

# 采用 1.2mm x 0.8mm WCSP 封装的 TPS6283810 小型 6 引脚 3A 降压转换器

## 1 特性

- DCS-Control™ 拓扑
- 1V 固定输出电压，精度为 1%
- 26mΩ 和 26mΩ 内部功率 MOSFET
- 2.4V 至 5.5V 输入电压范围
- 4μA 运行静态电流
- 3.5MHz 开关频率
- 可在轻载条件下实现高效率的省电模式
- 有源输出放电
- 电源正常输出
- 热关断保护
- 断续短路保护
- 采用 0.8mm x 1.2mm x 0.5mm 6 引脚 WCSP 封装
- 使用 TPS6283810 并借助 WEBENCH® 电源设计器创建定制设计方案

## 2 应用

- 消费类无线模块
- 可穿戴产品
- 智能手机
- 光学模块

## 3 说明

该器件是一款高频同步降压转换器，经优化具有小解决方案尺寸和高效率等特性。该器件的输入电压范围为 2.4V 至 5.5V，支持常用电池技术。该转换器在中等程度的负载到高负载时运行于脉宽调制 (PWM) 模式，并在轻负载时自动进入省电模式运行，从而在整个负载电流范围内保持高效率。该器件的开关频率为 3.5MHz，因此能够使用小型外部组件。凭借其所有的 DCS-control 架构，可实现出色的负载瞬态性能和输出电压调节精度。其他特性还具有过流保护、热关断保护、有源输出放电和电源良好指示等其他特性。该器件采用 6 引脚 WCSP 封装。

## 5 Pin Configuration and Functions

### Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
EN	A1	I	Device enable pin. To enable the device, this pin needs to be pulled high. Pulling this pin low disables the device. Do not leave floating.
PG	B1	O	Power good open drain output pin. The pull-up resistor can be connected to voltages up to 5.5 V. If unused, leave it floating.
FB	C1	I	Feedback pin. For the fixed output voltage versions, this pin must be connected to the output.
GND	C2		Ground pin.
SW	B2	PWR	Switch pin of the power stage.
VIN	A2	PWR	Input voltage pin.

## 6.6 Typical Characteristics

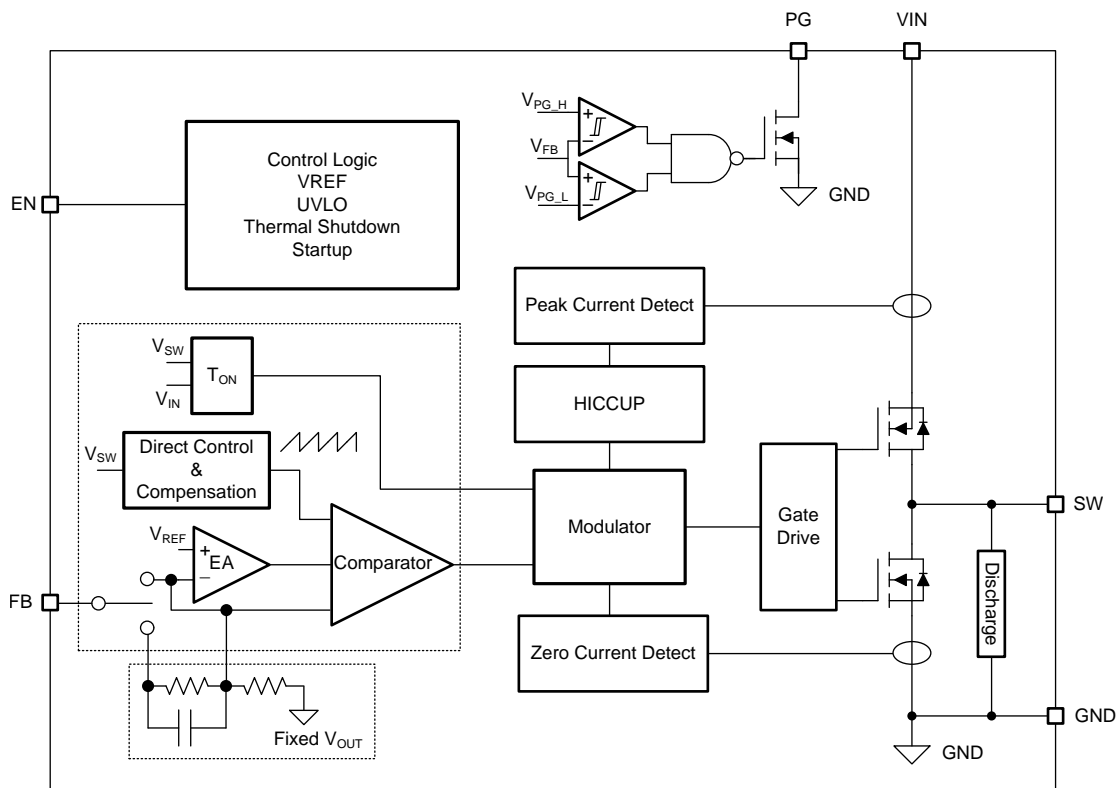

## 7 Detailed Description

### 7.1 Overview

The synchronous step-down converter adopts a DCS-Control (Direct Control with Seamless transition into Power Save Mode) topology. This is an advanced regulation topology that combines the advantages of hysteretic, voltage, and current mode control schemes.

The DCS-Control topology operates in PWM (pulse width modulation) mode for medium to heavy load conditions and in Power Save Mode at light load currents. In PWM mode, the converter operates with its nominal switching frequency of 3.5 MHz, having a controlled frequency variation over the input voltage range. As the load current decreases, the converter enters Power Save Mode, reducing the switching frequency and minimizing the IC current consumption to achieve high efficiency over the entire load current range. Because DCS-Control supports both operation modes (PWM and PFM) within a single building block, the transition from PWM mode to Power Save Mode is seamless and without effects on the output voltage. The devices offer both excellent DC voltage and superior load transient regulation, combined with very low output voltage ripple, minimizing interference with RF circuits.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Power Save Mode

As the load current decreases, the device enters Power Save Mode (PSM) operation. The power save mode occurs when the inductor current becomes discontinuous. PSM is based on a fixed on-time architecture and the switching frequency in PSM is reduced, as related in [公式 1](#).

## Feature Description (接下页)

$$t_{ON} = 250\text{ns} \times \frac{V_{OUT}}{V_{IN}}$$

$$f_{PSM} = \frac{2 \times I_{OUT}}{t_{ON}^2 \times \frac{V_{IN}}{V_{OUT}} \times \frac{V_{IN} - V_{OUT}}{L}} \quad (1)$$

In Power Save Mode, the output voltage rises slightly above the nominal output voltage. This effect is minimized by increasing the output capacitor or inductor value.

When the device operates close to 100% duty cycle mode, the device can't enter Power Save Mode regardless of the load current if the input voltage decreases to typically 10% above the output voltage. The device maintains output regulation in PWM mode.

### 7.3.2 100% Duty Cycle Low Dropout Operation

The devices offer low input-to-output voltage difference by entering 100% duty cycle mode. In this mode, the high-side MOSFET switch is constantly turned on and the low-side MOSFET is switched off. This is particularly useful in battery powered applications to achieve the longest operation time by taking full advantage of the whole battery voltage range. The minimum input voltage to maintain output regulation, depending on the load current and output voltage can be calculated as:

$$V_{IN,MIN} = V_{OUT} + I_{OUT,MAX} \times (R_{DS(on)} + R_L)$$

where

- $V_{IN,MIN}$  = Minimum input voltage to maintain an output voltage
- $I_{OUT,MAX}$  = Maximum output current
- $R_{DS(on)}$  = High-side FET ON-resistance
- $R_L$  = Inductor ohmic resistance (DCR) (2)

### 7.3.3 Soft Start

After enabling the device, there is a 250- $\mu$ s delay before switching starts. Then, an internal soft startup circuitry ramps up the output voltage which reaches nominal output voltage during the startup time of 1 ms. This avoids excessive inrush current and creates a smooth output voltage rise slope. It also prevents excessive voltage drops of primary cells and rechargeable batteries with high internal impedance.

