### 1.3 说明

TI MSP430F676x1A 多相计量 SoC 是用于收费仪表的功能强大的高度集成解决方案，可使用很少的外部组件实现精准计量并实现低系统成本。MSP430F676x1A 使用低功耗 MSP430™CPU 及 32 位乘法器来执行所有能量计算，从而在各种应用（如费率管理以及与 AMR 或 AMI 模块的通信）中实现计量功能。

MSP430F676x1A 采用了 TI 的 24 位  $\Sigma$ - $\Delta$  转换器技术，其精度优于 0.5%。系列产品成员包括高达 128KB 的闪存和 8KB 的 RAM 以及一个支持高达 320 段的 LCD 控制器。MSP430F676x1A 的超低功耗属性意味着可以最大限度地减小系统电源，以降低总体成本。最低待机功率意味着可以最大限度地减少备用能量存储，并在主电源发生故障时更长时间地保留关键数据。

MSP430F676x1A 系列执行 TI 能量测量软件库，该软件库可计算所有相关能量和功率结果。能量测量软件库随 MSP430F676x1A 一起免费提供。您还可以使用工业标准开发工具和硬件平台，在全球范围内加快符合所有 ANSI 和 IEC 标准的仪表的开发。

## 4.4 Pin Multiplexing

Pin multiplexing for these devices is controlled by both register settings and operating modes (for example, if the device is in test mode). For details of the settings for each pin and schematics of the multiplexed ports, see [§ 6.13](#).

## 4.5 Buffer Type

[Table 4-5](#) defines the buffer types that are referenced in [Table 4-1](#) and [Table 4-2](#).

**Table 4-5. Buffer Type**

BUFFER TYPE (STANDARD)	NOMINAL VOLTAGE	HYSTERESIS	PU OR PD	NOMINAL PU OR PD STRENGTH ( $\mu$ A)	OUTPUT DRIVE STRENGTH (mA)	OTHER CHARACTERISTICS
Analog	3.0 V	N	N/A	N/A	N/A	See analog modules in <a href="#">Section 5, Specifications</a> , for details
LVC MOS	3.0 V	Y	Programmable	See <a href="#">§ 5.8.4 Digital I/O Ports</a>	See <a href="#">§ 5.8.4 Digital I/O Ports</a>	
Power	3.0 V	Y with SVS on	N/A	N/A	N/A	

## 4.6 Connection of Unused Pins

[Table 4-6](#) lists the correct termination of unused pins.

**Table 4-6. Connection of Unused Pins<sup>(1)</sup>**

PIN	POTENTIAL	COMMENT
AVCC	DV <sub>CC</sub>	
AVSS	DV <sub>SS</sub>	
LDCAP	DV <sub>SS</sub>	
PJ.0/TDO PJ.1/TDI PJ.2/TMS PJ.3/TCK	Open	The JTAG pins are shared with general purpose I/O function (PJ.x). If not being used, these should be switched to port function, output direction (PJDIR.n = 1). When used as JTAG pins, these pins should remain open.
Px.y	Open	Switched to port function, output direction (PxDIR.n = 1). Px.y represents port x and bit y of port x (for example, P1.0, P1.1, P2.2, PJ.0, PJ.1)
$\overline{\text{RST}}$ /NMI	DV <sub>CC</sub> or V <sub>CC</sub>	47-k $\Omega$ pullup or internal pullup selected with 10-nF (2.2-nF) pulldown <sup>(2)</sup>
TEST	Open	This pin always has an internal pulldown enabled.
XIN	DV <sub>SS</sub>	For dedicated XIN pins only. XIN pins with shared GPIO functions should be programmed to GPIO and follow Px.y recommendations.
XOUT	Open	For dedicated XOUT pins only. XOUT pins with shared GPIO functions should be programmed to GPIO and follow Px.y recommendations.

- (1) Any unused pin with a secondary function that is shared with general purpose I/O should follow the Px.y unused pin connection guidelines.
- (2) The pulldown capacitor should not exceed 2.2 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools such as FET interfaces or GANG programmers.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages referenced to  $V_{SS} = V_{DVSS} = V_{AVSS}$ .
- (3) V<sub>CORE</sub> is for internal device use only. No external DC loading or voltage should be applied.
- (4) See [Table 5-35](#) for SD24\_B specifications.
- (5) See [Table 5-18](#) for AUX specifications.
- (6) A protection diode is connected to  $V_{CC}$  for the SD24\_B input pins. No protection diode is connected to  $V_{SS}$ .
- (7) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

		VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	$\pm 1000$	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	$\pm 250$	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 1000\text{ V}$  may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as  $\pm 250\text{ V}$  may actually have higher performance.

