

LP5890 16 × 48 矩阵驱动器，具有超低功耗

1 特性

- 支持分立式 V_{CC} 和 $V_{R/G/B}$ 电源
 - V_{CC} 电压范围：2.5V 至 5.5V
 - $V_{R/G/B}$ 电压范围：2.5V 至 5.5V
- 48 个电流源通道，范围为 0.2mA 至 20mA
 - 通道间精度： $\pm 0.5\%$ (典型值)， $\pm 2\%$ (最大值)；器件间精度： $\pm 0.5\%$ (典型值)， $\pm 2\%$ (最大值)
 - 低膝点电压：当 $I_{OUT} = 5\text{mA}$ 时为 0.26V (最大值)
 - 3 位 (8 级) 全局亮度控制
 - 8 位 (256 级) 色彩亮度控制
 - 最大 16 位 (65536 级) PWM 灰度控制
- 带 $190\text{m}\Omega$ $R_{DS(ON)}$ 的 16 个扫描线开关
- 超低功耗
 - 低至 2.5V 的独立 V_{CC}
 - 超低 I_{CC} (低至 3.9mA)，具有 50MHz GCLK
 - 智能省电模式
- 内置 SRAM 支持 1 至 32 路复用
 - 单个器件可驱动多达 16×48 个 LED 或 16×16 个 RGB LED
 - 两个器件堆叠后可驱动多达 32×96 个 LED 或 32×32 个 RGB LED
- 高速和低 EMI 连续时钟串行接口 (CCSI)
 - 仅三条线：SCLK/SIN/SOUT
 - 外部 50MHz (最大值) SCLK
 - 支持 40MHz 至 160MHz 范围 GCLK 的内部倍频器
- 经优化的显示性能

- 去除上下重影
- 低灰度增强
- 检测和消除 LED 开路、短路和弱短路

2 应用

- LED 数字标牌
- 键盘、游戏附件
- 大型和智能家用电器
- 智能音箱、有线和无线音箱
- 混音器、DJ 设备和广播
- 接入设备、交换机和服务器的

3 说明

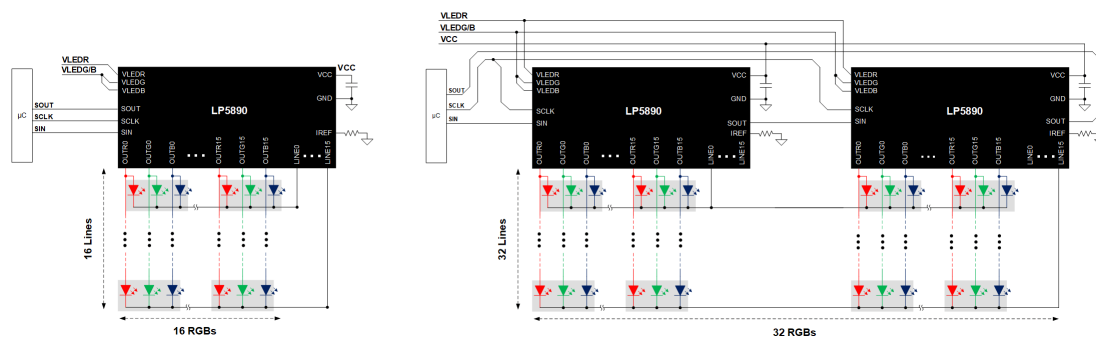

电子设备变得越来越智能，而且需要使用更多的 LED 提供动画效果和指示功能，因此需要使用高性能 LED 矩阵驱动器以小尺寸解决方案改善用户体验。

LP5890 是高度集成的共阴极矩阵 LED 显示驱动器，有 48 个恒流源和 16 个扫描 FET。单个 LP5890 能驱动 16×16 RGB LED 像素，两个 LP5890 堆叠后可驱动 32×32 RGB LED 像素。为实现低功耗，该器件可通过其共阴极结构为红色、绿色和蓝色 LED 提供分立式电源。此外，通过超低的工作电压范围 (V_{CC} 低至 2.5V) 和超低的工作电流 (I_{CC} 低至 3.9mA)，LP5890 可显著降低运行功率。

器件信息

器件型号	封装 ⁽¹⁾	封装尺寸 (标称值)
LP5890	VQFN (76)	9mm × 9mm
	BGA (96)	6mm × 6mm

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

单器件或双器件可堆叠连接的 LP5890

5 说明 (续)

LP5890 实现了一个高速传输接口，可支持高设备数菊花链和高刷新率，同时尽可能降低电磁干扰 (EMI)。该器件支持高达 50MHz 的 SCLK 和高达 160MHz 的 GCLK (内部)。同时，该器件集成了增强电路和智能算法，能够应对多种 LED 矩阵应用中的各种显示挑战：由 LED 开路或短路引起的上下重影、低灰度不均匀、耦合以及毛虫问题 (Caterpillar)，使 LP5890 成为此类应用的理想选择。

LP5890 还可以在运行期间实现 LED 开路/弱短路/短路的检测和消除，并可以将这些信息报告给配套的数字处理器。

6 Pin Configuration and Functions

图 6-1. LP5890 RRF Package 76-Pin VQFN With Exposed Thermal Pad Top View

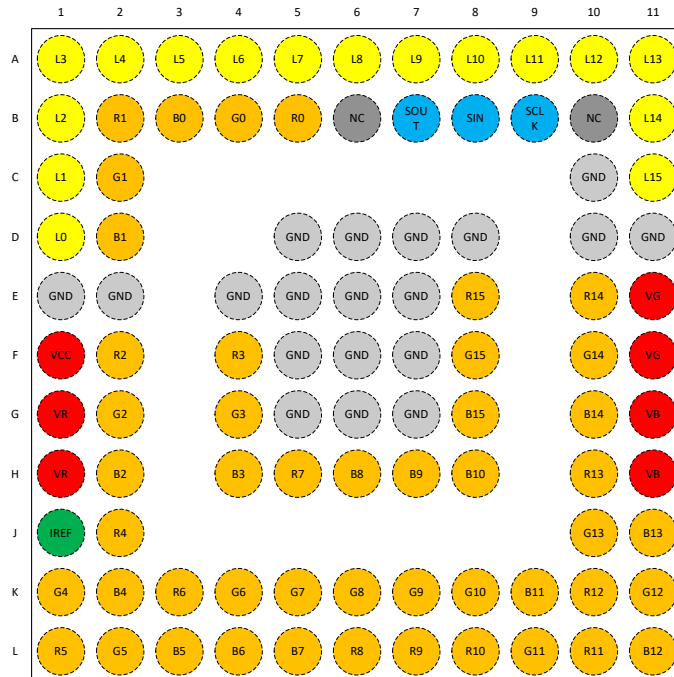

图 6-2. LP5890 ZXL Package 96-Pin BGA Top View

表 6-1. Pin Functions

PIN			I/O	DESCRIPTION
NAME	RRF NO.	ZXL NO.		
IREF	20	J1	I	Pin for setting the maximum constant-current value. Connecting an external resistor between IREF and GND sets the maximum current for each constant-current output channel. When this pin is connected directly to GND, all outputs are forced off. The external resistor should be placed close to the device.
VCC	8	F1	I	Device power supply.
VR	9, 10	G1, H1	I	Red LED power supply.
VG	51, 50	E11, F11	I	Green LED power supply.
VB	49, 48	G11, H11	I	Blue LED power supply.
R0-R15	1, 4, 11, 14, 17, 21, 24, 27, 32, 35, 38, 41, 44, 47, 54, 57	B5, B2, F2, F4, J2, L1, K3, H5, L6, L7, L8, L10, K10, H10, E10, E8	O	Red LED Constant-current output.
G0-G15	2, 5, 12, 15, 18, 22, 25, 28, 31, 34, 37, 40, 43, 46, 53, 56	B4, C2, G2, G4, K1, L2, K4, K5, K6, K7, K8, L9, K11, J10, F10, F8	O	Green LED Constant-current output.
B0-B15	3, 6, 13, 16, 19, 23, 26, 29, 30, 33, 36, 39, 42, 45, 52, 55	B3, D2, H2, H4, K2, L3, L4, L5, H6, H7, H8, K9, L11, J11, G10, G8	O	Blue LED Constant-current output.
LINE0-LINE15	76, 75, 74, 73, 72, 71, 70, 69, 68, 67, 66, 65, 64, 63, 62, 61	D1, C1, B1, A1, A2, A3, A4, A5, A6, A7, A8, A9, A10, A11, B11, C11	O	Scan Lines.
SCLK	60	B9	I	Clock-signal input pin.
SIN	59	B8	I	Serial-data input pin.
SOUT	58	B7	O	Serial data output pin.
GND	7	C10, E1, E2, D5, D6, D7, D8, D10, D11, E1, E2, E4, E5, E6, E7, F5, F6, F7, G5, G6, G7	-	Power-ground reference.
Thermal pad	-	-	-	The thermal pad and the GND pin must be connected together on the board.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	VCC	- 0.3	6	V
	VR/G/B	- 0.3	6	V
	IREF, SCLK, SIN, SOUT, VSYNC	- 0.3	6	V
	RX/GX/BX	- 0.3	6	V
	LINE0 to LINE15	- 0.3	6	V
Operating junction temperature, T _J		- 40	150	°C
Storage temperature, T _{stg}		- 55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VCC	Device supply voltage	2.5		5.5	V
VLEDR/G/B	LED supply voltage	2.5		5.5	V
V _{IH}	High level logic input voltage (SCLK, SIN, VSYNC)	0.7 × VCC			V
V _{IL}	Low level logic input voltage (SCLK, SIN, VSYNC)			0.3 × VCC	V
I _{OH}	High level logic output current (SOUT)			- 2	mA
I _{OL}	Low level logic output current (SOUT)			2	mA
I _{CH}	Constant output source current	0.2		20	mA
I _{LINE}	Line scan switch load current	0		2	A
T _A	Ambient operating temperature	- 40		85	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾	LP5890		UNIT	
	RRF (VQFN)	ZXL (BGA)

T _{TSD}	Thermal shutdown threshold		170		°C	
T _{HYS}	Thermal shutdown hysteresis		15		°C	

(1) The deviation of each output in same color group (OUTR0-15 or OUTG0-15 or OUTB0-15) from the average of same color group

constant current. The deviation is calculated by the formula. (X = R or G or B, n = 0-15)

$$\Delta(\%) = \left[\frac{I_{Xn}}{\frac{I_{X0} + I_{X1} + \dots + I_{X14} + I_{X15}}{16}} - 1 \right] \times 100$$

(2) The deviation of the average of constant-current in each color group from the ideal constant-current value. (X = R or G or B):

$$\Delta(\%) = \left[\frac{I_{X0} + I_{X1} + \dots + I_{X14} + I_{X15} - \text{Ideal Output Current}}{\text{Ideal Output Current}} \right] \times 100$$

Ideal current is calculated by the following equation:

$$I_{IDEAL_R(\text{or } G \text{ or } B)} = \frac{V_{IREF}}{R_{IREF}} \times GAIN_{(BC)} \times \frac{1 + CC_R(\text{or } CC_G \text{ or } CC_B)}{256}$$

(3) Line regulation is calculated by the following equation. (X = R or G or B, n = 0-15):

$$\Delta(\%V) = \left[\frac{(I_{Xn} \text{ at } V_{LED} = 5.5V) - (I_{Xn} \text{ at } V_{LED} = 2.5V)}{(I_{Xn} \text{ at } V_{LED} = 2.5V)} \right] \times \frac{100}{5.5V - 2.5V}$$

(4) Load regulation is calculated by the following equation. (X = R or G or B, n = 0-15):

$$\Delta(\%V) = \left[\frac{(I_{Xn} \text{ at } V_{Xn} = 1V) - (I_{Xn} \text{ at } V_{Xn} = 3V)}{(I_{Xn} \text{ at } V_{Xn} = 3V)} \right] \times \frac{100}{3V - 1V}$$

7.6 Timing Requirements

At VCC = VR = 2.8 V, VG/B = 3.8V and TA = -40°C to +85°C; Typical values are at TA = 25°C (unless otherwise specified)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
fSCLK	Clock frequency (SCLK)			50	MHz
t _{w(H0)}	High level pulse duration (SCLK)	9			ns
t _{w(L0)}	Low level pulse duration (SCLK)	9			ns
t _{su(0)}	Setup time	SIN to SCLK ↑	10		ns
t _{h(0)}	Hold time	SCLK ↑ to SIN ↑ ↓	2		ns

7.7 Switching Characteristics

At VCC = VR = 2.8 V, VG/B = 3.8V and TA = -40°C to +85°C; Typical values are at TA = 25°C (unless otherwise specified)

8 Detailed Description

8.1 Overview

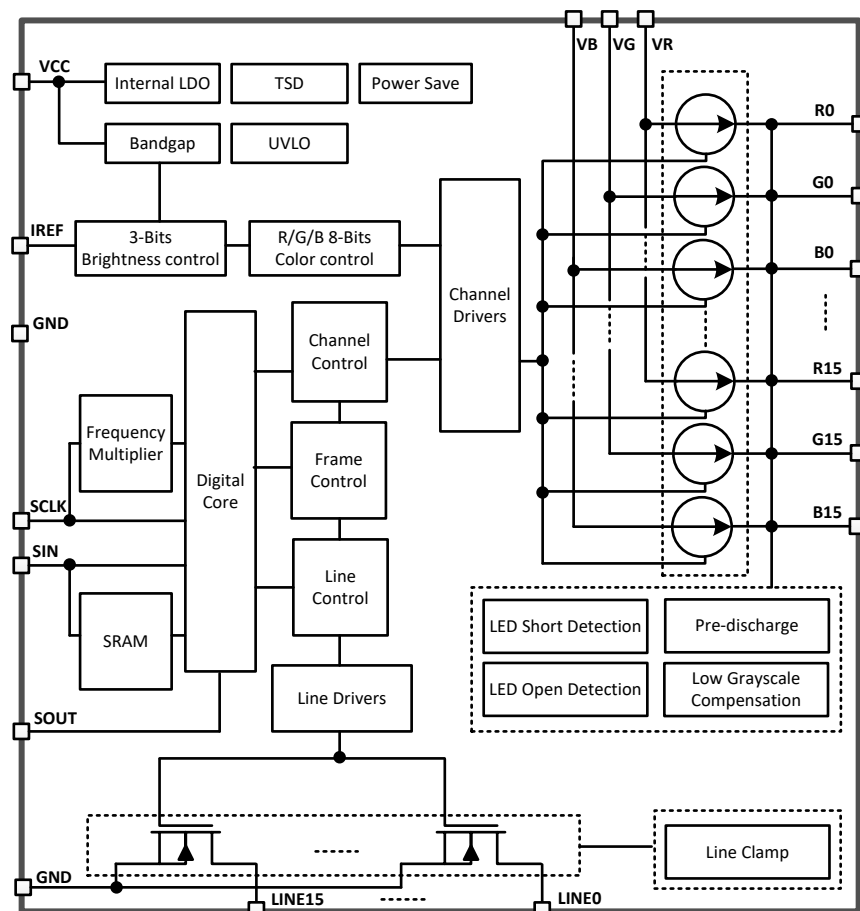

The LP5890 is a highly integrated RGB LED driver with 48 constant current sources and 16 scanning FETs. A single LP5890 is capable of driving 16×16 RGB LED pixels while stacking two LP5890s can drive 32×32 RGB LED pixels. To achieve low power consumption, the device supports separated power supplies for the red, green, and blue LEDs by its common cathode structure. Furthermore, the operation power of the LP5890 is significantly reduced by ultra-low operation voltage range (V_{CC} down to 2.5 V) and ultra-low operation current (I_{CC} down to 3.9 mA).

