

OPAx990-Q1 汽车类 40V 轨至轨输入或输出、低失调电压、低功耗运算放大器

1 特性

- 低失调电压： $\pm 300\mu\text{V}$
- 低失调电压漂移： $\pm 0.6\mu\text{V}/^\circ\text{C}$
- 低噪声： $30\text{nV}/\sqrt{\text{Hz}}$ (1kHz)
- 高共模抑制：115dB
- 低偏置电流： $\pm 10\text{pA}$
- 轨至轨输入和输出
- 支持多路复用器的比较器输入：
 - 放大器以最高达到电源轨的差分输入工作
 - 放大器可用于开环中，也可用作比较器
- 高带宽：1.1MHz GBW
- 高压摆率： $4.5\text{V}/\mu\text{s}$
- 低静态电流：每个放大器 $120\mu\text{A}$
- 宽电源电压： $\pm 1.35\text{V}$ 至 $\pm 20\text{V}$ ， 2.7V 至 40V
- 强大的 EMIRR 性能：1.8GHz 时为 78dB
- 高达电源轨电压的差分 and 共模输入电压范围

2 应用

- 针对 AEC-Q100 1 级应用进行了优化
- 混合动力汽车/电动汽车逆变器和电机控制
- 车载充电器 (OBC) 和无线充电器
- 混合动力汽车/电动汽车电池管理系统 (BMS)
- 车身电子装置和照明
- 信息娱乐系统与仪表组
- 被动安全
- 动力总成电流传感器
- 高侧电流检测

OPAx990-Q1 应用于高压多路复用数据采集系统

3 说明

OPAx990-Q1 系列 (OPA990-Q1、OPA2990-Q1 和 OPA4990-Q1) 是高压 (40V) 通用运算放大器系列。这些器件具有出色的直流精度和交流性能，包括轨至轨输入或输出、低失调电压 (典型值为 $\pm 300\mu\text{V}$) 和低温漂 (典型值为 $\pm 0.6\mu\text{V}/^\circ\text{C}$)。

OPAx990-Q1 具有高达电源轨电压的差分 and 共模输入电压范围、高短路电流 ($\pm 80\text{mA}$) 和高压摆率 ($4.5\text{V}/\mu\text{s}$) 等独特功能，是一款极其灵活且稳健的高性能运算放大器，适用于各种高压汽车类应用。

OPAx990-Q1 系列运算放大器采用多种标准封装 (如 SOT-23、SOIC 和 TSSOP)，其额定工作温度范围为 -40°C 至 125°C 。

器件信息

器件型号	通道数	封装 ⁽¹⁾	封装尺寸 (标称值) ⁽³⁾
OPA990-Q1	单通道	DBV (SOT-23 , 5) ⁽²⁾	2.9mm x 1.6mm
		DCK (SC70 , 5) ⁽²⁾	2mm x 1.25mm
OPA2990-Q1	双通道	D (SOIC , 8) ⁽²⁾	4.9mm x 3.9mm
		DGK (VSSOP , 8) ⁽²⁾	3mm x 3mm
OPA4990-Q1	四通道	D (SOIC , 14) ⁽²⁾	8.65mm x 3.9mm
		PW (TSSOP , 14)	5mm x 4.4mm

(1) 有关更多信息，请参阅节 10。

(2) 此封装为仅预发布状态。

(3) 封装尺寸 (长 × 宽) 为标称值，不包括引脚。

ADVANCE INFORMATION

5 Specifications

5.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, $V_S = (V+) - (V-)$		0	42	V
Signal input pins	Common-mode voltage ⁽³⁾	$(V-) - 0.5$	$(V+) + 0.5$	V
	Differential voltage ⁽³⁾		$V_S + 0.2$	V
	Current ⁽³⁾	- 10	10	mA
Output short-circuit ⁽²⁾		Continuous		
Operating ambient temperature, T_A		- 55	150	°C
Junction temperature, T_J			150	°C
Storage temperature, T_{stg}		- 65	150	°C

- (1) Operation outside the *Absolute Maximum Rating* may cause permanent device damage. *Absolute Maximum Rating* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Condition*. If used outside the *Recommended Operating Condition* but within the *Absolute Maximum Rating*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Short-circuit to ground, one amplifier per package. Extended short-circuit current, especially with higher supply voltage, can cause excessive heating and eventual destruction. For more information, see the *Thermal Protection* section.
- (3) Input pins are diode-clamped to the power-supply rails. Input signals that may swing more than 0.5V beyond the supply rails must be current limited to 10mA or less.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_S	Supply voltage, $(V+) - (V-)$	2.7	40	V
V_I	Input voltage range	$(V-) - 0.2$	$(V+) + 0.2$	V
T_A	Specified temperature	- 40	125	°C

5.4 Thermal Information for Single Channel

THERMAL METRIC ⁽¹⁾		OPA990-Q1		UNIT
		DBV (SOT-23)	DCK (SC70)	
		5 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	192.1	204.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	113.6	116.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	60.5	51.8	°C/W
ψ_{JT}	Junction-to-top characterization parameter	37.2	24.9	°C/W
ψ_{JB}	Junction-to-board characterization parameter	60.3	51.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