## 5.8 Timing and Switching Characteristics

### 5.8.1 Power Supply Sequencing

TI recommends powering AVCC and DVCC pins from the same source. At a minimum, during power up, power down, and device operation, the voltage difference between AVCC and DVCC must not exceed the limits specified in [Absolute Maximum Ratings](#). Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and flash.

### 5.8.2 Reset Timing

[Table 5-1](#) lists the device wake-up times.

$t_{\text{WAKE-UP-RESET}}$	Wake-up time from $\overline{\text{RST}}$ or BOR event to active mode <sup>(4)</sup>				2	3	ms

- (1) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVSL) and low-side monitor (SVM<sub>L</sub>).  $t_{\text{WAKE-UP-FAST}}$  is possible with SVSL and SVM<sub>L</sub> in full performance mode or disabled. For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430x5xx and MSP430x6xx Family User's Guide](#).
- (2) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVSL) and low-side monitor (SVM<sub>L</sub>).  $t_{\text{WAKE-UP-SLOW}}$  is set with SVSL and SVM<sub>L</sub> in normal mode (low current mode). For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the [MSP430x5xx and MSP430x6xx Family User's Guide](#).
- (3) The wake-up times from LPM0 and LPM1 to AM are not specified. They are proportional to MCLK cycle time but are not affected by the performance mode settings as for LPM2, LPM3, and LPM4.
- (4) This value represents the time from the wake-up event to the reset vector execution.

- (1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
  - Keep the trace between the device and the crystal as short as possible.
  - Design a good ground plane around the oscillator pins.
  - Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
  - Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
  - Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
  - If conformal coating is used, ensure that it does not induce capacitive or resistive leakage between the oscillator pins.
- (2) When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-Trigger Inputs section of this data sheet.
- (3) Maximum frequency of operation of the entire device cannot be exceeded.
- (4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVE<sub>x</sub> settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
  - For XT1DRIVE<sub>x</sub> = 0, C<sub>L,eff</sub> ≤ 6 pF
  - For XT1DRIVE<sub>x</sub> = 1, 6 pF ≤ C<sub>L,eff</sub> ≤ 9 pF
  - For XT1DRIVE<sub>x</sub> = 2, 6 pF ≤ C<sub>L,eff</sub> ≤ 10 pF
  - For XT1DRIVE<sub>x</sub> = 3, C<sub>L,eff</sub> ≥ 6 pF
- (5) Includes parasitic bond and package capacitance (approximately 2 pF per pin). Because the PCB adds additional capacitance, TI recommends verifying the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.
- (6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
- (7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies in between might set the flag.

- (1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency,  $f_{DCO}$ , should be set to reside within the range of  $f_{DCO(n,0),MAX} \leq f_{DCO} \leq f_{DCO(n,31),MIN}$ , where  $f_{DCO(n,0),MAX}$  represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and  $f_{DCO(n,31),MIN}$  represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual  $f_{DCO}$  frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.

(1) Modulator clock frequency: MIN = 32.768 kHz – 10% ≈ 30 kHz. MAX = 32.768 kHz × 64 + 10% ≈ 2.3 MHz

(2) The full-scale range (FSR) is defined by  $V_{FS+} = +V_{REF}/GAIN$  and  $V_{FS-} = -V_{REF}/GAIN$ :  $FSR = V_{FS+} - V_{FS-} = 2 \times V_{REF} / GAIN$ . If  $V_{REF}$  is sourced externally, the analog input range should not exceed 80% of  $V_{FS+}$  or  $V_{FS-}$ ; that is,  $V_{ID} = 0.8 V_{FS-}$  to  $0.8 V_{FS+}$ . If  $V_{REF}$  is sourced internally, the given  $V_{ID}$  ranges apply.

(3) There is no capacitance required on VREF. However, a capacitance of 100 nF is recommended to reduce any reference voltage noise.

