

## TPS65631 双输出有源矩阵有机发光二极管 (AMOLED) 显示屏电源

### 1 特性

- 2.9V 至 4.5V 输入电压范围
- 4.6V 固定正输出电压
- 25°C 至 85°C 温度范围内， $V_{POS}$  精度 0.5%
- 单独的  $V_{POS}$  输出感测引脚
- -1.4V 至 -4.4V 的数字可编程负输出电压（缺省值 -4V）
- 支持的输出电流高达 250mA
- 出色的线路瞬态稳压
- 短路保护功能
- 热关断
- 采用 3.00mm x 3.00mm 12 引脚四方扁平无引线 (QFN) 封装

### 2 应用范围

AMOLED 显示屏

### 3 说明

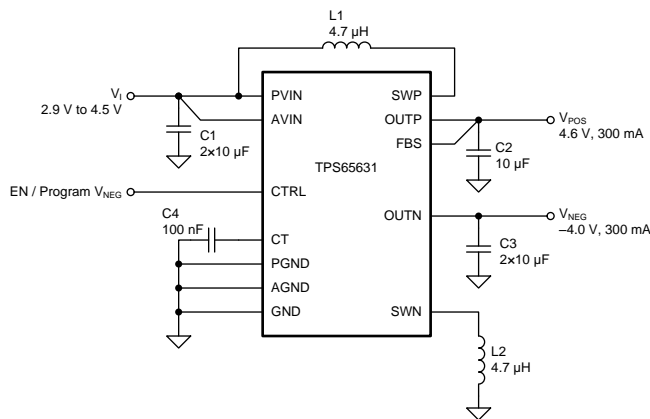

TPS65631 被设计用于驱动需要正负电源轨的 AMOLED（有源矩阵有机发光二极管）显示屏。此器件集成了一个针对  $V_{POS}$  的升压转换器和一个针对  $V_{NEG}$  的反相降压升压转换器，非常适合于电池供电类产品。数字控制引脚 (CTRL) 允许用数字步长设定负输出电压。TPS65631 使用能够实现出色线路瞬态性能的创新技术。

## 7 Specifications

### 7.1 Absolute Maximum Ratings <sup>(1)</sup>

 over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage <sup>(2)</sup>	SWP, OUTP, FBS, PVIN, AVIN	-0.3	6	V
	OUTN	-0.3	-6	V
	SWN	-6	6	V
	CTRL	-0.3	5.5	V
	CT	-0.3	3.6	V
Operating junction temperature range, T <sub>J</sub>		-40	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) With respect to GND pin.

### 7.2 Handling Ratings

		MIN	MAX	UNIT	
T <sub>STG</sub>	Storage temperature range	-65	150	°C	
V <sub>ESD</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	-2	2	kV
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	-500	500	V
		Machine model (MM) ESD stress voltage	-200	200	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process..

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	NOM	MAX	UNIT

## 8 Detailed Description

### 8.1 Overview

The TPS65631 consists of a boost converter and an inverting buck boost converter. The  $V_{POS}$  output is fixed at 4.6 V and  $V_{NEG}$  output is programmable via a digital interface in the range of -1.4 V ~ -4.4 V, the default is -4 V. The transition time of  $V_{NEG}$  output is adjustable by the CT pin capacitor.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Boost Converter

The boost converter uses a fixed-frequency current-mode topology, and its output voltage ( $V_{POS}$ ) is fixed at 4.6 V. For the highest output voltage accuracy, connect the output sense pin (FBS) directly to the positive pin of the output capacitor. If not used, the FBS pin can be left floating or connected to ground. If the FBS pin is not used, the boost converter senses its output voltage using the OUTP pin.

## Feature Description (continued)

### 8.3.2 Inverting Buck-Boost Converter

The inverting buck-boost converter uses a constant-off-time peak-current mode topology. The converter's default output voltage ( $V_{NEG}$ ) is  $-4\text{ V}$ , but it can be programmed to any voltage in the range  $-1.4\text{ V}$  to  $-4.4\text{ V}$  (see [Programming  \$V\_{NEG}\$](#) ).

#### 8.3.2.1 Programming $V_{NEG}$

The output voltage of the inverting buck-boost converter ( $V_{NEG}$ ) can be programmed using the CTRL pin. If output voltage programming is not required, the CTRL pin can be used as a standard enable pin (see [Enable \(CTRL\)](#)).