5.5 Thermal Information for Dual Channel

THERMAL METRIC ⁽¹⁾		OPA2990-Q1		UNIT
		D (SOIC)	DGK (VSSOP)	
		8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	138.7	189.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	78.7	75.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	82.2	111.0	°C/W
ψ_{JT}	Junction-to-top characterization parameter	27.8	15.4	°C/W
ψ_{JB}	Junction-to-board characterization parameter	81.4	109.3	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

5.6 Thermal Information for Quad Channel

THERMAL METRIC ⁽¹⁾		OPA4990-Q1		UNIT
		D (SOIC)	PW (TSSOP)	
		14 PINS	14 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	105.2	134.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	61.2	55.0	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	61.1	79.0	°C/W
ψ_{JT}	Junction-to-top characterization parameter	21.4	9.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	60.7	78.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

5.7 Electrical Characteristics

For $V_S = (V+) - (V-) = 2.7V$ to $40V$ ($\pm 1.35V$ to $\pm 20V$) at $T_A = 25^\circ C$, $R_L = 10k\Omega$ connected to $V_S / 2$, $V_{CM} = V_S / 2$, and $V_{O UT} = V_S / 2$, unless otherwise noted.

6 Detailed Description

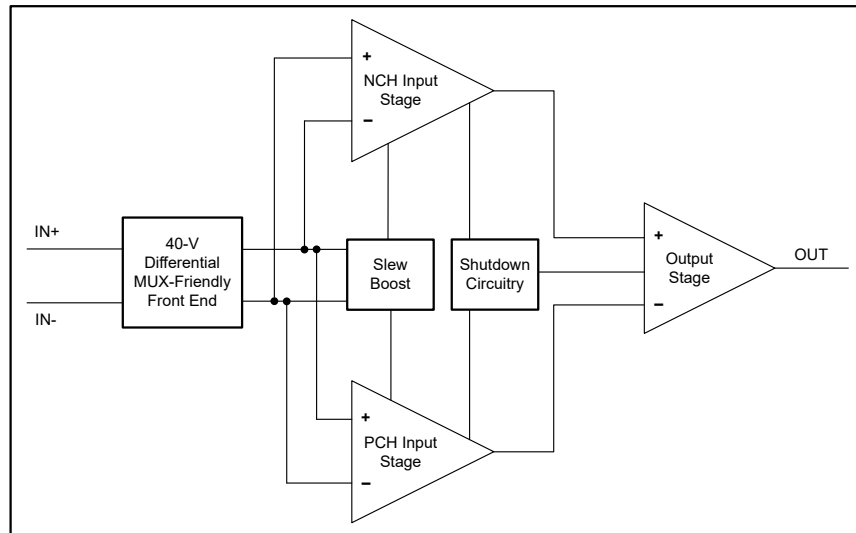

6.1 Overview

The OPAx990-Q1 family (OPA990-Q1, OPA2990-Q1, and OPA4990-Q1) is a family of high voltage (40V) general purpose operational amplifiers.

These devices offer excellent DC precision and AC performance, including rail-to-rail input or output, low offset ($\pm 300\mu\text{V}$, typ), and low offset drift ($\pm 0.6\mu\text{V}/^\circ\text{C}$, typ).

Unique features such as differential and common-mode input voltage range to the supply rail, high short-circuit current ($\pm 80\text{mA}$), and high slew rate ($4.5\text{V}/\mu\text{s}$) make the OPAx990-Q1 an extremely flexible, robust, and high-performance operational amplifier for high-voltage automotive applications.