- (1) The gain error E<sub>G</sub> specifies the deviation of the actual gain G<sub>act</sub> from the nominal gain G<sub>nom</sub>:  $E_G = (G_{act} - G_{nom})/G_{nom}$ . It covers process, temperature and supply voltage variations.
- (2) The gain error temperature coefficient ΔE<sub>G</sub> / ΔT specifies the variation of the gain error E<sub>G</sub> over temperature ( $E_G(T) = (G_{act}(T) - G_{nom})/G_{nom}$ ) using the box method (that is, MIN and MAX values):  
 $\Delta E_G / \Delta T = (\text{MAX}(E_G(T)) - \text{MIN}(E_G(T))) / (\text{MAX}(T) - \text{MIN}(T)) = (\text{MAX}(G_{act}(T)) - \text{MIN}(G_{act}(T))) / G_{nom} / (\text{MAX}(T) - \text{MIN}(T))$   
 with T ranging from -40°C to +85°C.
- (3) The gain error vs V<sub>CC</sub> coefficient ΔE<sub>G</sub> / ΔV<sub>CC</sub> specifies the variation of the gain error E<sub>G</sub> over supply voltage ( $E_G(V_{CC}) = (G_{act}(V_{CC}) - G_{nom})/G_{nom}$ ) using the box method (that is, MIN and MAX values):  
 $\Delta E_G / \Delta V_{CC} = (\text{MAX}(E_G(V_{CC})) - \text{MIN}(E_G(V_{CC}))) / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC})) = (\text{MAX}(G_{act}(V_{CC})) - \text{MIN}(G_{act}(V_{CC}))) / G_{nom} / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC}))$   
 with V<sub>CC</sub> ranging from 2.4 V to 3.6 V.
- (4) The offset error E<sub>OS</sub> is measured with shorted inputs in 2s-complement mode with +100% FS = V<sub>REF</sub> / G and -100% FS = -V<sub>REF</sub> / G. Conversion between E<sub>OS</sub> [FS] and E<sub>OS</sub> [V] is as follows: E<sub>OS</sub> [FS] = E<sub>OS</sub> [V] × G / V<sub>REF</sub>; E<sub>OS</sub> [V] = E<sub>OS</sub> [FS] × V<sub>REF</sub> / G.
- (5) The offset error temperature coefficient ΔE<sub>OS</sub> / ΔT specifies the variation of the offset error E<sub>OS</sub> over temperature using the box method (that is, MIN and MAX values):  
 $\Delta E_{OS} / \Delta T = (\text{MAX}(E_{OS}(T)) - \text{MIN}(E_{OS}(T))) / (\text{MAX}(T) - \text{MIN}(T))$   
 with T ranging from -40°C to +85°C.
- (6) The offset error vs V<sub>CC</sub> ΔE<sub>OS</sub> / ΔV<sub>CC</sub> specifies the variation of the offset error E<sub>OS</sub> over supply voltage using the box method (that is, MIN and MAX values):  
 $\Delta E_{OS} / \Delta V_{CC} = (\text{MAX}(E_{OS}(V_{CC})) - \text{MIN}(E_{OS}(V_{CC}))) / (\text{MAX}(V_{CC}) - \text{MIN}(V_{CC}))$   
 with V<sub>CC</sub> ranging from 2.4 V to 3.6 V.
- (7) The DC CMRR specifies the change in the measured differential input voltage value when the common-mode voltage varies:  
 $\text{DC CMRR} = -20 \log(\Delta_{MAX}/\text{FSR})$  with Δ<sub>MAX</sub> being the difference between the minimum value and the maximum value measured when sweeping the common-mode voltage (for example, calculating with 16-bit FSR = 65536, a maximum change by 1 LSB results in  $-20 \log(1/65536) \approx -96 \text{ dB}$ ).  
 The DC CMRR is measured with both inputs connected to the common-mode voltage (that is, no differential input signal is applied), and the common-mode voltage is swept from -1 V to V<sub>CC</sub>.

