

SN65HVS883 24V、八通道数字输入串行器

1 特性

- 八个传感器输入
 - 输入电压最高达 34V
 - 可选去抖动滤波器从 0ms 至 3ms
 - 可调节电流限制从 0.2mA 至 5.2mA
 - 现场输入和电源线路具有 15kV 人体模型 (HBM) 保护
- 用于外部状态 LED 的输出驱动器
- 支持多路输入级联 (输入数为 8 的倍数)
- 与 SPI 兼容的接口
- 用于外部数字隔离器的 5V 稳压输出
- 低电源电压指示灯

2 应用

- 用于工业自动化和过程控制的传感器输入
 - 符合 IEC61131-2 标准 1 类、2 类或 3 类的开关
 - 符合 EN60947-5-2 标准的接近开关
- 用于 PC 和可编程逻辑控制器 (PLC) 系统的高通道数数字输入模块
- 分立式 I/O 模块

3 说明

SN65HVS883 是一款用于工业自动化 PC 和 PLC 系统中高通道数的数字输入模块的 24V、八通道数字输入串行器。与电流隔离器配合使用时，此器件可将现场侧的 24V 传感器输出连接到控制侧的低压控制器输入。输入信号由符合 EN60947-5-2 标准的 2 线和 3 线接近开关提供

并进行电流限制，然后由内部去抖动滤波器进行验证。输入开关特性符合 IEC61131-2 标准关于 1 类、2 类和 3 类传感器开关的特性描述。

施加负载和时钟信号时，输入数据将被并行锁存到移位寄存器中，然后经过一个后置隔离器随时钟串行移出至串行 PLC 输入。

通过将前面器件的串行输出连接到后面器件的串行输入，可以将多个 SN65HVS883 级联在一起，从而实现高通道数输入模块的设计。输入状态通过 3mA 恒流 LED 输出来显示。为设置内部基准电流，需要外接一个精密电阻。集成的稳压器提供 5V 输出电压，为低功耗隔离器供电。内部电源电压监视器提供芯片正常 (CHOK) 指示。

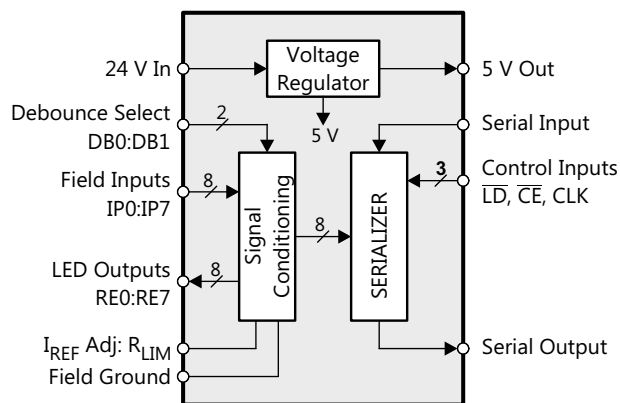

SN65HVS883 采用散热增强型 28 引脚 PWP PowerPAD™ 封装。该器件的额定工作温度范围为 -40°C 至 85°C。

8 Detailed Description

8.1 Overview

The SN65HVS883 is an 8 channel, digital input serializer which operates from a 24 V supply and accepts digital inputs of up to 34 V on the 8 channels (IP0-IP7). The device provides a serially shifted digital output with reduced voltage ranges of 0-5 V for applications in industrial and building automation systems. The SN65HVS883 meets JEDEC standards for ESD protection (refer to [ESD Ratings](#)), and is SPI compatible for interfacing with standard microcontrollers. The serializer operates in 2 fundamental modes: Load Mode and Shift mode. In Load mode, information from the field inputs is allowed to latch into the shift register. In Shift mode, the information stored in the parallel shift register can be serially shifted to the serial output (SOP). A detailed description of the functional modes is available in the [Device Functional Modes](#) section.

8.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated

8.3 Feature Description

8.3.1 Digital Inputs

Each digital input operates as a controlled current sink limiting the input current to a maximum value of I_{LIM} . The current limit is derived from the reference current via $I_{LIM} = n \times I_{REF}$, and I_{REF} is determined by $I_{REF} = V_{REF}/R_{LIM}$. Thus, changing the current limit requires the change of R_{LIM} to a different value via: $R_{LIM} = n \times V_{REF}/I_{LIM}$.