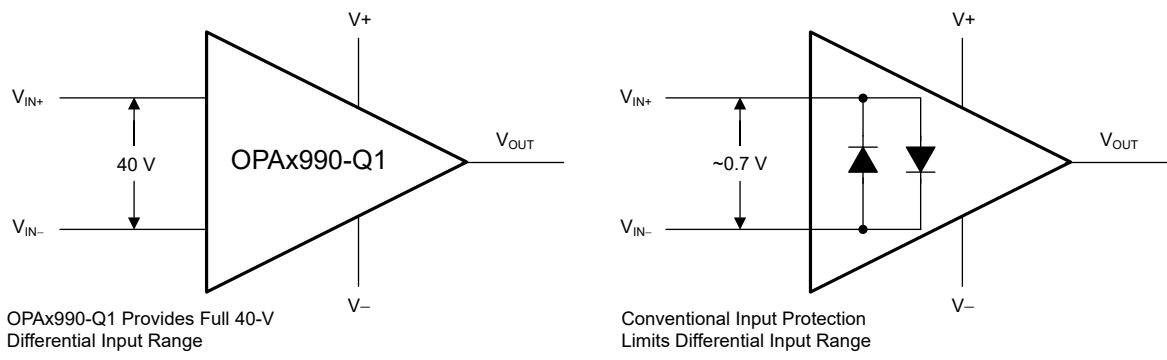

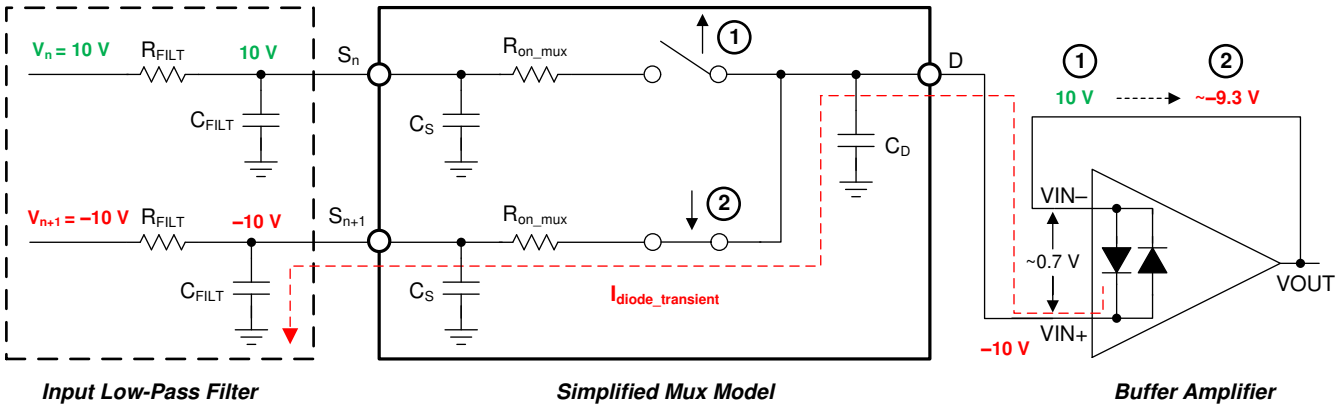

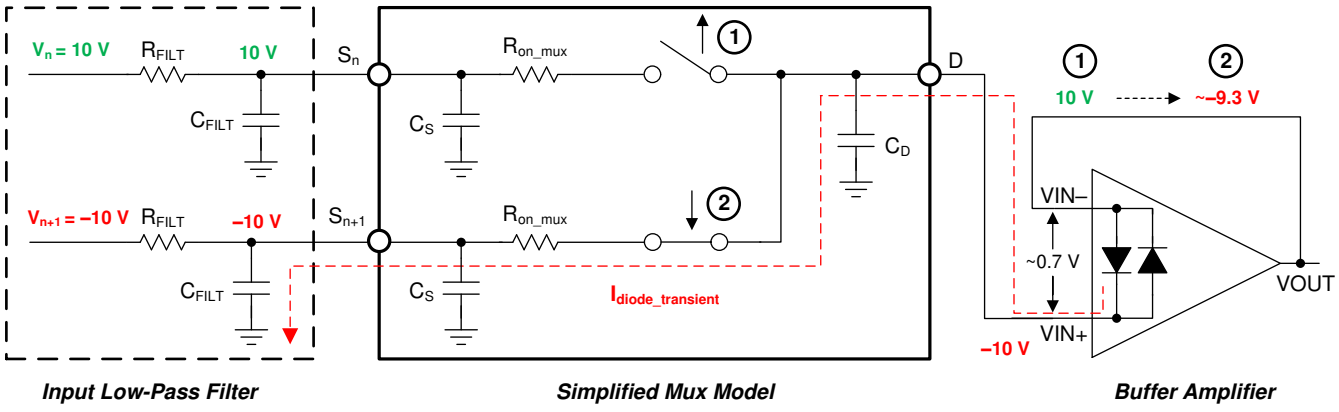

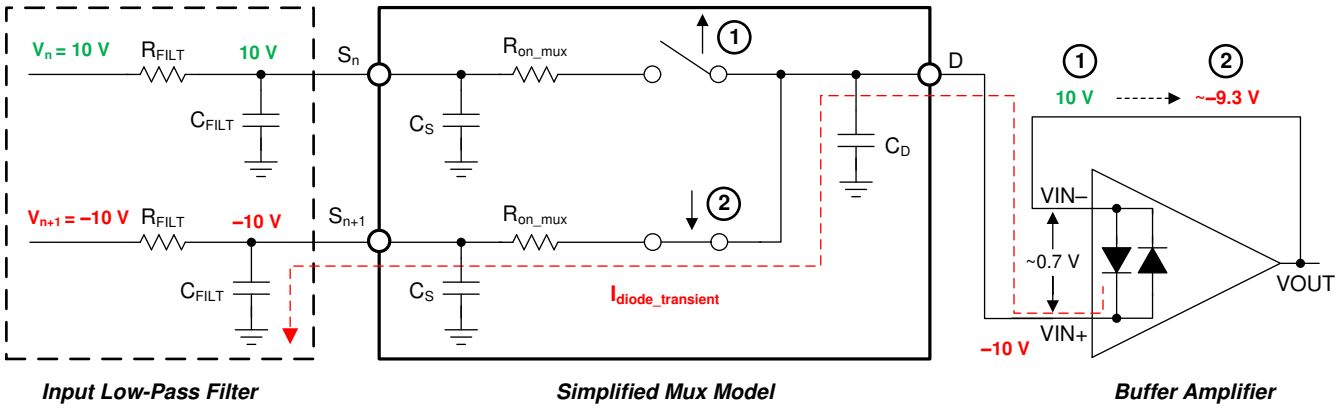

6.2 Functional Block Diagram

ADVANCE INFORMATION

6.3 Feature Description

6.3.1 Input Protection Circuitry

The OPAx990-Q1 uses a unique input architecture to eliminate the requirement for input protection diodes but still provides robust input protection under transient conditions.    Figure 6-1 shows conventional input diode protection schemes that are activated by fast transient step responses and introduce signal distortion and settling time delays because of alternate current paths, as shown in  Figure 6-2. For low-gain circuits, these fast-ramping input signals forward-bias back-to-back diodes, causing an increase in input current and resulting in extended settling time.

