

TPS22968-Q1 5.5V、4A、27mΩ 导通电阻负载开关

1 特性

- 集成双通道负载开关
 - 符合汽车应用要求:
 - 器件温度 1 级 (工作环境温度范围: -40°C 至 125°C)
 - 输入电压范围: 0.8V 至 5.5V
 - VBIAS 电压范围: 2.5V 至 5.5V
 - 导通电阻
 - $V_{\text{IN}} = 5\text{V}$ ($V_{\text{BIAS}} = 5\text{V}$) 时, $R_{\text{ON}} = 29\text{m}\Omega$
 - $V_{\text{IN}} = 3.3\text{V}$ ($V_{\text{BIAS}} = 5\text{V}$) 时, $R_{\text{ON}} = 27\text{m}\Omega$
 - $V_{\text{IN}} = 1.8\text{V}$ ($V_{\text{BIAS}} = 5\text{V}$) 时, $R_{\text{ON}} = 26\text{m}\Omega$
 - 每通道最大 4A 持续开关电流
 - 低静态电流
 - $V_{\text{BIAS}} = 5\text{V}$ 时为 $58\mu\text{A}$ (双通道)
 - 低控制输入阈值支持使用 1.2/1.8/2.5/3.3V 逻辑器件
 - 可通过 CT 引脚⁽¹⁾ 配置上升时间
 - 快速输出放电 (QOD)⁽²⁾
 - 10 引脚晶圆级小外形无引线 (WSON) 封装, 具有可湿性侧面
 - 静电放电 (ESD) 性能经测试符合 JEDEC STD 标准
 - $\pm 2\text{kV}$ 人体模型 (HBM) 和 $\pm 1\text{kV}$ 器件充电模型 (CDM)
 - 锁断性能达 100mA, 符合 JESD 78 II 类规范的要求
 - 通用输入输出 (GPIO) 使能 - 高电平有效
- (1) 有关 CT 值与上升时间的关系, 请参见 [Adjustable Rise Time](#)
- (2) 此特性通过一个 270Ω 电阻将开关的输出放电至接地 (GND), 从而防止输出悬空。

2 应用

- 汽车电子产品
- 信息娱乐
- 仪表盘
- ADAS

3 说明

TPS22968-Q1 是一款具有可配置上升时间的小型双通道负载开关。此器件包含两个可在 0.8 至 5.5V 输入电压范围内运行的 N 通道 MOSFET, 并且每通道可支持最大 4A 的持续电流。每个开关可由一个打开/关闭输入 (ON1 和 ON2) 独立控制, 此输入可与低压控制信号直接对接。TPS22968-Q1 包含一个 270Ω 片上负载电阻, 用于在此开关被关闭时进行快速输出放电。

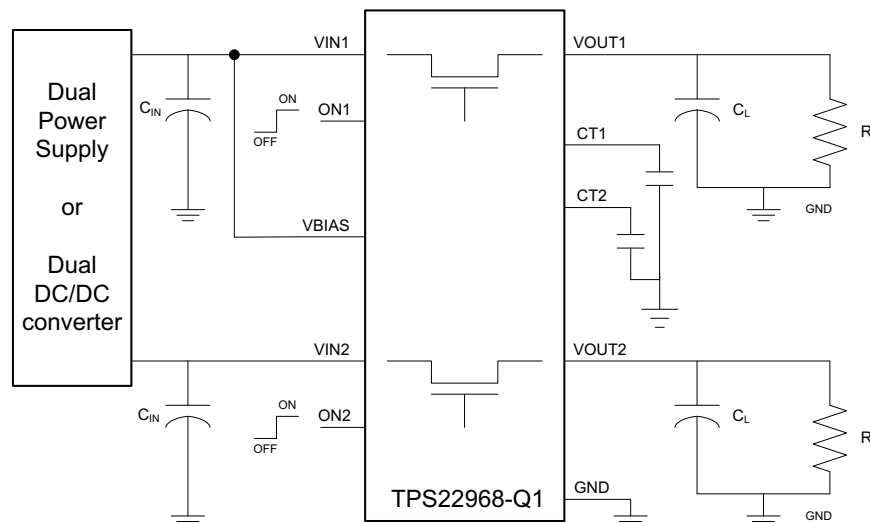

TPS22968-Q1 采用节省空间的小型封装 (DMG), 并且具有可湿性侧面和集成散热焊盘。可湿性侧面支持目视焊接检查。器件在自然通风环境下的额定运行温度范围为 40°C 至 125°C 。

