN}$ . In the LM117, this discharge path is through a large junction that is able to sustain 15-A surge. This is not true of all types of positive regulators. For output capacitors of 25  $\mu$ F or less, there is generally no need to use diodes.

The bypass capacitor on the adjustment terminal can discharge through a low current junction. Discharge occurs when *either* the input or output is shorted. Internal to the LM117 is a 50- $\Omega$  resistor which limits the peak discharge current. No protection is needed for output voltages of 25 V or less and 10- $\mu$ F capacitance. [图 8-4](#) shows an LM117 with protection diodes included for use with outputs greater than 25 V and high values of output capacitance.

D1 protects against C1 (such as due to a  $V_{IN}$  short)

D2 protects against C2 (such as due to a  $V_{OUT}$  short)

## 10 Power Supply Recommendations

The input supply to the LM117QML-SP must be kept at a voltage level such that its maximum input to output differential voltage is not exceeded. The minimum dropout voltage must also be met with extra headroom when possible to keep the LM117QML-SP in regulation. An input capacitor is recommended, especially when the input pin is located more than 6 in away from the power supply source. For more information regarding capacitor selection, refer to [External Capacitors](#).

## 11 Layout

### 11.1 Layout Guidelines

Ensure wide enough traces for those carrying the load current in order to reduce the amount of parasitic trace inductance. Keep the feedback loop from VOUT to ADJ as short as possible. To improve PSRR, a bypass capacitor can be placed at the ADJ pin and must be located as close as possible to the IC. In cases when VIN shorts to ground, an external diode must be placed from VOUT to VIN to divert the surge current from the output capacitor and protect the IC. Similarly, in cases when a large bypass capacitor is placed at the ADJ pin and VOUT shorts to ground, an external diode must be placed from ADJ to VOUT to provide a path for the bypass capacitor to discharge. These diodes must be placed close to the corresponding LM117QML-SP pins to increase their effectiveness.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
