

LM2676 SIMPLE SWITCHER® 电源转换器、3A、高效降压稳压器

1 特性

- 推出的新产品：
 - LMR51430 4.5V 至 36V、3A、500kHz 至 1.1MHz 同步转换器
- 用于加快上市速度：
 - TLVM13630 3V 至 36V、3A、200kHz 至 2.2MHz 电源模块
- 效率高达 94%
- 实现便捷设计 (使用现成的外部元件)
- 150mΩ DMOS 输出开关
- 3.3V、5V、12V 固定输出和可调节 (1.2V 至 37V) 版本
- 关断时的待机电流为 50μA
- 在所有线路和负载条件下具有 ±2% 的最大输出容差
- 宽输入电压范围：8V 至 40V
- 260kHz 固定频率内部振荡器
- 40°C 至 125°C 的工作结温范围

2 应用

- 通信模块
- 电表
- 呼叫按钮操作面板
- 电机驱动器

3 说明

LM2676 系列稳压器是为降压开关稳压器提供全部所示功能的单片集成电路，能够驱动高达 3A 的负载，并且拥有出色的线路和负载调节特性。使用低导通电阻 DMOS 电源开关可获得高效率 (>90%)。该系列包含 3.3V、5V 和 12V 固定输出电压和可调节输出版本。

SIMPLE SWITCHER® 电源转换器概念使用超少的外部元件即可提供完整设计。高固定频率振荡器 (260kHz) 允许使用物理尺寸更小的元件。多家制造商提供了一系列可与 LM2676 搭配使用的标准电感器，可极大地简化设计过程。

LM2676 系列还具有内置热关断、电流限制和开关控制输入，可将稳压器下电至 50μA 的低静态电流待机状态。可确保输出电压容差为 ±2%。时钟频率控制在 ±11% 的容差范围内。

封装信息

器件型号	封装 ⁽¹⁾	封装尺寸 (标称值)
LM2676	KTW (TO-263, 7)	10.10mm × 8.89mm
	NDZ (TO-220, 7)	14.986mm × 10.16mm
	NHM (VSON, 14)	6.00mm × 5.00mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

DAP connect to pin 9

图 5-3. NHM Package 14-Pin VSON Top View

表 5-1. Pin Functions

NAME	PIN		I/O	DESCRIPTION
	TO-263, TO-220	VSON		
Switch output	1	12, 13, 14	O	Source pin of the internal high-side FET. This is a switching node. Attached this pin to an inductor and the cathode of the external diode.
Input	2	2, 3	I	Supply input pin to collector pin of high-side FET. Connect to power supply and input bypass capacitors C_{IN} . Path from V_{IN} pin to high frequency bypass C_{IN} and GND must be as short as possible.
CB	3	4	I	Boot-strap capacitor connection for high-side driver. Connect a high-quality 100-nF capacitor from CB to VSW Pin.
GND	4	9	—	Power ground pins. Connect to system ground. Ground pins of C_{IN} and C_{OUT} . Path to C_{IN} must be as short as possible.
FB	6	7	I	Feedback sense input pin. Connect to the midpoint of feedback divider to set V_{OUT} for ADJ version or connect this pin directly to the output capacitor for a fixed output version.
ON/ OFF	7	8	I	Enable input to the voltage regulator. High = ON and low = OFF. Pull this pin high or float to enable the regulator.
NC	5	1, 5, 6, 10, 11	—	No connect pins

6 Specifications

6.1 Absolute Maximum Ratings

see (1) (2)

		MIN	MAX	UNIT
Input supply voltage			45	V
Soft-start pin voltage		- 0.1	6	V
Switch voltage to ground ⁽³⁾		- 1	V _{IN}	V
Boost pin voltage			V _{SW} + 8	V
Feedback pin voltage		- 0.3	14	V
Power dissipation		Internally Limited		
Soldering temperature	Wave, 4 s		260	°C
	Infrared, 10 s		240	
	Vapor phase, 75 s		219	
Storage temperature, T _{stg}		- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.
- (3) The absolute maximum specification of the *Switch Voltage to Ground* applies to DC voltage. An extended negative voltage limit of - 10 V applies to a pulse of up to 20 ns, - 6 V of 60 ns and - 3 V of up to 100 ns.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ^{(1) (2)}	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) ESD was applied using the human-body model, a 100-pF capacitor discharged through a 1.5-k Ω resistor into each pin.

6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
Supply voltage		8	40	V
Junction temperature (T _J)		- 40	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LM2678			UNIT	
		NDZ (TO-220)	KTW (TO-263)	NHM (VSON)		
		7 PINS	7 PINS	14 PINS

R _{θJC(top)}	Junction-to-case (top) thermal resistance	2	2	—	°C/W	

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report, SPRA953.