The LP5890 supports per channel current from 0.2 mA to 20 mA, with typical 1% channel-to-channel current deviation and typical 1% device-to-device current deviation. The DC current value of all 48 channels is set by an external IREF resistor and can be adjusted by the 8-step global brightness control (BC) and the 256-step per-color group brightness control (CCR/CCG/CCB).

The LP5890 implements a high speed transmission interface to support high device count daisy-chained and high refresh rate while minimizing electrical-magnetic interference (EMI). The LP5890 supports up to 50-MHz SCLK (external) and up to 160-MHz GCLK (internal). Meanwhile, the device integrates enhanced circuits and intelligent algorithms to solve the various display challenges in Narrow Pixel Pitch(NPP) LED display applications and Mini or Micro-LED products: Dim at the first scan line, Upper and downside ghosting, Non-uniformity in low grayscale, Coupling, Caterpillar caused by open or short LEDs, which make the LP5890 a perfect choice in such applications.

The LP5890 also implements LED open/weak short/short detections and removals during operations and can also report this information to the accompanying digital processor.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Independent and Stackable Mode

The LP5890 can operate in two different modes: independent or stackable. In independent mode, a single LP5890 can drive a 16×16 RGB LED matrix, while in stackable mode, up to three LP5890s can be stacked together, which means the line switches of one device can be shared to another. Stacking two LP5890s can drive a 32×32 RGB LED matrix while stacking three LP5890s can drive a 32×48 RGB matrix. The mode can be configured by the MOD_SIZE (For more details, see FC0).

8.3.1.1 Independent Mode

图 8-1 shows an implementation of a 16×32 RGB LED matrix using two LP5890s in independent mode. Each device is responsible for its own 16×16 RGB LED matrix which means that all the data for section A is stored in Device1 and the data for section B is stored in Device2.

图 8-1. Two Devices in Independent Mode

The unused line must be assigned to the last several lines of the device. For example, if there are only 14 scanning lines, then the two unused lines should be assigned to 1_LS14 and 1_LS15.

8.3.1.2 Stackable Mode

While operating the LP5890 in stackable mode, as shown in 图 8-2 and 图 8-3, Device2 needs to be rotated 180° relative to Device1. This action allows the position of line switches to be near the center column of the LED matrix for better routing. For Device1, the lines will be connected sequentially (line switch 0 connected to scan line 1). However, on Device2, it is connected in reverse order, with the 16th scan line is connected to line switch 15 and the 32th scan line is connected to line switch 0.

图 8-2 shows the connection between two LP5890 devices in stackable mode driving a 32×32 RGB LED pixels. The MOD_SIZE should be configured to 00b/10b. Device1 supplies 16 line switches for the first 16 scan line, and Device2 supplies 16 line switches for scan line 17-32. The data for matrix sections A and C are stored in Device1, while matrix sections B and D data are stored in Device2.

图 8-2. Two Devices in Stackable Mode

图 8-3 shows the connection between three devices connected in stackable mode with MOD_SIZE bits set to 11b. In this configuration, Device1 supplies the line switches for the first 16 scan lines, Device2 supplies line switches for scan lines 17-32, and the line switches of Device3 are not used. Matrix A and D's data are stored in Device 1, matrix B and E's data are stored in Device2, and matrix C and F's data are stored in Device3.

图 8-3. Three Devices in Stackable Mode

In order to make sure the scanning sequence is still from 1st line to 32nd line, the scan line switching order of the second device needs to be reversed. This action can be configured by the SCAN_REV (For more details, see FC4).

表 8-1 shows the pin assignment between the LED matrix physical lines and the LP5890 corresponding pins, depending on the SCAN_REV.

表 8-1. Stackable With Different SCAN_REV Value

LED Matrix Physical Line	Device Line Switch Pin (SCAN_REV = 1)	Device Line Switch Pin (SCAN_REV = 0)
L0	1_LS0	1_LS0
L1	1_LS1	1_LS1
L2	1_LS2	1_LS2
L3	1_LS3	1_LS3
L4	1_LS4	1_LS4
L5	1_LS5	1_LS5

表 8-1. Stackable With Different SCAN_REV Value (continued)

LED Matrix Physical Line	Device Line Switch Pin (SCAN_REV = 1)	Device Line Switch Pin (SCAN_REV = 0)
L6	1_LS6	1_LS6
L7	1_LS7	1_LS7
L8	1_LS8	1_LS8
L9	1_LS9	1_LS9
L10	1_LS10	1_LS10
L11	1_LS11	1_LS11
L12	1_LS12	1_LS12
L13	1_LS13	1_LS13
L14	1_LS14	1_LS14
L15	1_LS15	1_LS15
L16	2_LS15	2_LS0
L17	2_LS14	2_LS1
L18	2_LS13	2_LS2
L19	2_LS12	2_LS3
L20	2_LS11	2_LS4
L21	2_LS10	2_LS5
L22	2_LS9	2_LS6
L23	2_LS8	2_LS7
L24	2_LS7	2_LS8
L25	2_LS6	2_LS9
L26	2_LS5	2_LS10
L27	2_LS4	2_LS11
L28	2_LS3	2_LS12
L29	2_LS2	2_LS13
L30	2_LS1	2_LS14
L31	2_LS0	2_LS15

When the LP5890 devices are used in stackable mode, if there are unused line switches, these unused line switches must be the last line switches of the first or the second device. For example, if there are only 30 scanning lines, and if,

The unused line switches must be 2_LS14, 2_LS15 if SCAN_REV = '0'b, or 2_LS1, 2_LS0 if SCAN_REV = '1'b.

8.3.2 Current Setting

8.3.2.1 Brightness Control (BC) Function

The LP5890 device is able to adjust the output current of all constant-current outputs simultaneously. This function is called global brightness control (BC). The global BC for all outputs is programmed with a 3-bit register, thus all output currents can be adjusted in 8 steps for a given current-programming resistor, R_{IREF} . When the 3-bit BC register changes, the gain of output current, $GAIN_{BC}$ changes as 表 8-2 below.

表 8-2. Current Gain Versus BC Code

BC Register (BC)	Current Gain ($GAIN_{BC}$)
000b	24.17
001b	30.57
010b	49.49
011b (default)	86.61
100b	103.94
101b	129.92

表 8-2. Current Gain Versus BC Code (continued)

BC Register (BC)	Current Gain (GAIN _{BC})
110b	148.48
111b	173.23

The maximum output current per channel, I_{OUTSET} , is determined by resistor, R_{IREF} , and the $GAIN_{BC}$. The voltage on IREF is typically 0.8 V. R_{IREF} can be calculated by 方程式 1 below. For noise immunity purpose, suggest $R_{IREF} < 40 \text{ k}\Omega$.

$$R_{IREF} (k\Omega) = \frac{V_{IREF} (V)}{I_{IREF} (mA)} = \frac{V_{IREF} (V)}{I_{OUTSET} (mA)} \times GAIN_{(BC)} \quad (1)$$

8.3.2.2 Color Brightness Control (CC) Function

The LP5890 device is able to adjust the output current of each of the three color groups R0-R15, G0-G15, and B0-B15 separately. This function is called color brightness control (CC). For each color, it has 8-bit data register, CC_R, CC_G, or CC_B. Thus, all color group output currents can be adjusted in 256 steps from 0% to 100% of the maximum output current, I_{OUTSET} . The output current of each color, I_{OUT_R} (or G or B), can be calculated by Equation 2 below.

$$I_{OUT_R(or\ G\ or\ B)} = I_{OUTSET} \times \frac{1 + CC_R(or\ CC_G\ or\ CC_B)}{256} \quad (2)$$

Table 表 8-3 shows the CC data versus the constant-current against I_{OUTSET} :

表 8-3. CC Data vs Current Ratio

CC Register (CC_R or CC_G or CC_B)	Ratio of I_{OUTSET}	
0000 0000b	1/256	0.39%
0000 0001b	2/256	0.78%
...
0111 1111b (default)	128/256	50%
...
1111 1110b	255/256	99.61%
1111 1111b	256/256	100%

8.3.2.3 Choosing BC/CC for a Different Application

BC is mainly used for global brightness adjustment to adapt to ambient brightness, such as between day and night, indoor and outdoor.

Suggested BC is 3h or 4h, which is in the middle of the range, allowing flexible changes in brightness up and down.

- If the current of one color group (usually R LEDs) is close to the output maximum current (10 mA or 20 mA), choose the maximum BC value, 7h, to prevent the constant output current from exceeding the upper limit in case a larger BC code is input accidentally.
- If the current of one color group (usually B LEDs) is close to the output minimum current (0.2 mA), choose the minimum BC code, 0h, to prevent the constant output current from exceeding the lower limit in case a lower BC code is input accidentally.

The CC can be used to fine tune the brightness in 256 steps. The CC is suitable for white balance adjustment between RGB color group. To get a pure white color, the general requirement for the luminous intensity ratio of R, G, B LED is 5:3:2. Depending on the characteristics of the LED (Electro-Optical conversion efficiency), the current ratio of R, G, B LED will be much different from this ratio. Usually, the Red LED needs the largest

current. Choose 255d (the maximum value) CC code for the color group that needs the largest initial current, then choose proper CC code for the other two color groups according to the current ratio requirement of the LED used.

8.3.3 Frequency Multiplier

The LP5890 has an internal frequency multiplier to generate the GCLK by SCLK. The GCLK frequency can be configured by `FREQ_MOD` (for more details, see [FC0](#)) and `FREQ_MUL` (for more details, see [FC0](#)) from 40 MHz to 160 MHz. As [图 8-4](#) shows, if the GCLK frequency is not higher than 80 MHz, the `GCLK_MOD` is set to 0 to disable the bypass switch (enable the 1/2 divider), while the GCLK frequency is higher than 80 MHz, the `GCLK_MOD` is set to 1 to enable the bypass switch (disable the 1/2 divider).

图 8-4. Frequency Multiplier Block Diagram

8.3.4 Line Transitioning Sequence

The LP5890 defines a timing sequence of scan line transition. `T_SW` is the total transitioning time.

[表 8-4](#) is the relation between `LINE_SWT` bits and the line switch time (GCLK numbers) with different internal GCLK frequency.

表 8-4. Line Switch Time

LINE_SW T	GCLK numbers	T_SW (us, 40 MHz GCLK)	T_SW (us, 60 MHz GCLK)	T_SW (us, 100 MHz GCLK)	T_SW (us, 120 MHz GCLK)	T_SW(us, 160 MHz GCLK)
0000b	45	1.125	0.7515	0.45	0.3735	0.2835
0001b	60	1.5	1.002	0.6	0.498	0.378
0010b	90	2.25	1.503	0.9	0.747	0.567
0011b	120	3	2.004	1.2	0.996	0.756
0100b	150	3.75	2.505	1.5	1.245	0.945
0101b	180	4.5	3.006	1.8	1.494	1.134
0110b	210	5.25	3.507	2.1	1.743	1.323
0111b	240	6	4.008	2.4	1.992	1.512
1000b	270	6.75	4.509	2.7	2.241	1.701
1001b	300	7.5	5.01	3	2.49	1.89
1010b	330	8.25	5.511	3.3	2.739	2.079
1011b	360	9	6.012	3.6	2.988	2.268
1100b	390	9.75	6.513	3.9	3.237	2.457
1101b	420	10.5	7.014	4.2	3.486	2.646
1110b	450	11.25	7.515	4.5	3.735	2.835
1111b	480	12	8.016	4.8	3.984	3.024

`T0` is set by the `LINE_SW_T0` (see [FC4](#) for more details). `T2` constantly equals to 5 GCLKs.

`T1` and `T3` can be calculated by `LINE_TIMEMODE` (see [FC0](#) for more details).