Inserting the actual values for n and V_{REF} gives: $R_{LIM} = 90 \text{ V} / I_{LIM}$.

While the device is specified for a current limit of **3.6 mA**, (via $R_{LIM} = 25 \text{ k}\Omega$), it is easy to lower the current limit to further reduce the power consumption. For example, for a current limit of **2.5 mA** simply calculate:

$$R_{LIM} = \frac{90 \text{ V}}{I_{LIM}} = \frac{90 \text{ V}}{2.5 \text{ mA}} = 36 \text{ k}\Omega \tag{1}$$

Figure 13. Digital Input Stage

8.3.2 Debounce Filter

The HVS883 applies a simple analog/digital filtering technique to remove unintended signal transitions due to contact bounce or other mechanical effects. Any new input (either low or high) must be present for the duration of the selected debounce time to be latched into the shift register as a valid state.

The logic signal levels at the control inputs, DB0 and DB1 of the internal Debounce-Select logic determine the different debounce times listed in the following truth table.

Table 1. Debounce Times

DB1	DB0	FUNCTION
Open	Open	3 ms delay
Open	FGND	1 ms delay
FGND	Open	0 ms delay (Filter bypassed)
FGND	FGND	Reserved

Figure 14. Equivalent Input Diagram

8.3.3 Shift Register

The conversion from parallel input to serial output data is performed by an eight-channel, parallel-in serial-out shift register. Parallel-in access is provided by the internal inputs, PIP0–PIP7, that are enabled by a low level at the load input (LD). When clocked, the latched input data shift towards the serial output (SOP). The shift register also provides a clock-enable function.

Clocking is accomplished by a low-to-high transition of the clock (CLK) input while \overline{LD} is held high and the clock enable (\overline{CE}) input is held low for all registers in the shift register except the last register which is latched by a high-to-low transition. Parallel loading is inhibited when LD is held high. The parallel inputs to the register are enabled while \overline{LD} is low independently of the levels of the CLK, \overline{CE} , or serial (SIP) inputs.

Figure 15. Shift Register Logic Structure

Table 2. Function Table

INPUTS			FUNCTION
$\overline{\text{LD}}$	CLK	$\overline{\text{CE}}$	
L	X	X	Parallel load
H	X	H	No change
H	↑	L	Shift ⁽¹⁾
H	↓	L	Shift ⁽²⁾

(1) Shift = content of each internal register, except the last register, shifts towards serial output.

(2) Shift = content of the last register shifts towards serial output.

8.3.4 Voltage Regulator

The on-chip linear voltage regulator provides a 5 V supply to the internal- and external circuitry, such as digital isolators, with an output drive capability of 50 mA and a typical current limit of 115 mA. The regulator accepts input voltages from 34 V down to 10 V. Because the regulator output is intended to supply external digital isolator circuits proper output voltage decoupling is required. For best results connect a 1 μF and a 0.1 μF ceramic capacitor as close as possible to the 5VOP-output. For longer traces between the SN65HVS883 and isolators of the ISO72xx family use additional 0.1 μF and 10 pF capacitors next to the isolator supply pins. Make sure, however, that the total load capacitance does not exceed 4.7 μF.

For good stability the voltage regulator requires a minimum load current, I_{L-MIN} . Ensure that under any operating condition the ratio of the minimum load current in mA to the total load capacitance in μF is larger than 1:

$$\frac{I_{L-MIN}}{C_L} > \frac{1 \text{ mA}}{1 \mu\text{F}} \quad (2)$$

8.3.5 Supply Voltage Monitor

The integrated supply voltage monitor senses the supply voltage of the SN65HVS883 at the V24-pin. If this voltage drops below 15 V but stays within the regulator's operating range, i.e., $15 \text{ V} > V24 > 10 \text{ V}$, the output CHOK goes low 1 ms later. When the supply voltage returns to 24 V, the CHOK output turns logic high after 6 ms. Should the supply voltage drop below 10 V, the device ceases operation. Upon the supply returning to above 18 V, the CHOK output turns high again after 6 ms.

Figure 16. CHOK Output Timing as a Function of Supply Voltage Drop at V24

8.4 Device Functional Modes

The 2 functional modes of operation are Load mode and Shift mode.

Load mode enables information from the field inputs to latch into the shift register. To enter load mode, the $\overline{\text{LD}}$ pin must be held low, and the device remains in load mode regardless of the CLK, $\overline{\text{CE}}$, or serial (SIP) input levels. A high level at the $\overline{\text{LD}}$ pin switches the device into Shift mode.

