

## TL331B、TL391B 和 TL331 单路比较器

### 1 特性

- 全新 [TL331B](#) 和 [TL391B](#)
- 改进了 B 版本的规格
  - 最大额定值：高达 38V
  - ESD 等级 (HBM)：2kV
  - 提高了反向电压性能
  - 低输入失调电压：0.37mV
  - 低输入偏置电流：3.5nA
  - 低电源电流：430μA
  - 更短的响应时间 (1μs)
  - [TL391B](#) 提供了 [替代引脚排列](#)
- TL331B 是经改进的 TL331 直接替代产品
- 共模输入电压范围包括接地
- 差分输入电压范围等于最大额定电源电压：±38V
- 低输出饱和电压
- 输出与 TTL、MOS 和 CMOS 兼容

### 2 应用

- [扫地机器人](#)
- [单相 UPS](#)
- [服务器 PSU](#)
- [无线电动工具](#)
- [无线基础设施](#)
- [电器](#)
- [楼宇自动化](#)
- [工厂自动化与控制](#)
- [电机驱动器](#)
- [信息娱乐系统与仪表组](#)

### 3 说明

[TL331B](#) 和 [TL391B](#) 器件是业界通用 [TL331](#) 比较器的下一代版本。下一代器件为成本敏感型应用提供了卓越的价值，其特性包括更低的失调电压、更高的电源电压能力、更低的电源电流、更低的输入偏置电流、更低的传播延迟、更宽的温度范围以及更高的 2kV ESD 性能，并提供了直接替代的便利性。[TL331B](#) 是经改进的 [TL331I](#) 和 [TL331K](#) 版本直接替代产品，而 [TL391B](#) 可提供 [TL331B](#) 的 [替代引脚排列](#)，以替代同类竞争器件。

如果两个电源的电压差处于 2V 至 36V 范围内且 VCC 比输入共模电压至少高 1.5V，那么也可以使用双电源。漏极电流不受电源电压的影响。可将输出连接到其它集电极开路输出，以实现有线 AND 关联。

T <sub>stg</sub>	Storage temperature	- 65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential voltages, are with respect to the network ground.
- (3) Differential voltages are at IN+ with respect to IN-.
- (4) Short circuits from outputs to V<sub>CC</sub> can cause excessive heating and eventual destruction.
- (5) Input current flows thorough parasitic diode to ground and will turn on parasitic transistors that will increase ICC and may cause output to be incorrect. Normal operation resumes when input current is removed.

## 6 Detailed Description

### 6.1 Overview

The TL331 family is a single comparator with the ability to operate up to 36V on the supply pin. This standard device has proven ubiquity and versatility across a wide range of applications. This is due to its very wide supply voltages range (2V to 36V), low  $I_q$ , and fast response.

The open-collector output allows the user to configure the output's logic low voltage ( $V_{OL}$ ) and can be utilized to enable the comparator to be used in AND functionality.

The TL331B and TL391B are performance upgrades to standard TL331 using the latest process technologies allowing for lower offset voltages, lower input bias and supply currents and faster response time over an extended temperature range. The TL331B can drop-in replace the "I" or "K" versions of TL331. The TL391B is an alternate pinout for replacing competitive devices.

### 6.2 Functional Block Diagram

### 6.3 Feature Description

TL331x family consists of a PNP Darlington pair input, allowing the device to operate with very high gain and fast response with minimal input bias current. The input Darlington pair creates a limit on the input common mode voltage capability, allowing TL331x to accurately function from ground to  $V_{CC} - 1.5V$  differential input. In later revisions, a clamp was added around Q3 to mimic the outside-of-input voltage range behavior of the original classic silicon.

The output consists of an open collector NPN (pull-down or low side) transistor. The output NPN will sink current when the negative input voltage is higher than the positive input voltage and the offset voltage. The  $V_{OL}$  is resistive and will scale with the output current. Please see the "Output Low Voltage vs. Output Sinking Current" graphs in [Typical Characteristics](#) for  $V_{OL}$  values with respect to the output current.

### 6.4 Device Functional Modes

#### 6.4.1 Voltage Comparison

The TL331x operates solely as a voltage comparator, comparing the differential voltage between the positive and negative pins and outputting a logic low or high impedance (logic high with pull-up) based on the input differential polarity.

## 7 Application and Implementation

### 备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 7.1 Application Information

TL331x will typically be used to compare a single signal to a reference or two signals against each other. Many users take advantage of the open drain output to drive the comparison logic output to a logic voltage level to an MCU or logic device. The wide supply range and high voltage capability makes TL331x optimal for level shifting to a higher or lower voltage.

### 7.2 Typical Application

图 7-1. Typical Application Schematic

#### 7.2.1 Design Requirements

For this design example, use the parameters listed in 表 7-1 as the input parameters.