8.3.5 Protections and Diagnostics

8.3.5.1 Thermal Shutdown Protection

The Thermal Shutdown (TSD) function turns off all IC constant-current outputs when the junction temperature (T_J) exceeds 170°C (typical). Normal operation resumes when T_J falls below 155°C (typical).

8.3.5.2 IREF Resistor Short Protection

The IREF resistor short protection (ISP) function prevents unwanted large currents from flowing through the constant-current output when the IREF resistor is shorted accidentally. The LP5890 device turns off all output channels when the IREF pin voltage is lower than 0.19 V (typical). When the IREF pin voltage goes higher than 0.325 V (typical), the LP5890 device resumes normal operation.

8.3.5.3 LED Open Load Detection and Removal

8.3.5.3.1 LED Open Detection

The LED Open Detection (LOD) function detects faults caused by an open circuit in any LED, or a short from OUT_n to VLED with low impedance. LOD was realized by comparing the OUT_n voltage to the LOD detection threshold voltage level set by LODVTH_R/LODVTH_G/LODVTH_B (see FC3 for more details). If the OUT_n voltage is higher than the programmed voltage, the corresponding output LOD bit is set to 1 to indicate an open LED. Otherwise, the output of that LOD bit is 0. LOD data output by the detection circuit are valid only during the OUT_n turning on period.

图 8-5 shows the equivalent circuit of LED open detection.

图 8-5. LED Open Detection Circuit

The LED open detection function records the position of the open LED, which contains the scan line number and relevant channel number. The scan line order is stored in LOD_LINE_WARN register (for more details see FC12), and the channel number is latched into the internal 48-bit LOD data register (for more details see FC14) at the end of each segment. 图 8-6 shows the bit arrangement of the LOD data register.

图 8-6. Bit Arrangement in LOD Data Register

8.3.5.3.2 Read LED Open Information

The LOD readback function needs to be enabled before read LED open information. This function is enabled by LOD_LSD_RB (for more details, see FC3).

图 8-7 shows the steps to read LED open information. Wait at least one sub-period time between Step2 and Step3 command.

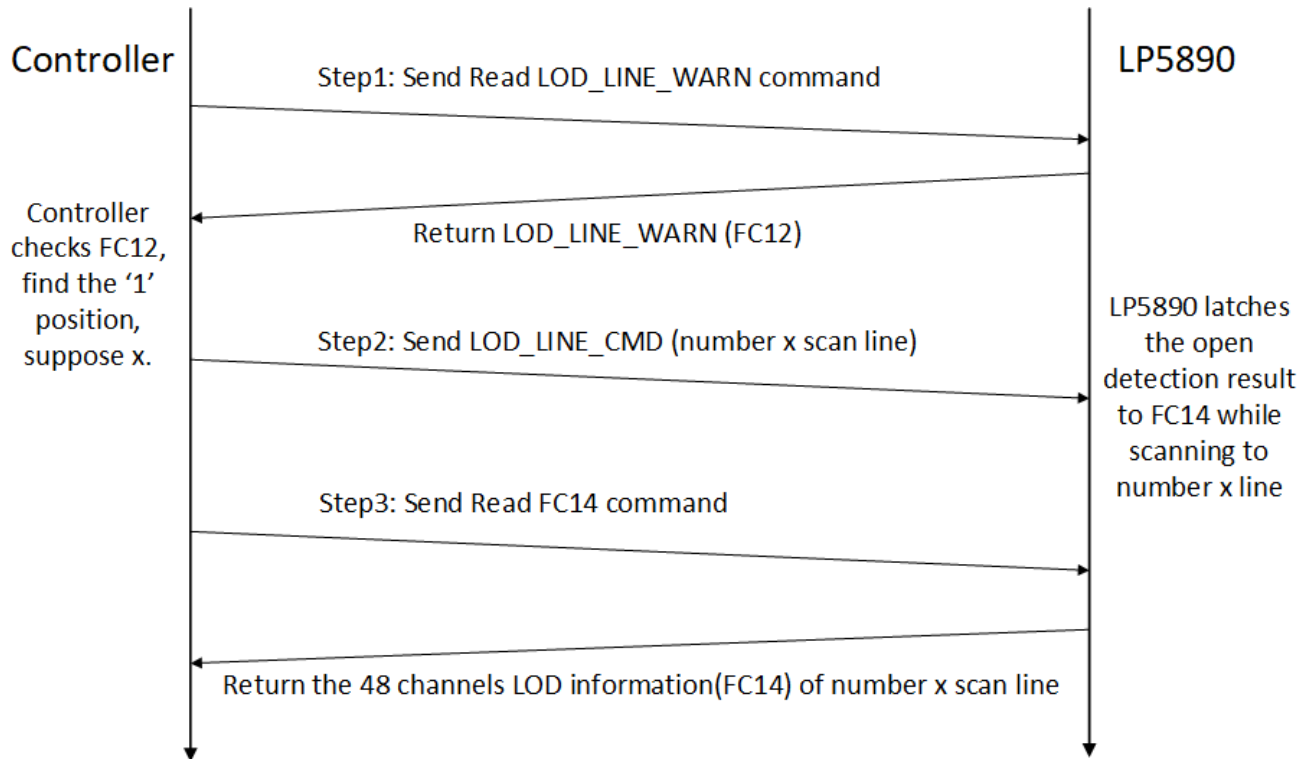

图 8-7. Steps to Read LED Open Information

8.3.5.3.3 LED Open Caterpillar Removal

图 8-8 shows the caterpillar issue caused by open LED. Suppose the LED0-1 is an open LED. When line0 is chosen and the OUT1 is turned on, the OUT1 voltage will be forced to approach to VLED because of the broken path of the current source. However, the voltage of the un-chosen lines are below the Vclamp which is much lower than VLED, causing all LEDs which connect to the channel OUT1 light unwanted.

图 8-8. LED Open Caterpillar

The LP5890 implements circuits that can eliminate the caterpillar issue caused by open LEDs. The LED open caterpillar removal function is configured by LODRM_EN (for more details, see [FC0](#)). When LODRM_EN is set to 1b, the caterpillar removal function is enabled. The corresponding channel OUTn is turned off when scanning to line with open LED. The caterpillar issue is eliminated until device resets or LODRM_EN is set to 0b.

The internal caterpillar elimination circuit can handle a maximum of three lines that have open LEDs fault condition. If there are open LEDs located in three or fewer lines, the LP5890 is able to handle the open LEDs all in these lines. If there are open LEDs in more than three lines, the caterpillar issue is solved for the lines where the first three open LEDs were detected, but the open LEDs in the fourth and subsequent lines still cause the caterpillar issue.

8.3.5.4 LED Short and Weak Short Circuitry Detection and Removal

8.3.5.4.1 LED Short and Weak Short Detection

The LED Short Detection (LSD) function detects faults caused by a short circuit in any LED. LSD was realized by comparing the OUTn voltage to the LSD threshold voltage. If the OUTn voltage is lower than the threshold

voltage, the corresponding output LSD bit is set to 1 to indicate an short LED, otherwise, the output of that LSD bit is 0. LSD data output by the detection circuit are valid only during the OUTn turning on period.

LSD weak short can be detected by adjusting threshold voltage, which level is set by LSDVTH_R/LSDVTH_G/LSDVTH_B (for more details, see FC3).

图 8-9 shows the equivalent circuit of LED short detection.

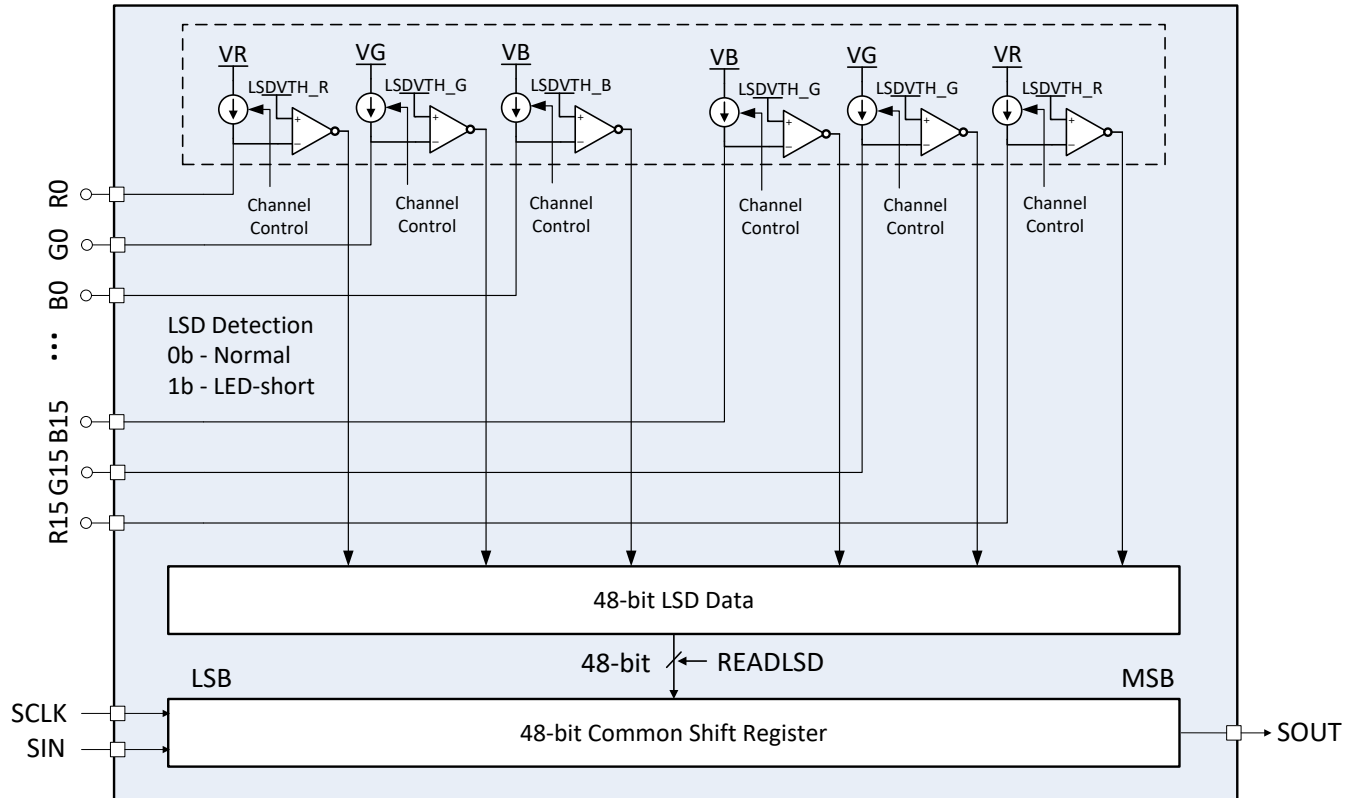

图 8-9. LED Short Detection Circuit

The LED short detection function records the position of the short LED, which contains the scan line order and relevant channel number. The scan line order is stored LSD_LINE_WARN register (for more details, see FC13), and the channel number is latched into the internal 48-bit LSD data register (fore more details see FC15) at the end of each segment. 图 8-10 shows the bit arrangement of the LSD data register.

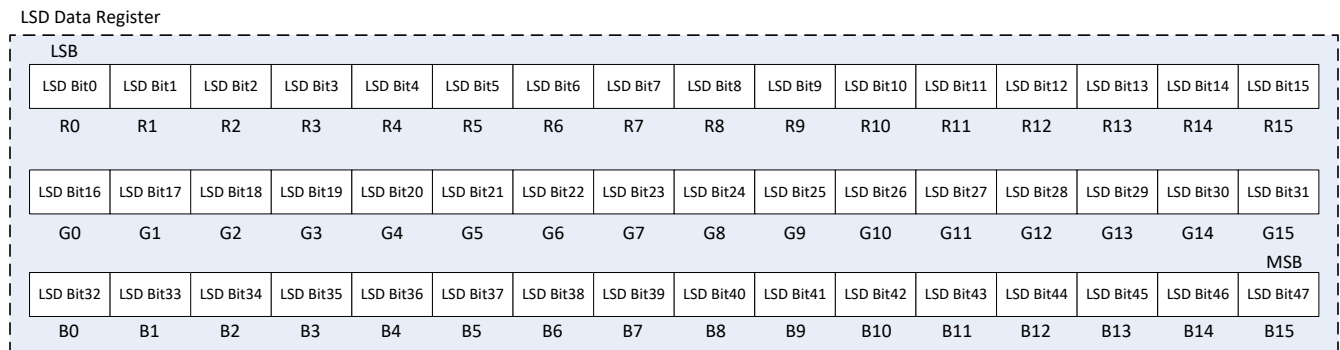

图 8-10. Bit Arrangement in the LSD Data Register

8.3.5.4.2 Read LED Short Information

The LSD readback function needs to be enabled before reading LED Short information. This function is enabled by LOD_LSD_RB (see FC3 for more details).

图 8-11 shows the steps to read LED Short information. Wait at least one sub-period time between Step2 and Step3 command.