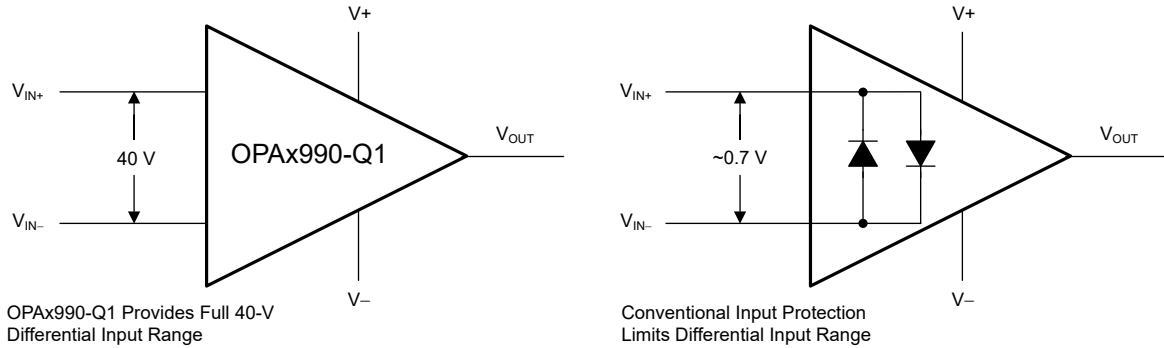

图 6-1. OPAx990-Q1 Input Protection Does Not Limit Differential Input Capability

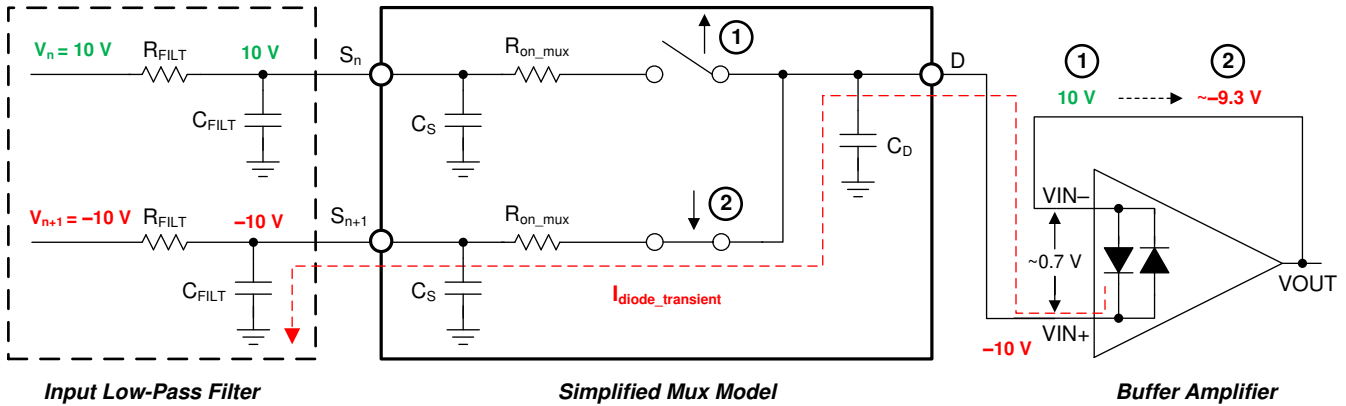

图 6-2. Back-to-Back Diodes Create Settling Issues

The OPAx990-Q1 family of operational amplifiers provides a true high-impedance differential input capability for high-voltage applications using a patented input protection architecture that does not introduce additional signal distortion or delayed settling time, making the device an optimal op amp for multichannel, high-switched, input applications. The OPA990-Q1 tolerates a maximum differential swing (voltage between inverting and non-inverting pins of the op amp) of up to 40V, making the device an excellent choice for use as a comparator or in applications with fast-ramping input signals such as data-acquisition systems; for more information, see the [MUX-Friendly Precision Operational Amplifiers](#) application brief.

6.3.2 EMI Rejection

The OPAx990-Q1 uses integrated electromagnetic interference (EMI) filtering to reduce the effects of EMI from sources such as wireless communications and densely-populated boards with a mix of analog signal chain and digital components. EMI immunity can be improved with circuit design techniques; the OPAx990-Q1 benefits from these design improvements. Texas Instruments developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10MHz to 6GHz. 图 6-3 shows the results of this testing on the OPAx990-Q1. 表 6-1 provides the EMIRR IN+ values for the OPAx990-Q1 at particular frequencies commonly encountered in real-world applications. For detailed information on the topic of EMIRR performance as it relates to op amps, see the [EMI Rejection Ratio of Operational Amplifiers](#) application report.