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
TPS22968-Q1	WSON (10)	2.00mm x 3.00mm

(1) 要了解所有可用封装, 请见数据表末尾的可订购产品附录。

5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
VIN1	1	I	Switch 1 input. Bypass this input with a ceramic capacitor to GND.
ON1	2	I	Active-high switch 1 control input. Do not leave floating.
VBIAS	3	I	Bias voltage. Power supply to the device. Recommended voltage range for this pin is 2.5 to 5.5 V. See VIN and VBIAS Voltage Range .
ON2	4	I	Active-high switch 2 control input. Do not leave floating.
VIN2	5	I	Switch 2 input. Bypass this input with a ceramic capacitor to GND.
VOUT2	6	O	Switch 2 output
CT2	7	O	Switch 2 slew rate control. Can be left floating.
GND	8	—	Ground
CT1	9	O	Switch 1 slew rate control. Can be left floating.
VOUT1	10	O	Switch 1 output
Thermal Pad	—	—	Thermal pad (exposed center pad) to alleviate thermal stress. Tie to GND. See Layout Guidelines .

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature (unless otherwise noted)⁽¹⁾ ⁽²⁾

		MIN	MAX	UNIT
V _{IN1,2}	Input voltage	-0.3	6	V
V _{BIAS}	Bias voltage	-0.3	6	V
V _{OUT1,2}	Output voltage	-0.3	6	V
V _{ON1,2}	ON voltage	-0.3	6	V
I _{MAX}	Maximum continuous switch current per channel, T _A = 50 °C		4	A
I _{PLS}	Maximum pulsed switch current, pulse <300 μs, 2% duty cycle		6	A
T _J	Maximum junction temperature		150	°C
T _{LEAD}	Maximum lead temperature (10-s soldering time)		300	°C
T _{stg}	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human Body Model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged-Device Model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

			MIN	MAX	UNIT
V _{IN1,2}	Input voltage range		0.8	V _{BIAS}	V
V _{BIAS}	Bias voltage range		2.5	5.5	V
V _{ON1,2}	ON voltage range		0	5.5	V
V _{OUT1,2}	Output voltage range			V _{IN}	V
V _{IH, ON1,2}	High-level input voltage, ON1,2	V _{BIAS} = 2.5 to 5.5 V	1.2	5.5	V
V _{IL, ON1,2}	Low-level input voltage, ON1,2	V _{BIAS} = 2.5 to 5.5 V	0	0.5	V
C _{IN1,2}	Input capacitor		1 ⁽¹⁾		μF
T _A	Operating free-air temperature ⁽²⁾		-40	125	°C

- (1) Refer to [Application Information](#).
- (2) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [T_{A(max)}] is dependent on the maximum operating junction temperature [T_{J(max)}], the maximum power dissipation of the device in the application [P_{D(max)}], and the junction-to-ambient thermal resistance of the part/package in the application (R_{θJA}), as given by the following equation: T_{A(max)} = T_{J(max)} - (R_{θJA} × P_{D(max)}).

6.4 Thermal Information

THERMAL METRIC ^{(1) (2)}		TPS22968-Q1	UNIT
		DMG (10 PINS)	
R _{θJA}	Junction-to-ambient thermal resistance	55.6	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	71.0	
R _{θJB}	Junction-to-board thermal resistance	21.7	
ψ _{JT}	Junction-to-top characterization parameter	1.9	
ψ _{JB}	Junction-to-board characterization parameter	21.7	
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	7.3	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

(2) For thermal estimates of this device based on PCB copper area, see the [TI PCB Thermal Calculator](#).