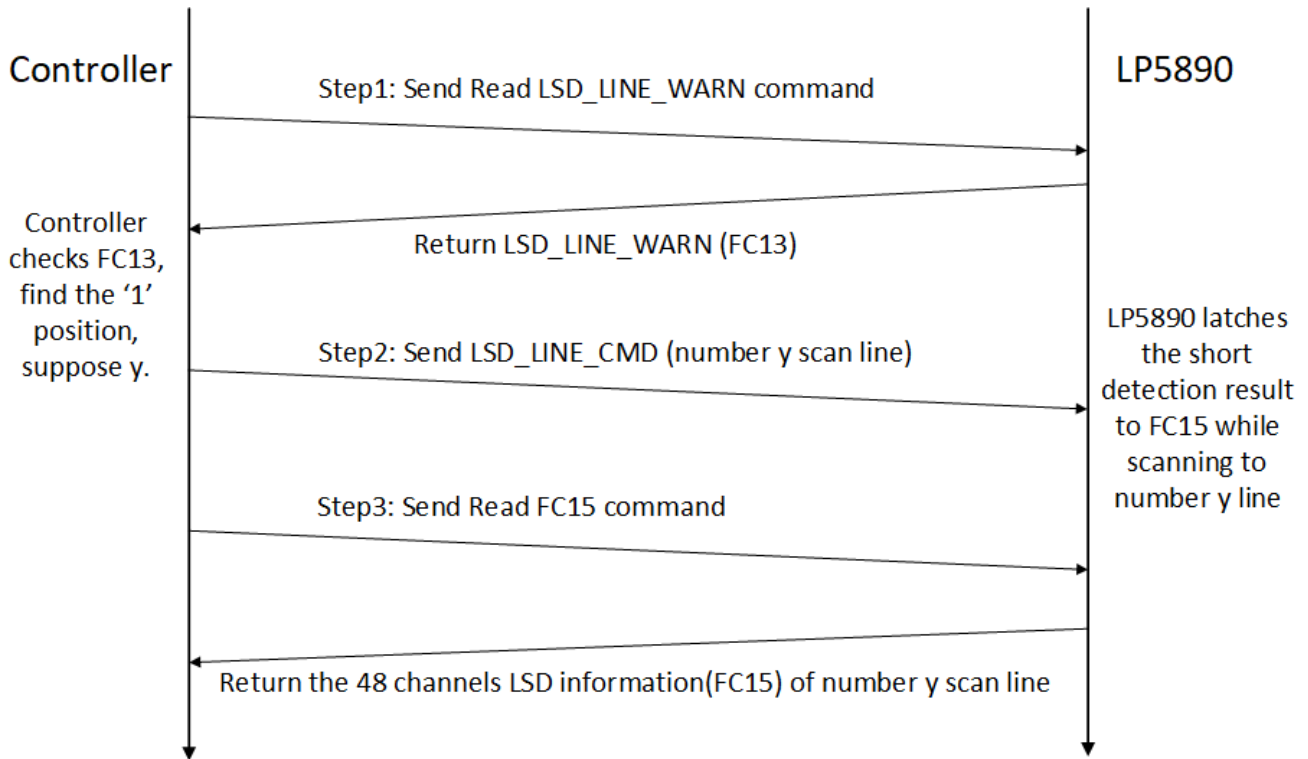

图 8-11. Steps to Read LED Short Information

8.3.5.4.3 LSD Caterpillar Removal

图 8-12 shows the LSD caterpillar issue caused by short LED. Suppose the LED0-1 is a short LED. When it scans to the line1 and the OUT1 is turned off, the OUT1 voltage is the same with scan line0 voltage because of the short path of the LED0-1. At this time, there is a current path from the line0 to the GND through the LED1-1 and SW1-1, which causes LED1-1 light to be unwanted.

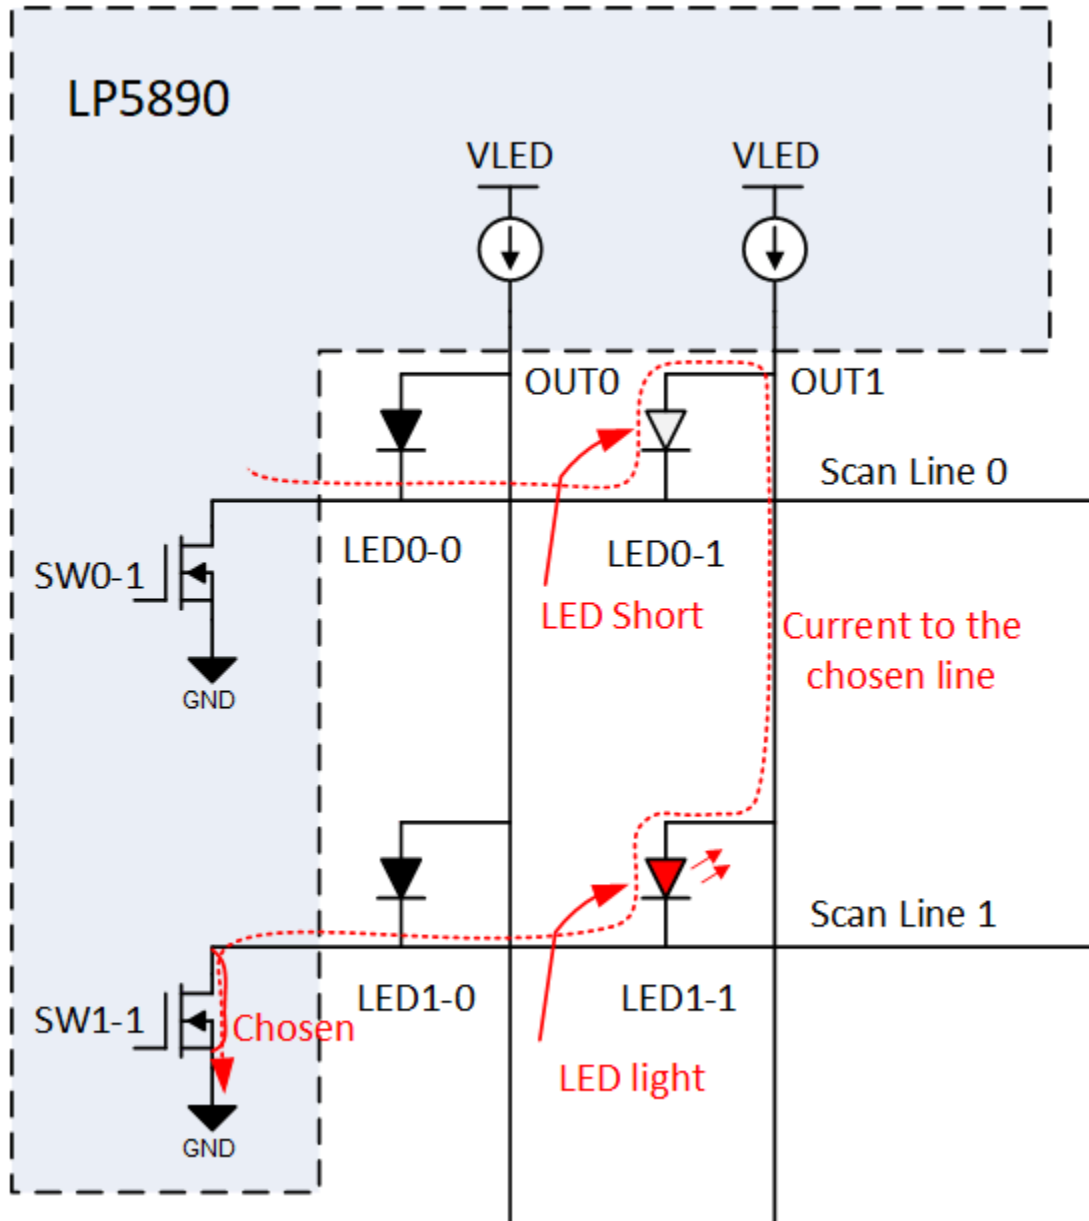

图 8-12. LED Short Caterpillar

The LP5890 device implements internal circuits that can eliminate the caterpillar issue by short LEDs. As is shown in 图 8-12, the LED short caterpillar is caused by the voltage of the Vclamp on the line, so it can be solved by adjusting the LSD_RM (see FC3 for more details) to let the voltage drop of the LED1-1 be smaller than LED forward voltage.

8.4 Device Functional Modes

图 8-13 lists the device functional modes.

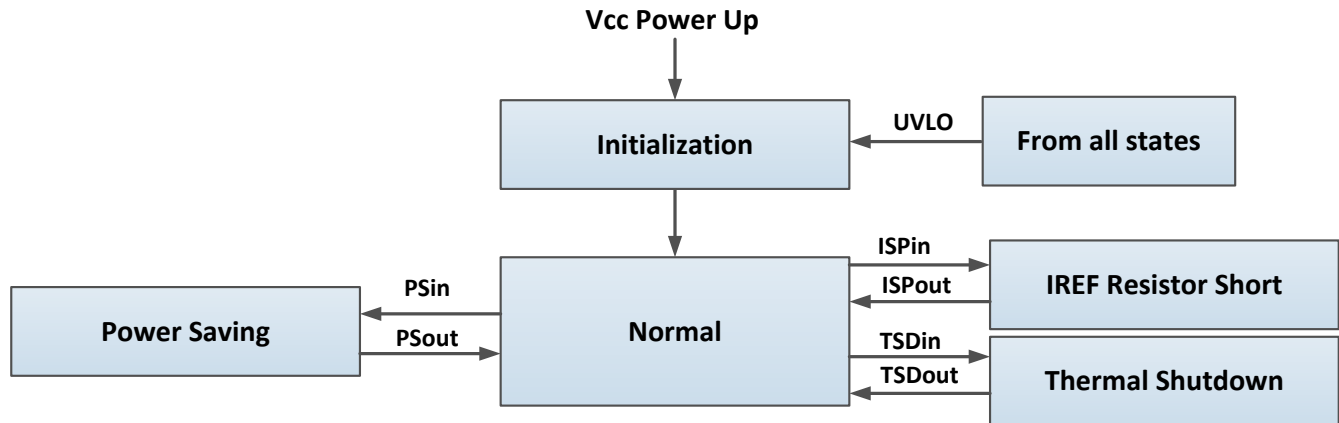

图 8-13. Functional Modes

- **Initialization:** The device enters into Initialization when Vcc goes down to UVLO voltage. In this mode, all the registers are reset. Entry can also be from any state.
- **Normal:** The device enters the normal mode when Vcc is higher than UVLO threshold. The display process is shown as below in normal mode.
- **Power Saving:** The device automatically enters and gets out from the power save mode when it detects the condition PSin and PSout. In this mode, all channels will turn off. PSin: after the device detects that the display data of the next frame all equal to zero, it will enter to power save mode when the VSYNC comes. PSout: after the device detects that there is non-zero display data of the next frame, it will get out from power save mode immediately.
- **IREF Resistor Short Protection:** The device automatically enters and gets out from the IREF Resistor Short Protection mode when it detects the condition ISPin and ISPOut. In this mode, all channels will turn off. ISPin: the device detects that the reference voltage is smaller than 0.195 V. ISPOut: the device detects that the reference voltage is larger than 0.325 V.
- **Thermal Shutdown:** The device automatically enters and gets out from the Thermal Shutdown mode when it detects the condition TSDin and TSDout. In this mode, all channels will turn off. TSDin: the device detects that the junction temperature exceeds 170° C. TSDout: the device detects that the junction temperature is below 155° C.

8.5 Continuous Clock Series Interface

The continuous Clock Series Interface (CCSI) provides access to the programmable functions and registers, SRAM data of the device. The interface contains two input digital pins. The pins are the serial data input (SIN) and serial clock (SCLK). Moreover, there is an another wire called serial data output (SOUT) as the output digital signal of the device. The SIN is set to HIGH when device is in idle status and the SCLK needs to be existent and continuous all the time considering it is the clock source of internal Frequency Multiplier. The SOUT is used to transmit the data or read the data of internal registers.

This protocol can support up to 32 devices cascaded in a data chain. The devices will receive the chip index command after power up. The chip index command will configure addresses of the devices from 0x00 up to 0x1F according to the sequence that receives the command. Then the controller can communicate with all the devices through the broadcast way or particular device through non-broadcast way.

The broadcast is mainly used to transmit function control commands. All the devices in a data chain will receive the same data in this way. The non-broadcast is mainly used to transmit function control commands or display data, and each device receives its own data in this way. These two ways are distinguished by the command identification.

8.5.1 Data Validity

The data on DIN wire must be stable at rising edges of the SCLK.

8.5.2 CCSI Frame Format

图 8-14 defines the format of the command and data transmission. There are four states in one frame.

- **IDLE:** SCLK is always existent and continuous, and DIN is always HIGH.
- **START:** DIN changes from HIGH to LOW after the IDLE states.
- **DATA:**
 - **Head_bytes:** It is the command identifier, contains one 16-bit data and one check bit. It can be WRITE COMMAND ID or READ COMMAND ID (see [Register Maps](#) for more details).
 - **Data_bytes_N:** The Nth data-bytes, contains 3 × 17-bit data, each 17-bit data contains one 16-bit data and one check bit. N is the number of devices cascaded in a data chain.
- **END:** The device recognizes continuous 18-bit HIGH on DIN, then returns to IDLE state.
- **CHECK BIT:** The check bit (17th bit) value is the **NOT** of 16th bit value, in order to avoid continuous 18-bit HIGH (to distinguish with END).

图 8-14. CCSI Frame

The IDLE state is not the necessary. That means the START state of next frame can connect to the END state of current frame.

8.5.3 Write Command

Take m devices cascaded in a data chain for example.

8.5.3.1 Chip Index Write Command

The chip index is used to set the identification of the device cascaded in a data chain. When the first device receives the chip index command, Head_bytes1, it sets the current address to 00h and meanwhile changes the chip index command, Head_bytes2, then sends to the next device. When the device receives the Head_bytes2, it sets the address to 01h and meanwhile changes the chip index command, Head_bytes3, then sends to the next device. Likewise, all the cascaded devices get their unique identifications.