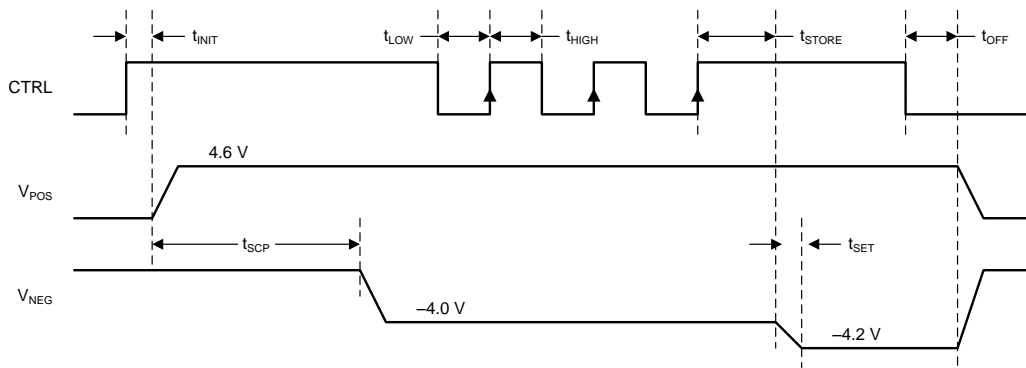

Figure 6. Programming  $V_{NEG}$  Using the CTRL Pin

When the CTRL pin is pulled high, the inverting buck-boost converter starts up with its default voltage of  $-4\text{ V}$ . The device now counts the rising edges applied to the CTRL pin and sets the output voltage ( $V_{NEG}$ ) according to [Table 1](#). For the timing diagram shown in [Figure 6](#),  $V_{NEG}$  is programmed to  $-4.2\text{ V}$ , since three rising edges are detected.

The CTRL interface is designed to work with pulses whose duration is between  $2\text{ }\mu\text{s}$  and  $25\text{ }\mu\text{s}$ . Pulses shorter than  $2\text{ }\mu\text{s}$  or longer than  $25\text{ }\mu\text{s}$  are not ensured to be recognized.

Table 1. Programming Table for  $V_{NEG}$

Number of Rising Edges	$V_{NEG}$	Number of Rising Edges	$V_{NEG}$
0 / no pulses	$-4\text{ V}$	16	$-2.9\text{ V}$
1	$-4.4\text{ V}$	17	$-2.8\text{ V}$
2	$-4.3\text{ V}$	18	$-2.7\text{ V}$
3	$-4.2\text{ V}$	19	$-2.6\text{ V}$
4	$-4.1\text{ V}$	20	$-2.5\text{ V}$
5	$-4.0\text{ V}$	21	$-2.4\text{ V}$
6	$-3.9\text{ V}$	22	$-2.3\text{ V}$
7	$-3.8\text{ V}$	23	$-2.2\text{ V}$
8	$-3.7\text{ V}$	24	$-2.1\text{ V}$
9	$-3.6\text{ V}$	25	$-2.0\text{ V}$
10	$-3.5\text{ V}$	26	$-1.9\text{ V}$
11	$-3.4\text{ V}$	27	$-1.8\text{ V}$
12	$-3.3\text{ V}$	28	$-1.7\text{ V}$
13	$-3.2\text{ V}$	29	$-1.6\text{ V}$
14	$-3.1\text{ V}$	30	$-1.5\text{ V}$
15	$-3.0\text{ V}$	31	$-1.4\text{ V}$

### 8.3.2.2 Controlling the $V_{NEG}$ Transition Time

The transition time ( $t_{set}$ ) is the time required to move  $V_{NEG}$  from one voltage level to the next. Users can control the transition time by connecting a capacitor between the CT pin and ground. When the CT pin is left open or is connected to ground, the transition time is as short as possible. When a capacitor is connected to the CT pin, the transition time is determined by the time constant ( $\tau$ ) of the external capacitor ( $C_{(CT)}$ ) and the internal resistance of the CT pin ( $R_{(CT)}$ ). The output voltage  $V_{NEG}$  reaches 70% of its programmed value after  $1\tau$ .

An example is given below for the case when using 100 nF for  $C_{(CT)}$ .

$$\tau \approx t_{set(70\%)} = R_{(CT)} \times C_{(CT)} = 300 \text{ k}\Omega \times 100 \text{ nF} = 30 \text{ ms} \quad (1)$$

The output voltage  $V_{NEG}$  reaches its programmed value after approximately  $3\tau$ .

The external capacitor connected to the CT pin has no effect on the first programming of  $V_{NEG}$ , when the inverting buck-boost converter ramps its output to the default voltage as fast as possible. Figure 7 shows the detail of programming of the  $V_{NEG}$  transition time with the CT pin during start-up.