- (2) Junction to ambient thermal resistance (no external heat sink) for the 7-lead TO-220 package mounted vertically, with 0.5 in leads in a socket, or on a PCB with minimum copper area.
- (3) Junction to ambient thermal resistance (no external heat sink) for the 7-lead TO-220 package mounted vertically, with 0.5 in leads soldered to a PCB containing approximately 4 square inches of (1 oz) copper area surrounding the leads.
- (4) Junction to ambient thermal resistance for the 7-lead DDPAK mounted horizontally against a PCB area of 0.136 square inches (the same size as the DDPAK package) of 1 oz (0.0014 in thick) copper.
- (5) Junction to ambient thermal resistance for the 7-lead DDPAK mounted horizontally against a PCB area of 0.4896 square inches (3.6 times the area of the DDPAK package) of 1 oz (0.0014 in thick) copper.
- (6) Junction to ambient thermal resistance for the 7-lead DDPAK mounted horizontally against a PCB copper area of 1.0064 square inches (7.4 times the area of the DDPAK 3 package) of 1 oz (0.0014 in thick) copper. Additional copper area reduces thermal resistance further.
- (7) Junction to ambient thermal resistance for the 14-lead VSON mounted on a PCB copper area equal to the die attach paddle.
- (8) Junction to ambient thermal resistance for the 14-lead VSON mounted on a PCB copper area using 12 vias to a second layer of copper equal to die attach paddle. Additional copper area reduces thermal resistance further. For layout recommendations, see the [AN-1187 Leadless Leadfram Package \(LLP\)](#) application report.

6.5 Electrical Characteristics: LM2676 - 3.3 V

Specifications apply for $T_A = T_J = 25^\circ\text{C}$ unless otherwise noted. $R_{ADJ} = 5.6\text{ k}\Omega$.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT	
V_{OUT}	Output voltage	$V_{IN} = 8\text{ V to }40\text{ V}$, $100\text{ mA} \leq I_{OUT} \leq 5\text{ A}$ A		3.234	3.3	3.366	V
			over the entire junction temperature range of operation - 40°C to 125°C	3.201		3.399	
η	Efficiency	$V_{IN} = 12\text{ V}$, $I_{LOAD} = 5\text{ A}$		86%			

- (1) All room temperature limits are 100% tested during production with $T_A = T_J = 25^\circ\text{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical values are determined with $T_A = T_J = 25^\circ\text{C}$ and represent the most likely norm.

6.6 Electrical Characteristics: LM2676 - 5 V

Specifications apply for $T_A = T_J = 25^\circ\text{C}$ unless otherwise noted. $R_{ADJ} = 5.6\text{ k}\Omega$.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT	
V_{OUT}	Output voltage	$V_{IN} = 8\text{ V to }40\text{ V}$, $100\text{ mA} \leq I_{OUT} \leq 5\text{ A}$ A		4.9	5	5.1	V
			over the entire junction temperature range of operation - 40°C to 125°C	4.85		5.15	
η	Efficiency	$V_{IN} = 12\text{ V}$, $I_{LOAD} = 5\text{ A}$		88%			

- (1) All room temperature limits are 100% tested during production with $T_A = T_J = 25^\circ\text{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical values are determined with $T_A = T_J = 25^\circ\text{C}$ and represent the most likely norm.

6.7 Electrical Characteristics: LM2676 - 12 B

Specifications apply for $T_A = T_J = 25^\circ\text{C}$ unless otherwise noted. $R_{ADJ} = 5.6\text{ k}\Omega$.

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT	
V_{OUT}	Output voltage	$V_{IN} = 15\text{ V to }40\text{ V}$, $100\text{ mA} \leq I_{OUT} \leq 5\text{ A}$ A		11.76	12	12.24	V
			over the entire junction temperature range of operation - 40°C to 125°C	11.64		12.36	
η	Efficiency	$V_{IN} = 24\text{ V}$, $I_{LOAD} = 5\text{ A}$		94%			

- (1) All room temperature limits are 100% tested during production with $T_A = T_J = 25^\circ\text{C}$. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical values are determined with $T_A = T_J = 25^\circ\text{C}$ and represent the most likely norm.

6.8 Electrical Characteristics: LM2676 - Adjustable

PARAMETER		TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT	
V _{FB}	Feedback voltage	V _{IN} = 8 V to 40 V, 100 mA ≤ I _{OUT} ≤ 5 A, V _{OUT} programmed for 5 V		1.186	1.21	1.234	V
			over the entire junction temperature range of operation - 40°C to 125°C	1.174		1.246	
η	Efficiency	V _{IN} = 12 V, I _{LOAD} = 5 A		88%			

- (1) All room temperature limits are 100% tested during production with T_A = T_J = 25°C. All limits at temperature extremes are specified through correlation using standard Quality Control (SQC) methods. All limits are used to calculate Average Outgoing Quality Level (AOQL).
- (2) Typical values are determined with T_A = T_J = 25°C and represent the most likely norm.

