

# TPS53317A 用于 DDR 存储器终端的 6A 输出、D-CAP+ 模式、同步降压集成 FET 转换器

## 1 特性

- 采用 TI 专有的集成金属氧化物半导体场效应晶体管 (MOSFET) 和封装技术
- 支持 DDR 内存终止，具有高达 6A 的持续输出源电流或者吸收电流
- 外部跟踪
- 最少的外部组件数
- 0.9V 至 6V 转换电压
- D-CAP+™ 模式架构
- 支持所有多层片式陶瓷输出电容器和 SP/POSCAP
- 可选跳跃 (SKIP) 模式或者强制 CCM
- 轻量级负载与重负载下的优化效率
- 可选 600kHz 或者 1MHz 开关频率
- 可选过流限制 (OCL)
- 过压、过温和断续欠压保护
- 可调输出电压范围为 0.45V 至 2V
- 3.5mm × 4mm 20 引脚超薄四方扁平无引线 (VQFN) 封装

## 2 应用

- 用于 DDR、DDR2、DDR3 和 DDR4 的存储器终端稳压器
- VTT 终止
- 用于 0.9V 至 6V 输入电源轨的低电压应用

## 3 说明

TPS53317A 器件是一款设计为主要用于 DDR 终端的集成场效应晶体管 (FET) 同步降压稳压器。它能够提供一个值为  $\frac{1}{2} V_{DDQ}$  的经稳压输出，此输出具有吸收电流和源电流功能。TPS53317A 器件采用 D-CAP+ 运行模式，简单易用，所需外部组件数较少并可提供快速瞬态响应。该器件还可用于其他电流要求高达 6A 的负载点 (POL) 稳压应用。此外，该器件支持具有严格电压调节功能的 6A 完整灌电流输出。

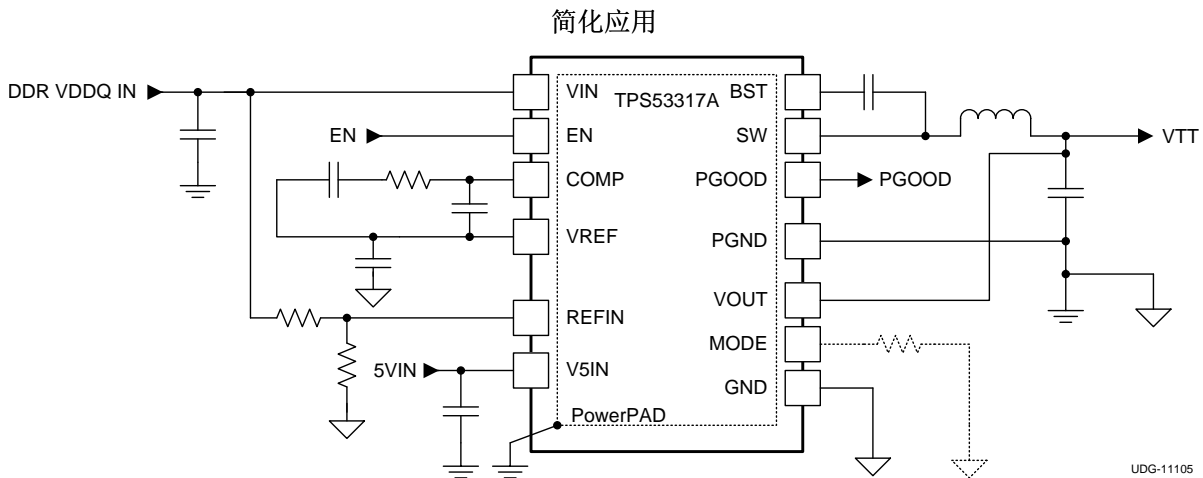

该器件具有两种开关频率设定值 (600kHz 和 1MHz)，可提供集成压降支持、外部跟踪功能、预偏置启动、输出软放电、集成自举开关、电源正常功能、V5IN 引脚欠压锁定 (UVLO) 保护功能，支持采用陶瓷和 SP/POSCAP 电容。该器件支持的输入电压最高可达 6V，而输出电压在 0.45V 至 2.0V 范围内可调。

TPS53317A 器件采用 3.5mm × 4mm 20 引脚超薄四方扁平无引线 (VQFN) 封装 (绿色环保，符合 RoHS 标准并且无铅)，其中应用了 TI 专有的集成 MOSFET 和封装技术，其额定运行温度范围为  $-40^{\circ}\text{C}$  至  $85^{\circ}\text{C}$ 。

## 5 Pin Configuration and Functions

**Pin Functions**

PIN		I/O <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
BST	16	I	Power supply for internal high-side gate driver. Connect a 0.1- $\mu$ F bootstrap capacitor between this pin and the SW pin. Include a series boot resistor when the voltage spike on switching node is above 7 V.
COMP	8	O	Connect an R-C-C network between this pin and VREF for loop compensation.
EN	17	I	Enable pin (3.3-V logic compatible).
GND	6	–	Analog ground.
MODE	18	I	Allows selection of different operation modes. (See <a href="#">表 1</a> )
PGND	1	G	Power ground.
	2		
	3		
PGOOD	19	O	Open drain power good output. Connect pullup resistor.
REFIN	9	I	External tracking reference input. Apply voltage between 0.45 V to 2.0 V. For non-tracking mode, connect REFIN to VREF via resistor divider.
SW	11	I/O	Switching node output.
	12		
	13		
	14		
	15		
V5IN	20	I	5-V power supply for analog circuits and gate drive.
VIN	4	I	Power supply input pin.
	5		
VOUT	10	I	Output voltage monitor input pin.
VREF	7	O	2.0-V reference output. Connect a ceramic capacitor with a value of 0.22- $\mu$ F or greater between this pin and GND.

