

## ONET2804T 28Gbps 4 通道限幅 TIA

### 1 特性

- 4 通道多速率运行，最高达 28Gbps
- 10k $\Omega$  差分互阻抗
- 21GHz 带宽
- 1.8 $\mu$ A<sub>rms</sub> 输入引入噪声
- 2.9mA<sub>PP</sub> 输入过载电流
- 可编程输出电压
- 可调增益和带宽
- 用于每个通道的接收信号强度指示器 (RSSI)
- 通道间 40dB 隔离 (仅限芯片)
- 3.3V 单电源
- 每通道 139mW
- 引脚控制或 2 线控制
- 片上滤波器电容
- 工作温度范围 -40°C 至 100°C
- 芯片尺寸: 3250 $\mu$ m  $\times$  1450 $\mu$ m, 750 $\mu$ m 通道间距

### 2 应用

- 100G 以太网光发射器
- ITU OTL4.4
- 具有内部重定时功能的 CFP2、CFP4 和 QSFP28 模块

### 3 说明

ONET2804T 是一款高增益限幅互阻抗放大器，适用于并行光学互连，数据速率最高可达 28Gbps。该器件与 750 $\mu$ m 间距离光电二极管阵列配合使用，可将光信号转换为差分输出电压。由内部电路提供光电二极管反向偏置电压并感测提供给各光电二极管的平均光电流。

该器件可配合引脚控制或两线制串口使用，从而实现输出幅值、增益、带宽和输入阈值的控制。

ONET2804T 具有 21GHz 带宽、10k $\Omega$  增益、1.8 $\mu$ A<sub>rms</sub> 输入引入噪声和每通道的接收信号强度指示器 (RSSI)。通道间的 40dB 隔离可降低接收器中的串扰。

该部件需要 3.3V 单电源供电，每个通道的功耗典型值为 139mW，差分输出幅度为 500mV<sub>PP</sub>。其工作温度范围为 -40°C 至 100°C，采用芯片形式，通道间距为 750 $\mu$ m。

要获得完整数据表，请发送邮件至: [onet2804t\\_request@ti.com](mailto:onet2804t_request@ti.com)。

## 5 Pin Configuration and Functions

### Bond Pad Functions

PAD	SYMBOL	TYPE	DESCRIPTION
6	AMPL	Digital input	3-state input for amplitude control of all 4 channels. VCC: 500 mVpp differential output swing Open: 300 mVpp differential output swing (default) GND: 250 mVpp differential output swing.
53	ADR1	Digital input	2-wire interface address programming pin. Leave this pad open for a default address of 0001100. Grounding this pad changes the 2 <sup>nd</sup> address bit to a 1 (0001110).
54	ADR0	Digital input	2-wire interface address programming pin. Leave this pad open for a default address of 0001100. Grounding this pad changes the 1 <sup>st</sup> address bit to a 1 (0001101).
12, 14, 19, 21, 26, 28, 33, 35	FILTERx	Analog output	Bias voltage for photodiode cathode. These pads are biased to VCC - 100 mV.
8	GAIN	Digital input	3-state input for gain control of all 4 channels. VCC: Minimum transimpedance Open: Default transimpedance GND: Medium transimpedance
11, 15, 18, 22, 25, 29, 32, 36, 47, 48, 51, 52, 55, 56, 59, 60, 63, 64, 67, 68, 71, 72, 75, 76	GND	Supply	Circuit ground. All GND pads are connected on die. Bonding all pads is recommended, except for 11, 15, 18, 22, 25, 29, 32, and 36.
5	I2CENA	Digital input	2-wire control option. Leave the pad unconnected for pad control of the IC. Two-wire control can be enabled by applying a high signal to the pad.
13, 20, 27, 34	INx	Analog input	Data input to TIAx (connect to photodiode anode).
16, 17, 23, 24, 30, 31, 42, 61, 62, 69	NC	No Connect	Do not connect
70	NRESET	Digital input	Used to reset the 2-wire state machine and registers. Leave open for normal operation and set low to reset the 2-wire interface.
49, 57, 65, 73	OUTx-	Analog output	Inverted CML data output for channel x. On-chip 50 $\Omega$ back-terminated to V <sub>CC</sub> .

