- $V_{CC}$  隔离特性 - 如果任何一个  $V_{CC}$  输入接地 (GND)，则所有 I/O 端口均处于高阻抗状态
- $I_{off}$  支持局部断电模式运行
- 完全可配置的双轨设计，支持各个端口在 1.4V 至 3.6V 的整个电源电压范围内运行
- I/O 可承受 4.6V 的电压

### 2 应用

- 个人电子产品
- 工业
- 企业
- 电信

### 3 说明

这款 8 位同相总线收发器使用两个独立的可配置电源轨。SN74AVC8T245 经过优化，可在  $V_{CCA}/V_{CCB}$  设置为 1.4V 至 3.6V 的范围内正常运行。该器件可在  $V_{CCA}$  和  $V_{CCB}$  低至 1.2V 时正常运行。A 端口旨在跟踪  $V_{CCA}$ 。  $V_{CCA}$  支持从 1.2V 到 3.6V 范围内的任一电源电压。B 端口旨在跟踪  $V_{CCB}$ 。  $V_{CCB}$  可接受 1.2V 到 3.6V 范围内的任意电源电压，因此可在 1.2V、1.5V、1.8V、2.5V 和 3.3V 电压节点之间任意进行通用低压双向转换。

SN74AVC8T245 旨在实现数据总线间的异步通信。根据方向控制 (DIR) 输入上的逻辑电平，此器件将数据从 A 总线发送至 B 总线，或者将数据从 B 总线发送至 A 总线。输出使能 ( $\overline{OE}$ ) 可被用来禁用输出，这样可有效隔离总线。

SN74AVC8T245 旨在使控制引脚 (DIR 和  $\overline{OE}$ ) 由  $V_{CCA}$  供电。

SN74AVC8T245 与单电源系统兼容，并且后续可以替换为具备 '245 的功能，只需较小程度的印刷电路板重新设计。

该器件完全符合使用  $I_{off}$  的部分断电应用的规范要求。 $I_{off}$  电路禁用输出，从而可防止其断电时破坏性电流从该器件回流。

$V_{CC}$  隔离特性可确保只要有任何一个  $V_{CC}$  输入接地 (GND)，两个端口均处于高阻抗状态。

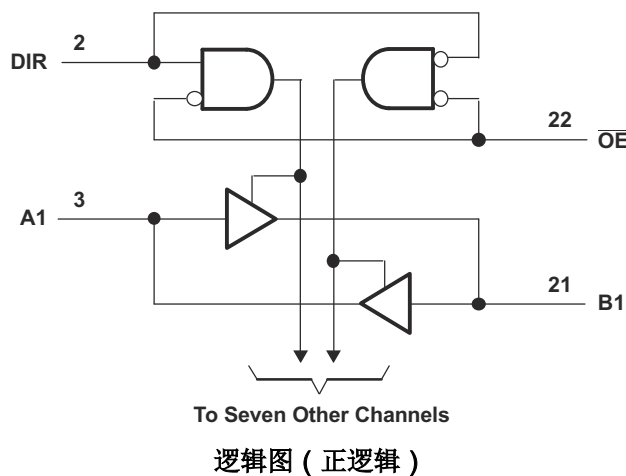

要在上电或断电期间将器件置于高阻抗状态，应通过一个上拉电阻器将  $\overline{OE}$  连接至  $V_{CC}$ ；该电阻器的最小值由驱动器的电流灌入能力决定。

## 6 Detailed Description

### 6.1 Overview

The SN74AVC8T245 is an 8-bit, dual-supply noninverting transceiver with bidirectional voltage level translation.  $V_{CCA}$  supports pins A and the control pins (DIR and  $\overline{OE}$ ), and  $V_{CCB}$  supports pins B. The A port is able to accept I/O voltages ranging from 1.2 V to 3.6 V, while the B port can accept I/O voltages from 1.2 V to 3.6 V. A high on DIR allows data transmission from A to B and a low on DIR allows data transmission from B to A when  $\overline{OE}$  is set to low. When  $\overline{OE}$  is set to high, both A and B are in the high-impedance state.