表 7-1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input Voltage Range	0V to $V_{CC} - 1.5V$
Supply Voltage	2V to 36V
Logic Supply Voltage ( $R_{PULLUP}$ Voltage)	2V to 36V
Output Current ( $V_{LOGIC}/R_{PULLUP}$ )	1 $\mu$ A to 4mA
Input Overdrive Voltage	100mV
Reference Voltage	2.5V
Load Capacitance ( $C_L$ )	15pF

#### 7.2.2 Detailed Design Procedure

When using TL331x in a general comparator application, determine the following:

- Input voltage range
- Minimum overdrive voltage
- Output and drive current
- Response time

### 7.2.2.1 Input Voltage Range

When choosing the input voltage range, the input common mode voltage range ( $V_{ICR}$ ) must be taken in to account. If temperature operation is above or below 25°C the  $V_{ICR}$  can range from 0V to  $V_{CC} - 1.5V$ . This limits the input voltage range to as high as  $V_{CC} - 1.5V$  and as low as 0V. Operation outside of this range can yield incorrect comparisons.

Below is a list of input voltage situation and their outcomes:

1. When both IN- and IN+ are both within the common mode range:
  - a. If IN- is higher than IN+ and the offset voltage, the output is low and the output transistor is sinking current
  - b. If IN- is lower than IN+ and the offset voltage, the output is high impedance and the output transistor is not conducting
2. When IN- is higher than common mode and IN+ is within common mode, the output is low and the output transistor is sinking current
3. When IN+ is higher than common mode and IN- is within common mode, the output is high impedance and the output transistor is not conducting
4. When IN- and IN+ are both higher than common mode, please see the *Both Inputs Above Input Range Behavior* section of the [LM339 Family Application Note \(SNOAA35\)](#).

### 7.2.2.2 Minimum Overdrive Voltage

Overdrive Voltage is the differential voltage produced between the positive and negative inputs of the comparator over the offset voltage ( $V_{IO}$ ). To make an accurate comparison the Overdrive Voltage ( $V_{OD}$ ) should be higher than the input offset voltage ( $V_{IO}$ ). Overdrive voltage can also determine the response time of the comparator, with the response time decreasing with increasing overdrive. [图 7-2](#) and [图 7-3](#) show positive and negative response times with respect to overdrive voltage.

### 7.2.2.3 Output and Drive Current

Output current is determined by the load/pull-up resistance and logic/pull-up voltage. The output current produces a output low voltage ( $V_{OL}$ ) from the comparator. In which  $V_{OL}$  is proportional to the output current. Use *Output Low Voltage vs Output Current ( $I_{OL}$ )* to determine  $V_{OL}$  based on the output current.

The output current can also effect the transient response. More is explained in the next section.

### 7.2.2.4 Response Time

Response time is a function of input over drive. See [节 7.2.3](#) for typical response times. The rise and fall times can be determined by the load capacitance ( $C_L$ ), load/pullup resistance ( $R_{PULLUP}$ ), and equivalent collector-emitter resistance ( $R_{CE}$ ).

- The rise time ( $\tau_R$ ) is approximately  $\tau_R \sim R_{PULLUP} \times C_L$
- The fall time ( $\tau_F$ ) is approximately  $\tau_F \sim R_{CE} \times C_L$ 
  - $R_{CE}$  can be determined by taking the slope of *Output Low Voltage vs Output Current ( $I_{OL}$ )* in its linear region at the desired temperature, or by dividing the  $V_{OL}$  by  $I_{out}$

### 7.2.3 Application Curves

The following curves were generated with 5V on  $V_{CC}$  and  $V_{Logic}$ ,  $R_{PULLUP} = 5.1k\Omega$ , and 50pF scope probe.

### 7.2.4 ESD Protection

The "B" and TiB versions add dedicated ESD protections on all the pins for improved ESD performance. Please see Application Note [SNOAA35](#) for more information.

### 7.2.5 Power Supply Recommendations

For fast response and comparison applications with noisy or AC inputs, it is recommended to use a bypass capacitor on the supply pin to reject any variation on the supply voltage. This variation can eat into the comparator's input common mode range and create an inaccurate comparison.

### 7.2.6 Layout

#### 7.2.6.1 Layout Guidelines

For accurate comparator applications without hysteresis it is important maintain a stable power supply with minimized noise and glitches, which can affect the high level input common mode voltage range. To achieve this, it is best to add a bypass capacitor between the supply voltage and ground. This should be implemented on the positive power supply and negative supply (if available). If a negative supply is not being used, do not put a capacitor between the IC's GND pin and system ground.

### 8.5 静电放电警告

静电放电 (ESD) 会损坏这个集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