### Bond Pad Functions (continued)

PAD	SYMBOL	TYPE	DESCRIPTION
50, 58, 66, 74	OUTx+	Analog output	Non-inverted CML data output for channel x. On-chip 50 $\Omega$ back-terminated to $V_{CC}$ .
7	RATE	Digital input	3-state input for bandwidth control of all 4 channels. VCC: Increase the bandwidth Open: 21 GHz bandwidth (default) GND: reduce the bandwidth
9, 10, 37, 38	RSSIx	Analog output	Indicates the strength of the received signal (RSSI) for channel x if the photo diode is biased from FILTERx. The analog output current is proportional to the input data amplitude. Connect to an external resistor to ground (GND). For proper operation, ensure that the voltage at the RSSI pad does not exceed $V_{CC} - 0.65$ V. If the RSSI feature is not used these pads should be left open.
40	SCL	Digital input	2-wire interface serial clock input. Includes a 10 k $\Omega$ pull-up resistor to $V_{CC}$ .
39	SDA	Digital –in/out	2-wire interface serial data input. Includes a 10 k $\Omega$ pull-up resistor to $V_{CC}$ .
41	TRSH	Digital input	3-state input for threshold control. VCC: Crossing point shifted down Open: No threshold adjustment (default) GND: Crossing point shifted up
1, 2, 45, 46	VCCOx	Supply	2.97 V – 3.47 V supply voltage for AGCx and CMLx amplifiers.
3, 4, 43, 44	VCCIx	Supply	2.97 V – 3.47 V supply voltage for input TIAx stage.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage <sup>(1)</sup>	VCCIx, VCCOx	−0.3	4	V
Voltage <sup>(1)</sup>	FILTERx, OUTx+, OUTx−, RSSIx, SCL, SDA, I2CENA, AMPL, RATE, GAIN, TRSH, ADR1, ADR0 and NRESET	−0.3	4	V
Average Input current	INx	−0.7	5	mA
	FILTERx	−8	8	mA
Continuous current at outputs	OUTx+, OUTx−	−8	8	mA
Maximum junction temperature, T <sub>J</sub>			125	°C
Storage temperature, T <sub>stg</sub>		−65	150	°C

(1) All voltage values are with respect to network ground terminal.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	All pins except input INx	±1000
			Pin INx	±500

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	TYP	MAX	UNIT
V <sub>CC</sub>	Supply voltage		2.97	3.3	3.47	V
I <sub>(INx)</sub>	Average Input current				2.7	mA
T <sub>A</sub>	Operating backside die temperature		−40		100	°C
L <sub>(FILTER)</sub> , L <sub>(IN)</sub>	Wire-bond inductance at pins FILTERx and INx			0.3		nH
C <sub>(PD)</sub>	Photodiode Capacitance			0.1		pF
V <sub>IH</sub>	Digital input high voltage	SDA, SCL	2			V
V <sub>IL</sub>	Digital input low voltage	SDA, SCL			0.8	V
	3-state input high voltage		V <sub>CC</sub> − 0.4			V
	3-state input low voltage				0.4	V

## 6.4 DC Electrical Characteristics

Over recommended operating conditions with  $V_{OD} = 500 \text{ mV}_{PP}$  unless otherwise noted. Typical values are at  $V_{CC} = 3.3 \text{ V}$  and  $T_A = 25^\circ\text{C}$

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{CC}$ Supply voltage		2.97	3.3	3.47	V
$I_{CC}$ Supply current	Per channel, $30 \mu\text{A}_{PP}$ input, maximum $85^\circ\text{C}$		42	$57^{(1)}$	mA
	Per channel, $30 \mu\text{A}_{PP}$ input, maximum $100^\circ\text{C}$			$60^{(1)}$	
$P_{(RX)}$ Receiver power dissipation	Per channel, $30 \mu\text{A}_{PP}$ input, maximum $85^\circ\text{C}$		139	198	mW
	Per channel, $30 \mu\text{A}_{PP}$ input, maximum $100^\circ\text{C}$			208	
$V_{IN}$ Input bias voltage		0.75	0.85	0.98	V
$R_{OUT}$ Output resistance	Single-ended to $V_{CC}$	40	50	60	$\Omega$
$V_{(FILTER)}$ Photodiode bias voltage <sup>(2)</sup>		2.8	3.2		V
$A_{(RSSI\_IB)}$ RSSI gain	Resistive load to GND <sup>(3)</sup>	0.49	0.5	0.54	A/A
RSSI output offset current (no light)		0		2.5	$\mu\text{A}$

(1) Including RSSI current

(2) Regulated voltage typically 100mV lower than  $V_{CC}$ .

(3) The RSSI output is a current output, which requires a resistive load to ground (GND). The voltage gain can be adjusted for the intended application by choosing the external resistor; however, for proper operation, ensure that the voltage at RSSI does not exceed  $V_{CC}-0.65\text{V}$ .