图 6-3. EMIRR Testing

表 6-1. OPA990-Q1 EMIRR IN+ for Frequencies of Interest

FREQUENCY	APPLICATION OR ALLOCATION	EMIRR IN+
400MHz	Mobile radio, mobile satellite, space operation, weather, radar, ultra-high frequency (UHF) applications	59.5dB
900MHz	Global system for mobile communications (GSM) applications, radio communication, navigation, GPS (to 1.6GHz), GSM, aeronautical mobile, UHF applications	68.9dB
1.8GHz	GSM applications, mobile personal communications, broadband, satellite, L-band (1GHz to 2GHz)	77.8dB
2.4GHz	802.11b, 802.11g, 802.11n, Bluetooth®, mobile personal communications, automotive, scientific and medical (ISM) radio band, amateur radio and satellite, S-band (2GHz to 4GHz)	78.0dB
3.6GHz	Radiolocation, aero communication and navigation, satellite, mobile, S-band	88.8dB
5GHz	802.11a, 802.11n, aero communication and navigation, mobile communication, space and satellite operation, C-band (4GHz to 8GHz)	87.6dB

6.3.3 Thermal Protection

The internal power dissipation of any amplifier causes its internal (junction) temperature to rise. This phenomenon is called *self heating*. The absolute maximum junction temperature of the OPAx990-Q1 is 150°C. Exceeding this temperature causes damage to the device. The OPAx990-Q1 has a thermal protection feature that reduces damage from self heating. The protection works by monitoring the temperature of the device and turning off the op amp output drive for temperatures above 170°C. 图 6-4 shows an application example for the OPA990-Q1 that has significant self heating because of its power dissipation (0.81 W). Thermal calculations indicate that for an ambient temperature of 65°C, the device junction temperature must reach 177°C. The actual device, however, turns off the output drive to recover towards a safe junction temperature. 图 6-4 shows how the circuit behaves during thermal protection. During normal operation, the device acts as a buffer so the output is 3V. When self heating causes the device junction temperature to increase above the internal limit, the thermal protection forces the output to a high-impedance state and the output is pulled to ground through resistor R_L . If the condition that caused excessive power dissipation is not removed, then the amplifier will oscillate between a shutdown and enabled state until the output fault is corrected.

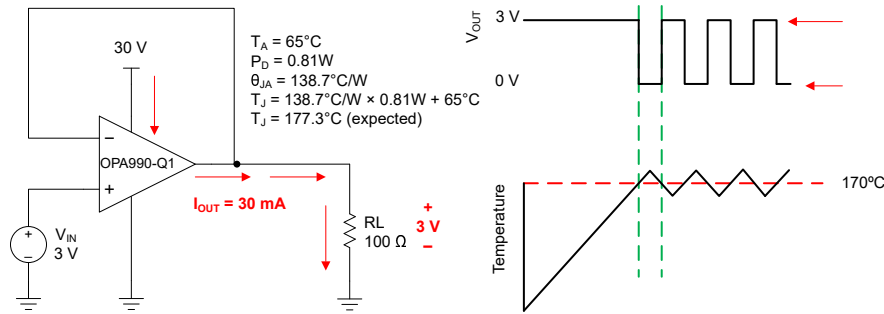

图 6-4. Thermal Protection

6.3.4 Capacitive Load and Stability

The OPAx990-Q1 features a resistive output stage capable of driving moderate capacitive loads, and by leveraging an isolation resistor, the device can easily be configured to drive large capacitive loads. As shown in 图 6-5 and 图 6-6, increasing the gain enhances the ability of the amplifier to drive greater capacitive loads. The particular op amp circuit configuration, layout, gain, and output loading are some of the factors to consider when establishing whether an amplifier will be stable in operation.

图 6-5. Small-Signal Overshoot vs Capacitive Load (10mV Output Step, G = 1)

图 6-6. Small-Signal Overshoot vs Capacitive Load (10mV Output Step, G = -1)

For additional drive capability in unity-gain configurations, improve capacitive load drive by inserting a small resistor, R_{ISO} , in series with the output, as shown in 图 6-7. This resistor significantly reduces ringing and maintains DC performance for purely capacitive loads. However, if a resistive load is in parallel with the capacitive load, then a voltage divider is created, thus introducing a gain error at the output and slightly reducing the output swing. The error introduced is proportional to the ratio R_{ISO} / R_L , and is generally negligible at low output levels. A high capacitive load drive makes the OPAx990-Q1 an excellent choice for applications such as reference buffers, MOSFET gate drives, and cable-shield drives. The circuit shown in 图 6-7 uses an isolation resistor, R_{ISO} , to stabilize the output of an op amp. R_{ISO} modifies the open-loop gain of the system for increased phase margin.

图 6-7. Extending Capacitive Load Drive With the OPA990-Q1

6.3.5 Common-Mode Voltage Range

The OPAx990-Q1 is a 40V, true rail-to-rail input operational amplifier with an input common-mode range that extends 200 mV beyond either supply rail. This wide range is achieved with paralleled complementary N-channel and P-channel differential input pairs, as shown in [图 6-8](#). The N-channel pair is active for input voltages close to the positive rail, typically $(V+) - 1V$ to 100 mV above the positive supply. The P-channel pair is active for inputs from 100 mV below the negative supply to approximately $(V+) - 2V$. There is a small transition region, typically $(V+) - 2V$ to $(V+) - 1V$ in which both input pairs are on. This transition region can vary modestly with process variation, and within this region PSRR, CMRR, offset voltage, offset drift, noise, and THD performance may be degraded compared to operation outside this region.

[图 5-5](#) shows this transition region for a typical device in terms of input voltage offset in more detail.

For more information on common-mode voltage range and PMOS/NMOS pair interaction, see [Op Amps With Complementary-Pair Input Stages](#) application note.