When the device is in Shift mode, a low level at the $\overline{\text{CE}}$ pin causes the data stored in all registers of the parallel shift register except for the last register, to be serially shifted toward the serial output (SOP) on the rising edge of CLK. The final register in the shift register will be shifted toward the serial output (SOP) on the falling edge of CLK. A high level at the $\overline{\text{CE}}$ pin inhibits the serial shifting, which is demonstrated in [Figure 21](#). After 8 consecutive CLK cycles, the serial output (SOP) remains at the level of the serial input (SIP) which is internally pulled to logic high. A logic high at the $\overline{\text{CE}}$ pin is required to signify the end of the serial data output. For of a daisy chained configuration, the serial output (SOP) of the SN65HVS883 can be connected to the serial input (SIP) of a following device, and additional clock cycles are required to shift the additional data out of the chain. The number of consecutive clock cycles will equal 8 times the number of devices in the chain. See [Figure 22](#) for an example of a cascaded chain of 4x SN65HVS883.

9 Application and Implementation

NOTE

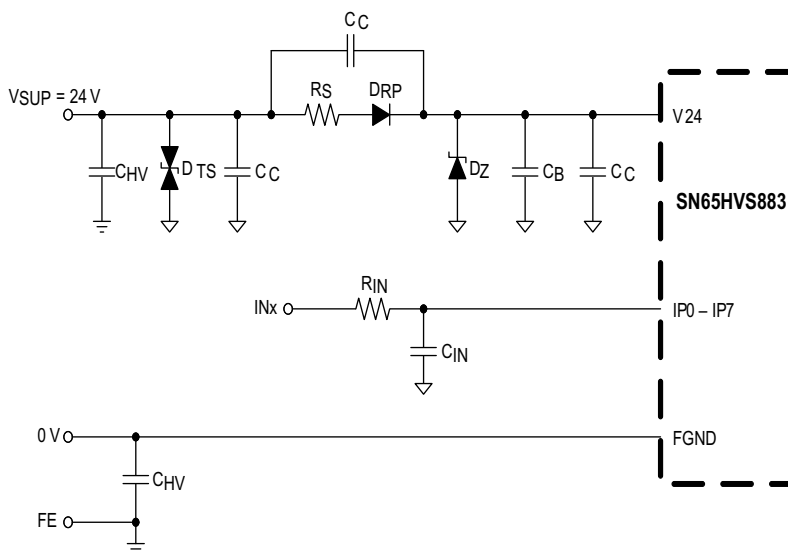

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 System-Level EMC

The SN65HVS883 must operate reliably in harsh industrial environments. At a system level, the device is tested according to several international electromagnetic compatibility (EMC) standards.

In addition to the device internal ESD structures, external protection circuitry, such as the one in [Figure 17](#), can be used to absorb as much energy from burst- and surge-transients as possible.

C _B	1 μF - 10 μF, 60 V Ceramic Capacitor

9.1.2 Input Channel Switching Characteristics

The input stage of the SN65HVS883 is so designed, that for an input resistor $R_{IN} = 1.2\text{ k}\Omega$ the trip point for signalling an ON-condition is at 9.4 V at 3.6 mA. This trip point satisfies the switching requirements of IEC61131-2 Type 1 and Type 3 switches.

Figure 18. Switching Characteristics for IEC61131-2 Type 1, 2, and 3 Proximity Switches

For a Type 2 switch application, two inputs are connected in parallel. The current limiters then add to a total maximum current of 7.2 mA. While the return-path (RE-pin), of one input might be used to drive an indicator LED, the RE-pin of the other input channel should be connected to ground (FGND).

Paralleling input channels reduces the number of available input channels from an octal Type 1 or Type 3 input to a quad Type 2 input device. Note, that in this configuration output data of an input channel is represented by two shift register bits.

Figure 19. Paralleling Two Type 1 or Type 3 Inputs Into One Type 2 Input

9.1.3 Digital Interface Timing

The digital interface of the SN65HVS883 is SPI compatible and interfaces, isolated or non-isolated, to a wide variety of standard micro controllers.