## 6.5 AC Electrical Characteristics

Over recommended operating conditions with  $V_{OD} = 500 \text{ mV}_{PP}$  unless otherwise noted. Typical values are at  $V_{CC} = 3.3 \text{ V}$  and  $T_A = 25^\circ\text{C}$

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$Z_{21}$ Small signal transimpedance	$25 \mu\text{A}_{PP}$ input signal	7	10		$\text{k}\Omega$
$f_{(3dB-H)}$ –3dB bandwidth	$25 \mu\text{A}_{PP}$ input signal <sup>(1)</sup>	18.5	21		GHz
$f_{(3dB-L)}$ Low frequency –3dB bandwidth			30	100	kHz
$i_{N(IN)}$ Input referred RMS noise	CPD = 0.1 pF, 28 GHz BT4 filter <sup>(2)</sup>		1.8	2.5	$\mu\text{A}$
DJ Deterministic jitter	$35 \mu\text{A}_{PP} < i_{IN} < 250 \mu\text{A}_{PP}$ (27.95 Gbps, PRBS9 pattern)		2		$\text{ps}_{pp}$
	$250 \mu\text{A}_{PP} < i_{IN} < 500 \mu\text{A}_{PP}$ (27.95 Gbps, PRBS9 pattern)		2		
	$500 \mu\text{A}_{PP} < i_{IN} < 2900 \mu\text{A}_{PP}$ (27.95 Gbps, PRBS9 pattern)		4		
$V_{OD}$ Differential output voltage	500 mV <sub>PP</sub> setting	250	500	700	mV <sub>PP</sub>
Crosstalk	Between adjacent channels, up to 20 GHz <sup>(3)</sup>		–40		dB
RSSI response time			1		$\mu\text{s}$
PSRR Power supply rejection ratio	$F < 10 \text{ MHz}^{(4)}$		–15		dB

(1) The small signal bandwidth is specified over process corners, temperature, and supply voltage variation. The assumed photodiode capacitance is 0.1pF and the bond-wire inductance is 0.3nH. The small signal bandwidth strongly depends on environmental parasitics. Careful attention to layout parasitics and external components is necessary to achieve optimal performance.

(2) Input referred RMS noise is (RMS output noise)/ (gain at 100 MHz).

(3) Die only, no wire bonds

(4) PSRR is the differential output amplitude divided by the voltage ripple on the supply. No input current at IN.

## 6.6 Typical Characteristics

Typical operating condition is at  $V_{CC} = 3.3\text{ V}$ ,  $T_A = 25^\circ\text{C}$  and  $V_{OD} = 500\text{ mVpp}$  (unless otherwise noted).

## 7 Detailed Description

### 7.1 Overview

A simplified block diagram of one channel of the ONET2804T is shown in [Functional Block Diagram](#).