The device is able to start into a pre-biased output capacitor. It starts with the applied bias voltage and ramps the output voltage to its nominal value.

### 7.3.4 Switch Current Limit and HICCUP Short-Circuit Protection

The switch current limit prevents the device from high inductor current and from drawing excessive current from the battery or input voltage rail. Excessive current might occur with a shorted or saturated inductor or a heavy load or shorted output circuit condition. If the inductor current reaches the threshold  $I_{LIM}$ , the high-side MOSFET is turned off and the low-side MOSFET remains off, while the inductor current flows through its body diode and quickly ramps down.

When this switch current limit is triggered 32 times, the device stops switching. The device then automatically starts a new start-up after a typical delay time of 128  $\mu$ s has passed. This is named HICCUP short-circuit protection. The device repeats this mode until the high load condition disappears.

### 7.3.5 Undervoltage Lockout

To avoid mis-operation of the device at low input voltages, under voltage lockout is implemented that shuts down the device at voltages lower than  $V_{UVLO}$ .

## Feature Description (接下页)

### 7.3.6 Thermal Shutdown

The device goes into thermal shutdown and stops the power stage switching when the junction temperature exceeds  $T_{JSD}$ . When the device temperature falls below the threshold by 20°C, the device returns to normal operation automatically by switching the power stage again.

## 7.4 Device Functional Modes

### 7.4.1 Enable and Disable

The device is enabled by setting the EN pin to a logic High. Accordingly, shutdown mode is forced if the EN pin is pulled Low with a shutdown current of typically 50 nA. In shutdown mode, the internal power switches as well as the entire control circuitry are turned off. An internal switch smoothly discharges the output through the SW pin in shutdown mode. Do not leave the EN pin floating.

The typical threshold value of the EN pin is 0.89 V for rising input signal, and 0.62 V for falling input signal.

### 7.4.2 Power Good

The device has a power good output. The PG pin goes high impedance once the FB pin voltage is above 96% and less than 105% of the nominal voltage, and is driven low once the voltage falls below typically 92% or higher than 110% of the nominal voltage. The PG pin is an open-drain output and is specified to sink up to 1 mA. The power good output requires a pull-up resistor connecting to any voltage rail less than 5.5 V. The PG signal can be used for sequencing of multiple rails by connecting it to the EN pin of other converters. Leave the PG pin unconnected when not used.

The PG rising edge has a 100- $\mu$ s blanking time and the PG falling edge has a deglitch delay of 20  $\mu$ s.

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

### 8.2.2.2 Output Filter Design

The inductor and the output capacitor together provide a low-pass filter. To simplify this process, [表 5](#) outlines possible inductor and capacitor value combinations for most applications. Checked cells represent combinations that are proven for stability by simulation and lab test. Further combinations should be checked for each individual application.

**表 5. Matrix of Output Capacitor and Inductor Combinations**

NOMINAL L [ $\mu$ H] <sup>(1)</sup>	NOMINAL C <sub>OUT</sub> [ $\mu$ F] <sup>(2)</sup>			
	10	2 x 10 or 1 x 22	47	100
0.24	+	+ <sup>(3)</sup>	+	
0.33	+	+	+	
0.47				

(1) Inductor tolerance and current derating is anticipated. The effective inductance can vary by 20% and –30%.

(2) Capacitance tolerance and bias voltage derating is anticipated. The effective capacitance can vary by 20% and –50%.

(3) This LC combination is the standard value and recommended for most applications.

### 8.2.2.3 Inductor Selection

The main parameter for the inductor selection is the inductor value and then the saturation current of the inductor. To calculate the maximum inductor current under static load conditions, [公式 3](#) is given.

$$I_{L,MAX} = I_{OUT,MAX} + \frac{\Delta I_L}{2}$$

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f_{SW}}$$

where

- $I_{OUT,MAX}$  = Maximum output current
- $\Delta I_L$  = Inductor current ripple
- $f_{SW}$  = Switching frequency
- $L$  = Inductor value

(3)

It is recommended to choose a saturation current for the inductor that is approximately 20% to 30% higher than  $I_{L,MAX}$ . In addition, DC resistance and size should also be taken into account when selecting an appropriate inductor. [表 6](#) lists recommended inductors.