Figure 20. Simple Isolation of the Shift Register Interface

Upon a low-level at the load input, \overline{LD} , the information of the field inputs, IP0 to IP7 is latched into the shift register. Taking \overline{LD} high again blocks the parallel inputs of the shift register from the field inputs. A low-level at the clock-enable input, \overline{CE} , enables the clock signal, CLK, to serially shift the data to the serial output, SOP. Data is clocked into the shift register at the rising edge of CLK and out of the shift register on the falling edge of CLK. Thus after eight consecutive clock cycles all field input data have been clocked out of the shift register and the information of the serial input, SIP, appears at the serial output, SOP.

The \overline{CE} signal should only be transitioned low while the CLK signal is low which ensures that a rising edge of CLK occurs before a falling edge of CLK. This shifts the data into and through the shift register up until the final register before the first bit that was loaded into the final register is shifted out the serial output, SOP. If a falling edge of CLK is seen first following the transition of \overline{CE} to low, the final register outputs the first bit, IP0, on the serial output, SOP, before shifting the rest of the bits through the shift register. The previous value of the second to last register prior to the \overline{LD} event will then be shifted into the final register on the next rising CLK edge and output on the serial output, SOP, before the next valid bit, IP1, is output on the serial output, SOP. This appears as an erroneous bit in the serial data. Also, depending on how many falling CLK edges were seen before the \overline{CE} signal is transitioned back high, the final bit, IP7, may not get shifted out of the shift register.

Figure 21. Interface Timing for Parallel-Load and Serial-Shift Operation of the Shift Register

9.1.4 Cascading for High Channel Count Input Modules

Designing high-channel count modules require cascading multiple SN65HVS883 devices. Simply connect the serial output (SOP) of a leading device with the serial input (SIP) of a following device without changing the processor interface.

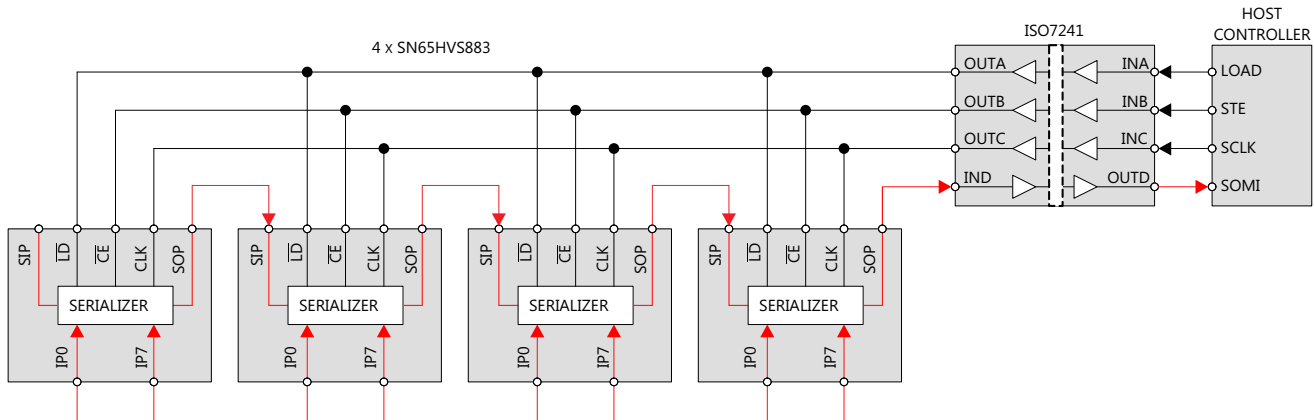

Figure 22. Cascading Four SN65HVS883 for a 32-Channel Input Module

NOTE

When daisy-chaining multiple devices, the maximum operating rate (CLK pulse width) may need to be restricted in order to maintain minimum set-up/hold timing relationships between the serial data (SIP/SOP) and the CLK line.

9.2 Typical Application

Copyright © 2016, Texas Instruments Incorporated

Figure 23. Typical Digital Input Module Application

Typical Application (continued)

9.2.1 Design Requirements

The simplified schematic in [Figure 23](#) demonstrates a typical application of the SN65HVS883 for sensing the state of digital switches with 24-V high logic levels. In this application, a 5-V host controller must receive the state of 8 switches as a serial input, while remaining isolated from the high voltage power supply.

9.2.2 Detailed Design Procedure

9.2.2.1 Input Stage

Selection of the current limiting resistor R_{LIM} sets the input current limit I_{LIM} for the device. [Digital Inputs](#) includes necessary equations for choosing the limiting resistor.