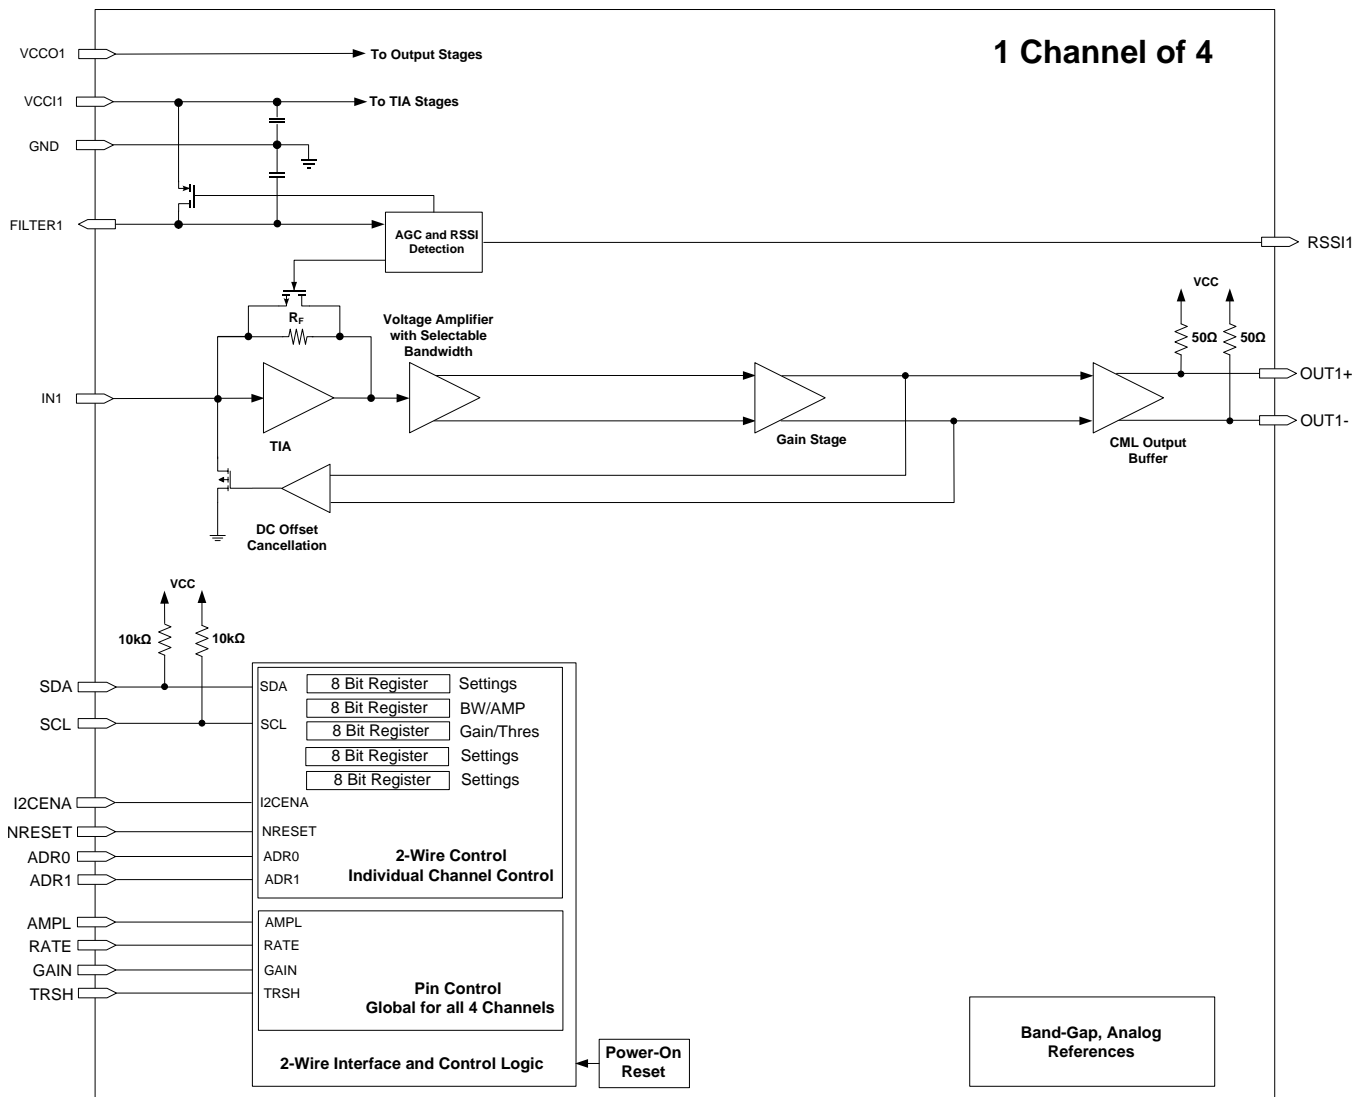

The ONET2804T consists of the signal path, supply filters, a control block for DC input bias, automatic gain control (AGC) and received signal strength indication (RSSI), an analog reference block and a 2-wire serial interface and control logic block.

The signal path consists of a transimpedance amplifier stage, a voltage amplifier, and a CML output buffer. The on-chip filter circuit provides a filtered  $V_{CC}$  for the PIN photodiode and for the transimpedance amplifier. The RSSI provides the bias for the TIA stage and the control for the AGC.

The DC input bias circuit and automatic gain control use internal low pass filters to cancel the DC current on the input and to adjust the transimpedance amplifier gain. Furthermore, circuitry is provided to monitor the received signal strength.

The output amplitude, gain, bandwidth and input threshold can be globally controlled through pin settings or each channel can be individually controlled through the 2-wire interface.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Signal Path

The first stage of the signal path is a transimpedance amplifier which converts the photodiode current into a voltage. If the input signal current exceeds a certain value, the transimpedance gain is reduced by means of a nonlinear AGC circuit to limit the signal amplitude.

The second stage is a limiting voltage amplifier that provides additional limiting gain and converts the single ended input voltage into a differential data signal. The output stage provides CML outputs with an on-chip 50 $\Omega$  back-termination to  $V_{CC}$ .

The TIA has adjustable gain, amplitude, bandwidth and input threshold and they can be globally controlled through pad settings or each channel can be individually controlled through the 2-wire interface. The default mode of operation is pad control where the state (OPEN, HI or LO) of the AMPL, BW, GAIN and TRSH pads sets the respective parameter. To enable 2-wire control, the I2CENA pad should be set HIGH and the functionality of each channel can be controlled individually through the 2-wire interface.

### 7.3.2 Gain Adjustment

The gain of all TIAs can be adjusted using the GAIN pad (pad 8) in pad control mode. The gain is set to default if the pad is left open. The gain is reduced approximately 4 dB if the pad is tied to ground, and reduced approximately 8 dB if the pad is tied to VCC. In 2-wire control mode, the gain of each channel can be adjusted from minimum to default. The gain is controlled with the GAIN[0..1] bits in registers 2, 8, 14 and 20 respectively for channels 1, 2, 3 and 4.