6.9 Electrical Characteristics - All Output Voltage Versions

Specifications are for T_A = T_J = 25°C unless otherwise specified. Unless otherwise specified V_{IN} = 12 V for the 3.3-V, 5-V, and Adjustable versions and V_{IN} = 24 V for the 12-V version.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DEVICE PARAMETERS						
I _Q	Quiescent current	V _{FEEDBACK} = 8 V for 3.3-V, 5-V, and ADJ versions, V _{FEEDBACK} = 15 V for 12-V versions		4.2	6	mA
I _{STBY}	Standby quiescent current	ON/ OFF pin = 0 V		50	100	μA
			over the entire junction temperature range of operation - 40°C to 125°C		150	
I _{CL}	Current limit		3.8	4.5	5.25	A
		over the entire junction temperature range of operation - 40°C to 125°C	3.6		5.4	
I _L	Output leakage current	V _{IN} = 40 V, soft-start pin = 0 V	V _{SWITCH} = 0V		200	μA
			V _{SWITCH} = -1V		16	15
R _{DS(ON)}	Switch ON-resistance	I _{SWITCH} = 5 A		0.15	0.17	Ω
			over the entire junction temperature range of operation - 40°C to 125°C		0.29	
f _O	Oscillator frequency	Measured at switch pin		260		kHz
			over the entire junction temperature range of operation - 40°C to 125°C	225		
D	Duty cycle	Maximum duty cycle		91%		
		Minimum duty cycle		0%		
I _{BIAS}	Feedback bias current	V _{FEEDBACK} = 1.3 V ADJ version only		85		nA
V _{ON/OFF}	ON/OFF threshold voltage			1.4		V
		over the entire junction temperature range of operation - 40°C to 125°C	0.8		2	
I _{ON/OFF}	ON/OFF input current	ON/ OFF pin = 0 V		20		μA
			over the entire junction temperature range of operation - 40°C to 125°C

7 Detailed Description

7.1 Overview

The LM2676 provides all of the active functions required for a step-down (buck) switching regulator. The internal power switch is a DMOS-power MOSFET to provide power supply designs with high current capability, up to 3 A, and highly efficient operation.

The design support WEBENCH can also be used to provide instant component selection, circuit performance calculations for evaluation, a bill of materials component list, and a circuit schematic for LM2676.

7.2 Functional Block Diagram

* Active Inductor Patent Number 5,514,947 † Active Capacitor Patent Number 5,382,918

7.3 Feature Description

7.3.1 Switch Output

This is the output of a power MOSFET switch connected directly to the input voltage. The switch provides energy to an inductor, an output capacitor, and the load circuitry under control of an internal pulse-width-modulator (PWM). The PWM controller is internally clocked by a fixed 260-kHz oscillator. In a standard step-down application, the duty cycle (Time ON/Time OFF) of the power switch is proportional to the ratio of the power supply output voltage to the input voltage. The voltage on pin 1 switches between V_{IN} (switch ON) and below ground by the voltage drop of the external Schottky diode (switch OFF).

7.3.2 Input

The input voltage for the power supply is connected to pin 2. In addition to providing energy to the load, the input voltage also provides bias for the internal circuitry of the LM2676. For ensured performance, the input voltage must be in the range of 8 V to 40 V. For best performance of the power supply, the input pin must always be bypassed with an input capacitor located close to pin 2.

7.3.3 C Boost

A capacitor must be connected from pin 3 to the switch output, pin 1. This capacitor boosts the gate drive to the internal MOSFET above V_{IN} to fully turn it ON. This minimizes conduction losses in the power switch to maintain high efficiency. The recommended value for C Boost is 0.01 μ F.

7.3.4 Ground

This is the ground reference connection for all components in the power supply. In fast-switching, high-current applications such as those implemented with the LM2676, TI recommends that a broad ground plane be used to minimize signal coupling throughout the circuit.

7.3.5 Feedback

This is the input to a two-stage high gain amplifier, which drives the PWM controller. It is necessary to connect pin 6 to the actual output of the power supply to set the DC output voltage. For the fixed output devices (3.3-V, 5-V, and 12-V outputs), a direct wire connection to the output is all that is required as internal gain setting resistors are provided inside the LM2676. For the adjustable output version, two external resistors are required to set the DC output voltage. For stable operation of the power supply, it is important to prevent coupling of any inductor flux to the feedback input.

7.3.6 ON/OFF

This input provides an electrical ON/OFF control of the power supply. Connecting this pin to ground or to any voltage less than 0.8 V completely turns OFF the regulator. The current drain from the input supply when OFF is only 50 μ A. Pin 7 has an internal pullup current source of approximately 20 μ A and a protection clamp Zener diode of 7 V to ground. When electrically driving the ON/ $\overline{\text{OFF}}$ pin, the high voltage level for the ON condition must not exceed the 6-V absolute maximum limit. When ON/OFF control is not required, pin 7 must be left open circuited.