(1) I = Input, O = Output, G = Ground

## 6 Specifications

### 6.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage range	BST (with respect to SW), V5IN, VIN	-0.3	7	V
	BST	-0.3	14	
	EN	-0.3	7	
	MODE, REFIN	-0.3	3.6	
	VOUT	-1	3.6	
Output voltage range	SW	-2	7	V
	SW (transient 20 ns and E = 5 µJ)	-3		
	COMP, VREF	-0.3	3.6	
	PGOOD	-0.3	7	
	PGND	-0.3	0.3	
Operating junction temperature, T <sub>J</sub>		-40	150	°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds			300	°C
Storage temperature, T <sub>stg</sub>		-55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±500

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions. Pins listed as ±500 V may actually have higher performance.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
Input voltage range	BST (with respect to SW), EN, VIN	-0.1		6.5	V
	V5IN	4.5		6.5	
	BST	-0.1		13.5	
	SW	-1.0		6.5	
	VOUT, MODE, REFIN	-0.1		3.5	
Output voltage range	COMP	-0.1		3.5	V
	VREF		2		
	PGOOD	-0.1		6.5	
	PGND	-0.1		0.1	
Operating temperature range, T <sub>A</sub>		-40		85	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS53317A	UNIT
		RGB (VQFN)	
		20 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	35.5	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	39.6	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	12.4	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.5	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	12.5	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	3.7	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

<b>TIMERS: ON-TIME, MINIMUM OFF-TIME, SS, AND I/O TIMINGS</b>						
$t_{ONESHOTC}$	PWM one-shot <sup>(1)</sup>	$V_{VIN} = 5\text{ V}$ , $V_{VOUT} = 1.05\text{ V}$ , $f_{SW} = 1\text{ MHz}$		210		ns
		$V_{VIN} = 5\text{ V}$ , $V_{VOUT} = 1.05\text{ V}$ , $f_{SW} = 600\text{ kHz}$		310		
$t_{MIN(off)}$	Minimum OFF time	$V_{VIN} = 5\text{ V}$ , $V_{VOUT} = 1.05\text{ V}$ , $f_{SW} = 1\text{ MHz}$ , DRVL on, SW = PGND, $V_{VOUT} < V_{REFIN}$		270		ns
$t_{INT(SS)}$	Soft-start time	From $V_{OUT}$ ramp starting to $V_{OUT}$ =95%, default setting		1.6		ms
$t_{INT(SSDLY)}$	Internal soft-start delay time	From $V_{VREF} = 2\text{ V}$ to $V_{OUT}$ is ready to ramp up		260		μs
$t_{PGDPLY}$	PGOOD startup delay time	At external tracking, the time from $V_{OUT}$ is ready to ramp up		8		ms
$t_{PGDPDLYH}$	PGOOD high propagation delay time	50 mV over drive, rising edge	0.8	1	1.2	ms
$t_{PGDPDLYL}$	PGOOD low propagation delay time	50 mV over drive, falling edge		10		μs
$t_{OVPDLY}$	OVP delay time	Time from the VOUT pin out of +20% of $V_{REFIN}$ to OVP fault		10		μs
$t_{UVLDYEN}$	Undervoltage fault enable delay	Time from EN_INT going high to undervoltage fault is ready		2		ms
		External tracking from VOUT ramp starts		8		
$t_{UVPDLY}$	UVP delay time	Time from the VOUT pin out of -32% of $V_{REFIN}$ to UVP fault		256		μs
<b>LOGIC PINS: I/O VOLTAGE AND CURRENT</b>						
	PGOOD pull-down voltage	PGOOD low impedance, $I_{SINK} = 4\text{ mA}$ , $V_{V5IN} = 4.5\text{ V}$			0.3	V
	PGOOD leakage current	PGOOD high impedance, forced to 5.5 V	-1	0	1	μA
	EN logic high	EN, VCCP logic	2			V
	EN logic low	EN, VCCP logic			0.5	V
	EN input current				1	μA

 (2) If  $V_{V5IN}$  is higher than 1.5 V, PGOOD is valid regardless of the voltage applied at VIN. This is based on bench testing.

### Electrical Characteristics (continued)

over recommended free-air temperature range,  $V_{VIN} = 5.0\text{ V}$ , PGND = GND (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
MODE threshold voltage <sup>(3)</sup>	Threshold 1	80	130	180	mV

## 7 Detailed Description

### 7.1 Overview

The TPS53317A device is a D-CAP+™ mode adaptive on-time converter. Integrated high-side and low-side FETs support a maximum of 6-A DC output current. The converter automatically operates in discontinuous conduction mode (DCM) to optimize light-load efficiency. Multiple switching frequencies are provided to enable optimization of the power train for the cost, size and efficiency requirements of the design (see 表 1).

In adaptive on-time converters, the controller varies the on-time as a function of input and output voltage to maintain a nearly constant frequency during steady-state conditions. In conventional constant on-time converters, each cycle begins when the output voltage crosses to a fixed reference level. However, in the TPS53317A device, the cycle begins when the current feedback reaches an error voltage level which is the amplified difference between the reference voltage and the feedback voltage.

### 7.2 Functional Block Diagram

UDG-11106

## 7.3 Feature Description

### 7.3.1 PWM Operation

Referring to [图 17](#), in steady state, continuous conduction mode, the converter operates in the following way.

Starting with the condition that the top FET is off and the bottom FET is on, the current feedback ( $V_{CS}$ ) is higher than the error amplifier output ( $V_{COMP}$ ).  $V_{CS}$  falls until it hits  $V_{COMP}$ , which contains a component of the output ripple voltage.  $V_{CS}$  is not directly accessible by measuring signals on pins of TPS53317A device. The PWM comparator senses where the two waveforms cross and triggers the on-time generator.