### 7.3.3 Amplitude Adjustment

The output amplifier of all buffers can be adjusted using the AMPL pad (pad 6) in pad control mode. The amplitude is set to 300 mVpp differential if the pad is left open, 250 mVpp if the pad is tied to ground and 500 mVpp if the pad is tied to VCC (recommended mode of operation). In 2-wire control mode, the amplitude of each channel can be adjusted from 0mVpp to 600 mVpp. The amplitude is controlled with the AMPL[0..3] bits in registers 1, 7, 13 and 19 respectively for channels 1, 2, 3 and 4.

### 7.3.4 Rate Select

The small signal bandwidth can be adjusted using the RATE pad (pad 7) in pad control mode. The bandwidth is typically 21 GHz if the pad is left open. The bandwidth is reduced approximately 0.4 GHz if the pad is tied to ground, and increased by approximately 0.4 GHz if the pad is tied to VCC. In 2-wire control mode, the bandwidth of each channel can be adjusted up or down using the register settings RATE[0..3] in registers 1, 7, 13 and 19 respectively for channels 1, 2, 3 and 4.

### 7.3.5 Threshold Adjustment

The TIAs have DC offset cancellation to maintain a 50% crossing point; however, the crossing point can be adjusted using the TRSH pad (pad 41) in pad control mode. No threshold adjustment is applied if the pad is left open. The crossing point is shifted up approximately 12% if the pad is tied to ground, and it is shifted down approximately 12% if the pad is tied to VCC. In 2-wire control mode, the crossing point can be adjusted up or down using register settings TH[0..3] in registers 2, 8, 14 and 20 for channels 1, 2, 3 and 4.

### 7.3.6 Filter Circuitry

The FILTER pins provide a regulated and filtered VCC for a PIN photodiode bias. The supply voltages for the transimpedance amplifier have on-chip capacitors but it is recommended to use external filter capacitors as well for best performance. The input stage has a separate VCC supply (VCCI) which is not connected on chip to the supply of the limiting and CML stages (VCCO).

### 7.3.7 AGC and RSSI

The voltage drop across the regulated photodiode FET is monitored by the bias and RSSI control circuit block in the case where a PIN diode is biased using the FILTER pins.

If the DC input current exceeds a certain level then it is partially cancelled by means of a controlled current source. This keeps the transimpedance amplifier stage within sufficient operating limits for optimum performance.

## Feature Description (continued)

The automatic gain control circuitry adjusts the voltage gain of the AGC amplifier to ensure limiting behavior of the complete amplifier.

Finally this circuit block senses the current through the FILTER FET and generates a mirrored current that is proportional to the input signal strength. The mirrored currents are available at the RSSI outputs and can be sunk to ground (GND) using an external resistor. For proper operation, ensure that the voltage at the RSSI pad does not exceed  $V_{CC} - 0.65\text{ V}$ .

## 7.4 Device Functional Modes

The device has two functional modes of operation: pad control mode and 2-wire interface control mode.

### 7.4.1 Pad Control

The default mode of operation is pad control and it is recommended that the amplitude be increased to the 500 mVpp setting by bonding AMPL (pad 6) to VCC. If further adjustment is desired as described above, then the control pads RATE (pad 7), GAIN (pad 8) and TRSH (pad 41) and can be bonded to either ground or VCC.

### 7.4.2 2-Wire Interface Control

To enable 2-wire interface control I2CENA (pad 5) must be bonded to VCC. In this mode of operation pad control is not functional and all control is initiated through the 2-wire interface as described in the [2-Wire Interface and Control Logic](#) section.

### 7.4.3 2-Wire Interface and Control Logic

The ONET2804T uses a 2-wire serial interface for digital control. For example, the two circuit inputs, SDA and SCK, are driven by the serial data and serial clock from a microcontroller. Both inputs include 10 k $\Omega$  pull-up resistors to VCC. For driving these inputs, an open drain output is recommended. The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out control and status signals. The ONET2804T is a slave device only which means that it cannot initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. It is recommended that the device be used on a bus with only one master. The protocol for a data transmission is as follows:

1. START command
2. 7 bit slave address (0001100) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ.
3. 8 bit register address
4. 8 bit register data word
5. STOP command

Regarding timing, the ONET2804T is I<sup>2</sup>C compatible. The typical timing is shown in [Figure 14](#) and a complete data transfer is shown in [Figure 15](#). Parameters for [Figure 14](#) are defined in [Table 1](#).

### 7.4.4 Bus Idle

Both SDA and SCK lines remain HIGH

### 7.4.5 Start Data Transfer

A change in the state of the SDA line, from HIGH to LOW, while the SCK line is HIGH, defines a START condition (S). Each data transfer is initiated with a START condition.

### 7.4.6 Stop Data Transfer

A change in the state of the SDA line from LOW to HIGH while the SCK line is HIGH defines a STOP condition (P). Each data transfer is terminated with a STOP condition; however, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

## Device Functional Modes (continued)

### 7.4.7 Data Transfer

Only one data byte can be transferred between a START and a STOP condition. The receiver acknowledges the transfer of data.