7.4 Device Functional Modes

7.4.1 Shutdown Mode

The ON/ $\overline{\text{OFF}}$ pin provides electrical ON and OFF control for the LM2676. When the voltage of this pin is lower than 1.4 V, the device is shutdown mode. The typical standby current in this mode is 45 μ A.

7.4.2 Active Mode

When the voltage of the ON/ $\overline{\text{OFF}}$ pin is higher than 1.4 V, the device starts switching and the output voltage rises until it reaches a normal regulation voltage.

8 Application and Implementation

备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

8.1 Application Information

8.1.1 Design Considerations

Power supply design using the LM2676 is greatly simplified by using recommended external components. A wide range of inductors, capacitors, and Schottky diodes from several manufacturers have been evaluated for use in designs that cover the full range of capabilities (input voltage, output voltage, and load current) of the LM2676. A simple design procedure using nomographs and component tables provided in this data sheet leads to a working design with very little effort.

The individual components from the various manufacturers called out for use are still just a small sample of the vast array of components available in the industry. While TI recommends these components, they are not exclusively the only components for use in a design. After a close comparison of component specifications, equivalent devices from other manufacturers can be substituted for use in an application.

The following sections include important considerations for each external component and an explanation of how the nomographs and selection tables were developed.

8.1.2 Inductor

The inductor is the key component in a switching regulator. For efficiency, the inductor stores energy during the switch ON time and then transfers energy to the load while the switch is OFF.

Nomographs are used to select the inductance value required for a given set of operating conditions. The nomographs assume that the circuit is operating in continuous mode (the current flowing through the inductor never falls to zero). The magnitude of inductance is selected to maintain a maximum ripple current of 30% of the maximum load current. If the ripple current exceeds this 30% limit, the next larger value is selected.

The inductors offered have been specifically manufactured to provide proper operation under all operating conditions of input and output voltage and load current. Several part types are offered for a given amount of inductance. Both surface mount and through-hole devices are available. The inductors from each of the three manufacturers have unique characteristics:

- Renco:
 - Ferrite stick core inductors
 - Typically has the lowest cost
 - Can withstand ripple and transient peak currents above the rated value
 - Have an external magnetic field, which can generate EMI
- Pulse Engineering:
 - Powdered iron toroid core inductors
 - Can withstand higher than rated currents
 - Because they are toroid inductors, they have low EMI.
- Coilcraft:
 - Ferrite drum core inductors
 - Are the smallest physical size inductors
 - Are only available as surface mount components
 - Generate EMI, but less than stick inductors

8.1.3 Output Capacitor

The output capacitor acts to smooth the DC output voltage and also provides energy storage. Selection of an output capacitor, with an associated equivalent series resistance (ESR), impacts both the amount of output ripple voltage and stability of the control loop.

The output ripple voltage of the power supply is the product of the capacitor ESR and the inductor ripple current. The capacitor types recommended in the tables were selected for having low ESR ratings.

In addition, both surface mount tantalum capacitors and through-hole aluminum electrolytic capacitors are offered as solutions.

Impacting frequency stability of the overall control loop and the output capacitance, in conjunction with the inductor, creates a double pole inside the feedback loop. In addition, the capacitance and the ESR value create a zero. These frequency response effects together, with the internal frequency compensation circuitry of the LM2676, modify the gain and phase shift of the closed-loop system.

As a general rule for stable switching regulator circuits, it is desired to have the unity gain bandwidth of the circuit to be limited to no more than one-sixth of the controller switching frequency. With the fixed 260-kHz switching frequency of the LM2676, the output capacitor is selected to provide a unity gain bandwidth of 40 kHz (maximum). Each recommended capacitor value has been chosen to achieve this result.

In some cases, multiple capacitors are required either to reduce the ESR of the output capacitor, to minimize output ripple (a ripple voltage of 1% of V_{OUT} or less is the assumed performance condition), or to increase the output capacitance to reduce the closed-loop unity gain bandwidth to less than 40 kHz. When parallel combinations of capacitors are required, it has been assumed that each capacitor is the exact same part type.

The RMS current and working voltage (WV) ratings of the output capacitor are also important considerations. In a typical step-down switching regulator, the inductor ripple current (set to be no more than 30% of the maximum load current by the inductor selection) is the current that flows through the output capacitor. The capacitor RMS current rating must be greater than this ripple current. The voltage rating of the output capacitor must be greater than 1.3 times the maximum output voltage of the power supply. If operation of the system at elevated temperatures is required, the capacitor voltage rating can be de-rated to less than the nominal room temperature rating. Careful inspection of the manufacturer's specification for de-rating of working voltage with temperature is important.