UDG-10187

图 17. D-CAP+™ Mode Basic Waveforms

The current feedback is an amplified and filtered version of the voltage between PGND and SW during low-side FET on-time. The device also provides a single-ended voltage ( $V_{OUT}$ ) feedback to increase the system accuracy and reduce the dependence of circuit performance on layout.

### 7.3.2 PWM Frequency and Adaptive On-Time Control

In general, the on-time (at the SW node) can be estimated by [公式 1](#).

$$t_{ON} = \frac{V_{OUT}}{V_{IN}} \times \frac{1}{f_{SW}}$$

where

- $f_{SW}$  is the frequency selected by the connection of the MODE pin (1)

The on-time pulse is sent to the top FET. The inductor current and the current feedback rises to peak value. Each ON pulse is latched to prevent double pulsing. Switching frequency settings are shown in [表 1](#).

### 7.3.3 Light-Load Power Saving Features

The TPS53317A device has an automatic pulse-skipping mode to provide excellent efficiency over a wide load range. The converter senses inductor current and prevents negative flow by shutting off the low-side gate driver. This saves power by eliminating re-circulation of the inductor current. Further, when the bottom FET shuts off, the converter enters discontinuous mode, and the switching frequency decreases, thus reducing switching losses as well.

The device also provides a special light-load power saving feature, called ripple reduction. Essentially, it reduces the on-time in SKIP mode to effectively reduce the output voltage ripple associated with using an all MLCC capacitor output power stage design.

## Feature Description (接下页)

### 7.3.4 Power Sequences

#### 7.3.4.1 Non-Tracking Startup

The TPS53317A device can be configured for non-tracking application. When non-tracking is configured, output voltage is regulated to the REFIN voltage which taps off the voltage dividers from the 2-V reference voltage. Either the EN pin or the V5IN pin can be used to start up the device. The device uses internal voltage servo DAC to provide a 1.6-ms soft-start time during soft-start initialization. (See [图 19](#).)

In a non-tracking application, the output voltage is determined by the resistive divider between the VREF pin and the REFIN pin.

$$V_{OUT} = V_{REF} \times \frac{R2}{R1 + R2} \tag{2}$$

图 18. Non-Tracking Configuration

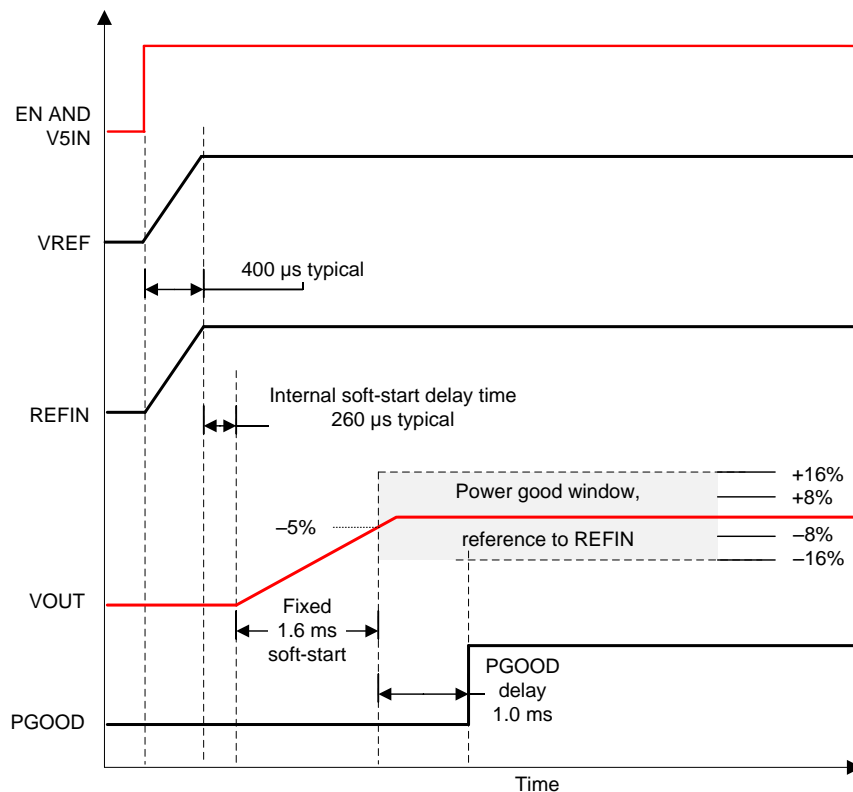

图 19. Non-Tracking Startup Timing

## Feature Description (接下页)

### 7.3.4.2 Tracking Startup

The TPS53317A device can also be configured for tracking application. When tracking configuration is desired, output voltage is also regulated to the REF pin voltage which comes from an external power source. In order for the device to differentiate between a non-tracking configuration or a tracking configuration, there is a minimum delay time of 260  $\mu$ s required between the time when VREF reaches 2 V to the time when the REF pin voltage can be applied, in order for the device to track properly (see 图 22). The valid REF pin voltage range is between 0.45 V and 2 V.