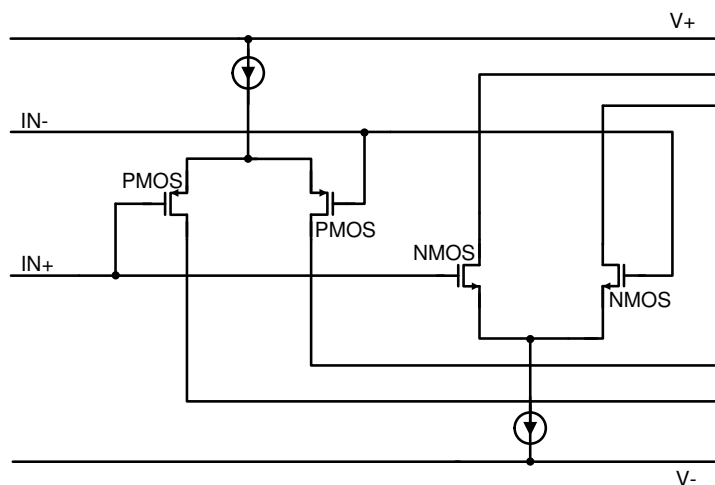

图 6-8. Rail-to-Rail Input Stage

6.3.6 Phase Reversal Protection

The OPAx990-Q1 family has internal phase-reversal protection. Many op amps exhibit a phase reversal when the input is driven beyond its linear common-mode range. This condition is most often encountered in non-inverting circuits when the input is driven beyond the specified common-mode voltage range, causing the output to reverse into the opposite rail. The OPAx990-Q1 is a rail-to-rail input op amp; therefore, the common-mode range can extend up to the rails. Input signals beyond the rails do not cause phase reversal; instead, the output limits into the appropriate rail. This performance is shown in [图 6-9](#). For more information on phase reversal, see [Op Amps With Complementary-Pair Input Stages](#) application note.

C016

图 6-9. No Phase Reversal

6.3.7 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress (EOS). These questions tend to focus on the device inputs, but may involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

Having a good understanding of this basic ESD circuitry and its relevance to an electrical overstress event is helpful. 图 6-10 shows an illustration of the ESD circuits contained in the OPAx990-Q1 (indicated by the dashed line area). The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power-supply lines, where the diodes meet at an absorption device or the power-supply ESD cell, internal to the operational amplifier. This protection circuitry is intended to remain inactive during normal circuit operation.

ADVANCE INFORMATION

图 6-10. Equivalent Internal ESD Circuitry Relative to a Typical Circuit Application

An ESD event is very short in duration and has a very high voltage (for example; 1kV, 100ns), whereas an EOS event is long in duration and has a lower voltage (for example; 50V, 100 ms). The ESD diodes are designed for out-of-circuit ESD protection (that is, during assembly, test, and storage of the device before being soldered to the PCB). During an ESD event, the ESD signal is passed through the ESD steering diodes to an absorption circuit (labeled ESD power-supply circuit). The ESD absorption circuit clamps the supplies to a safe level.

Although this behavior is necessary for out-of-circuit protection, excessive current and damage is caused if activated in-circuit. A transient voltage suppressors (TVS) can be used to prevent against damage caused by turning on the ESD absorption circuit during an in-circuit ESD event. Using the appropriate current limiting resistors and TVS diodes allows for the use of device ESD diodes to protect against EOS events.

6.3.8 Overload Recovery

Overload recovery is defined as the time required for the op amp output to recover from a saturated state to a linear state. The output devices of the op amp enter a saturation region when the output voltage exceeds the rated operating voltage, either due to the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices require time to return back to the linear state. After the charge carriers return back to the linear state, the device begins to slew at the specified slew rate. Thus, the propagation delay in case of an overload condition is the sum of the overload recovery time and the slew time. The overload recovery time for the OPAx990-Q1 is approximately 600ns.

6.3.9 Typical Specifications and Distributions

Designers often have questions about a typical specification of an amplifier to design a more robust circuit. Due to natural variation in process technology and manufacturing procedures, every specification of an amplifier will exhibit some amount of deviation from the target value, like an amplifier's input offset voltage. These deviations often follow *Gaussian (bell curve)*, or *normal* distributions, and circuit designers can leverage this information to guardband their system, even when there is not a minimum or maximum specification in the [Electrical Characteristics](#) table.

图 6-11. Gaussian Distribution

图 6-11 shows an example distribution, where μ , or μ , is the mean of the distribution, and where σ , or σ , is the standard deviation of a system. For a specification that exhibits this kind of distribution, approximately two-thirds (68.26%) of all units can be expected to have a value within one standard deviation, or one sigma, of the mean (from $\mu - \sigma$ to $\mu + \sigma$).

Depending on the specification, values listed in the *typical* column of the [Electrical Characteristics](#) table are represented in different ways. As a general rule, if a specification naturally has a nonzero mean (for example, like gain bandwidth), then the typical value is equal to the mean (μ). However, if a specification naturally has a mean near zero (like input offset voltage), then the typical value is equal to the mean plus one standard deviation ($\mu + \sigma$) to most accurately represent the typical value.