8.1.4 Input Capacitor

Fast changing currents in high current switching regulators place a significant dynamic load on the unregulated power source. An input capacitor helps provide additional current to the power supply and smooth out input voltage variations.

Like the output capacitor, the key specifications for the input capacitor are RMS current rating and working voltage. The RMS current flowing through the input capacitor is equal to one-half of the maximum DC load current so the capacitor must be rated to handle this. Paralleling multiple capacitors proportionally increases the current rating of the total capacitance. The voltage rating must also be selected to be 1.3 times the maximum input voltage. Depending on the unregulated input power source, under light load conditions, the maximum input voltage can be significantly higher than normal operation. Consider this when selecting an input capacitor.

The input capacitor must be placed very close to the input pin of the LM2676. Due to relative high current operation with fast transient changes, the series inductance of input connecting wires or PCB traces can create ringing signals at the input terminal which can possibly propagate to the output or other parts of the circuitry. It can be necessary in some designs to add a small valued (0.1 μF to 0.47 μF) ceramic type capacitor in parallel with the input capacitor to prevent or minimize any ringing.

8.1.5 Catch Diode

When the power switch in the LM2676 turns OFF, the current through the inductor continues to flow. The path for this current is through the diode connected between the switch output and ground. This forward-biased diode clamps the switch output to a voltage less than ground. This negative voltage must be greater than -1 V so TI recommends a low voltage drop (particularly at high current levels) Schottky diode. Total efficiency of the entire

power supply is significantly impacted by the power lost in the output catch diode. The average current through the catch diode is dependent on the switch duty cycle (D) and is equal to the load current times (1-D). Use of a diode rated for much higher current than is required by the actual application helps minimize the voltage drop and power loss in the diode.

During the switch ON time, the diode is reversed biased by the input voltage. The reverse voltage rating of the diode must be at least 1.3 times greater than the maximum input voltage.

8.1.6 Boost Capacitor

The boost capacitor creates a voltage used to overdrive the gate of the internal power MOSFET. This improves efficiency by minimizing the on-resistance of the switch and associated power loss. For all applications, TI recommends a 0.01- μ F, 50-V ceramic capacitor.

8.1.7 Additional Application Information

When the output voltage is greater than approximately 6 V and the duty cycle at minimum input voltage is greater than approximately 50%, the designer must exercise caution in selection of the output filter components. When an application designed to these specific operating conditions is subjected to a current limit fault condition, it can be possible to observe a large hysteresis in the current limit. This can affect the output voltage of the device until the load current is reduced sufficiently to allow the current limit protection circuit to reset itself.

Under current limiting conditions, the LM267x is designed to respond in the following manner:

1. At the moment when the inductor current reaches the current limit threshold, the ON-pulse is immediately terminated. This happens for any application condition.
2. However, the current limit block is also designed to momentarily reduce the duty cycle to below 50% to avoid subharmonic oscillations, which can cause the inductor to saturate.
3. Thereafter, after the inductor current falls below the current limit threshold, there is a small relaxation time during which the duty cycle progressively rises back above 50% to the value required to achieve regulation.

If the output capacitance is sufficiently *large*, it can be possible that as the output tries to recover. The output capacitor charging current is large enough to repeatedly re-trigger the current limit circuit before the output has fully settled. This condition is exacerbated with higher output voltage settings because the energy requirement of the output capacitor varies as the square of the output voltage ($\frac{1}{2} CV^2$), thus requiring an increased charging current.

A simple test to determine if this condition can exist for a suspect application is to apply a short circuit across the output of the converter, then remove the shorted output condition. In an application with properly selected external components, the output recovers smoothly.

Practical values of external components that have been experimentally found to work well under these specific operating conditions are $C_{OUT} = 47 \mu\text{F}$, $L = 22 \mu\text{H}$. Note that even with these components, for a current limit of I_{CLIM} of the device, the maximum load current under which the possibility of the large current limit hysteresis can be minimized, is $I_{CLIM} / 2$. For example, if the input is 24 V and the set output voltage is 18 V, then for a desired maximum current of 1.5 A, the current limit of the chosen switcher must be confirmed to be at least 3 A.

Under extreme overcurrent or short-circuit conditions, the LM267x employs frequency foldback in addition to the current limit. If the cycle-by-cycle inductor current increases above the current limit threshold (due to short circuit or inductor saturation for example), the switching frequency is automatically reduced to protect the IC. Frequency below 100 kHz is typical for an extreme short-circuit condition.