In a tracking application, the output voltage should be one half of the VDDQ voltage. VDDQ can be VIN or it can be an additional voltage rail. Thus, R1= R2 both in 图 20 and 图 21.

$$V_{OUT} = \frac{1}{2} \times V_{VDDQ} \quad (3)$$

图 20. Tracking Configuration 1

图 21. Tracking Configuration 2

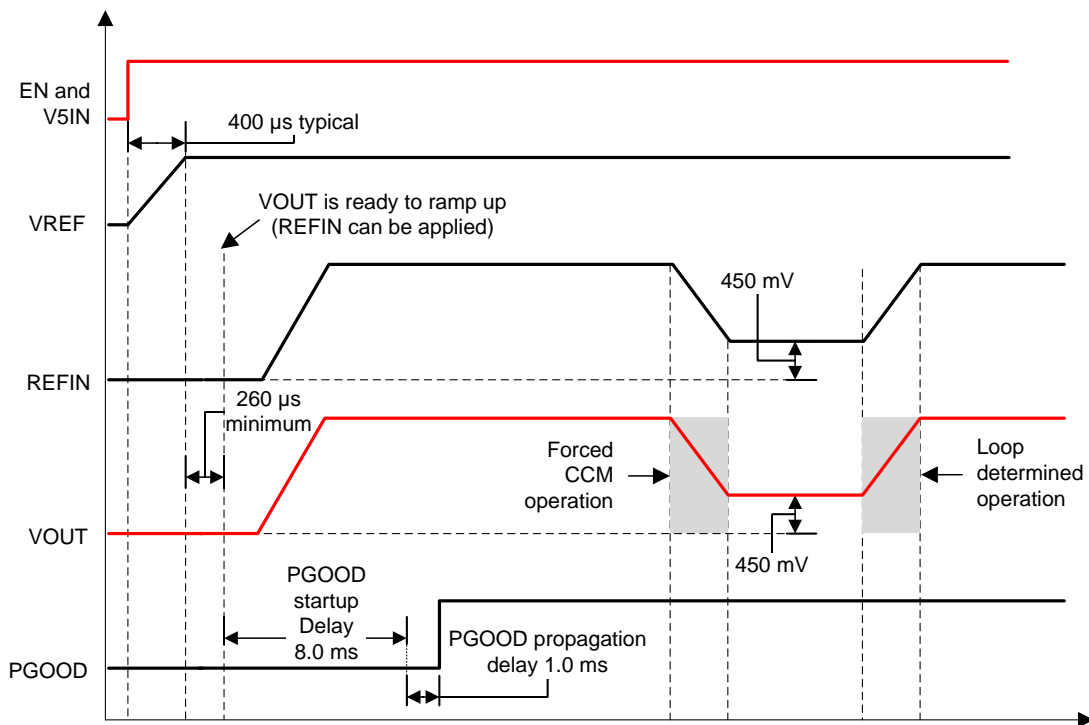

图 22. Tracking Startup Timing

Select PWM mode for an application that requires external tracking, because the output voltage can not be decreased during a no-load condition when the device operates in SKIP mode.

## Feature Description (接下页)

### 7.3.5 Protection Features

The TPS53317A device offers many features to protect the converter power train as well as the system electronics.

#### 7.3.5.1 5-V Undervoltage Protection (UVLO)

The TPS53317A device continuously monitors the voltage on the V5IN pin to ensure that the voltage level is high enough to bias the device properly and to provide sufficient gate drive potential to maintain high efficiency. The converter starts with approximately 4.3 V and has a nominal 440 mV of hysteresis. If the 5-V UVLO limit is reached, the converter transitions the phase node into an off function, and the converter remains in the off state until the device is reset by cycling the 5-V supply until the 5-V POR is reached (2.3-V nominal). The power input does not have a UVLO function.

#### 7.3.5.2 Power Good Signals

The TPS53317A device has one open-drain *power good* (PGOOD) pin. During startup, there is a 1-ms power good high propagation delay. The PGOOD pin de-asserts as soon as the EN pin is pulled low or an undervoltage condition on V5IN or any other fault is detected.

#### 7.3.5.3 Output Overvoltage Protection (OVP)

In addition to the power good function described above, the TPS53317A device has additional OVP and UVP thresholds and protection circuits.

An OVP condition is detected when the output voltage is approximately  $120\% \times V_{REFIN}$ . In this case, the converter de-asserts the PGOOD signals and performs the overvoltage protection function. During OVP, the low-side FET is always on before triggering a negative overcurrent. When a negative OC is also tripped, the low-side FET is no longer continuously on, and pulsed signals are generated to limit the negative inductor current. When the VOUT pin voltage drops below 250 mV, the low-side FET turns off and the converter latches off. The converter remains in the off state until the device is reset by cycling the 5-V supply until the 5-V POR is reached (2.3-V nominal) or when the EN pin is toggled off and on.

#### 7.3.5.4 Output Undervoltage Protection (UVP)

Output undervoltage protection works in conjunction with the current protection described in the [Overcurrent Protection](#) and [Overcurrent Limit](#) sections. If the output voltage drops below 68% of  $V_{REFIN}$ , after approximately a 250- $\mu$ s delay, the device stops switching and enters hiccup mode. After a hiccup waiting time, a restart is attempted. If the fault condition is not cleared, hiccup mode operation may continue indefinitely.

#### 7.3.5.5 Overcurrent Protection

Both positive and negative overcurrent protection are provided in the TPS53317A device.

- Overcurrent Limit (OCL)
- Negative OCL

##### 7.3.5.5.1 Overcurrent Limit

If the sensed current value is above the OCL setting, the converter delays the next ON pulse until the current drops below the OCL limit. Current limiting occurs on a pulse-by-pulse basis. The device uses a valley current limiting scheme where the DC OCL trip point is the OCL limit plus half of the inductor ripple current. The typical valley OCL threshold is 7.6 A or 5.4 A (depending on mode selection). The average output current limit calculation is shown in [公式 4](#).