6.5 Electrical Characteristics (V_{BIAS} = 5 V)

V_{BIAS} = 5 V. Typical values are for T_A = 25°C, unless otherwise noted

PARAMETER		TEST CONDITIONS	T _A	MIN	TYP	MAX	UNIT

7 Parameter Measurement Information

Test Circuit

Timing Waveforms

A. Rise and fall times of the control signal is 100 ns.

Figure 33. Test Circuit and Timing Waveforms

8 Detailed Description

8.1 Overview

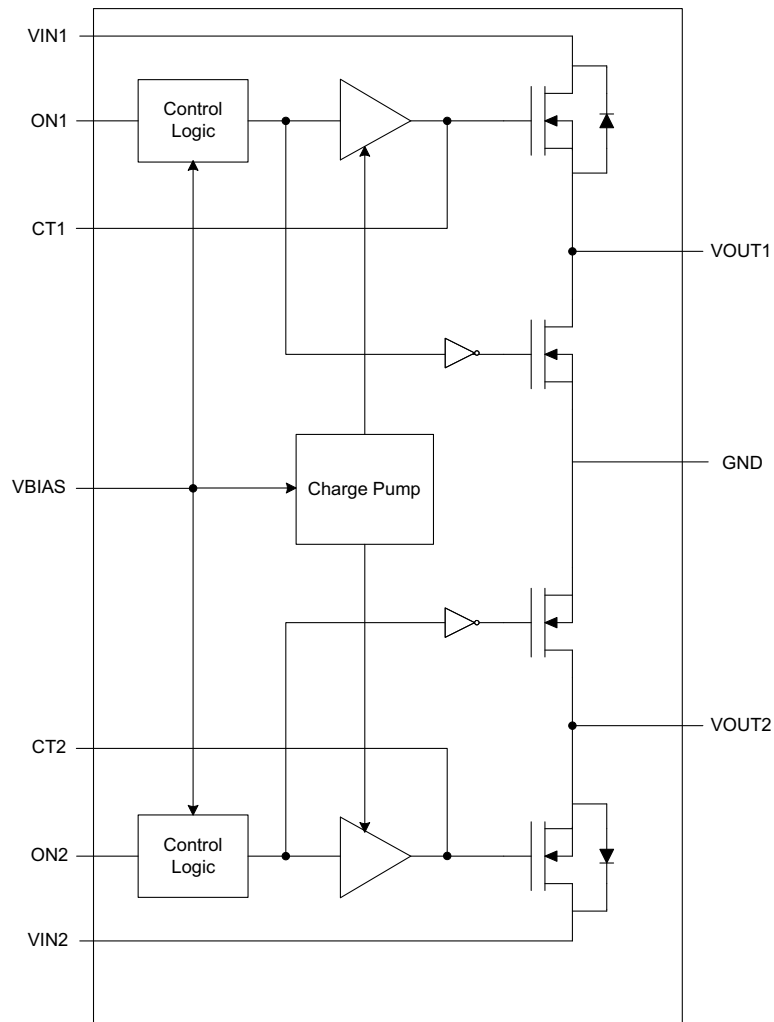

The device is a 5.5-V, 4-A, dual-channel ultra-low R_{ON} load switch with controlled turn on. The device contains two N-channel MOSFETs. Each channel can support a maximum continuous current of 4 A. Each channel is controlled by an on/off GPIO-compatible input. The ON pin must be connected and cannot be left floating. The device is designed to control the turn-on rate and therefore the inrush current. By controlling the inrush current, power supply sag can be reduced during turn-on. The slew rate for each channel is set by connecting a capacitor to GND on the CT pins.

The slew rate is proportional to the capacitor on the CT pin. Refer to [Adjustable Rise Time](#) to determine the correct CT value for a desired rise time.

The internal circuitry is powered by the VBIAS pin, which supports voltages from 2.5 to 5.5 V. This circuitry includes the charge pump, QOD, and control logic. For these internal blocks to function correctly, a voltage between 2.5 and 5.5 V must be supplied to VBIAS.

When a voltage is supplied to VBIAS and the ON1, 2 pin goes low, the QOD turns on. This connects VOUT1, 2 to GND through an on-chip resistor. The typical pulldown resistance (R_{PD}) is 270 Ω .

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 ON/OFF Control

The ON pins control the state of the switch. Asserting ON high enables the switch. ON is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2-V or higher GPIO voltage. This pin cannot be left floating and must be tied either high or low for proper functionality.

8.3.2 Quick Output Discharge (QOD)

The TPS22968-Q1 includes a QOD feature. When the switch is disabled, a discharge resistor is connected between VOUT and GND. This resistor has a typical value of 270 Ω and prevents the output from floating while the switch is disabled.

8.3.3 Adjustable Rise Time

A capacitor to GND on the CT pins sets the slew rate for each channel. The capacitor to GND on the CT pins should be rated for 25 V and above. An approximate formula for the relationship between CT and slew rate with $V_{BIAS} = 5\text{ V}$ is:

$$SR = 0.35 \times CT + 25$$

where

- SR = slew rate (in $\mu\text{s/V}$)
- CT = the capacitance value on the CT pin (in pF)
- The units for the constant 25 is in $\mu\text{s/V}$.