8.2 Typical Applications

8.2.1 Typical Application for All Output Voltage Versions

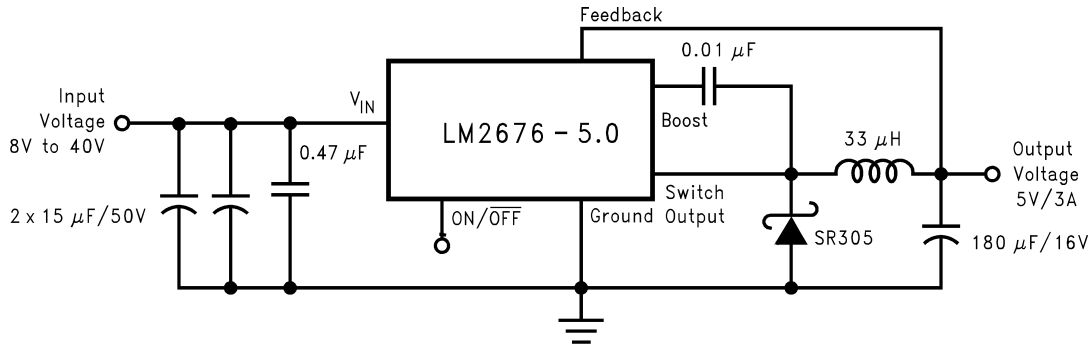

图 8-1. Basic Circuit for All Output Voltage Versions

8.2.1.1 Design Requirements

Select the power supply operating conditions and the maximum output current and follow below procedures to find the external components for LM2676.

8.2.1.2 Detailed Design Procedure

A complete step-down regulator can be designed in a few simple steps using the nomographs and tables in this data sheet (or use the available design software at www.ti.com).

Step 1: Define the power supply operating conditions:

- Required output voltage
- Maximum DC input voltage
- Maximum output load current

Step 2: Set the output voltage by selecting a fixed output LM2676 (3.3-V, 5-V or 12-V applications) or determine the required feedback resistors for use with the adjustable LM2676-ADJ.

Step 3: Determine the inductor required by using one of the four nomographs (图 8-2 through 图 8-5). 表 8-3 provides a specific manufacturer and part number for the inductor.

Step 4: Using 表 8-5 and 表 8-6 (fixed output voltage) or 表 8-9 and 表 8-10 (adjustable output voltage), determine the output capacitance required for stable operation. 表 8-1 and 表 8-2 provide the specific capacitor type from the manufacturer of choice.

Step 5: Determine an input capacitor from 表 8-7 or 表 8-8 for fixed output voltage applications. Use 表 8-1 or 表 8-2 to find the specific capacitor type. For adjustable output circuits, select a capacitor from 表 8-1 or 表 8-2 with a sufficient working voltage (WV) rating greater than $V_{IN\ max}$, and an RMS current rating greater than one-half the maximum load current (two or more capacitors in parallel can be required).

Step 6: Select a diode from 表 8-4. The current rating of which must be greater than $I_{LOAD\ max}$ and the reverse voltage rating must be greater than $V_{IN\ max}$.

Step 7: Include a 0.01- μ F, 50-V capacitor for C_{BOOST} in the design.

8.2.2 Application Curves

For Continuous Mode Operation

8.2.3 Fixed Output Voltage Application

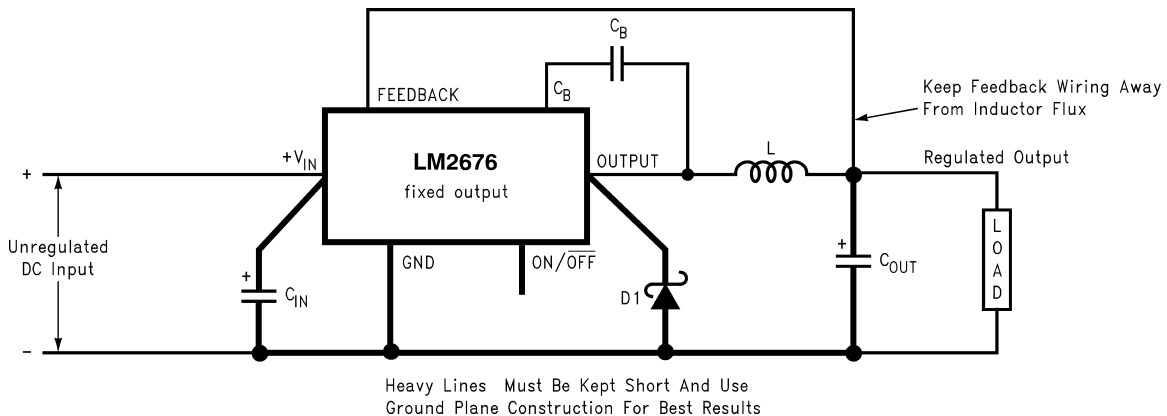

图 8-6. Basic Circuit for Fixed Output Voltage Applications.

8.2.3.1 Design Requirements

Select the power supply operating conditions and the maximum output current and follow below procedures to find the external components for the LM2676.