This chart can be used to calculate approximate probability of a specification in a unit; for example, for OPAX990-Q1, the typical input voltage offset is 300 μ V, so 68.2% of all OPAX990-Q1 devices are expected to have an offset from -300 μ V to +300 μ V. At 4 σ (\pm 1200 μ V), 99.9937% of the distribution has an offset voltage less than \pm 1200 μ V, which means 0.0063% of the population is outside of these limits, which corresponds to about 1 in 15,873 units.

Specifications with a value in the minimum or maximum column are specified by TI, and units outside these limits will be removed from production material. For example, the OPAX990-Q1 family has a maximum offset voltage of 2.1 mV at 25°C, and even though this corresponds to 7 σ , which is extremely unlikely, any unit with larger offset than 2.1 mV will be removed from production material.

For specifications with no value in the minimum or maximum column, consider selecting a sigma value of sufficient guardband for the application, and design worst-case conditions using this value. For example, the 6 σ value corresponds to about 1 in 500 million units, which is an extremely unlikely chance, and could be an option as a wide guardband to design a system around. In this case, the OPAX990-Q1 family does not have a maximum or minimum for offset voltage drift, but based on [图 5-2](#) and the typical value of 0.6 μ V/°C in the [Electrical Characteristics](#) table, it can be calculated that the 6- σ value for offset voltage drift is about 3.6 μ V/°C. When designing for worst-case system conditions, this value can be used to estimate the worst possible offset across temperature without having an actual minimum or maximum value.

However, process variation and adjustments over time can shift typical means and standard deviations, and unless there is a value in the minimum or maximum specification column, TI cannot assure the performance of a device. This information should only be used to estimate the performance of a device.

6.4 Device Functional Modes

The OPAX990-Q1 has a single functional mode and is operational when the power-supply voltage is greater than or equal to 2.7V (\pm 1.35V). The maximum power supply voltage for the OPAX990-Q1 is 40V (\pm 20V).

7 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The OPAx990-Q1 family offers excellent DC precision and AC performance. These devices operate up to 40V supply rails and offer true rail-to-rail input or output, low offset voltage and offset voltage drift, as well as 1.1MHz bandwidth and high output drive. These features make the OPAx990-Q1 a robust, high-performance operational amplifier for high-voltage automotive applications.

7.2 Typical Applications

7.2.1 Low-Side Current Measurement

图 7-1 shows the OPAx990-Q1 configured in a low-side current sensing application. For a full analysis of the circuit shown in 图 7-1 including theory, calculations, simulations, and measured data, see TI Precision Design TIPD129, [0-A to 1-A Single-Supply Low-Side Current-Sensing Solution](#).

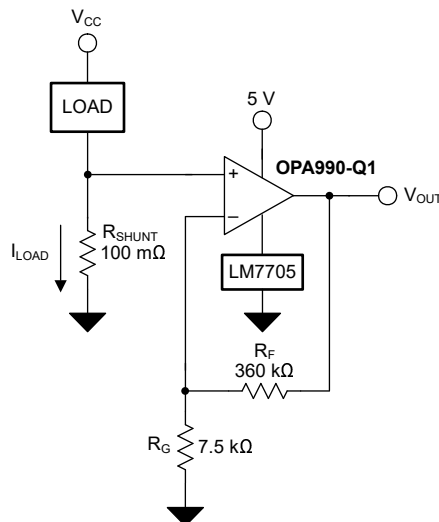

图 7-1. OPAx990-Q1 in a Low-Side, Current-Sensing Application

7.2.1.1 Design Requirements

The design requirements for this design are:

- Load current: 0 A to 1 A
- Output voltage: 4.9V
- Maximum shunt voltage: 100 mV

7.2.1.2 Detailed Design Procedure

The transfer function of the circuit in 图 7-1 is given in 方程式 1.

$$V_{OUT} = I_{LOAD} \times R_{SHUNT} \times Gain \quad (1)$$

The load current (I_{LOAD}) produces a voltage drop across the shunt resistor (R_{SHUNT}). The load current is set from 0 A to 1 A. To keep the shunt voltage below 100 mV at maximum load current, the largest shunt resistor is defined using 方程式 2.

$$R_{SHUNT} = \frac{V_{SHUNT_MAX}}{I_{LOAD_MAX}} = \frac{100\text{ mV}}{1\text{ A}} = 100\text{ m}\Omega \quad (2)$$

Using 方程式 2, R_{SHUNT} is calculated to be 100 m Ω . The voltage drop produced by I_{LOAD} and R_{SHUNT} is amplified by the OPA990-Q1 to produce an output voltage of 0V to 4.9V. The gain needed by the OPA990-Q1 to produce the necessary output voltage is calculated using 方程式 3.

$$Gain = \frac{(V_{OUT_MAX} - V_{OUT_MIN})}{(V_{IN_MAX} - V_{IN_MIN})} \quad (3)$$

Using 方程式 3, the required gain is calculated to be 49V/V, which is set with resistors R_F and R_G . 方程式 4 is used to size the resistors, R_F and R_G , to set the gain of the OPA990-Q1 to 49V/V.

$$Gain = 1 + \frac{(R_F)}{(R_G)} \quad (4)$$

Choosing R_F as 360 k Ω , R_G is calculated to be 7.5 k Ω . R_F and R_G were chosen as 360 k Ω and 7.5 k Ω because they are standard value resistors that create a 49:1 ratio. Other resistors that create a 49:1 ratio can also be used. 图 7-2 shows the measured transfer function of the circuit shown in 图 7-1.