(1)

Rise time can be calculated by multiplying the input voltage by the slew rate. [Table 1](#) contains rise time values measured on a typical device.

Table 1. Rise Time Table

CTx (pF)	Rise Time (μs) ⁽¹⁾ ⁽²⁾					
	$V_{IN} = 5\text{ V}$	$V_{IN} = 3.3\text{ V}$	$V_{IN} = 2.5\text{ V}$	$V_{IN} = 1.8\text{ V}$	$V_{IN} = 1.2\text{ V}$	$V_{IN} = 0.8\text{ V}$
0	84	63	52	43	35	27

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

This section highlights some of the design considerations for implementing this device in various applications. A PSPICE model for this device is also available on the [product page](#) for further aid.

9.1.1 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor, a capacitor must be placed between VIN and GND. A 1- μ F ceramic capacitor, C_{IN} , placed close to the pins, is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during high-current applications. When switching heavy loads, TI recommends to have an input capacitor about 10x higher than the output capacitor to avoid excessive voltage drop.

9.1.2 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, TI highly recommends a C_{IN} greater than C_L . A C_L greater than C_{IN} can cause the voltage on VOUT to exceed VIN when the system supply is removed. This could result in current flow through the body diode from VOUT to VIN. TI recommends a C_{IN} to C_L ratio of 10 to 1 for minimizing VIN dip caused by inrush currents during startup.

9.1.3 VIN and VBIAS Voltage Range

For optimal R_{ON} performance, make sure $V_{IN} \leq V_{BIAS}$. The device is still functional if $V_{IN} > V_{BIAS}$, but it will exhibit R_{ON} greater than what is listed in the [Electrical Characteristics \(\$V_{BIAS} = 5\text{ V}\$ \)](#) and [Electrical Characteristics \(\$V_{BIAS} = 2.5\text{ V}\$ \)](#). See [Figure 34](#) for an example of a typical device. Notice the increasing R_{ON} as V_{IN} exceeds V_{BIAS} voltage. Be sure to never exceed the maximum voltage rating for V_{IN} and V_{BIAS} .

$T_A = 25^\circ\text{C}$

$I_{OUT} = -200\text{ mA}$

Figure 34. R_{ON} vs V_{IN}

Application Information (continued)

9.1.3.1 Parallel Configuration

To increase the current capabilities and lower the R_{ON} by approximately 50%, both channels can be placed in parallel as shown in Figure 35 (parallel configuration). With this configuration, the CT1 and CT2 pins can be tied together to use one capacitor, CT, as shown in Figure 35. With a single CT capacitor, the rise time will be half of the typical rise-time value. Refer to the Table 1 for typical timing values.

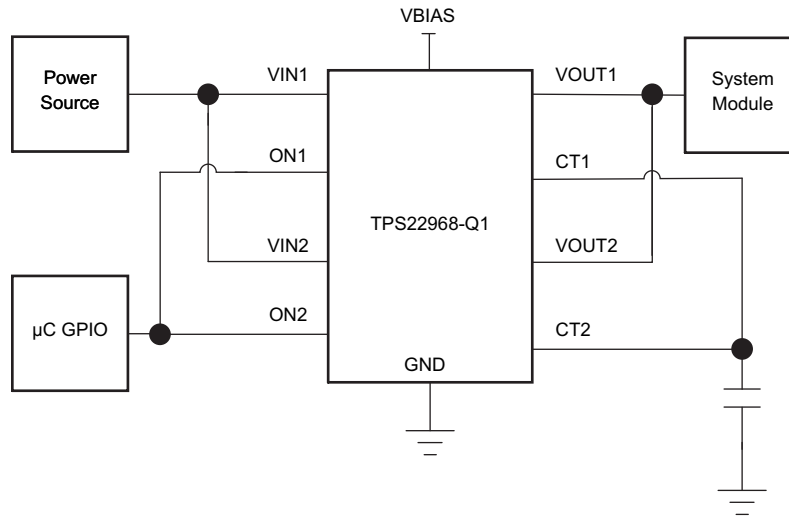

Figure 35. Parallel Configuration Schematic

9.1.3.2 Standby Power Reduction

TPS22968-Q1 can help to reduce the standby power consumption of a module. Some loads will consume a non-trivial amount of power when turned off. If the power to the load is removed by the load switch, the standby power consumption can be significantly reduced.