- (8) The AC CMRR is the difference between a hypothetical signal with the amplitude and frequency of the applied common-mode ripple applied to the inputs of the ADC and the actual common-mode signal spur visible in the FFT spectrum:  
 $AC \text{ CMRR} = \text{Error Spur [dBFS]} - 20\log(V_{CM} / 1.2 \text{ V} / G) \text{ [dBFS]}$  with a common-mode signal of  $V_{CM} \times \sin(2\pi \times f_{CM} \times t)$  applied to the analog inputs.  
 The AC CMRR is measured with the both inputs connected to the common-mode signal (that is, no differential input signal is applied).  
 With the specified typical values the error spur is within the noise floor (as specified by the SINAD values).
- (9) The AC PSRR is the difference between a hypothetical signal with the amplitude and frequency of the applied supply voltage ripple applied to the inputs of the ADC and the actual supply ripple spur visible in the FFT spectrum:  
 $AC \text{ PSRR} = \text{Error Spur [dBFS]} - 20\log(50 \text{ mV} / 1.2 \text{ V} / G) \text{ [dBFS]}$  with a signal of  $50 \text{ mV} \times \sin(2\pi \times f_{VCC} \times t)$  added to  $V_{CC}$ .  
 The AC PSRR is measured with the inputs grounded (that is, no analog input signal is applied).  
 With the specified typical values the error spur is within the noise floor (as specified by the SINAD values).  
 $SD24GAIN: 1 \rightarrow \text{Hypothetical signal: } 20\log(50 \text{ mV} / 1.2 \text{ V} / 1) = -27.6 \text{ dBFS}$   
 $SD24GAIN: 8 \rightarrow \text{Hypothetical signal: } 20\log(50 \text{ mV} / 1.2 \text{ V} / 8) = -9.5 \text{ dBFS}$   
 $SD24GAIN: 32 \rightarrow \text{Hypothetical signal: } 20\log(50 \text{ mV} / 1.2 \text{ V} / 32) = 2.5 \text{ dBFS}$
- (10) The crosstalk (XT) is specified as the tone level of the signal applied to the crosstalk source seen in the spectrum of the converter under test. It is measured with the inputs of the converter under test being grounded.

- (1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C<sub>I</sub>, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
- (2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
- (3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
- (4) The accuracy limits the minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
- (5) Two decoupling capacitors, 10 μF and 100 nF, should be connected to VeREF to decouple the dynamic current required for an external reference source if it is used for the ADC10\_A. Also see the *MSP430x5xx and MSP430x6xx Family User's Guide*.

(4) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time t<sub>SENSOR(on)</sub>.

(5) The on-time t<sub>VMID(on)</sub> is included in the sampling time t<sub>VMID(sample)</sub>; no additional on time is needed.

(6) The condition is that the error in a conversion started after t<sub>REFON</sub> is ≤ 1 LSB.

### 6.3 CPU

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock. Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see [图 6-3](#)).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

## 6.7 Bootloader (BSL)

The BSL lets users program the flash memory or RAM using various serial interfaces. 表 6-4 lists the BSL interface pin requirements. Access to the device memory by the BSL is protected by a user-defined password. BSL entry requires a specific entry sequence on the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  and  $\text{TEST}/\text{SBWTCK}$  pins. For complete description of the features of the BSL and its implementation, see [MSP430 Programming With the Bootloader \(BSL\)](#).

**表 6-4. UART BSL Pin Requirements and Functions**

## 6.8 JTAG Operation

### 6.8.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The  $\text{TEST}/\text{SBWTCK}$  pin is used to enable the JTAG signals. In addition to these signals, the  $\overline{\text{RST}}/\text{NMI}/\text{SBWTDIO}$  is required to interface with MSP430 development tools and device programmers. 表 6-5 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#) and [MSP430 Programming With the JTAG Interface](#).

**表 6-5. JTAG Pin Requirements and Functions**

DEVICE SIGNAL	DIRECTION	FUNCTION

## 6.8.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the two-wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. 表 6-6 lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the [MSP430 Hardware Tools User's Guide](#) and [MSP430 Programming With the JTAG Interface](#).

## 6.9 Flash Memory

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually or as a group with segments 0 to n. Segments A to D are also called *information memory*.
- Segment A can be locked separately.

## 6.10 RAM

The RAM is made up of n sectors. Each sector can be completely powered down to save leakage; however, all data are lost. Features of the RAM include:

- RAM has n sectors of 2K bytes each.
- Each sector 0 to n can be complete disabled; however, data retention is lost.
- Each sector 0 to n automatically enters low-power retention mode when possible.