The On/Off voltage thresholds at the device pin $V_{TH(IP+)}$ and $V_{TH(IP-)}$ are fixed to 5.2 V and 4.3 V respectively, however the On/Off voltage thresholds of the field input $V_{TH(IN+)}$ and $V_{TH(IN-)}$ are determined by the value of the series resistor R_{IN} placed between the field input and the device. The threshold voltage $V_{TH(IN+)}$ is determined with the following equation:

$$V_{TH(IN+)} = I_{IN} \times R_{IN} + V_{TH(IP+)} \quad (3)$$

Substituting [Equation 1](#) and solving for R_{IN} produces an equation for R_{IN} given a desired on-threshold.

$$R_{IN} = \frac{(V_{TH(IN+)} - 5.2V) \times R_{LIM}}{90V} \quad (4)$$

The following equation can be used to calculate the off-threshold voltage given a value for R_{IN}

$$V_{TH(IN-)} = \frac{90V \times R_{IN}}{R_{LIM}} + V_{TH(IP-)} \quad (5)$$

[Figure 24](#) contains an example input characteristic:

Figure 24. SN65HVS883 Example Input Characteristic

Typical Application (continued)

9.2.2.2 Setting Debounce Time

The logic signals at the DB0 and DB1 pins determine the denounce times for the device according to the table in section 6.5. The DB0 and DB1 pins are internally pulled high. Connecting the pins to GND in different configurations allows for selection of 0, 1, or 3 ms debounce times. In noisy environments, it is recommended that unused DB pins should be connected externally to a 5 V supply.

9.2.2.3 Example: High-Voltage Sensing Application

For the high-voltage sensing application in [Figure 23](#), inputs from each switch (S0-S7) are connected to the 8 parallel inputs (IP0-IP7) of the SN65HVS883 through 1.2 kΩ MELF resistors. Small capacitors (22 nF) are tied to ground at each input to provide noise protection for the signals. A resistor is added between the R_{LIM} pin and GND to provide a device current limit according to the equation $I_{LIM} = 90 \text{ V} / R_{LIM}$. In this example, with a 24.9 kΩ resistor, the current limit for the device is set to 3.6 mA. LEDs are placed between pins RE0-RE7 to allow for external status observation of the parallel inputs. Finally the SN65HVS883 is connected through a digital isolation device to the host controller to provide galvanic isolation to the external interfaces and to allow for communication between the 5 V SN65HVS883 logic and the 5-V host controller. The host controller manages mode switching and clocking of the SN65HVS883 through the digital isolation device.

9.2.3 Application Curve

The application traces acquired in [Figure 25](#) demonstrates the typical behavior of the SN65HVD883 when in shift mode (Load Pulse Input pulled high and Clock Enable Input pulled low). Channel 1 shows the SIP input, Channel 2 shows the CLK input, and Channel 3 shows the SOP output.

Figure 25. SN65HVS883 Serial Input and Output Timing

10 Power Supply Recommendations

The SN65HVS883 operates within a recommended supply voltage range from 4.5 V to 5.5 V. A 0.1 μF or larger capacitor should be placed between V_{CC} and ground to improve power supply noise immunity. A current limiting resistor can be used to reduce overall power consumption as described in [Digital Inputs](#). The high voltage parallel field inputs can accept voltages ranging from 0 V to 34 V, however all other inputs must remain between 0 V to 5 V. Refer to the [Recommended Operating Conditions](#) table for more detailed voltage suggestions. High voltage field inputs should be buffered as shown in [Figure 23](#) to improve input noise immunity.

11 Layout

11.1 Layout Guidelines

1. Place series MELF resistors between the field inputs and the device input pins.
2. Place small ~ 22 nF capacitors close to the field input pins to reduce noise.
3. Place a supply buffering 0.1- μF capacitor around as close to the V_{CC} pin as possible.

11.2 Layout Example

12 器件和文档支持

12.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 接收文档更新通知

如需接收文档更新通知，请访问 www.ti.com.cn 网站上的器件产品文件夹。点击右上角的提醒我 (Alert me) 注册后，即可每周定期收到已更改的产品信息。有关更改的详细信息，请查阅已修订文档中包含的修订历史记录。

12.3 社区资源

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 商标

PowerPAD, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 静电放电警告

这些装置包含有限的内置 ESD 保护。存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

12.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65HVS883PWPR	ACTIVE	HTSSOP	PWP	28	2000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	HVS883	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