### 7.4.8 Acknowledge

Each receiving device, when addressed, is obliged to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver does not acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition.

**Figure 14. I²C Timing Diagram**

**Table 1. Timing Diagram Definitions**

		MIN	MAX	UNIT
$f_{SCK}$	SCK clock frequency		400	kHz
$t_{BUF}$	Bus free time between START and STOP conditions	1.3		$\mu$ s
$t_{HDSTA}$	Hold time after repeated START condition. After this period, the first clock pulse is generated	0.6		$\mu$ s
$t_{LOW}$	Low period of the SCK clock	1.3		$\mu$ s
$t_{HIGH}$	High period of the SCK clock	0.6		$\mu$ s
$t_{SUSTA}$	Setup time for a repeated START condition	0.6		$\mu$ s
$t_{HDDAT}$	Data HOLD time	0		$\mu$ s
$t_{SUDAT}$	Data setup time	100		ns
$t_R$	Rise time of both SDA and SCK signals		300	ns
$t_F$	Fall time of both SDA and SCK signals		300	ns
$t_{SUSTO}$	Setup time for STOP condition	0.6		$\mu$ s

## 8 Application and Implementation

### 8.1 Application Information

Figure 42 shows the ONET2804T being used in a 4 x 25 Gbps fiber optic receiver with pin control and Figure 45 shows the device being used with 2-wire control. The ONET2804T converts the electrical current generated by the PIN photodiode into a differential output voltage. The FILTER inputs provide a DC bias voltage for the PIN that is low pass filtered. Because the voltage drop across the photodiode FET is sensed and used by the bias circuit, the photodiode must be connected to the FILTER pads for the bias to function correctly.

The RSSI outputs are used to mirror the photodiode output current and can be connected via resistors to GND. The voltage gain can be adjusted for the intended application by choosing the external resistor; however, for proper operation of the ONET2804T, ensure that the voltage at RSSI never exceeds  $V_{CC} - 0.65\text{ V}$ . If the RSSI outputs are not used while operating with internal PD bias they should be left open.

The OUT+ and OUT– pins are internally terminated by  $50\ \Omega$  pull-up resistors to VCC. The outputs must be AC coupled, for example by using  $0.1\ \mu\text{F}$  capacitors, to the succeeding device.

### 8.2 Typical Applications

#### 8.2.1 Typical Application, Pad Control

Figure 42. Basic Application Circuit with Pad Control

##### 8.2.1.1 Design Requirements

Table 28. Design Parameters

PARAMETER	VALUE
Input voltage	3.3 V
Output voltage	500 mV <sub>PP</sub>

### 8.2.1.2 Detailed Design Procedure

The ONET2804T is designed to be used in conjunction with a 750  $\mu\text{m}$  pitch photodiode array or individual photodiodes and assembled into a receiver optical sub-assembly (ROSA). The TIA will typically be mounted on a ceramic substrate with etched connections for VCC, RSSI and 100  $\Omega$  differential transmission lines for the output voltage. The photodiode converts the optical input signal into a current that is supplied to the TIA through wire bonds. The TIA then converts the input current into a voltage and further amplifies the signal. It is recommended to set the output amplitude to the 500 mV<sub>PP</sub> level by bonding AMPL (pad 6) to VCC.

The ROSA is typically mounted on a printed circuit board (PCB) with 100  $\Omega$  differential transmission lines and RF connectors such as GPPO or 2.4 mm SMA. When measuring the output from the ROSA mounted on the PCB, the frequency dependent loss of the transmission lines will impact the frequency response. The loss can be de-embedded from the measurement to determine the actual frequency response at the output of the ROSA. [Figure 43](#) shows a typical frequency response without the loss de-embedded and [Figure 44](#) shows a typical frequency response with the loss de-embedded.

### 8.2.1.3 Application Curves

**Figure 43. Gain vs Frequency (Without De-embedding)**

**Figure 44. Gain vs Frequency (With De-embedding)**

## 8.2.2 Typical Application, 2-Wire Control

**Figure 45. Basic Application Circuit with 2-Wire Control**

### 8.2.2.1 Design Requirements

Refer to [Typical Application, Pad Control](#) for the Design Requirements.

### 8.2.2.2 Detailed Design Procedure

Refer to [Typical Application, Pad Control](#) for the Detailed Design Procedure.

### 8.2.2.3 Application Curves

Refer to [Typical Application, Pad Control](#) for the Application Curves.