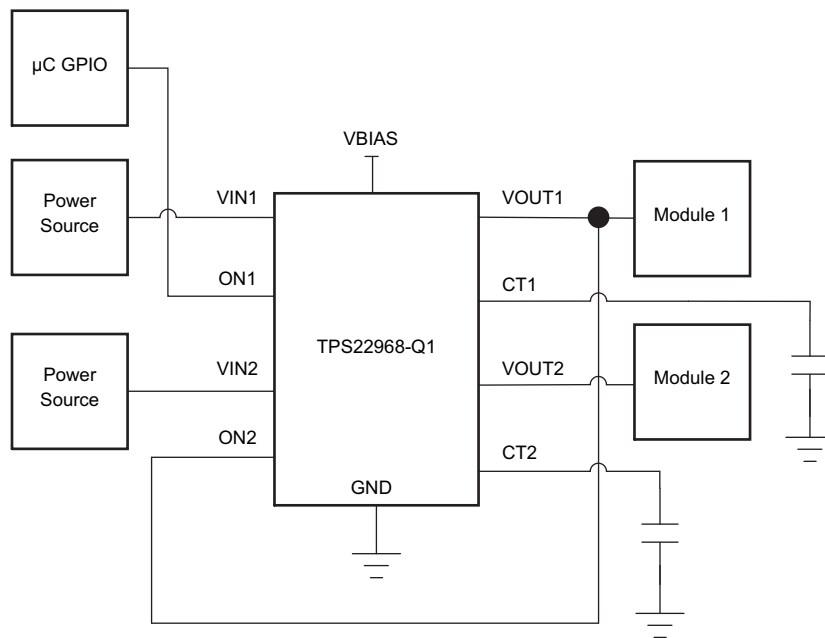

Figure 36. Standby Power Reduction Schematic

Application Information (continued)

9.1.3.3 Power Supply Sequencing Without a GPIO Input

In many end equipments, there is a need to power up various modules in a predetermined manner. TPS22968-Q1 can solve the problem of power sequencing without adding any complexity to the overall system.

A. VIN1 must be greater V_{IH} .

Figure 37. Power Sequencing Without a GPIO Input Schematic

9.1.3.4 Reverse Current Blocking

In certain applications, it may be desirable to have reverse current blocking. Reverse current blocking prevents current from flowing from the output to the input of the load switch when the device is disabled. With the following configuration, the TPS22968-Q1 can be converted into a single-channel switch with reverse current blocking. In this configuration, VIN1 or VIN2 can be used as the input and VIN2 or VIN1 is the output.

Figure 38. Reverse Current Blocking Schematic

9.2 Typical Application

This application demonstrates how the TPS22968-Q1 can be used to power a downstream load with a large capacitance. The example in [Figure 39](#) is powering a 22- μF capacitive output load.

Figure 39. Typical Application Schematic for Powering a Downstream Module

9.2.1 Design Requirements

For this design example, use the following as the input parameters.

Table 3. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
V_{IN}	3.3 V
V_{BIAS}	5.0 V
Output capacitance (C_L)	22 μF
Allowable inrush current on VOUT	0.400 A

9.2.2 Detailed Design Procedure

To begin the design process, the designer needs to know the following:

- V_{IN} voltage
- V_{BIAS} voltage
- Output capacitance (C_L)
- Allowable inrush current on VOUT due to C_L capacitor

9.2.2.1 Inrush Current

To determine how much inrush current will be caused by the C_L capacitor, use [Equation 2](#).

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

where

- I_{INRUSH} = amount of inrush current caused by C_L
- C_L = capacitance on VOUT
- $dt = V_{OUT}$ rise time
- dV_{OUT} = increase in V_{OUT} during the rise time (2)

Inrush current is proportional to rise time. The rise time is adjustable by use of the CT capacitor. The appropriate rise time can be calculated using the design requirements and the inrush current equation ([Equation 2](#)).

$$400 \text{ mA} = 22 \mu\text{F} \times 3.3 \text{ V} / dt \quad (3)$$

$$dt = 182 \mu\text{s} \quad (4)$$

To ensure an inrush current of less than 400 mA, choose a CT capacitor value that will yield a rise time of more than 182 μs . See the oscilloscope captures in the [Application Curves](#) for an example of how the CT capacitor can be used to reduce inrush current. See [Table 1](#) for correlation between rise times and CT values.

An appropriate C_L value should be placed on VOUT such that the I_{MAX} and I_{PLS} specifications of the device are not violated.