### 6.2 Functional Block Diagram

### 6.3 Feature Description

#### 6.3.1 Fully Configurable Dual-Rail Design

The fully configurable dual-rail design allows each port to operate over the full 1.2-V to 3.6-V power-supply range. Both  $V_{CCA}$  and  $V_{CCB}$  can be supplied at any voltage between 1.2 V and 3.6 V making the device an excellent choice for translating between any of the low voltage nodes (1.2 V, 1.8 V, 2.5 V, and 3.3 V).

#### 6.3.2 Support High-Speed Translation

SN74AVC8T245 can support high data rate application. The translated signal data rate can be up to 320Mbps when the device power supply is more than 1.8 V.

#### 6.3.3 $I_{off}$ Supports Partial-Power-Down Mode Operation

$I_{off}$  prevents backflow current by disabling I/O output circuits when device is in partial power-down mode. The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by  $I_{off}$  in the *Electrical Characteristics*.

#### 6.3.4 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads, so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. Two outputs can be connected together for 2X stronger output drive strength. The electrical and thermal limits defined in the *Absolute Maximum Ratings* must be followed at all times.

#### 6.3.5 Vcc Isolation

The I/Os of both ports will enter a high-impedance state when one of the supplies are at GND, while the other supply is still connected to the device (IOZ shown in *Electrical Characteristics*).

## 6.4 Device Functional Modes

The SN74AVC8T245 is a voltage level transceiver that can operate from 1.2 V to 3.6 V ( $V_{CCA}$ ) and 1.2 V to 3.6 V ( $V_{CCB}$ ). The signal translation between 1.2 V and 3.6 V requires direction control and output enable control. When  $\overline{OE}$  is low and DIR is high, data transmission is from A to B. When  $\overline{OE}$  is low and DIR is low, data transmission is from B to A. When  $\overline{OE}$  is high, both output ports will be high-impedance.

## 7 Application and Implementation

### 备注

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

### 7.1 Application Information

The SN74AVC8T245 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The SN74AVC8T245 device is an excellent choice for data transmission when direction is different. It is recommended to tie all unused I/Os to GND. The device should not have any floating I/Os when changing translation direction. The maximum data rate can be up to 320Mbps when device voltage power supply is more than 1.8 V.

For this design example, use the parameters listed in 表 7-1.

表 7-1. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range	1.2 V to 3.6 V
Output voltage range	1.2 V to 3.6 V

## 7.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
  - Use the supply voltage of the device that is driving the SN74AVC8T245 device to determine the input voltage range. For a valid logic high the value must exceed the  $V_{IH}$  of the input port. For a valid logic low the value must be less than the  $V_{IL}$  of the input port.
- Output voltage range
  - Use the supply voltage of the device that the SN74AVC8T245 device is driving to determine the output voltage range.

## 7.2.3 Application Curve

图 7-2. Translation Up (1.2 V to 3.3 V) at 2.5 MHz

## 7.3 Power Supply Recommendations

The SN74AVC8T245 device uses two separate configurable power-supply rails,  $V_{CCA}$  and  $V_{CCB}$ .  $V_{CCA}$  accepts any supply voltage from 1.2 V to 3.6 V and  $V_{CCB}$  accepts any supply voltage from 1.2 V to 3.6 V. The A port and B port are designed to track  $V_{CCA}$  and  $V_{CCB}$ , respectively, allowing for low-voltage bidirectional translation between any of the 1.2-V, 1.5-V, 1.8-V, 2.5-V and 3.3-V voltage nodes. The recommendation is to first power-up the input supply rail to help avoid internal floating while the output supply rail ramps up. However, both power-supply rails can be ramped up simultaneously.

The output-enable  $\overline{OE}$  input circuit is designed so that it is supplied by  $V_{CCA}$  and when the  $\overline{OE}$  input is high, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the  $\overline{OE}$  input pin must be tied to  $V_{CCA}$  through a pullup resistor and must not be enabled until  $V_{CCA}$  and  $V_{CCB}$  are fully ramped and stable. The minimum value of the pullup resistor to  $V_{CCA}$  is determined by the current-sinking capability of the driver.

## 7.4 Layout

### 7.4.1 Layout Guidelines

For device reliability, follow common printed-circuit board layout guidelines such as:

- Use bypass capacitors on power supplies.
- Use short trace lengths to avoid excessive loading.

- Place pads on the signal paths for loading capacitors or pullup resistors to adjust the signals rise and fall times, depending on the system requirements.