During the overcurrent protection event, the output voltage droops if the duty cycle cannot satisfy output voltage requirements and continues to droop until the UVP limit is reached. Then, the converter de-asserts the PGOOD pin, and then enters hiccup mode after a 250- $\mu$ s delay. The converter remains in hiccup mode until the fault is cleared.

$$I_{OCL(dc)} = I_{OCL(valley)} + \frac{1}{2} \times I_{P-P} \quad (4)$$

## Feature Description (接下页)

### 7.3.5.5.2 Negative OCL

The negative OCL circuit acts when the converter is sinking current from the output capacitor(s). The converter continues to act in a *valley* mode, the typical value of the negative OCL set point is  $-9.3\text{ A}$  or  $-6.5\text{ A}$  (depending on mode selection).

### 7.3.6 Thermal Protection

The TPS53317A device has an internal temperature sensor. When the temperature reaches a nominal  $145^{\circ}\text{C}$ , the device shuts down until the temperature decreases by approximately  $10^{\circ}\text{C}$ , when the converter restarts.

## 7.4 Device Functional Modes

### 7.4.1 Non-Droop Configuration

The TPS53317A device can be configured as a non-droop solution. The benefit of a non-droop approach is that load regulation is flat, therefore, in a system where tight DC tolerance is desired, the non-droop approach is recommended. For the Intel system agent application, non-droop is recommended as the standard configuration.

The non-droop approach can be implemented by connecting a resistor and a capacitor between the COMP and the VREF pins. The purpose of the type II compensation is to obtain high DC feedback gain while minimizing the phase delay at unity gain cross over frequency of the converter.

The value of the resistor ( $R_C$ ) can be calculated using the desired unity gain bandwidth of the converter, and the value of the capacitor ( $C_C$ ) can be calculated by knowing where the zero location is desired. The capacitor  $C_P$  is optional, but recommended. Its appropriate capacitance value can be calculated using the desired pole location.

图 23 shows the basic implementation of the non-droop mode using the device

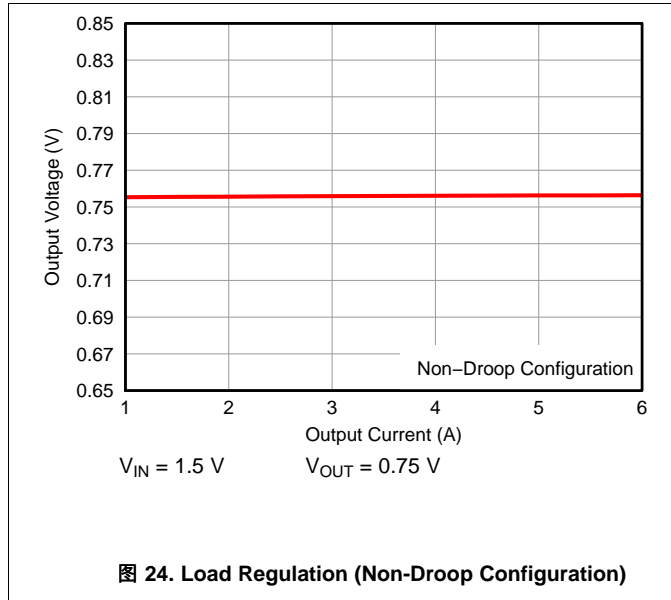

图 23. Non-Droop Mode Basic Implementation

### Device Functional Modes (接下页)

图 24 shows shows the load regulation using non-droop configuration.

图 25 shows the transient response of the device using non-droop configuration, where  $C_{OUT} = 3 \times 47 \mu\text{F}$ . The applied step load is from 0 A to 2 A.

### 7.4.2 Droop Configuration

The terminology for droop is the same as *load line* or *voltage positioning* as defined in the Intel CPU  $V_{CORE}$  specification. Based on the actual tolerance requirement of the application, load-line set points can be defined to maximize either cost savings (by reducing output capacitors) or power reduction benefits.

Accurate droop voltage response is provided by the finite gain of the droop amplifier. The equation for droop voltage is shown in 公式 5.

$$V_{DROOP} = \frac{A_{CSINT} \times I_{OUT}}{R_{DROOP} \times g_M}$$

where

- low-side on-resistance is used as the current sensing element
  - $A_{CSINT}$  is a constant, which nominally is 53 mV/A.
  - $I_{OUT}$  is the DC current of the inductor, or the load current
  - $R_{DROOP}$  is the value of resistor from the COMP pin to the VREF pin
  - $g_M$  is the transconductance of the droop amplifier with nominal value of 1 mS
- (5)

公式 6 can be used to easily derive  $R_{DROOP}$  for any load line slope/droop design target.

$$R_{LOAD\_LINE} = \frac{V_{DROOP}}{I_{OUT}} = \frac{A_{CSINT}}{R_{DROOP} \times g_M} \therefore R_{DROOP} = \frac{A_{CSINT}}{R_{LOAD\_LINE} \times g_M}$$

(6)

Choose a value for the  $R_{DROOP}$  resistor that is below 20 kΩ. More than 20 kΩ of droop resistance may cause the loop to become unstable.

Device Functional Modes (接下页)

图 26 shows the basic implementation of the droop mode using the TPS53317A device.

图 26. DROOP Mode Basic Implementation

The droop (voltage positioning) method was originally recommended to reduce the number of external output capacitors required. The effective transient voltage range is increased because of the active voltage positioning (see 图 27).