## 9 Power Supply Recommendations

The ONET2804T is designed to operate from an input supply voltage range between 2.97 V and 3.47 V. There are a total of 8 power supply pads that must be connected for proper operation. VCCI1-4 are used to supply power to the input transimpedance amplifier stages and VCCO1-4 are used to supply power to the voltage amplifiers and output buffers. Each amplifier is powered up separately but there are some common internal connections for support circuitry such as the 2-wire interface. Therefore, if only one channel is being evaluated, all 8 supply pads must be connected. It is recommended to use two single layer ceramic (SLC) capacitors in the range of 270 pF to 680 pF for power supply decoupling. VCCI1, VCCI2, VCCO1 and VCCO2 should be bonded to one capacitor and VCCI3, VCCI4, VCCO3 and VCCO4 should be bonded to the other capacitor. Refer to [Figure 42](#) and [Figure 45](#) for reference.

## 10 Layout

### 10.1 Layout Guidelines

Careful attention to assembly parasitics and external components is necessary to achieve optimal performance.

- Minimize the total capacitance on the IN pad by using a low capacitance photodiode (100fF) and paying attention to stray capacitances. Place the photodiode close to the ONET2804T die and keep the wire bond inductance in the range of 300 to 400pH.
- Use identical termination and symmetrical transmission lines at the AC coupled differential output pins OUT+ and OUT–.
- Use short bond wire connections for the supply terminals VCCIx, VCCOx and GND. Supply voltage filtering is provided on chip but filtering may be improved by using an additional external capacitor.
- The die has backside metal and conductive epoxy must be used to attach the die to ground.

### 10.2 Layout Example

The IC dimensions are shown in [Figure 46](#), and the pad locations are provided in [Table 29](#). The device is designed for wire bonding not flip chip.

**Figure 46. Chip Dimensions and Pad Locations**

Die Thickness:  $203 \pm 13 \mu\text{m}$

Pad Dimensions:  $105 \mu\text{m} \times 65 \mu\text{m}$

Die Size:  $3250 \mu\text{m} \pm 40 \mu\text{m} \times 1450 \mu\text{m} \pm 40 \mu\text{m}$

## Layout Example (continued)

**Table 29. Bond Pad Co-ordinates**

PAD	COORDINATES (Referenced to Pad 1)		SYMBOL	TYPE	DESCRIPTION
	x (μm)	y (μm)			
1	0	0	VCCO1	Supply	3.3V supply voltage
2	0	–94	VCCO2	Supply	3.3V supply voltage
3	0	–188	VCCI2	Supply	3.3V supply voltage
4	0	–282	VCCI1	Supply	3.3V supply voltage
5	0	–376	I2CENA	Digital input	I2C Enable
6	0	–470	AMPL	Digital input	Amplitude control
7	0	–580	RATE	Digital input	Rate selection
8	0	–704	GAIN	Digital input	Gain control
9	0	–814	RSSI1	Analog output	Receive signal strength indicator for channel 1
10	0	–908	RSSI2	Analog output	Receive signal strength indicator for channel 2
11	180	–1110	GND	Supply	Circuit ground
12	290	–1110	FILTER1	Analog output	Bias voltage for photodiode 1
13	400	–1110	IN1	Analog input	TIA input for channel 1
14	510	–1110	FILTER1	Analog output	Bias voltage for photodiode 1
15	620	–1110	GND	Supply	Circuit ground
16	720	–1110	NC	No connect	Do not connect
17	829	–1110	NC	No connect	Do not connect
18	929	–1110	GND	Supply	Circuit ground
19	1039	–1110	FILTER2	Analog output	Bias voltage for photodiode 2
20	1149	–1110	IN2	Analog input	TIA input for channel 2
21	1259	–1110	FILTER2	Analog output	Bias voltage for photodiode 2
22	1369	–1110	GND	Supply	Circuit ground
23	1469	–1110	NC	No connect	Do not connect
24	1580	–1110	NC	No connect	Do not connect
25	1680	–1110	GND	Supply	Circuit ground
26	1790	–1110	FILTER3	Analog output	Bias voltage for photodiode 3
27	1900	–1110	IN3	Analog input	TIA input for channel 3
28	2010	–1110	FILTER3	Analog output	Bias voltage for photodiode 3
29	2120	–1110	GND	Supply	Circuit ground
30	2239	–1110	NC	No connect	Do not connect
31	2329	–1110	NC	No connect	Do not connect
32	2429	–1110	GND	Supply	Circuit ground
33	2539	–1110	FILTER4	Analog output	Bias voltage for photodiode 4
34	2649	–1110	IN4	Analog input	TIA input for channel 4
35	2759	–1110	FILTER4	Analog output	Bias voltage for photodiode 4
36	2869	–1110	GND	Supply	Circuit ground
37	3051	–908	RSSI3	Analog output	Receive signal strength indicator for channel 3
38	3051	–814	RSSI4	Analog output	Receive signal strength indicator for channel 4
39	3051	–704	SDA	Digital in/out	2-wire data
40	3051	–579	SCL	Digital input	2-wire clock
41	3051	–470	TRSH	Digital input	Input threshold control (cross-point)
42	3051	–376	NC	No connect	Do not connect
43	3051	–282	VCCI4	Supply	3.3V supply voltage
44	3051	–188	VCCI3	Supply	3.3V supply voltage