## 6.11 Backup RAM

The backup RAM provides a limited number of bytes of RAM that are retained during LPMx.5. This backup RAM is part of the Backup subsystem, which operates on dedicated power supply AUXVCC3. 8 bytes of backup RAM are available in this device. The backup RAM can be word-wise accessed through the registers BAKMEM0, BAKMEM1, BAKMEM2, and BAKMEM3. The backup RAM registers cannot be accessed by the CPU when the high-side SVS is disabled by software.

## 6.12 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. The peripherals can be managed using all instructions. For complete module descriptions, see the [MSP430x5xx and MSP430x6xx Family User's Guide](#).

### 6.12.1 Oscillator and System Clock

The unified clock system (UCS) module includes support for a 32768-Hz watch crystal oscillator, an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), and an integrated internal digitally controlled oscillator (DCO). The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the selected FLL reference frequency. The internal DCO provides a fast turn-on clock source and stabilizes in 3  $\mu$ s (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32768-Hz watch crystal, the internal low-frequency oscillator (VLO), or the trimmed low-frequency oscillator (REFO).
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, or ACLK/32

### 6.12.2 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, and brownout protection. The brownout circuit provides the proper internal reset signal to the device during power on and power off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM are available on the primary supply and the core supply.

### 6.12.3 Auxiliary Supply System

The auxiliary supply system can operate the device from auxiliary supplies when the primary supply fails. There are two auxiliary supplies supported: AUXVCC1 and AUXVCC2. This module supports automatic and manual switching from primary supply to auxiliary supplies while maintaining full functionality. It allows threshold based monitoring of primary and auxiliary supplies. The device can be started from primary supply or AUXVCC1, whichever is higher. The auxiliary supply system enables internal monitoring of voltage levels on primary and auxiliary supplies using ADC10\_A. Also this module implements simple charger for backup supplies.

### 6.12.4 Backup Subsystem

The Backup subsystem operates on a dedicated power supply AUXVCC3. This subsystem includes low-frequency oscillator (XT1), RTC module, and backup RAM. The functionality of the Backup subsystem is retained during LPM3.5. The Backup subsystem module registers cannot be accessed by the CPU when the high-side SVS is disabled by user. It is necessary to keep the high-side SVS enabled with SVSHMD = 1 and SVSMHACE = 0 to turn off the low-frequency oscillator (XT1) in LPM4.

### 6.12.5 Digital I/O

Up to nine I/O ports are implemented. For 100-pin options, Ports P1 to P8 are complete. P9 is reduced to 4-bit I/O. For 80-pin options, Ports P1 to P6 are complete, and P7, P8, and P9 are completely removed. Port PJ contains four individual I/O pins, common to all devices. All I/O bits are individually programmable.

- Any combination of input, output, and interrupt conditions is possible.
- Pullup or pulldown on all ports is programmable.
- Programmable drive strength on all ports.
- Edge-selectable interrupt and LPM3.5 or LPM4.5 wake-up input capability available for all bits of ports P1 and P2.
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise (P1 through P9) or word-wise in pairs (PA through PE).

### 6.12.6 Port Mapping Controller

The port mapping controller allows flexible and reconfigurable mapping of digital functions to P1, P2, and P3 (see 表 6-7). 表 6-8 lists the default settings for all pins that support port mapping.

### 6.12.7 System Module (SYS)

The SYS module handles many of the system functions within the device. These include power on reset (POR) and power up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators (see 表 6-9), bootloader entry mechanisms, and configuration management (device descriptors). It also includes a data exchange mechanism through JTAG called a JTAG mailbox that can be used in the application.

### 6.12.8 Watchdog Timer (WDT\_A)

The primary function of the WDT\_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the timer can be configured as an interval timer and can generate interrupts at selected time intervals.

### 6.12.9 DMA Controller

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC10\_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral. 表 6-10 lists the available DMA triggers.

### **6.12.10 CRC16**

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

### **6.12.11 Hardware Multiplier**

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

### **6.12.12 Enhanced Universal Serial Communication Interface (eUSCI)**

The eUSCI module is used for serial data communication. The eUSCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I<sup>2</sup>C, and asynchronous communication protocols such as UART, enhanced UART with automatic baudrate detection, and IrDA.

The eUSCI\_An module supports for SPI (3- or 4-pin), UART, enhanced UART, or IrDA.

The eUSCI\_Bn module supports for SPI (3- or 4-pin) or I<sup>2</sup>C.

Three eUSCI\_A and one eUSCI\_B module are implemented.