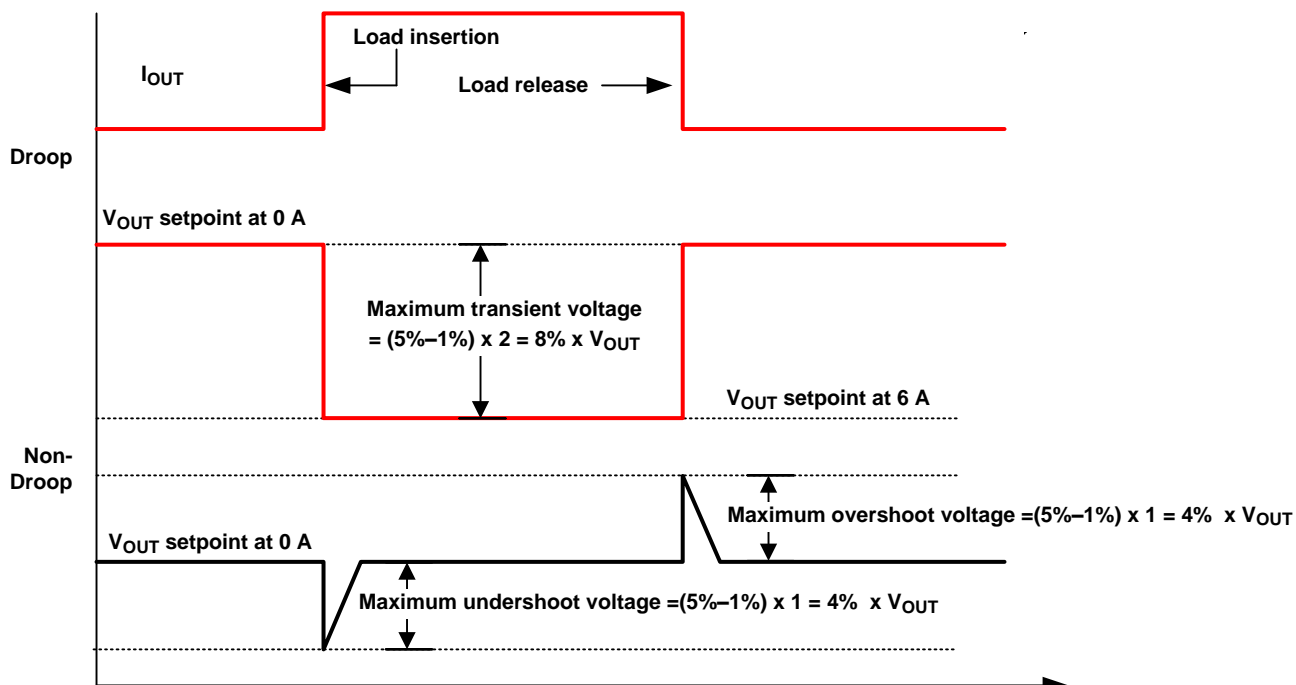

图 27. DROOP vs Non-DROOP in Transient Voltage Window

### Device Functional Modes (接下页)

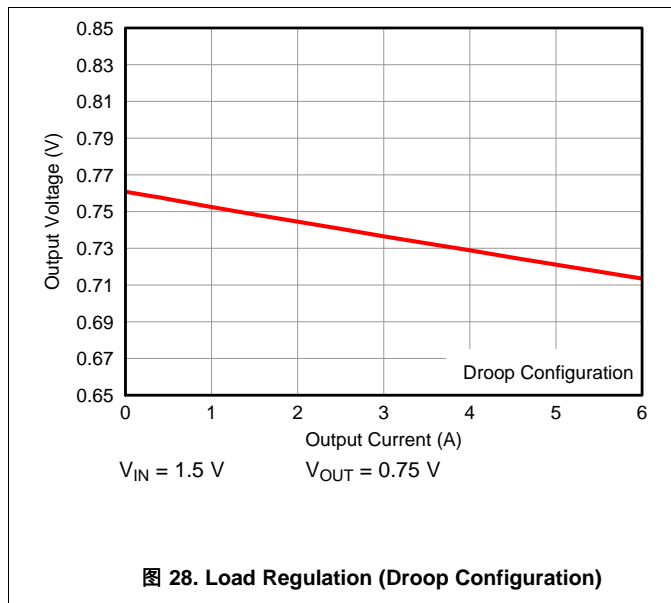

In applications where the DC and the AC tolerances are not separated, (meaning that there is no strict DC tolerance requirement) the droop method can be used.

表 1. Mode Definitions

MODE	MODE RESISTANCE (kΩ)	LIGHT-LOAD POWER SAVING MODE	SWITCHING FREQUENCY (f <sub>sw</sub> )	OVERCURRENT LIMIT (OCL) VALLEY (A)

## 8 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS53317A device is a FET-integrated synchronous buck regulator designed mainly for DDR termination. It can provide a regulated output at  $\frac{1}{2}$  VDDQ with both sink and source capability. The device employs D-CAP+ mode operation that provides ease-of-use, low external component count and fast transient response.

### 8.2 Typical Applications

#### 8.2.1 DDR4 SDRAM Application

This DDR4 application requires a tight load tolerance, fast transient response, and sinking current capability, the design uses a non-droop PWM configuration.