**Figure 7. Programming the Transition Time of  $V_{NEG}$**

### 8.3.3 Soft-Start and Start-Up Sequence

The TPS65631 features a soft-start function to limit inrush current. When the device is enabled by a high-level signal applied to the CTRL pin, the boost converter starts switching with a reduced switch current limit. Ten milliseconds after the CTRL pin goes high, the inverting buck-boost converter starts with a default value of  $-4 \text{ V}$ . A typical start-up sequence is shown in Figure 8.

**Figure 8. Typical Start-Up Sequence**

### 8.3.4 Enable (CTRL)

The CTRL pin serves two functions. One is to enable and disable the device, and the other is to program the output voltage ( $V_{NEG}$ ) of the inverting buck-boost converter (see [Programming  \$V\_{NEG}\$](#) ). If the digital interface is not required, the CTRL pin can be used as a standard enable pin for the device, which will come up with its default value on  $V_{NEG}$  of  $-4$  V. When CTRL is pulled high, the device is enabled. The device is shut down with CTRL low.

### 8.3.5 Undervoltage Lockout

The TPS65631 features an undervoltage lockout function that disables the device when the input supply voltage is too low for normal operation.

### 8.3.6 Short Circuit Protection

The TPS65631 is protected against short-circuits of  $V_{POS}$  and  $V_{NEG}$  to ground and to each other.

#### 8.3.6.1 Short-Circuits During Normal Operation

During normal operation an error condition is detected if  $V_{POS}$  falls below 4.1 V for more than 3 ms or  $V_{NEG}$  is pulled above the programmed nominal output by 500 mV for longer than 3 ms. In either case the device enters shutdown mode: the converters are disabled and their outputs are disconnected from the input. To resume normal operation either cycle the input supply voltage or toggle the CTRL pin low and then high again.

#### 8.3.6.2 Short-Circuits During Start-Up

During start up an error condition is detected if:

- $V_{POS}$  is not in regulation 10 ms after a high-level is applied to the CTRL pin.
- $V_{NEG}$  is higher than threshold level 10 ms after a high-level is applied to the CTRL pin.
- $V_{NEG}$  is not in regulation 20 ms after a high-level is applied to the CTRL pin.

To resume normal operation either cycle the input supply voltage or toggle the CTRL pin low and then high again.

### 8.3.7 Output Discharge During Shutdown

The TPS65631 actively discharges its outputs during shutdown. [Figure 9](#) shows the output discharge control.

Figure 9. Active Discharge of  $V_{POS}$  and  $V_{NEG}$  During Shutdown

### 8.3.8 Thermal Shutdown

The TPS65631 enters thermal shutdown mode if its junction temperature exceeds  $145^{\circ}\text{C}$  (typical). During thermal shutdown mode none of the device functions are available. To resume normal operation, either cycle the input supply voltage or toggle the CTRL pin low and then high again.

## 8.4 Device Functional Modes

### 8.4.1 Operation with $V_I < 2.9\text{ V}$

The recommended minimum input supply voltage for full performance is 2.9 V. The device continues to operate with input supply voltages below 2.9 V; however, full performance is not guaranteed. The device does not operate with input supply voltages below the UVLO threshold.

### 8.4.2 Operation with $V_I \approx V_{POS}$ (Diode Mode)

The TPS65631 features a "diode" mode that enables it to regulate its output voltage even when the input supply voltage is close to  $V_{POS}$  (that is, too high for normal boost operation). When operating in diode mode the converter's high-side switch stops switching and its body diode is used as the rectifier. Boost converter efficiency is reduced when operating in diode mode. At low output currents ( $\approx 2\text{ mA}$  and below), the boost converter automatically transitions from pulse-width modulation to pulse-skip mode. This ensures that  $V_{POS}$  stays in regulation but increases the output voltage ripple on  $V_{POS}$ .

### 8.4.3 Operation with CTRL

When a low-level signal is applied to the CTRL pin the device is disabled and switching is inhibited. When the input supply voltage is above the UVLO threshold and a high-level signal is applied to the CTRL pin the device is enabled and its start-up sequence begins.

## 9 Applications and Implementation

### 9.1 Application Information

Figure 10 shows a typical application circuit suitable for supplying AMOLED displays in smartphone applications. The circuit is designed to operate from a single-cell Li-Ion battery and generates a positive output voltage  $V_{POS}$  of 4.6 V and a negative output voltage of  $-4\text{ V}$ . Both outputs are capable of supplying up to 300 mA of output current.

### 9.2 Typical Application

**Figure 10. Typical Application Schematic**

## Typical Application (continued)

### 9.2.1 Design Requirements

For this design example, use the following input parameters.