表 6. List of Recommended Inductors<sup>(1)</sup>

(1) See [Third-party Products](#) disclaimer.

### 8.2.2.4 Capacitor Selection

The input capacitor is the low-impedance energy source for the converters which helps to provide stable operation. A low ESR multilayer ceramic capacitor is recommended for best filtering and must be placed between VIN and GND as close as possible to those pins. For most applications, 4.7 μF is sufficient, though a larger value reduces input current ripple.

The architecture of the device allows the use of tiny ceramic output capacitors with low equivalent series resistance (ESR). These capacitors provide low output voltage ripple and are recommended. To keep its low resistance up to high frequencies and to get narrow capacitance variation with temperature, TI recommends using X7R or X5R dielectrics. The recommended typical output capacitor value is 2 x 10 μF or 1 x 22 μF; this capacitance can vary over a wide range as outline in the output filter selection table.

### 8.2.3 Application Curves

V<sub>IN</sub> = 5.0 V, V<sub>OUT</sub> = 1.0 V, T<sub>A</sub> = 25 °C, BOM = [表 3](#), unless otherwise noted.

$V_{IN} = 5.0\text{ V}$ ,  $V_{OUT} = 1.0\text{ V}$ ,  $T_A = 25\text{ }^\circ\text{C}$ , BOM = 表 3, unless otherwise noted.

## 9 Power Supply Recommendations

The device is designed to operate from an input voltage supply range from 2.4 V to 5.5 V. Ensure that the input power supply has a sufficient current rating for the application.

## 10 Layout

### 10.1 Layout Guidelines

The printed-circuit-board (PCB) layout is an important step to maintain the high performance of the device. See and [图 15](#) for the recommended PCB layout.

- The input/output capacitors and the inductor should be placed as close as possible to the IC. This keeps the power traces short. Routing these power traces direct and wide results in low trace resistance and low parasitic inductance.
- The low side of the input and output capacitors must be connected properly to the power GND to avoid a GND potential shift.
- The sense traces connected to FB is a signal trace. Special care should be taken to avoid noise being induced. Keep these traces away from SW nodes. The connection of the output voltage trace for the FB resistors should be made at the output capacitor.
- Refer to and [图 15](#) for an example of component placement, routing and thermal design.

### 10.2 Layout Example

**图 15. PCB Layout of Fixed Output Voltage Application**

### 10.3 Thermal Considerations

Implementation of integrated circuits in low-profile and fine-pitch surface-mount packages typically requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power dissipation limits of a given component.

Two basic approaches for enhancing thermal performance are:

- Improving the power dissipation capability of the PCB design
- Introducing airflow in the system

### 11.3 社区资源

下列链接提供到 TI 社区资源的连接。链接的内容由各个分销商“按照原样”提供。这些内容并不构成 TI 技术规范，并且不一定反映 TI 的观点；请参阅 TI 的《[使用条款](#)》。

**TI E2E™ 在线社区** *TI 的工程师对工程师 (E2E) 社区*。此社区的创建目的在于促进工程师之间的协作。在 [e2e.ti.com](http://e2e.ti.com) 中，您可以咨询问题、分享知识、拓展思路并与同行工程师一道帮助解决问题。

**设计支持** *TI 参考设计支持* 可帮助您快速查找有帮助的 E2E 论坛、设计支持工具以及技术支持的联系信息。

### 11.4 商标

DCS-Control, E2E are trademarks of Texas Instruments.

WEBENCH is a registered trademark of Texas Instruments.

### 11.5 静电放电警告

这些装置包含有限的内置 ESD 保护。存储或装卸时，应将导线一起截短或将装置放置于导电泡棉中，以防止 MOS 门极遭受静电损伤。

### 11.6 术语表

[SLYZ022](#) — *TI 术语表*。

这份术语表列出并解释术语、缩写和定义。

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如欲获取此数据表的浏览器版本，请参阅左侧的导航。

**PACKAGING INFORMATION**

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