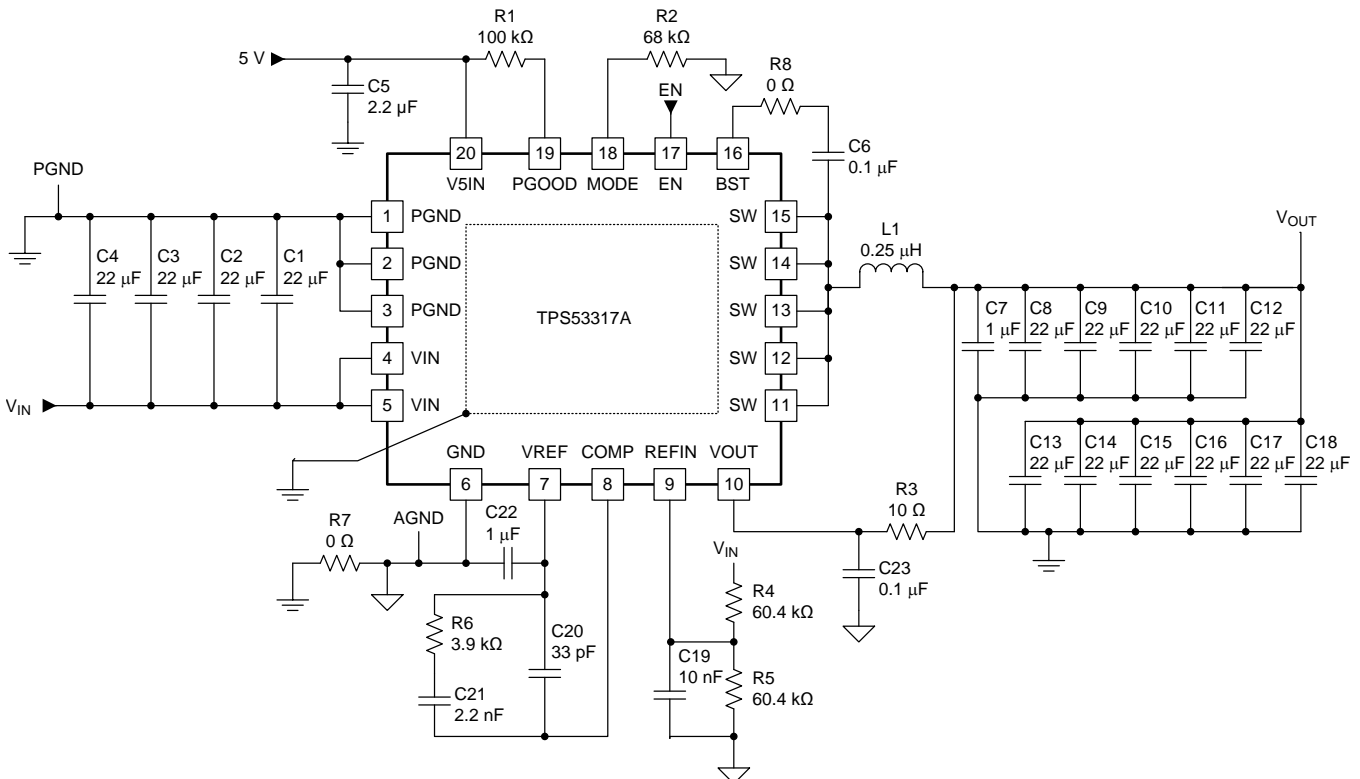

图 30. DDR4 SDRAM Application

#### 8.2.1.1 Design Requirements

- Input voltage :  $V_{IN} = 1.2$  V
- Output voltage:  $V_{OUT} = 0.6$  V
- Maximum load step size of 3 A @ slew rate 7 A/µs (–1.5 A to 1.5 A)
- DC +AC + Ripple voltage regulation limit at sense point:  $\pm 42$  mV (0.642 V overshoot, 0.558 V undershoot)
- Maximum load:  $I_{MAX} = 2.5$  A

## Typical Applications (接下页)

### 8.2.1.2 Detailed Design Procedure

#### 8.2.1.2.1 Step 1. Determine Configuration

Because this DDR4 application requires a tight load tolerance, fast transient response, and sinking current capability, the design uses a non-droop PWM configuration. Choose 600-kHz switching frequency due to the duty cycle and minimum off-time of the device, and set an overcurrent (OC) valley limit of 5.4 A due to the maximum load requirement of 2.5 A. Referring to 表 1 select an  $R_{MODE}$  value of 68 k $\Omega$ .

#### 8.2.1.2.2 Step 2. Select Inductor

Smaller inductor values have better transient performance but higher ripple and lower efficiency. High values have the opposite characteristics. It is common practice to limit the ripple current to 30% to 50% of the maximum current. Choose 50% to allow use of a smaller inductor for faster transient performance.

$$\Delta I_{P-P} = 2.5 A \times 0.5 = 1.25 A \quad (7)$$

$$L = \frac{1}{f_{SW} \times \Delta I_{P-P}} \times V_{OUT} \times (1 - D)$$

where

- D = duty cycle (8)

Because this device operates in DCAP+ mode, the frequency and duty cycle vary based on the input voltage, the output voltage and load. With a 2.5-A load, a 1.2-V input voltage and 0.60 V output voltage,  $f_{SW}$  is experimentally measured at approximately 800 kHz and duty cycle of 0.55. Therefore L is calculated as shown in 公式 10.

$$L = \frac{1}{(800 \text{ kHz} \times 1.25 A)} \times 0.6 V \times 0.45 = 0.270 \mu H \quad (9)$$

Choose the closest standard value, 0.25  $\mu$ H.

#### 8.2.1.2.3 Step 3. Determine Output Capacitance

Use 公式 10 to calculate the output capacitance for a desired maximum overshoot.

$$C_{OUT(min),OS} = \frac{\Delta I_{OUT}^2 \times L}{2 \times V_{OUT} \times V_{OS}}$$

where

- $C_{OUT(min),OS}$  is the minimum output capacitance for a desired overshoot
- $\Delta I_{OUT}$  is the maximum output current change in the application
- $V_{OUT}$  = desired output voltage
- $V_{OS}$  is the desired output voltage change due to overshoot (10)

Choose a value of 30 mV to account for normal output voltage ripple.

$$C_{OUT(min),OS} = \frac{(3 A)^2 \times 0.25 \mu H}{2 \times 0.6 V \times 0.03 V} = 62.5 \mu F \quad (11)$$

Use 公式 12 to calculate the necessary output capacitance for a desired maximum undershoot.