7.2.1.3 Application Curve

图 7-2. Low-Side, Current-Sense, Transfer Function

7.2.2 Slew Rate Limit for Input Protection

In control systems for valves or motors, abrupt changes in voltages or currents can cause mechanical damages. By controlling the slew rate of the command voltages into the drive circuits, the load voltages ramps up and down at a safe rate. For symmetrical slew-rate applications (positive slew rate equals negative slew rate), one additional op amp provides slew-rate control for a given analog gain stage. The unique input protection and high output current and slew rate of the OPAx990-Q1 make the device an optimal amplifier to achieve slew rate control for both dual- and single-supply systems. 图 7-3 shows the OPA990-Q1 in a slew-rate limit design.

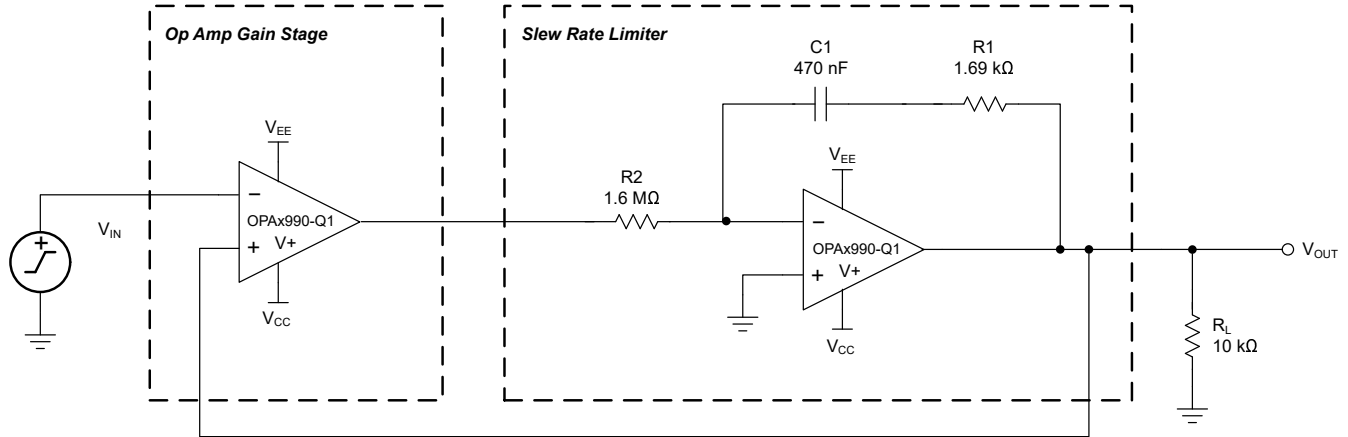

图 7-3. Slew Rate Limiter Uses One Op Amp

7.3 Power Supply Recommendations

The OPAx990-Q1 is specified for operation from 2.7V to 40V ($\pm 1.35\text{V}$ to $\pm 20\text{V}$); many specifications apply from -40°C to 125°C or with specific supply voltages and test conditions. For parameters that can exhibit significant variance regarding operating voltage or temperature, see the [Typical Characteristics](#) section.

小心

Supply voltages larger than 40V can permanently damage the device; for more information, see the [Absolute Maximum Ratings](#) section.

Place $0.1\mu\text{F}$ bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the [Layout](#) section.

7.4 Layout

7.4.1 Layout Guidelines

For best operational performance, use good PCB layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and op amp itself. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
 - Connect low-ESR, $0.1\mu\text{F}$ ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Physically separate the digital and analog grounds paying attention to the flow of the ground current.
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, then crossing the sensitive trace perpendicular is much better as opposed to in parallel with the noisy trace.
- Place the external components as close to the device as possible. As shown in [图 7-5](#), keeping RF and RG close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.

- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.
- Cleaning the PCB following board assembly is recommended for best performance.
- Any precision integrated circuit can experience performance shifts due to moisture ingress into the plastic package. Following any aqueous PCB cleaning process, baking the PCB assembly is recommended to remove moisture introduced into the device packaging during the cleaning process. A low temperature, post cleaning bake at 85°C for 30 minutes is sufficient for most circumstances.

8 Device and Documentation Support

8.1 Device Support

8.1.1 Development Support

8.1.1.1 TINA-TI™ (Free Software Download)

TINA™ is a simple, powerful, and easy-to-use circuit simulation program based on a SPICE engine. TINA-TI is a free, fully-functional version of the TINA software, preloaded with a library of macro models in addition to a range of both passive and active models. TINA-TI provides all the conventional dc, transient, and frequency domain analysis of SPICE, as well as additional design capabilities.

Available as a [free download](#) from the Analog eLab Design Center, TINA-TI offers extensive post-processing capability that allows users to format results in a variety of ways. Virtual instruments offer the ability to select input waveforms and probe circuit nodes, voltages, and waveforms, creating a dynamic quick-start tool.

备注

These files require that either the TINA software (from DesignSoft™) or TINA-TI software be installed. Download the free TINA-TI software from the [TINA-TI folder](#).

8.2 Documentation Support

8.2.1 Related Documentation

For related documentation, see the following:

- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

ADVANCE INFORMATION

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
OPA4990QPWRQ1	ACTIVE	TSSOP	PW	14	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	Q4990PW	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