### **6.12.13 ADC10\_A**

The ADC10\_A module supports fast 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator, and a conversion results buffer. A window comparator with a lower and upper limit allows CPU independent result monitoring with three window comparator interrupt flags.

### **6.12.14 SD24\_B**

The SD24\_B module integrates up to three independent 24-bit sigma-delta ADCs. Each converter is designed with a fully differential analog input pair and programmable gain amplifier input stage. The converters are based on second-order over-sampling sigma-delta modulators and digital decimation filters. The decimation filters are comb-type filters with selectable oversampling ratios of up to 1024.

### 6.12.15 TA0

TA0 is a 16-bit timer/counter (Timer\_A type) with three capture/compare registers. TA0 can support multiple capture/compares, PWM outputs, and interval timing (see 表 6-11). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

### 6.12.21 Real-Time Clock (RTC\_C)

The RTC\_C module can be configured for real-time clock (RTC) or calendar mode providing seconds, hours, day of week, day of month, month, and year. The RTC\_C control and configuration registers are password-protected to ensure clock integrity against runaway code. Calendar mode integrates an internal calendar that compensates for months with less than 31 days and includes leap year correction. The RTC\_C also supports flexible alarm functions, offset calibration, and temperature compensation. The RTC\_C on this device operates on dedicated AUXVCC3 supply and supports operation in LPM3.5.

### 6.12.22 Reference (REF) Module Voltage Reference

The REF generates all of the critical reference voltages that can be used by the various analog peripherals in the device. These include the ADC10\_A, LCD\_C, and SD24\_B modules.

### 6.12.23 LCD\_C

The LCD\_C driver generates the segment and common signals required to drive a liquid crystal display (LCD). The LCD\_C controller has dedicated data memories to hold segment drive information. Common and segment signals are generated as defined by the mode. Static, 2-mux, 3-mux, 4-mux, up to 8-mux LCDs are supported. The module can provide an LCD voltage independent of the supply voltage with its integrated charge pump. It is possible to control the level of the LCD voltage, and thus contrast, by software. The module also provides an automatic blinking capability for individual segments in static, 2-mux, 3-mux, and 4-mux modes.

#### 6.12.24 *Embedded Emulation Module (EEM) (S Version)*

The EEM supports real-time in-system debugging. The S version of the EEM has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

## 6.16 Identification

### 6.16.1 Revision Identification

The device revision information is shown as part of the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to all of the errata sheets for the devices in this data sheet, see [节 8.4](#).

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Hardware Revision" entries in [节 6.14](#).

### 6.16.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings. For links to all of the errata sheets for the devices in this data sheet, see [节 8.4](#).

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the "Device ID" entries in [节 6.14](#).

### 6.16.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in detail in [MSP430 Programming With the JTAG Interface](#).

### ***Implementation of a Low-Cost Three-Phase Watt-Hour Meter Using the MSP430F67641(A) (SLAA621)***

This application report describes the implementation of a low-cost three-phase electronic electricity meter using the Texas Instruments MSP430F67641(A) metering processor. This application report includes the necessary information with regard to metrology software and hardware procedures for this single-chip implementation.

### ***Class 0.5 Three-Phase Smart Meter Reference Design (TIDM-THREEPHASEMETER-F67641)***

This design implements a complete smart meter design using the MSP430F67641(A) polyphase metering System on Chip. The design meets all requirements for ANSI/IEC Class 0.5 accuracy and the firmware provided calculates all energy measurement parameters. The F67641(A) SoC features 128KB of on-chip flash plus a 320-segment LCD controller for a single-chip solution to low-cost polyphase meter design challenges.

### **Features**

- Low-cost three-phase electricity meter for Class 0.5 accuracy
- TI Energy Library firmware calculates all energy measurement parameters including active and reactive power and energy, RMS current and voltage, power factor, line frequency, fundamental and THD readings
- Add-on communications modules for wireless communications standards such as ZigBee®, Wi-Fi®, Wireless M-Bus, and IEEE Std 802.15.4g for both 2.4 GHz and sub-1 GHz.
- Built-in 160-segment display
- Powered from three-phase line voltage

### 8.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

**XMS** – Experimental device that is not necessarily representative of the final device's electrical specifications

**MSP** – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. [图 8-1](#) provides a legend for reading the complete device name.