$$C_{OUT(min),US} = \frac{\Delta I_{OUT}^2 \times L \times \left( \frac{V_{OUT}}{V_{IN}} \times t_{SW} + t_{MIN(off)} \right)}{2 \times V_{OUT} \times V_{US} \times \left( \frac{V_{IN} - V_{OUT}}{V_{IN}} \times t_{SW} - t_{MIN(off)} \right)}$$

where

- $C_{OUT(min),US}$  is the minimum output capacitance for a desired undershoot
- $V_{US}$  is the desired output voltage change due to overshoot
- $t_{SW}$  is the period of switch node
- $t_{MIN(off)}$  is the minimum off-time (270 ns) (12)

## Typical Applications (接下页)

Again, choose 30 mV to account for normal output voltage ripple.

$$C_{OUT(min),US} = \frac{(3 A)^2 \times 0.25 \mu H \times \left( \frac{0.6 V}{1.2 V} \times \frac{1}{800 kHz} + 270 ns \right)}{2 \times 0.6 V \times 0.03 V \times \left( \frac{1.2 V - 0.6 V}{1.2 V} \times \frac{1}{800 kHz} - 270 ns \right)} = 157.6 \mu F \quad (13)$$

The undershoot requirements determine, so there must be a minimum of 157.6  $\mu F$ . Because this is a DDR application where size is also a consideration, this design uses only ceramic capacitors. To account for voltage de-rating of capacitors and provide additional margin, this design includes eleven 22- $\mu F$  output capacitors.

### 8.2.1.2.4 Step 4. Input Capacitance

This design requires sufficient input capacitance to filter the input current from the host source. Use [公式 14](#) to calculate the necessary input capacitance.

$$C_{IN(min)} = I_{out} \times \frac{D \times (1 - D)}{\Delta V_{IN(P-P)} \times f_{SW}}$$

where

- $\Delta V_{IN(P-P)}$  is the desired input voltage ripple (typically 1% of the input voltage) (14)

$$C_{IN(min)} = 2.5 A \times \frac{0.55 \times (1 - 0.55)}{12 mV \times 800 kHz} = 64.45 \mu F \quad (15)$$

As with the output capacitance selection, this design accounts for voltage de-rating of capacitors and provides additional margin, using four 22- $\mu F$  input capacitors.

### 8.2.1.2.5 Step 5. Compensation Network

In order to achieve stable operation, the crossover frequency should be less than 1/5 of the switching frequency.

$$f_{CO} = \frac{1}{2\pi} \times \frac{g_M}{C_{OUT}} \times \frac{R_C}{R_S} = 80 kHz$$

where

- $R_S = 53 m\Omega$  (16)

Account for capacitor de-rating here and set the value of  $C_{OUT}$  to 160  $\mu F$ , so that [公式 17](#) is true.

$$R_C = \frac{f_{CO} \times R_S \times 2\pi \times C_{OUT}}{g_M} = \frac{80 kHz \times 53 m\Omega \times 2\pi \times 160 \mu F}{1 mS} = 4.26 k\Omega \quad (17)$$

Choose an  $R_C$  value of 3.9  $k\Omega$ . Determine  $C_C$  by choosing the value of the zero created by  $R_C$  and  $C_C$ . Using the relationship described in [公式 18](#).

$$f_z = \frac{f_{CO}}{5} = \frac{1}{2\pi \times R_C \times C_C} \quad (18)$$

[公式 18](#) yields a  $C_C$  value of 2.55 nF. Choose the closest common capacitor value of 2.2 nF. To determine a value for  $C_P$ , first consider the relationship described in [公式 19](#).

$$f_p = \frac{1}{2\pi \times R_C \times \frac{C_C \times C_P}{C_C + C_P}} \approx \frac{1}{2\pi \times R_C \times C_P} \quad (19)$$

- $C_C \gg C_P$

Because  $C_C \gg C_P$ , set the pole to be two times the switching frequency as described in [公式 20](#).

$$C_P \cong \frac{1}{2\pi \times R_C \times 2f_{SW}} = \frac{1}{2\pi \times 3.9 k\Omega \times 2 \times 800 kHz} = 25.5 pF \quad (20)$$

To boost the gain margin, set  $C_P$  to 33 pF.

Typical Applications (接下页)

图 31. Compensation Network Circuit

8.2.1.2.6 Peripheral Component Selection

As described in 表 1, connect a 0.22- $\mu$ F capacitor from the VREF pin to GND and connect a 0.1- $\mu$ F bootstrap capacitor from the SW pin to the BST pin. Because the PGOOD pin is open drain, connect a pullup resistor between it and the 5-V rail.

## 9 Power Supply Recommendations

This device operates from an input voltage supply between 0.9 V and 6 V. This device requires a separate 5-V power supply for analog circuits and gate drive. Use the proper bypass capacitors for both the input supply and the 5-V supply in order to filter noise and to ensure proper device operation.

## 10 Layout

### 10.1 Layout Guidelines

Stable power supply operation depends on proper layout. Follow these guidelines for an optimized PCB layout.

- Connect PGND pins to the thermal pad underneath the device. Use four vias to connect the thermal pad to internal ground planes.
- Place VIN, V5IN and VREF decoupling capacitors as close to the device as possible.
- Use wide traces for the VIN, PGND and SW pins. These nodes carry high current and also serve as heat sinks.
- Place feedback and compensation components as close to the device as possible.
- Place COMP and VOUT analog signal traces away from noisy signals (SW, BST).
- The GND pin should connect to the PGND in only one place, through a via or a 0-Ω resistor.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS53317ARGBR	ACTIVE	VQFN	RGB	20	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	53317A	<a href="#">Samples</a>
TPS53317ARGBT	ACTIVE	VQFN	RGB	20	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	53317A	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

## THERMAL PAD MECHANICAL DATA

RGB (R-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.