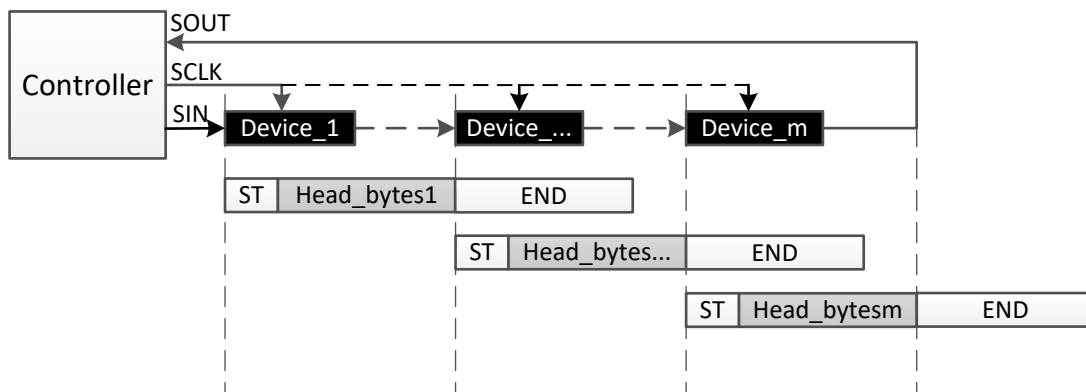

图 8-15. Chip Index Write Command

8.5.3.2 VSYNC Write Command

The VSYNC is used to sync the display of each frame for the devices in a cascaded chain. The VSYNC is a write-only command. The devices receive VSYNC command one time from the controller in each frame, and the VSYNC command needs to be active for all devices at the same time.

Since some devices receive the command earlier in the data chain, they need to wait until the last device receives the command, then all the devices are active at that time. In order to realize such function, each device needs to know its delay time from receiving VSYNC command to enabling VSYNC. The device uses some register bits to restore the device number in a data chain. This number will minus the device identification, and the result is the delay time of the device.

Since the sync function has been done by the device, the controller only needs to send the VSYNC command to the first device in a data chain.

图 8-16. VSYNC Write Command

8.5.3.3 Soft_Reset Command

The Soft_Reset Command is used to reset all the function registers to the default value, except for SRAM data. The format of this command is the same with VSYNC shown as [VSYNC Write Command](#). The difference is the headbytes.

8.5.3.4 Data Write Command

The device implements two kinds of transmission formats, which are called broadcast and non-broadcast. With broadcast way, the devices which are cascaded in a data chain receive the same data from the controller as [Data Write Command with Broadcast](#) shows. With non-broadcast way, each device will receive its own data sent from controller. The order of the data is the reverse of the order in which the device cascades as shown in [Data Write Command with Non-Broadcast](#).

For 48-bits RGB data, the Blue data is the first to be transmitted, then are the Green and the Red. Also, for all bits in one frame, it is always the MSB transmitted first and the LSB transmitted last.

Here is the data write command with broadcast way. The devices copy to the internal registers after receiving the data. Generally, it is used to write FC0-FC11 command and read LOD/LSD command.

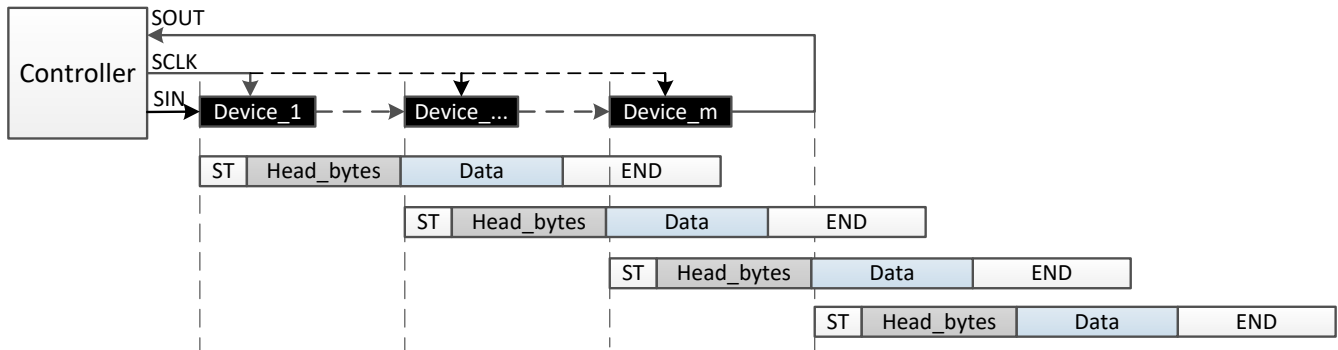

图 8-17. Data Write Command With Broadcast

图 8-18 shows the timing diagram of the data write command with broadcast.

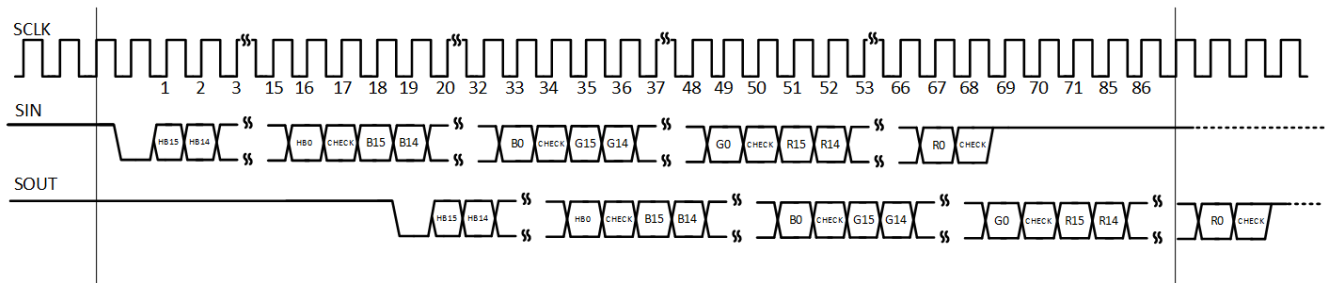

图 8-18. Data Write Command With Broadcast (Timing Diagram)

Here is the data write command with non-broadcast way. When the first device recognizes End_bytes, it cuts off the last 51-bit (3×17-bit) data before End_bytes, and the left are shifted out from SOUT to the second device; likewise, when the last device recognizes End_bytes from the former device, it cuts off the last 51-bit (3 × 17-bit) data before End_bytes and the left are shifted out from SOUT. Generally, it is used for write SRAM command (WRTGS), details about how to write a frame data into memory bank can be found in [Write a Frame Data into Memory Book](#).

图 8-19. Data Write Command With Non-Broadcast

图 8-20 shows the timing diagram of the Data Write Command with Non-Broadcast.

图 8-20. Data Write Command with Non-Broadcast (Timing Diagram)

8.5.4 Read Command

The controller sends the read command. When the first device receives this command, it inserts its 48-bit data before End_bytes, and meanwhile shifts out to the second device. When the second device receives this command, it inserts its 48-bit data before End_bytes and meanwhile shifts out to the third device. The data of all the device will be shifted out from the last device SOUT with this flow. The MSB is always transmitted first and the LSB is transmitted last.

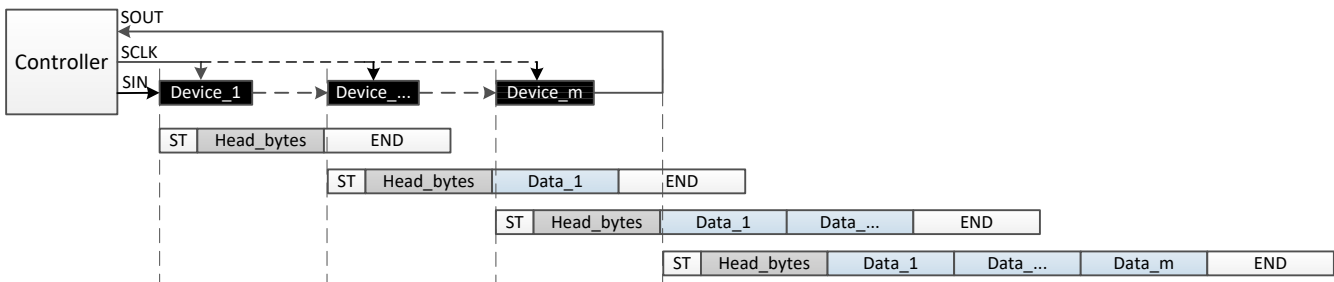

图 8-21. Data Read Command

8.6 PWM Grayscale Control

8.6.1 Grayscale Data Storage and Display

8.6.1.1 Memory Structure Overview

The LP5890 implements a display memory unit to achieve high refresh rate and high contrast ratio in LED display products. The internal display memory unit is divided into two BANKs: BANK A and BANK B. During the normal operation, one BANK is selected to display the data of current frame, another is used to restore the data of next frame. The BANK switcher is controlled by the BANK_SEL bit, which is an internal flag register bit.

After power on, BANK_SEL is initialized to 0, and BANK A is selected to restore the data of next frame. Meanwhile, the data in BANK B is read out for display. When one frame has elapsed, the controller sends the vertical synchronization (VSYNC) command to start the next frame. The BANK_SEL bit value is toggled and the selection of the two BANKs reverses. Repeat this operation until all the frame images are displayed.

With this method, the LP5890 device can display the current frame image at a very high refresh rate. See [Figure 8-22](#) for more details about the BANK-selection exchange operation.

Figure 8-22. Bank Selection Exchange Operation

8.6.1.2 Details of Memory Bank

Each memory BANK contains the frame-image grayscale data of all the 32 lines. Each line comprises sixteen 48-bit-width memory units. Each memory unit contains the grayscale data of the corresponding R/G/B channels.

Depending on the number of scan lines set in SCAN_NUM (FC0 bit 20 to bit 16), the total number of memory units that must be written in one BANK is: $48 \times$ the number of scan lines. For example, if the number of scan lines is set to 32, then 1536 ($32 \times 48 = 1536$) memory units must be written during each frame period.

[Figure 8-23](#) shows the detailed memory structure of the LP5890 device.

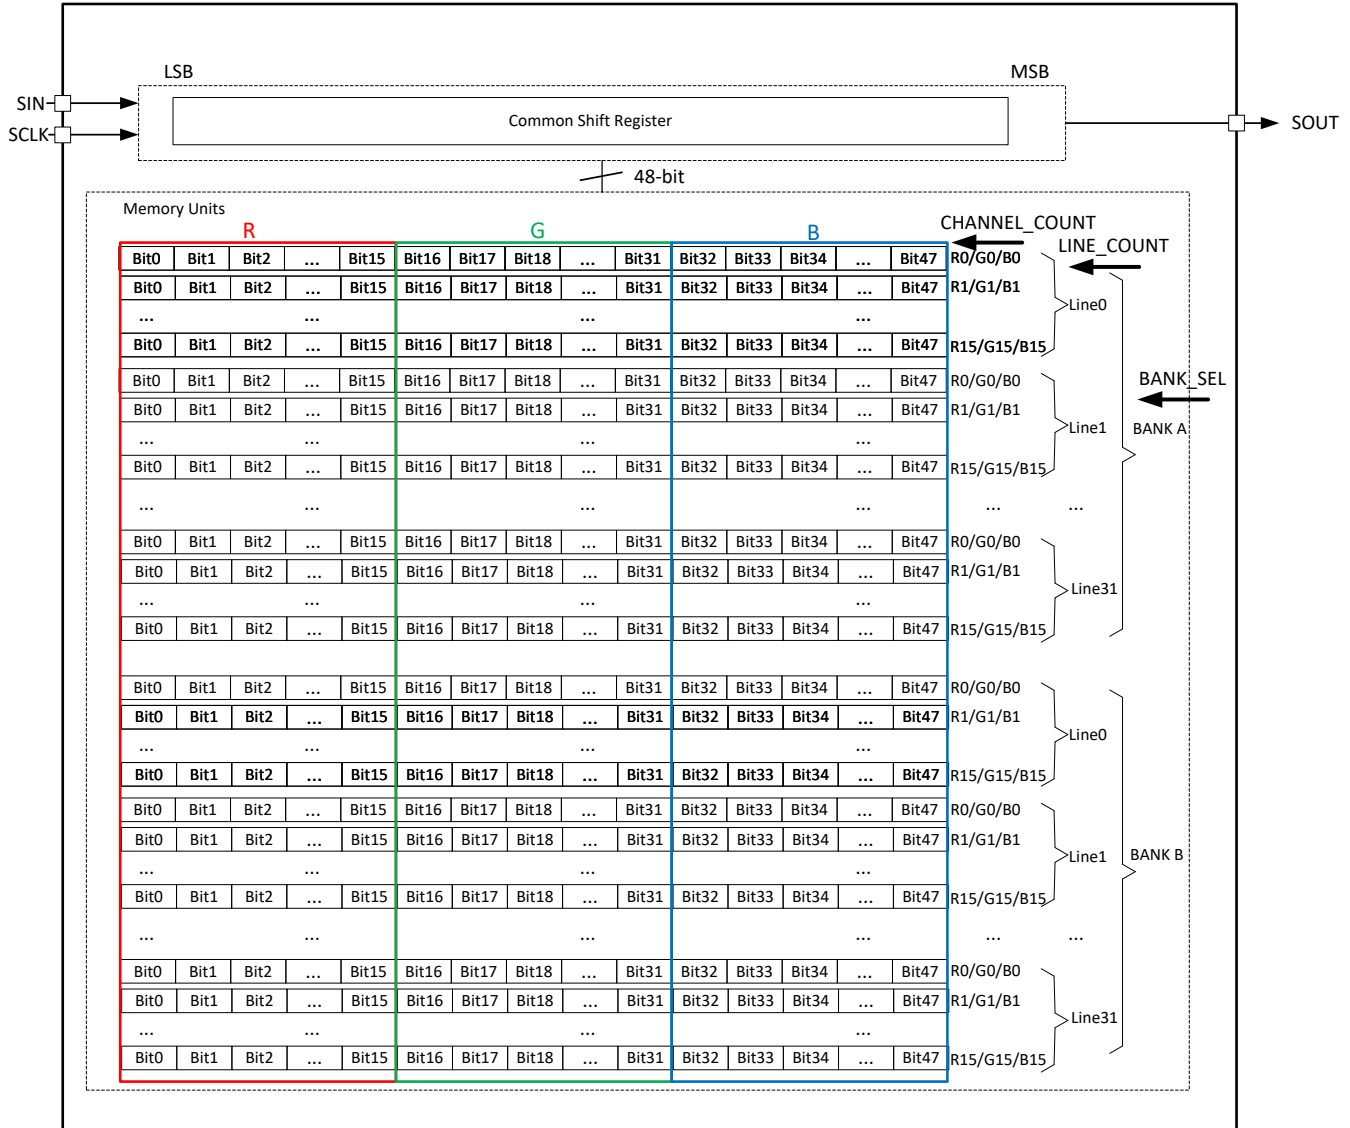

图 8-23. LP5890 Memory-unit Structure

8.6.1.3 Write a Frame Data into Memory Bank

After power on, the LP5890 internal flag BANK_SEL, and counters LINE_COUNT, CHANNEL_COUNT, are all initialized to 0. Thus, the memory unit of channel R0/G0/B0, locating in line 0 of BANK A, is selected to restore the data transmitted the first time after VSYNC command.

When the first WRTGS command is received, all the data in the common shift register is latched into the memory unit of channel R0/G0/B0, locating in line 0 of BANK A. Then CHANNEL_COUNT increases by 1 and LINE_COUNT stays the same. Thus, the memory unit of channel R1/G1/B1, locating in line 0 of BANK A, is selected to restore the data transmitted the second time after VSYNC command.

When the second WRTGS command is received, all the data in the common shift register is latched into the memory unit of channel R1/G1/B1, locating in line 0 of BANK A. Then CHANNEL_COUNT increases by 1 and LINE_COUNT stays the same. Thus, the memory unit of channel R2/G2/B2, locating in line 0 of BANK A, is selected to restore the data transmitted the third time after VSYNC command.

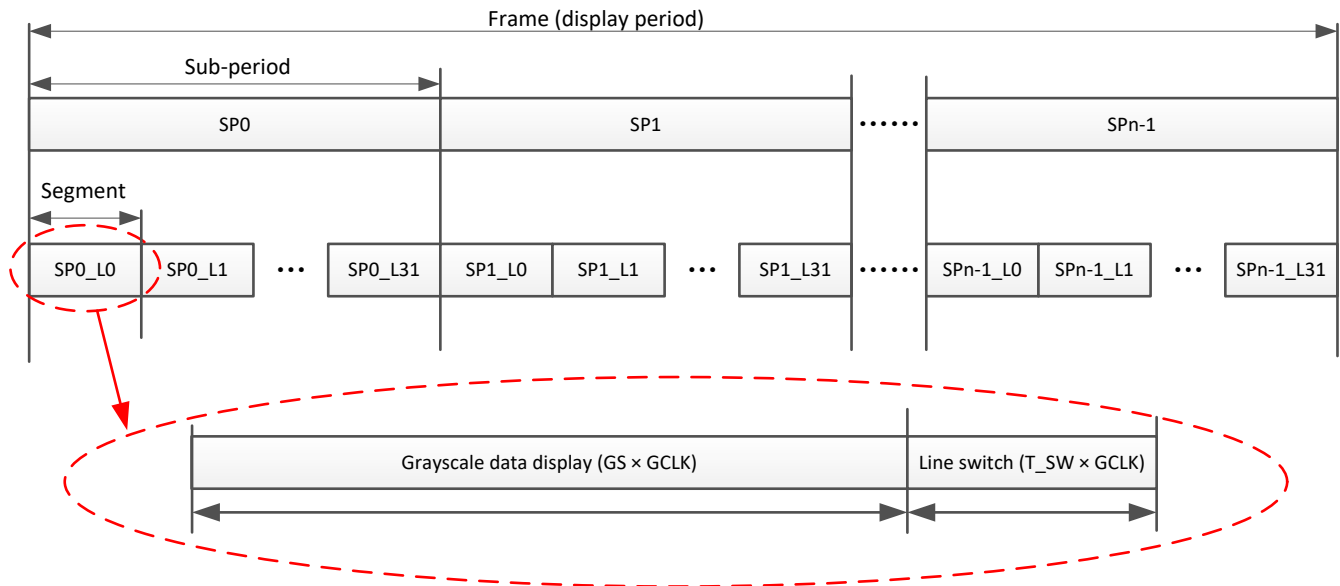

Repeat the grayscale-data-write operation until the 16th WRTGS command is received. Then CHANNEL_COUNT is reset to 0 and LINE_COUNT increases by 1. Thus, the memory unit of channel

R0/G0/B0, located in line 1 of BANK A, is selected to restore the data transmitted the 17th time after VSYNC command.

Repeat this operation for each line until the LINE_COUNT exceeds the number of scan lines set in the SCAN_NUM (See FC0 register bit20-16) and all scan lines have been updated with new GS data, which means one frame of GS data is restored into the memory BANK. Then the LINE_COUNT is reset to 0.

8.6.2 PWM Control for Display

In order to increase the refresh rate in time-multiplexing display system, an DS-PWM (Dynamic Spectrum-Pulse Width Modulation) algorithm is proposed in this device. One frame is divided into many segments shown as below. Note that one frame is divided into n sub-periods, n is set by SUBP_NUM (FC0 register bit23-21), and each sub-period is divided into 32 segments for 32 scan lines. Each segment contains GS GCLKs time for grayscale data display and T_SW GCLKs time for switching lines. GS is configured by the SEG_LENGTH (FC1 register bit9-0 in [表 8-8](#)), and T_SW is the line switch time, which is configured by the LINE_SWT (see FC1 register bit 40-37 in [表 8-8](#)).

Note that, SP0: Sub-period 0, L0: Scan line 0

图 8-24. DS-PWM Algorithm with 32 Scan Lines

The DS-PWM can not only increase the refresh rate meanwhile keep the same frame rate, but also decrease the brightness loss in low grayscale, which can smoothly increase the sub-period number when the grayscale data increases.

In order to achieve ultra-low luminance, the LED driver should have the ability to output a very short current pulse (1 GCLK time), however, because of the parasitic capacitor of the LEDs, such pulse could not turn on the LEDs. And the larger GCLK frequency is, the harder to turn on LEDs.

DS-PWM algorithm has a parameter called subperiod threshold, which is used to calculate when to change subperiod number according to the giving grayscale data. Subperiod threshold defines the LED minimum turn-on time, so as to conquer the current loss caused by LED parasitic capacitor. Subperiod threshold is configured by the SUBP_TH_R/G/B (FC1 register bit24-10 in 表 8-8).

With DS-PWM algorithm, the brightness has smoothly increased with the gradient grayscale data.

8.7 Register Maps

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The LP5890 integrates 48 constant current sources and 16 scanning FETs. A single LP5890 is capable of driving 16×16 RGB LED pixels while stacking two LP5890s can drive 32×32 RGB LED pixels. To achieve low power consumption, the LP5890 supports separated power supplies for the red, green, and blue LEDs by its common cathode structure.

The LP5890 implements a high speed rising-edge transmission interface (up to 50 MHz) to support high device count daisy-chained and high refresh rate while minimizing electrical-magnetic interference (EMI). SCLK must be continuous, no matter there are data on SIN or not, since SCLK is not only used to sample the data on SIN, but also used as an clock source to generate GCLK by internal frequency multiplier. Based on CCSI protocol, all the commands/FC registers/SRAM data are written from the SIN input terminal, and all the FC registers/ LED open and short flag can be read out from the SOUT output terminal. Moreover, the device supports up to 160-MHz GCLK frequency and can achieve 16-bit PWM resolution, with 3840 Hz or even higher refresh rate.

Meanwhile, the LP5890 integrates enhanced circuits and intelligent algorithms to solve the various display challenges in Narrow Pixel Pitch (NPP) LED display applications and Mini and Micro-LED products: Dim at the first scan line, Upper and downside ghosting, Non-uniformity in low grayscale, Coupling, Caterpillar caused by open or short LEDs, which make the LP5890 a perfect choice in such applications.

The LP5890 also implements LED open or weak short or short detections and removals during operations and can also report those information out to the accompanying digital processor.

9.2 Typical Application

The LP5890 are typically connected in series in a daisy-chain to drive the LED matrix with only a few controller ports.  9-1 shows a typical application diagram with two LP5890 devices stackable connection to drive 32×32 RGB LED pixels.

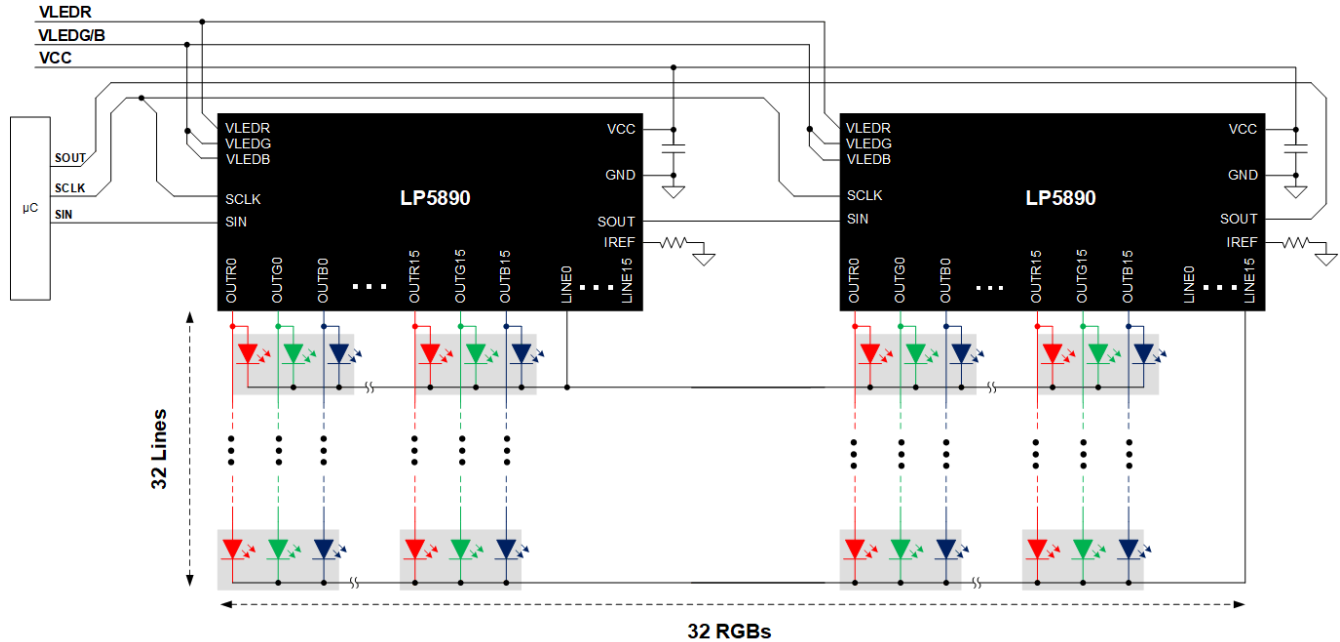

图 9-1. LP5890 with Dual Devices Stackable Connection

9.2.1 Design Requirements

Taking 4K micro-LED elevation for example, the resolution of the screen is 3840 × 2160 and the screen consists of many modules. The following sections show an example of how to build an LED display module with 240 × 180 pixels.

The example uses the following values as the system design parameters.

表 9-1. LP5890 Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{CC} and V_R	2.8 V
V_G and V_B	3.8 V
Maximum current per LED	$I_{RED} = 3 \text{ mA}$, $I_{GREEN} = 2 \text{ mA}$, $I_{BLUE} = 1 \text{ mA}$
PWM resolution	14 bits
Frame rate	120 Hz
Refresh rate	3840 Hz
Display module size	240 × 180 pixels
cascaded devices number	8
devices number per LED display module	96

9.2.1.1 System Structure

To build an LED display module with 240 × 180 pixels, 96 LP5890s are required.

图 9-2. LED Display Module

As shown in [图 9-2](#), the total module can be divided into 48 30 × 30 matrix, each matrix includes 2 devices with stackable connection.

Note

In order to achieve the best performance, TI suggests to distribute the redundant channels and lines to each 32 × 32 matrix. For this case, two Red/Green/Blue channels and two lines are not used in each matrix, and these unused pins can be floated. For the software, zero data is suggested to send to the unused channels. There is no need to send the zero data to unused lines.

9.2.1.2 SCLK Frequency

The SCLK frequency is determined by the data volume of one frame and frame rate. In this application, the data volume V_Data is $30 \times 32 \times 48 \text{ bits} \times 4 = 184.32 \text{ Kb}$, the frame rate is 120 Hz. Suppose the data transmission efficiency is 0.8, the minimum frequency of SCLK should be: $f_{SCLK} = V_Data \times f_{frame} / 0.8$. So the minimum SCLK frequency is 27.65 MHz with rising-edge transmission.

9.2.1.3 Internal GCLK Frequency

The internal GCLK frequency is configured by the Frequency Multiplier (FREQ_MUL) and is determined by the PWM resolution. The GCLK frequency can be calculated by the below equations:

$$N_{sub_period} = \frac{f_{refresh_rate}}{f_{frame_rate}}$$

$$GS_{max} = 2^K$$

$$GS_{max} = N_{GCLK_Seg} \times N_{sub_period}$$

$$\frac{1}{f_{frame_rate}} = \left(\frac{N_{GCLK_Seg}}{f_{GCLK}} + T_{SW} \right) \times N_{scan_line} \times N_{sub_period} + T_{Blank} \quad (3)$$

where

- $f_{refresh_rate}$ means the refresh rate
- f_{frame_rate} means the frame rate
- K means the PWM resolution
- N_{sub_period} means the sub-period numbers within one frame
- N_{GCLK_seg} means the GCLK number per segment (line switch time excluded)
- f_{GCLK} means GCLK frequency
- T_{SW} means line switching time
- N_{scan_line} means the scan line number
- T_{blank} means the blank time in one frame, equals to 0 in ideal configuration
- GS_{max} means the maximum grayscale that the device can output in one frame

表 9-2 gives the values based on the system configuration and equation.

表 9-2. LP5890 Design Parameters for GCLK Frequency Calculation

DESIGN PARAMETER	EXAMPLE VALUE
N_{sub_period}	32
N_{scan_line}	30
T_{SW}	1.5 μ s
T_{blank}	0
N_{GCLK_seg}	512
GS_{max}	16383
f_{GCLK}	71.3 MHz

Considering SCLK frequency and FREQ_MUL, the SCLK can be 27.7 MHz and FREQ_MUL can be 0010b. So the GCLK will be 83.1 MHz.

9.2.1.4 Line Switch Time

The line switch time is digitized with the GCLK number and can be set by the LINE_SWT (Bit 40-37 in FC1 register). In this application, it is $1.5\mu s \times 83.1 \text{ MHz} = 125 \text{ GCLKs}$, so the LINE_SWT equals to 0011b (120 GCLKs), the actual line switch time is 1.44 μ s.

9.2.1.5 Blank Time Removal

The LP5890 has an algorithm to distribute the blank time into each subperiod in order to prevent the black field when taking photos or video.

From Equation 3, 83.1-MHz GCLK frequency and 1.44- μ s line switch time, the calculated blank time is 1.0361 ms (86100 GCLK), which is too long and will bring black field.

Here are detailed steps of the algorithm:

Step1: Distribute blank time into each segment

When the blank GCLK number is larger than $N_{sub_period} \times N_{scan_line}$, it can be distributed into each segment.

In this application, the blank GCLK number is 86100 and $N_{sub_period} \times N_{scan_line}$ is 960, so the distributed GCLK number in each segment is $86100/960 = 89...660$. These 89 GCLKs can be used to increase PWM length or extend line switch time. If used to increase PWM length, the GCLK number in each segment will be $512 + 89 = 601$, so the SEG_LENGTH (Bit9-0 in FC1 register) will be 1001011001b.

Step2: Distribute blank time into each sub-period

If the left GCLK number is larger than N_{sub_period} , it can be distributed into each sub-period.

In this application, the left GCLK is 600 and the distributed GCLK number in each sub-period is $600/32=18...24$. The BLK_ADJ (Bit46-41 in FC1 register) is 010001b.

After distributing into each sub-period, the left GCLK number is 24, which is about 289 ns. This time is too short to bring black field.

9.2.1.6 BC and CC

Select the reference current-setting resistor R_{IREF} and configure a proper BC value to set the maximum current of the RGB LEDs (see [Brightness Control \(BC\) Function](#) for more details). Here the maximum current is 3 mA, BC value is 03h, according to equation [方程式 1](#), the reference resistor value is $0.8V/3mA \times 86.61 = 23 k\Omega$.

Configure the CC_R/CC_G/CC_B registers to set the current of Red/ Green/Blue LED current to 3 mA/2 mA/1 mA (see [Color Brightness Control \(CC\) Function](#) for more details).

[表 9-3](#) shows the reference current setting resistor R_{IREF} , BC and CC_R/CC_G/CC_B register value.

表 9-3. Current Setting Value

DESIGN PARAMETER	EXAMPLE VALUE
R_{IREF}	23 k Ω
BC	011 b
CC_R	11111110 b
CC_G	10101001 b
CC_B	01010100 b

9.2.2 Detailed Design Procedure

图 9-3 给出了 LED 显示的详细设计程序。电源开启且数字信号就绪后，第一步是控制器发送芯片索引命令，让设备知道它们的身份。然后，它发送配置数据到 FC 寄存器。之后，它在每帧的开始发送 VSYNC 并同时将数据发送到每个设备。设备将在 VSYNC 到来时显示上一帧的数据，同时接收来自控制器的当前帧数据。寄存器可以在帧的任何时候读取。

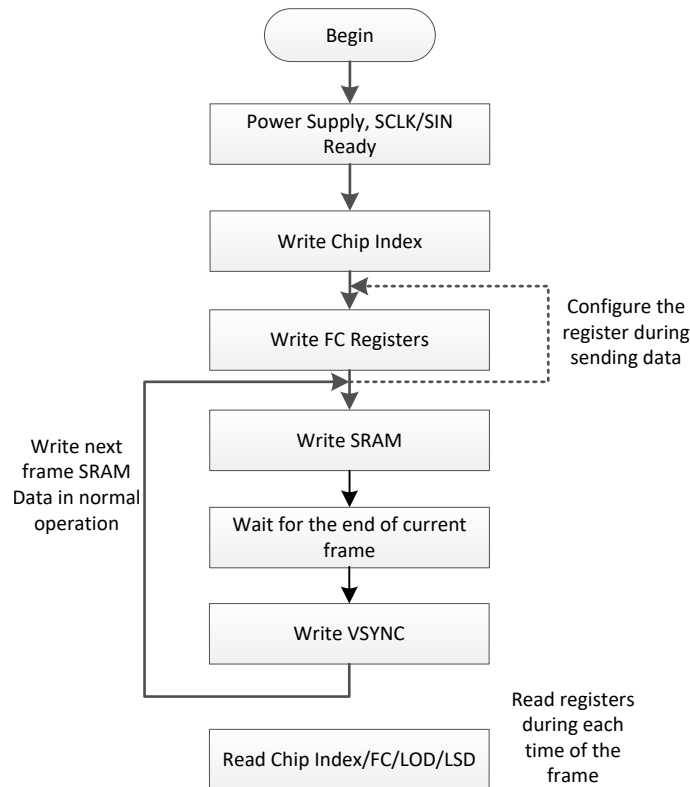

图 9-3. Design Procedure for LED Display

9.2.2.1 Chip Index Command

芯片索引用于在数据链中分布设备的地址。每个设备通过此命令获得其唯一地址。详细信息可在 [Chip Index Write Command](#) 中找到。

9.2.2.2 FC Registers Settings

某些 FC0、FC1、FC3 寄存器的位必须在设备正常工作前正确配置。在此应用中，寄存器值可以是：

表 9-4. FC Registers Value

FC Registers	Register Value(BIN)	Register Value(HEX)
FC0	0001 0000 0000 0000 0001 1000 0011 1101 0000 0001 0000 0111 b	1000 283D 0107 h
FC1	0010 0100 0110 0000 0000 0000 1001 0100 1010 0110 0101 1001 b	2460 0094 A659 h
FC3	0000 0000 0011 1011 0101 0100 1010 1001 1111 1110 0000 0000 b	003B 54A9 FE00 h

控制器可以通过数据写入命令与广播模式配置 FC（参见 [Data Write Command](#) 以获取更多细节）。FC0、FC1 寄存器在 VSYNC 命令到来后更新，而其他 FC 寄存器无论 VSYNC 命令何时到来都会立即更新。

9.2.2.3 Grayscale Data Write

The channel grayscale data will be written to SRAM of the device by the data write command with non-broadcast way, details can be found in [Data Write Command](#) and [Write a Frame Data into Memory Book](#).

[Data Write Flow](#) is the data write flow for this application, $P(i, j)$ is the data of pixel locating in $i+1$ row and $j+1$ column. Suppose channel R15/G15/B15 of each device is not used and not connected, but the channel R14/G14/B14 is connected to $P(i, 0)$, the channel R13/G13/B13 is connected to $P(i, 1)$, ..., and channel R0/G0/B0 is connected to $P(i, 14)$. The data of unused channel should be zero noting D_Zero in below figure, and $D_Zero = 0000000000000001\ 0000000000000001\ 0000000000000001$ b.

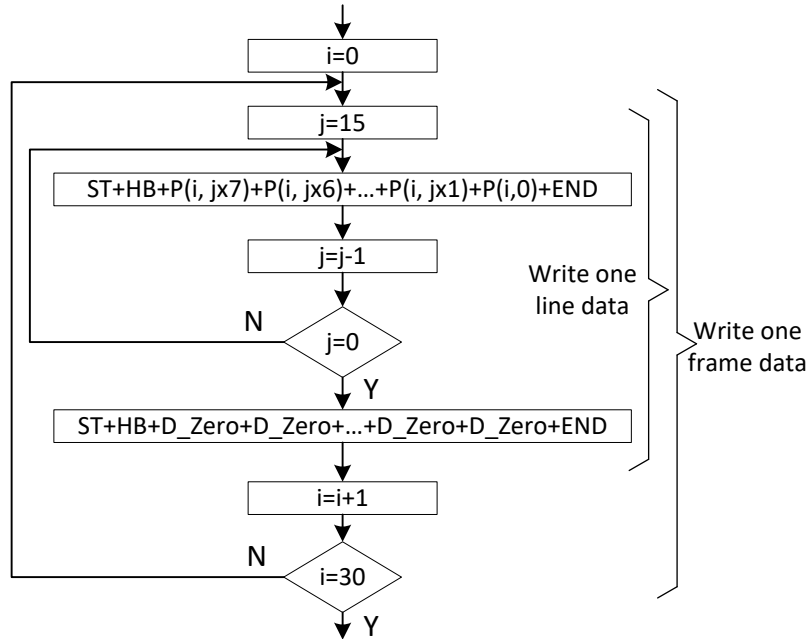

图 9-4. Data Write Flow

9.2.2.4 VSYNC Command

The VSYNC is used to sync the display of each frame for the devices in a cascaded chain. Details can be found in [VSYNC Write Command](#).

9.2.2.5 LED Open and Short Read

FC10, FC11, FC12, FC13, FC14, FC15 are the read commands for LOD/LSD information. Details can be found in [Read LED-open Information](#) and [Read LED-short Information](#).

9.2.3 Application Curves

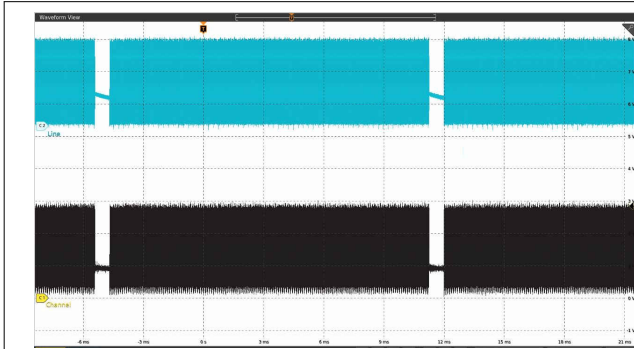

图 9-5. Line and Channel Waveform in One Frame (GSn=0xFFFFh)

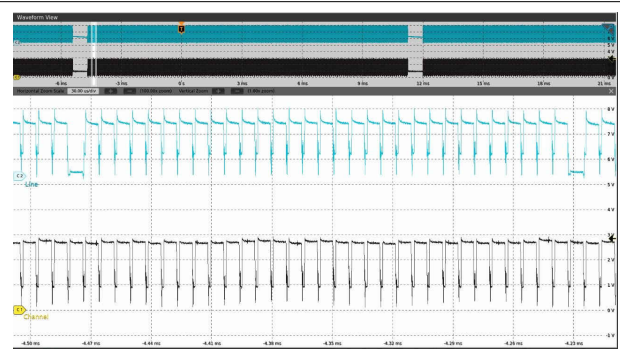

图 9-6. Line and Channel Waveform in One Subperiod (GSn=0xFFFFh)

图 9-7. Line and Channel Waveform in One Frame (GSn=0x0001h)

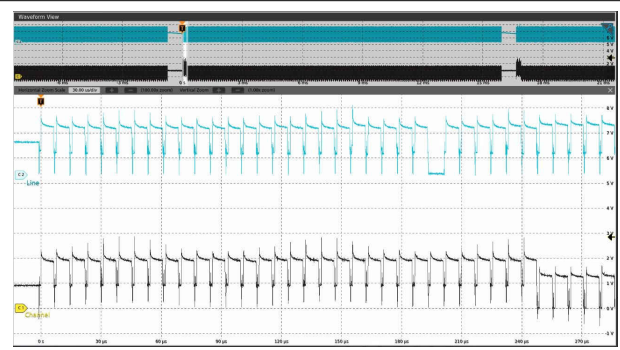

图 9-8. Line and Channel Waveform in One Frame (GSn=0x0001h)

10 Power Supply Recommendations

Decouple the VCC power supply voltage by placing a 0.1- μ F ceramic capacitor close to VCC pin and GND plane. Depending on panel size, several electrolytic capacitors must be placed on the board equally distributed to get well regulated LED supply voltage VR/VG/VB. The ripple of the LED supply voltage must be less than 5% of their nominal value. Generally, the green and blue LEDs have the similar forward voltage and can be supplied by the same power rail.

Furthermore, the $V_R > V_f(R) + 0.35 \text{ V}$ (10-mA constant current example), the $V_G = V_B > V_f(G/B) + 0.35 \text{ V}$ (10-mA constant current example), and here $V_f(R)$, $V_f(G/B)$ are representative for the maximum forward voltage of red, green/blue LEDs.

Also in order to simplify the power design, VCC can be connected to VR power rail.

11 Layout

11.1 Layout Guidelines

- Place the decoupling capacitor near the VCC/VR, VG/VB pins and GND plane.
- Place the current programming resistor RIREF close to IREFpin and GND plane.
- Route the GND thermal pad as widely as possible for large GND currents. Maximum GND current is approximately 2 A for two devices ($96\text{-CH} \times 20\text{ mA} = 1.92\text{ A}$).
- The Thermal pad must be connected to GND plane because the pad is used as power ground pin internally. There is a large current flow through this pad when all channels turn on. Furthermore, this pad should be connected to a heat sink layer by thermal via to reduce device temperature. For more information about suggested thermal via pattern and via size, see the [PowerPAD™ Thermally Enhanced Package Application Report](#).
- Routing between the LED Anode side and the device OUTXn pin should be as short and straight as possible to reduce wire inductance.
- The line switch pins should be located in the middle of the matrix, which should be laid out as symmetrically as possible.