8.2.3.2 Detailed Design Procedure

A system logic power supply bus of 3.3 V is to be generated from a wall adapter which provides an unregulated DC voltage of 13 V to 16 V. The maximum load current is 2.5 A. Through-hole components are preferred.

Step 1: Operating conditions are:

- $V_{OUT} = 3.3\text{ V}$
- V_{IN} maximum = 16 V
- I_{LOAD} maximum = 2.5 A

Step 2: Select an LM2676T-3.3. The output voltage has a tolerance of $\pm 2\%$ at room temperature and $\pm 3\%$ over the full operating temperature range.

Step 3: Use the nomograph for the 3.3-V device (图 8-2). The intersection of the 16-V horizontal line (V_{IN} max) and the 2.5-A vertical line (I_{LOAD} max) indicates that L33, a 22- μH inductor, is required.

From 表 8-3, L33 in a through-hole component is available from Renco with part number RL-1283-22-43 or part number PE-53933 from Pulse Engineering.

Step 4: Use 表 8-5 or 表 8-6 to determine an output capacitor. With a 3.3-V output and a 22- μH inductor, there are four through-hole output capacitor solutions with the number of same type capacitors to be paralleled and an identifying capacitor code given. 表 8-1 or 表 8-2 provides the actual capacitor characteristics. Any of the following choices work in the circuit:

- 1 \times 220- μF , 10-V Sanyo OS-CON (code C5)
- 1 \times 1000- μF , 35-V Sanyo MV-GX (code C10)
- 1 \times 2200- μF , 10-V Nichicon PL (code C5)
- 1 \times 1000- μF , 35-V Panasonic HFQ (code C7)

Step 5: Use 表 8-7 or 表 8-8 to select an input capacitor. With a 3.3-V output and 22 μH , there are three through-hole solutions. These capacitors provide a sufficient voltage rating and an RMS current rating greater than 1.25 A ($1/2 I_{LOAD}$ max). Again, using 表 8-1 or 表 8-2 for specific component characteristics, the following choices are suitable:

- 1 \times 1000- μF , 63-V Sanyo MV-GX (code C14)
- 1 \times 820- μF , 63-V Nichicon PL (code C24)
- 1 \times 560- μF , 50-V Panasonic HFQ (code C13)

Step 6: From 表 8-4, a 3-A Schottky diode must be selected. For through-hole components, 20-V rated diodes are sufficient and two part types are suitable:

- 1N5820
- SR302

Step 7: A 0.01- μF capacitor is used for C_{BOOST} .

(4) Check voltage rating of capacitors to be greater than application input voltage.

8.2.4 Adjustable Output Voltage Application

Locate the Programming Resistors near the Feedback Pin Using Short Leads

图 8-7. Basic Circuit for Adjustable Output Voltage Applications

8.2.4.1 Design Requirements

Select the power supply operating conditions and the maximum output current and follow the following procedures to find the external components for the LM2676.

8.2.4.2 Detailed Design Procedure

In this example, it is desired to convert the voltage from a two battery automotive power supply (voltage range of 20 V to 28 V, typical in large truck applications) to the 14.8-VDC alternator supply typically used to power electronic equipment from single battery 12-V vehicle systems. The load current required is 2 A (maximum). It is also desired to implement the power supply with all surface mount components.

Step 1: Operating conditions are:

- $V_{OUT} = 14.8 \text{ V}$
- $V_{IN \text{ max}} = 28 \text{ V}$
- $I_{LOAD \text{ max}} = 2 \text{ A}$

Step 2: Select an LM2676S-ADJ. To set the output voltage to 14.9 V, two resistors must be chosen (R_1 and R_2 in 图 8-7). For the adjustable device, the output voltage is set by the following relationship:

$$V_{OUT} = V_{FB} \left(1 + \frac{R_2}{R_1} \right) \quad (1)$$

where

- V_{FB} is the feedback voltage of typically 1.21 V

A recommended value to use for R_1 is 1 k Ω . In this example, R_2 is determined to be:

$$R_2 = R_1 \left(\frac{V_{OUT}}{V_{FB}} - 1 \right) = 1 \text{ k}\Omega \left(\frac{14.8 \text{ V}}{1.21 \text{ V}} - 1 \right) \quad (2)$$

$R_2 = 11.23 \text{ k}\Omega$

The closest standard 1% tolerance value to use is 11.3 k Ω .

This sets the nominal output voltage to 14.88 V which is within 0.5% of the target value.