**Layout Example (continued)**
**Table 29. Bond Pad Co-ordinates (continued)**

PAD	COORDINATES (Referenced to Pad 1)		SYMBOL	TYPE	DESCRIPTION
	x (μm)	y (μm)			
45	3051	–94	VCCO3	Supply	3.3V supply voltage
46	3051	0	VCCO4	Supply	3.3V supply voltage
47	2888	140	GND	Supply	Circuit ground
48	2799	140	GND	Supply	Circuit ground
49	2699	140	OUT4–	Analog output	Inverted data output for channel 4
50	2599	140	OUT4+	Analog output	Non-inverted data output for channel 4
51	2499	140	GND	Supply	Circuit ground
52	2410	140	GND	Supply	Circuit ground
53	2322	140	ADR1	Digital input	2-wire address bit 1 control
54	2228	140	ADR0	Digital input	2-wire address bit 0 control
55	2139	140	GND	Supply	Circuit ground
56	2050	140	GND	Supply	Circuit ground
57	1950	140	OUT3–	Analog output	Inverted data output for channel 3
58	1850	140	OUT3+	Analog output	Non-inverted data output for channel 3
59	1750	140	GND	Supply	Circuit ground
60	1661	140	GND	Supply	Circuit ground
61	1572	140	NC	No connect	Do not connect
62	1477	140	NC	No connect	Do not connect
63	1388	140	GND	Supply	Circuit ground
64	1299	140	GND	Supply	Circuit ground
65	1199	140	OUT2–	Analog output	Inverted data output for channel 2
66	1099	140	OUT2+	Analog output	Non-inverted data output for channel 2
67	999	140	GND	Supply	Circuit ground
68	910	140	GND	Supply	Circuit ground
69	821	140	NC	No connect	Do not connect
70	728	140	NRESET	Digital input	2-wire negative reset
71	639	140	GND	Supply	Circuit ground
72	550	140	GND	Supply	Circuit ground
73	450	140	OUT1–	Analog output	Inverted data output for channel 1
74	350	140	OUT1+	Analog output	Non-inverted data output for channel 1
75	250	140	GND	Supply	Circuit ground
76	161	140	GND	Supply	Circuit ground

## 11 器件和文档支持

### 11.1 接收文档更新通知

如需接收文档更新通知，请访问 [www.ti.com.cn](http://www.ti.com.cn) 网站上的器件产品文件夹。请单击右上角的提醒我 进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

### 11.2 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《使用条款》。

**TI E2E™ 在线社区** TI 的工程师对工程师 (E2E) 社区。此社区的创建目的在于促进工程师之间的协作。在 [e2e.ti.com](http://e2e.ti.com) 中，您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

**设计支持** TI 参考设计支持 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

### 11.3 商标

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

### 11.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

### 11.5 Glossary

**SLYZ022** — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，也不会对此文档进行修订。如需获取此数据表的浏览器版本，请参阅左侧的导航栏。

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
ONET2804TY	Active	Production	DIESALE (Y)   0	675   OTHER	-	Call TI	Call TI	-40 to 100	
ONET2804TY.A	Active	Production	DIESALE (Y)   0	675   OTHER	-	Call TI	Call TI	-40 to 100	

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## 重要通知和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做任何明示或暗示的担保，包括但不限于对适销性、与某特定用途的适用性或不侵犯任何第三方知识产权的暗示担保。

这些资源可供使用 TI 产品进行设计的熟练开发人员使用。您将自行承担以下全部责任：(1) 针对您的应用选择合适的 TI 产品，(2) 设计、验证并测试您的应用，(3) 确保您的应用满足相应标准以及任何其他安全、安保法规或其他要求。

这些资源如有变更，恕不另行通知。TI 授权您仅可将这些资源用于研发本资源所述的 TI 产品的相关应用。严禁以其他方式对这些资源进行复制或展示。您无权使用任何其他 TI 知识产权或任何第三方知识产权。对于因您对这些资源的使用而对 TI 及其代表造成的任何索赔、损害、成本、损失和债务，您将全额赔偿，TI 对此概不负责。

TI 提供的产品受 [TI 销售条款](#)、[TI 通用质量指南](#) 或 [ti.com](#) 上其他适用条款或 TI 产品随附的其他适用条款的约束。TI 提供这些资源并不会扩展或以其他方式更改 TI 针对 TI 产品发布的适用的担保或担保免责声明。除非德州仪器 (TI) 明确将某产品指定为定制产品或客户特定产品，否则其产品均为按确定价格收入目录的标准通用器件。

TI 反对并拒绝您可能提出的任何其他或不同的条款。