9.2.3 Application Curves

The two scope captures below show how the CT capacitor can be used to reduce inrush current.

10 Power Supply Recommendations

The device is designed to operate from a V_{BIAS} range of 2.5 to 5.5 V and V_{IN} range of 0.8 to 5.5 V. This supply must be well regulated and placed as close to the device pin as possible with the recommended 1- μ F bypass capacitor. If the supply is located more than a few inches from the device pins, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 10 μ F may be sufficient.

11 Layout

11.1 Layout Guidelines

- V_{IN} and V_{OUT} traces should be as short and wide as possible to accommodate for high current.
- Use vias under the exposed thermal pad for thermal relief for high current operation.
- V_{INx} pins should be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1- μ F ceramic with X5R or X7R dielectric. This capacitor should be placed as close to the device pins as possible.
- V_{OUTx} pins should be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is one-tenth of the V_{INx} bypass capacitor of X5R or X7R dielectric rating. This capacitor should be placed as close to the device pins as possible.
- The V_{BIAS} pin should be bypassed to ground with low-ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 0.1- μ F ceramic with X5R or X7R dielectric.
- The CTx capacitors should be placed as close to the device pins as possible. The typical recommended CTx capacitance is a capacitor of X5R or X7R dielectric rating with a rating of 25 V or higher.