Step 3: Using the nomograph for the adjustable device (图 8-5) requires a calculation of the inductor Volt × microsecond constant ($E \times T$ expressed in $V \times \mu S$) from 方程式 3:

$$E \times T = (V_{IN(MAX)} - V_{OUT} - V_{SAT}) \times \frac{V_{OUT} + V_D}{V_{IN(MAX)} - V_{SAT} + V_D} \times \frac{1000}{260} (V \times \mu s) \quad (3)$$

where

- V_{SAT} is the voltage drop across the internal power switch which is $R_{ds(ON)} \times I_{LOAD}$

In this example, this is typically $0.15 \Omega \times 2 A$ or $0.3 V$ and V_D is the voltage drop across the forward biased Schottky diode, typically $0.5 V$. The switching frequency of $260 kHz$ is the nominal value to use to estimate the ON time of the switch during which energy is stored in the inductor.

For this example $E \times T$ is found to be:

$$E \times T = (28 - 14.8 - 0.3) \times \frac{14.8 + 0.5}{28 - 0.3 + 0.5} \times \frac{1000}{260} (V \times \mu s) \quad (4)$$

$$E \times T = (12.9V) \times \frac{15.3}{28.2} \times 3.85 (V \times \mu s) = 26.9 (V \times \mu s) \quad (5)$$

Using 图 8-5, the intersection of $27 V \times \mu S$ horizontally and the $2 A$ vertical line ($I_{load \ max}$) indicates that L38, a $68\text{-}\mu H$ inductor, must be used.

From 表 8-3, L38 in a surface mount component is available from Pulse Engineering with part number PE-54038S.

Step 4: Use 表 8-9 or 表 8-10 to determine an output capacitor. With a $14.8\text{-}V$ output, the 12.5 to $15 V$ row is used, and with a $68\text{-}\mu H$ inductor, there are three surface mount output capacitor solutions. 表 8-1 or 表 8-2 provide the actual capacitor characteristics based on the C Code number. Any of the following choices can be used:

- $1 \times 33\text{-}\mu F$, $20 V$ AVX TPS (code C6)
- $1 \times 47\text{-}\mu F$, $20 V$ Sprague 594 (code C8)
- $1 / 47\text{-}\mu F$, $20 V$ Kemet T495 (code C8)

备注

When using the adjustable device in low voltage applications (less than $3\text{-}V$ output), if the nomograph (图 8-5) selects an inductance of $22 \mu H$ or less, 表 8-9 and 表 8-10 do not provide an output capacitor solution. With these conditions, the number of output capacitors required for stable operation becomes impractical. TI recommends to use either a $33\text{-}\mu H$ or $47\text{-}\mu H$ inductor and the output capacitors from 表 8-9 or 表 8-10.

Step 5: An input capacitor for this example requires at least a $35\text{-}V$ WV rating with an RMS current rating of $1 A$ ($1/2 I_{OUT \ max}$). From 表 8-1 or 表 8-2, it can be seen that C12, a $33\text{-}\mu F$, $35\text{-}V$ capacitor from Sprague, has the required voltage and current rating of the surface mount components.

Step 6: From 表 8-4, a $3\text{-}A$ Schottky diode must be selected. For surface mount diodes with a margin of safety on the voltage rating one of five diodes can be used:

- SK34
- 30BQ040
- 30WQ04F
- MBRS340
- MBRD340

Step 7: A 0.01- μ F capacitor is used for C_{BOOST} .

8.3 Power Supply Recommendations

The LM2676 is designed to operate from an input voltage supply up to 40 V. This input supply must be well regulated and able to withstand maximum input current and maintain a stable voltage.

8.4 Layout

8.4.1 Layout Guidelines

Board layout is critical for the proper operation of switching power supplies. First, the ground plane area must be sufficient for thermal dissipation purposes. Second, appropriate guidelines must be followed to reduce the effects of switching noise. Switch mode converters are very fast switching devices. In such cases, the rapid increase of input current combined with the parasitic trace inductance generates unwanted $L di/dt$ noise spikes. The magnitude of this noise tends to increase as the output current increases. This noise can turn into electromagnetic interference (EMI) and can also cause problems in device performance. Therefore, take care in layout to minimize the effect of this switching noise. The most important layout rule is to keep the AC current loops as small as possible. 图 8-8 shows the current flow in a buck converter. The top schematic shows a dotted line which represents the current flow during the top switch ON-state. The middle schematic shows the current flow during the top switch OFF-state. The bottom schematic shows the currents referred to as ac currents. These AC currents are the most critical because they are changing in a very short time period. The dotted lines of the bottom schematic are the traces to keep as short and wide as possible. This also yields a small loop area reducing the loop inductance. To avoid functional problems due to layout, review the PCB layout example. Best results are achieved if the placement of the LM2679 device, the bypass capacitor, the Schottky diode, RFBB, RFBT, and the inductor are placed as shown in the example. Note that, in the layout shown, R1 = RFBB and R2 = RFBT. TI also recommends using 2-oz copper boards or heavier to help thermal dissipation and to reduce the parasitic inductances of board traces. See the [AN-1229 SIMPLE SWITCHER® PCB Layout Guidelines](#) application report for more information.

9.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