11.2 Layout Example

In order to simplify the system power rails design, we suggest that VR, VCC use one power rail, and VG, VB use another power rail. [图 11-1](#) gives an example for power rails routing.

Connect the GND pin to thermal pad on board with the shortest wire and the thermal pad is connected to GND plane with the vias, as many as possible to help the power dissipation.

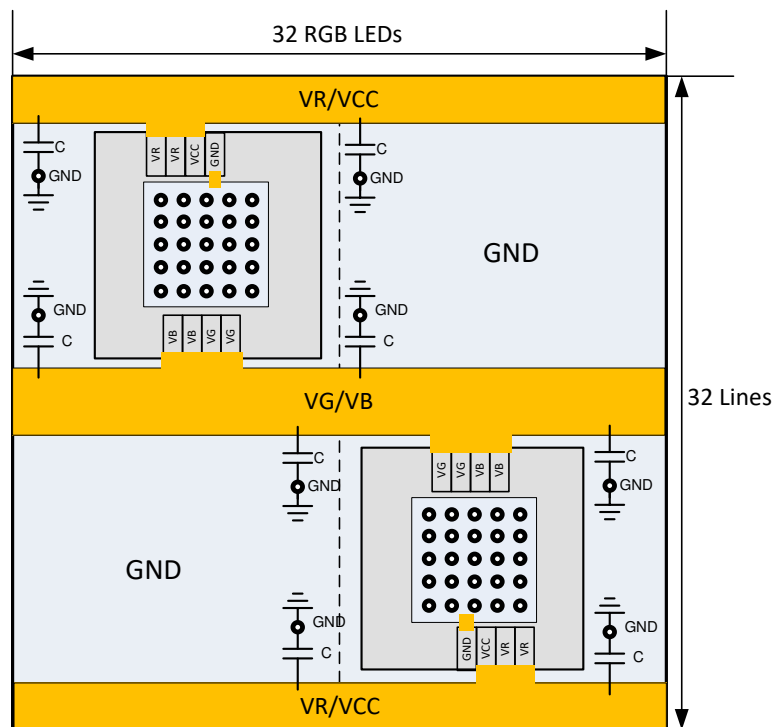

图 11-1. Power Rails Routing Suggestion

[图 11-2](#) gives an example for line routing. Connect the line switch to the center of the line bus, so as to uniform the current flowing from the line switch to the left side and right side LEDs in white grayscale. With this connection, the unbalance of the parasitic inductor from the routing will be the smallest and the display performance will be better, especially in low grayscale condition.

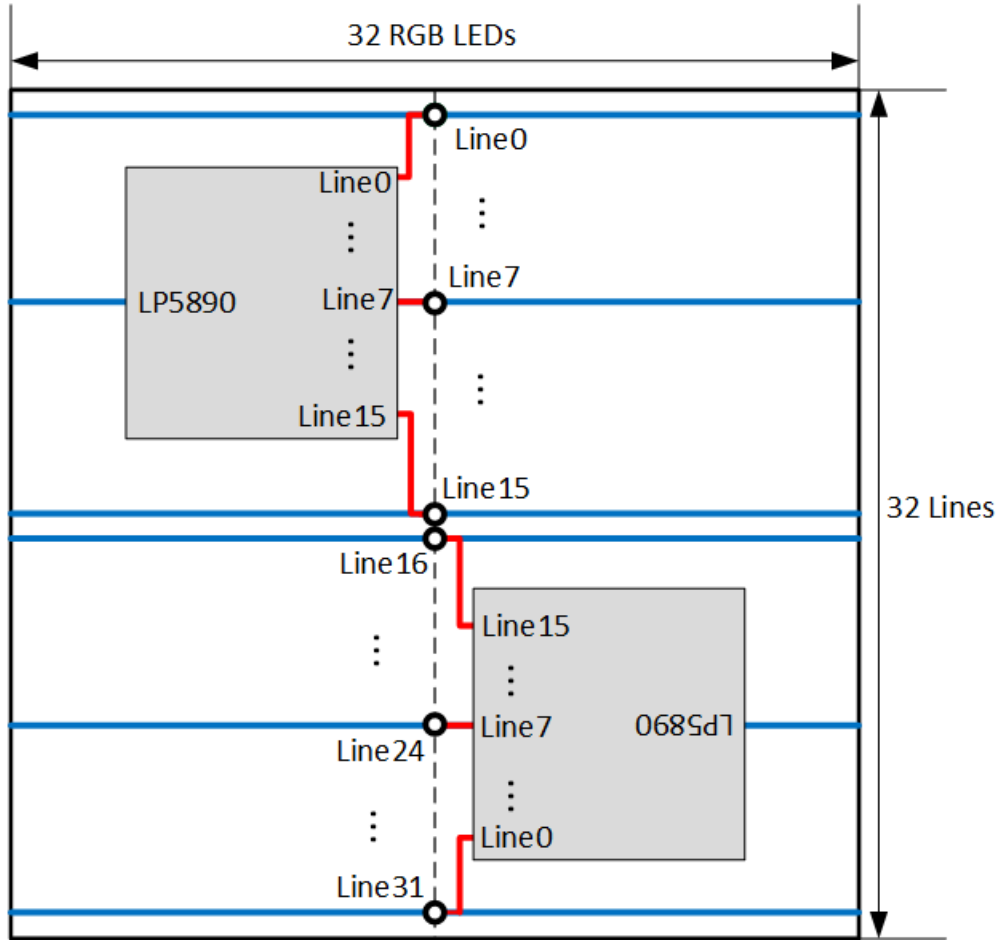

图 11-2. Line Routing Suggestion

图 11-3 gives an example for channel routing with the shortest wire. With this connection, the channel to the LED path is the shortest, which can reduce the wire inductance, and be a benefit to the performance. However, the data transmission sequence should be adjusted to follow the pins routing map. For example, R0 connects to column 15 (LED15). The first data should be column 15 (LED15) rather than column 0 (LED0).

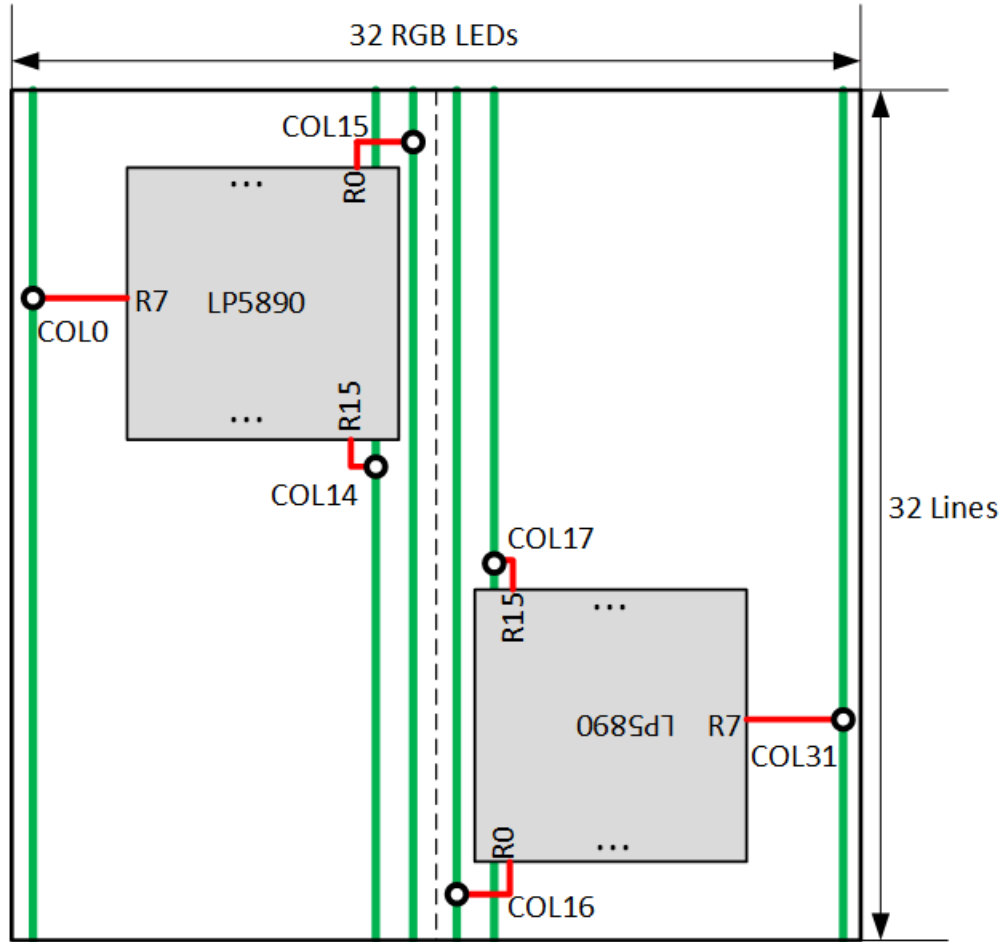

图 11-3. Channel Routing Suggestion with Shortest Wire

图 11-4 给出了通道布线与引脚编号序列的例子。通过这种连接，数据传输序列将与引脚编号序列相同。例如，R0 连接到第 0 列 (LED0)。第一个数据将是第 0 列 (LED0)。然而，通过这种连接，每个通道的电感可能会有所不同，这可能会导致最差情况下的微小差异。

图 11-4. Channel Routing Suggestion with Channel Order Sequence

12 Device and Documentation Support

12.1 接收文档更新通知

要接收文档更新通知，请导航至 [ti.com](https://www.ti.com) 上的器件产品文件夹。点击 [订阅更新](#) 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

12.2 支持资源

TI E2E™ 支持论坛是工程师的重要参考资料，可直接从专家获得快速、经过验证的解答和设计帮助。搜索现有解答或提出自己的问题可获得所需的快速设计帮助。

链接的内容由各个贡献者“按原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《[使用条款](#)》。

12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES:

NanoFree is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 15X

SOLDER MASK DETAILS
NOT TO SCALE

4225828/A 03/2020

NOTES: (continued)

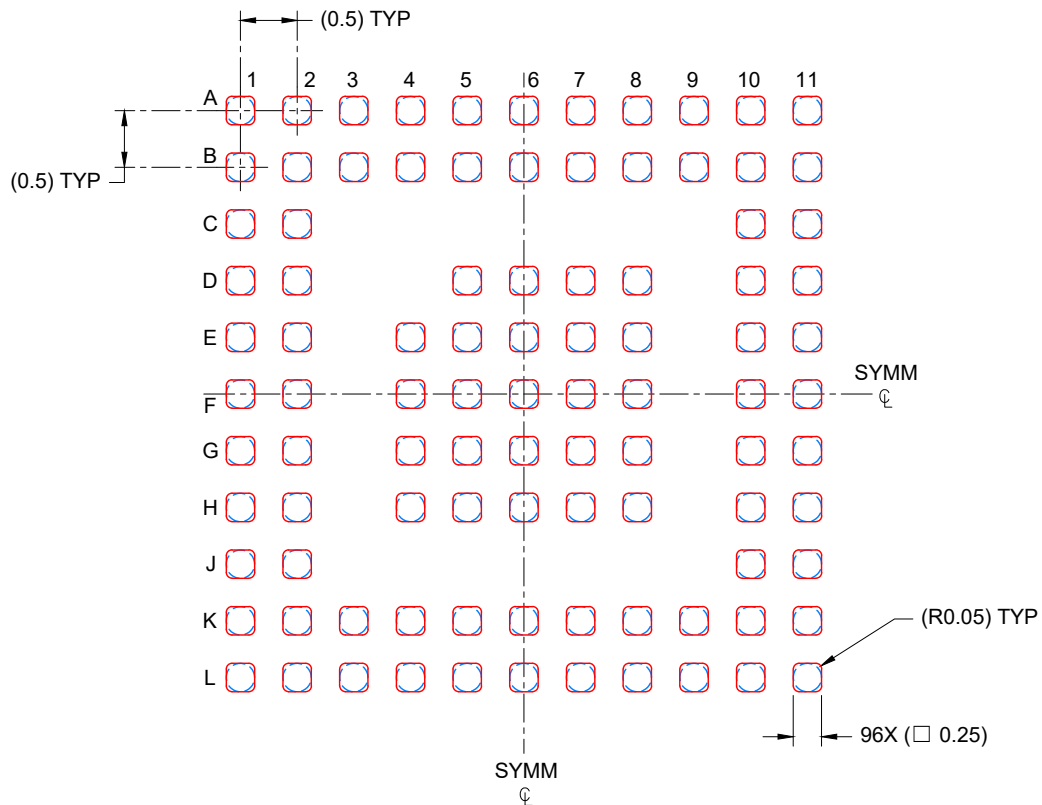

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. Refer to Texas Instruments Literature number SNVA009 (www.ti.com/lit/snva009).

EXAMPLE STENCIL DESIGN

ZXL0096A

NFBGA - 1.08 mm max height

PLASTIC BALL GRID ARRAY

SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
SCALE: 15X

4225828/A 03/2020

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

GENERIC PACKAGE VIEW

RRF 76

VQFN - 1 mm max height

9 x 9, 0.4 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4232009/A

PACKAGE OUTLINE

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

4224965/A 04/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RRF0076A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 10X

4224965/A 04/2019

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RRF0076A

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
BASED ON 0.125 MM THICK STENCIL
SCALE: 10X

EXPOSED PAD 77
63% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE

4224965/A 04/2019

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