11.2 Layout Example

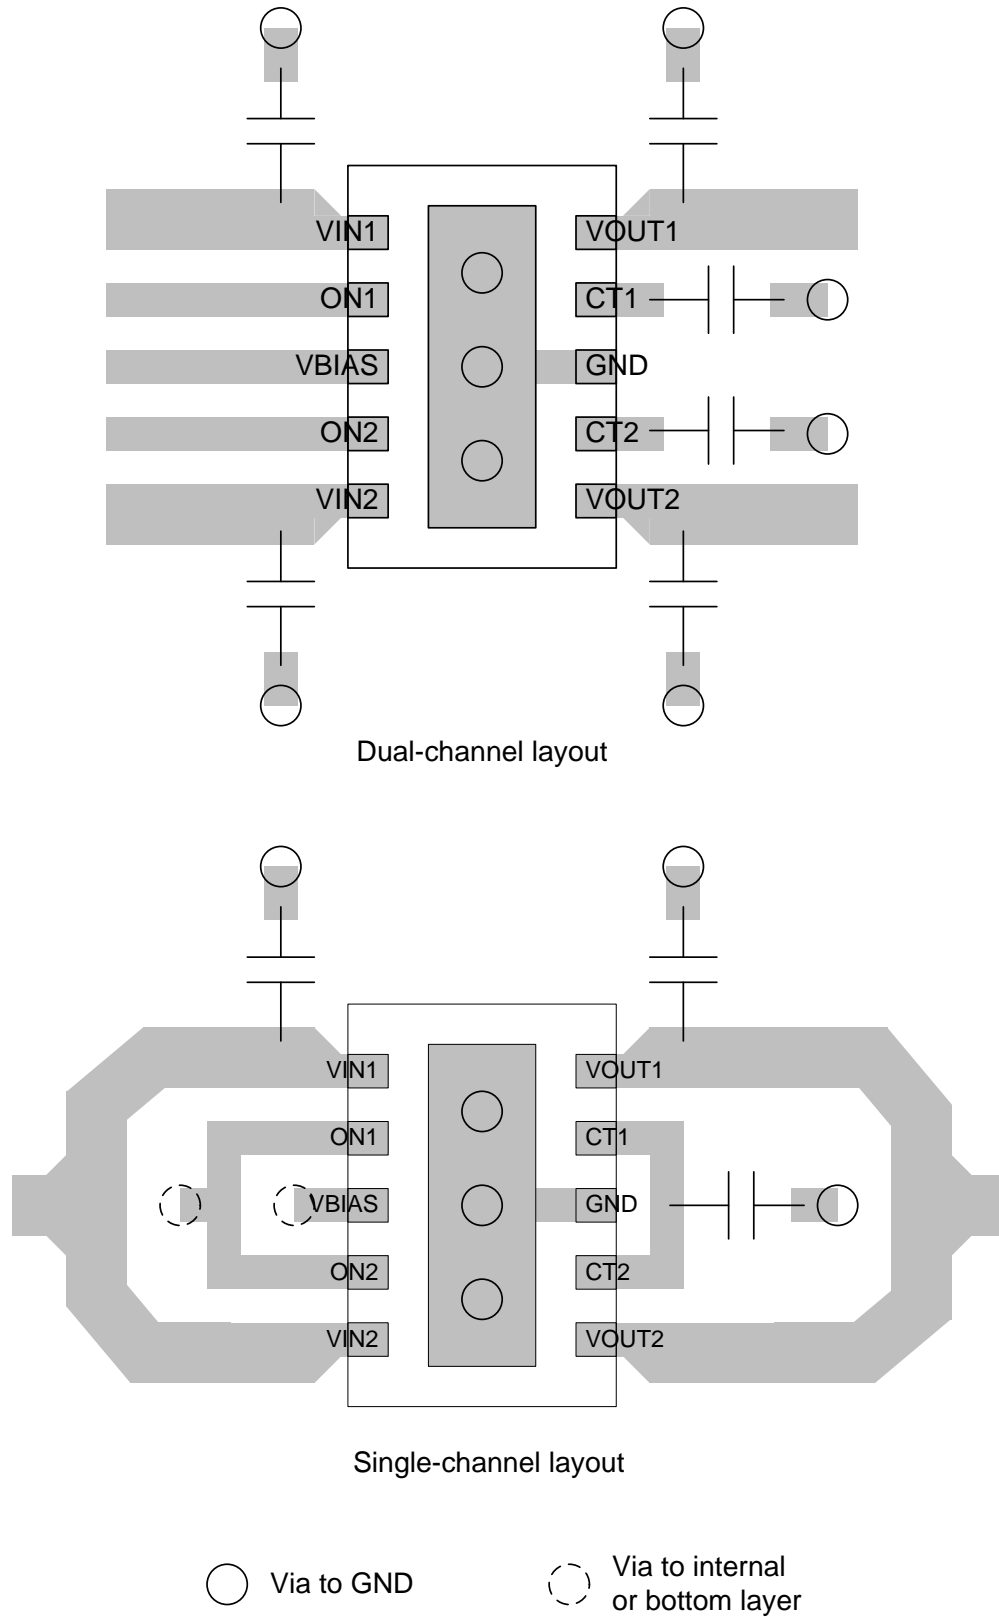

Figure 42. Layout Schematic

11.3 Thermal Considerations

The maximum IC junction temperature should be restricted to 150°C under normal operating conditions. To calculate the maximum allowable dissipation, $P_{D(max)}$ for a given ambient temperature, use [Equation 5](#).

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}}$$

where

- $P_{D(max)}$ = maximum allowable power dissipation
- $T_{J(max)}$ = maximum allowable junction temperature (150°C for the TPS22968-Q1)
- T_A = ambient temperature of the device
- $R_{\theta JA}$ = junction to air thermal impedance. See [Thermal Information](#). This parameter is highly dependent upon board layout. (5)

Following are two examples demonstrating how to use the above information: For $V_{BIAS} = 5\text{ V}$, $V_{IN} = 5\text{ V}$, the maximum allowable ambient temperature with a 3-A load through each channel can be determined by using the following calculations.

NOTE

When calculating power dissipation in the switch, it is important to use the correct R_{ON} value. R_{ON} is dependent on the junction temperature of the device.

$$P_D = I^2 \times R \times 2 \text{ (multiplied by 2 because there are two channels)} \quad (6)$$

$$2 \times I^2 \times R = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}} \quad (7)$$

$$T_A = T_{J(MAX)} - R_{\theta JA} \times 2 \times I^2 \times R \quad (8)$$

$$T_A = 150^\circ\text{C} - 55.6^\circ\text{C/W} \times 2 \times (3\text{ A})^2 \times 45\text{ m}\Omega = 105^\circ\text{C} \quad (9)$$

For $V_{BIAS} = 5\text{ V}$, $V_{IN} = 5\text{ V}$, the maximum continuous current for an ambient temperature of 85°C with the same current flowing through each channel can be determined by using the following calculation:

$$2 \times I^2 \times R = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}} \quad (10)$$

$$I = \sqrt{\frac{T_{J(MAX)} - T_A}{2 \times R \times R_{\theta JA}}} \quad (11)$$

$$I = \sqrt{\frac{150^\circ\text{C} - 85^\circ\text{C}}{2 \times 45\text{ m}\Omega \times 55.6^\circ\text{C/W}}} = 3.6\text{ A} \quad (12)$$

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