**Table 2. Design Parameters**

DESIGN PARAMETER	EXAMPLE
Input voltage range	2.9 V to 4.5 V
Output voltage	$V_{POS} = 4.6V$ , $V_{NEG} = -4 V$
Switching frequency	1.7 MHz

### 9.2.2 Detailed Design Procedure

In order to maximize performance, the TPS65631 has been optimized for use with a relatively narrow range of component values, and customers are strongly recommended to use the application circuit shown in [Figure 10](#) with the components listed in [Table 3](#) and [Table 4](#).

#### 9.2.2.1 Inductor Selection

The boost converter and inverting buck-boost converter have been optimized for use with 4.7  $\mu$ H inductors, and it is recommended that this value be used in all applications. Customers using other values of inductor are strongly recommended to characterize circuit performance on a case-by-case basis.

**Table 3. Inductor Selection**

PARAMETER	VALUE	MANUFACTURER	PART NUMBER
L1, L2	4.7 $\mu$ H	Coilmaster	MMPP252012-4R7N
		Toko	1239AS-H-4R7M
		ABCO	LPP252012-4R7N
		Coilcraft	XFL4020-4R7ML

#### 9.2.2.2 Capacitor Selection

The recommended capacitor values are shown in [Table 4](#). Applications using less than the recommended capacitance (e.g. to save PCB area) may experience increased voltage ripple. In general, the lower the output power, the lower the necessary capacitance.

**Table 4. Capacitor Selection**

PARAMETER	VALUE	MANUFACTURER	PART NUMBER
C1	$2 \times 10 \mu$ F	Murata	GRM21BR71A106KE51
C2	10 $\mu$ F	Murata	GRM21BR71A106KE51
C3	$2 \times 10 \mu$ F	Murata	GRM21BR71A106KE51
C4	100 nF	Murata	GRM21BR71E104KA01

#### 9.2.2.3 Stability

Applications using component values that differ significantly from those recommended in [Table 3](#) and [Table 4](#) should be checked for stability over the full range of operating conditions.

### 9.2.3 Application Curves

The performance shown in the following graphs was obtained using the circuit shown in [Figure 10](#) and the external components shown in [Table 3](#) and [Table 4](#). The output voltage settings for these measurements were  $V_{POS} = 4.6\text{ V}$  and  $V_{NEG} = -4\text{ V}$ .

## 10 Power Supply Recommendations

The TPS65631 is designed to operate from an input voltage supply range between 2.9 V and 4.5 V. If the input supply is located more than a few centimeters from the TPS65631 additional bulk capacitance may be required. The 2x10  $\mu$ F shown in the schematics in this data sheet are a typical choice for this function.

## 11 Layout

### 11.1 Layout Guidelines

No PCB layout is perfect, and compromises are always necessary. However, following the basic principles listed below (in order of importance) should go a long way to achieving good performance:

- Route switching currents on the top layer using short, wide traces. Do not route these signals through vias, which have relatively high parasitic inductance and resistance.
- Place C1 as close as possible to pin 12.
- Place C2 as close as possible to pin 3.
- Place C3 as close as possible to pin 9.
- Place L1 as close as possible to pin 1.
- Place L2 as close as possible to pin 10.
- Use the thermal pad to join GND, AGND and PGND.
- Connect the FBS pin directly to the positive pin of C2, that is, keep this connection separate from the connection between OUTP and C2.
- Use a copper pour on layer 2 as a thermal spreader and connect the thermal pad to it using a number of thermal vias.

Figure 24 illustrates how a PCB layout following the above principles may be realized in practice.

### 11.2 Layout Example

Figure 24 shows the above principles implemented for the circuit of Figure 10.

- Via to signal layer on internal or bottom layer.
- Thermal via to copper pour on internal or bottom layer.

Figure 24. PCB Layout Example

## 12 器件和文档支持

### 12.1 器件支持

#### 12.1.1 第三方产品免责声明

TI 发布的与第三方产品或服务有关的信息，不能构成与此类产品或服务或保修的适用性有关的认可，不能构成此类产品或服务单独或与任何 TI 产品或服务一起的表示或认可。

### 12.2 Trademarks

All trademarks are the property of their respective owners.

### 12.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

DPD (S-PWSON-N12)

PLASTIC SMALL OUTLINE NO-LEAD

4212354/C 01/12

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - Small Outline No-Lead (SON) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance, if present.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions, if present.

## THERMAL PAD MECHANICAL DATA

DPD (S-PUSON-N12)

PLASTIC SMALL OUTLINE NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions
