# 脱离电池运行的 TPS7B81-Q1 150mA、超低 $I_Q$ (3µA) 低压降稳压器

## 1 特性

- 符合面向汽车 应用的 AEC-Q100 标准：
  - 温度等级 1：-40°C 至 125°C，$T_A$
- 器件结温范围：
  -40°C 至 150°C
- 3V 至 40V 宽 $V_{IN}$ 输入电压范围，瞬态电压高达 45V
- 最大输出电流：150mA
- 低静态电流 $I_Q$：
  - EN = 低电平时典型值为 300nA （关断模式）
  - 轻负载时典型值为 2.7µA
  - 轻负载时最大值为 4.5µA
- 线路、负载和温度范围内的输出电压精度为 1.5%
- 最大压降电压：对于固定 5V 输出电压版本，150mA 负载电流下为 540mV
- 与低 ESR（0.001Ω 至 5Ω）陶瓷输出稳定电容器（1µF 至 200µF）搭配使用时可保持稳定
- 5V、3.3V 和 2.5V 固定输出电压
- 集成故障保护：
  - 热关断
  - 短路和过流保护
- 封装：
  - DGN（8 引脚 HVSSOP），$R_{\theta JA}$ = 63.9°C/W
  - DRV（6 引脚 WSON），$R_{\theta JA}$ = 72.8°C/W
  - KVU（5 引脚 TO-252）)，$R_{\theta JA}$ = 38.8°C/W 添加了项目符号

## 2 应用

- 汽车音响主机
- 前照灯
- 电池管理系统 (BMS)
- 逆变器和电机控制

## 3 说明

在汽车电池连接 应用中，低静态电流 ($I_Q$) 对于省电和延长电池寿命而言非常重要。始终开启的系统必须在扩展温度范围内实现超低 $I_Q$，以便在车辆点火开关关闭时也能实现持久运行。

TPS7B81-Q1 是一款低压降 (LDO) 线性稳压器，专为高达 40V $V_{IN}$ 的 这些领域而设计。此器件在轻负载时的典型静态电流仅为 2.7µA，是用于为待机系统中的微控制器以及控制器局域网和本地互联网络 (CAN/LIN) 收发器供电的最佳解决方案。

此器件 具有 集成式短路和过流保护。此器件可在 -40°C 至 +125°C 的环境温度下运行，结温范围为 -40°C 至 +150°C。此外，此器件提供多种具有不同尺寸和热导率的封装选项。小型 WSON 封装有助于实现最紧凑的 PCB 设计，即使整个器件散热较多，TO-252 封装也能让器件实现持久运行。这些 特性 使得此器件非常适合用作各种电池连接汽车 这些领域。

器件信息[(1)]

| 器件型号 | 封装 | 封装尺寸（标称值） |
|---|---|---|
| TPS7B81-Q1 | HVSSOP (8) | 3.00mm × 3.00mm |
| | WSON (6) | 2.00mm × 2.00mm |
| | TO-252 (5) | 6.10mm × 6.60mm |

## Pin Functions

| PIN | | | | I/O | DESCRIPTION |
|---|---|---|---|---|---|
| NAME | NO. | | | | |
| | DGN | DRV | KVU | | |
| DNC | — | 5 | 4 | — | Do not connect to a biased voltage. Tie this pin to ground or leave floating. |
| EN | 2 | 2 | 2 | I | Enable input pin. Drive EN greater than $V_{IH}$ to turn on the regulator. Drive EN less than $V_{IL}$ to put the low-dropout (LDO) into shutdown mode. |
| GND | 4, 5, 6 | 3,4 | 3, TAB | — | Ground reference |
| IN | 1 | 1 | 1 | I | Input power-supply pin. For best transient response and to minimize input impedance, use the recommended value or larger ceramic capacitor from IN to ground as listed in the *Recommended Operating Conditions* table and the *Input Capacitor* section. Place the input capacitor as close to the output of the device as possible. |
| NC | 3, 7 | — | — | — | Not internally connected |
| OUT | 8 | 6 | 5 | O | Regulated output voltage pin. A capacitor is required from OUT to ground for stability. For best transient response, use the nominal recommended value or larger ceramic capacitor from OUT to ground; see the *Recommended Operating Conditions* table and the *Output Capacitor* section. Place the output capacitor as close to output of the device as possible. |
| Thermal pad | | | | — | Connect the thermal pad to a large-area GND plane for improved thermal performance. |

# 6 Specifications

## 6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)[1][2]

| | | MIN | MAX | UNIT |
|---|---|---|---|---|
| $V_{IN}$ | Unregulated input[3] | –0.3 | 45 | V |
| $V_{EN}$ | Enable input[3] | –0.3 | $V_{IN}$ | V |
| $V_{OUT}$ | Regulated output | –0.3 | 7 | V |
| $T_J$ | Junction temperature range | –40 | 150 | °C |
| $T_{stg}$ | Storage temperature range | –40 | 150 | °C |

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to GND.
(3) Absolute maximum voltage, can withstand 45 V for 200 ms.

## 6.2 ESD Ratings

| | | | | VALUE | UNIT |
|---|---|---|---|---|---|
| $V_{(ESD)}$ | Electrostatic discharge | Human-body model (HBM), per AEC Q100-002[1] | | ±2000 | V |
| | | Charged-device model (CDM), per AEC Q100-011 | Corner pins | ±750 | |
| | | | Other pins | ±500 | |

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

## 6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

| | | MIN | MAX | UNIT |
|---|---|---|---|---|
| $V_{IN}$ | Unregulated input voltage | 3 | 40 | V |
| $V_{EN}$ | Enable input voltage | 0 | $V_{IN}$ | V |
| $C_{OUT}$ | Output capacitor requirements[1] | 1 | 200 | µF |
| ESR | Output capacitor ESR requirements[2] | 0.001 | 5 | Ω |
| $T_A$ | Ambient temperature range | –40 | 125 | °C |
| $T_J$ | Junction temperature range | –40 | 150 | °C |

(1) The output capacitance range specified in the table is the effective value.
(2) Relevant ESR value at f = 10 kHz

## 6.4 Thermal Information

| THERMAL METRIC[1] | | TPS7B81-Q1 | | | UNIT |
|---|---|---|---|---|---|
| | | DGN (HVSSOP) | DRV (WSON) | KVU (TO-252) | |
| | | 8 PINS | 6 PINS | 5 PINS | |
| $R_{θJA}$ | Junction-to-ambient thermal resistance | 63.9 | 72.8 | 31.1 | °C/W |
| $R_{θJC(top)}$ | Junction-to-case (top) thermal resistance | 50.2 | 85.8 | 39.9 | °C/W |
| $R_{θJB}$ | Junction-to-board thermal resistance | 22.6 | 37.4 | 9.9 | °C/W |
| $ψ_{JT}$ | Junction-to-top characterization parameter | 1.8 | 2.7 | 4.2 | °C/W |
| $ψ_{JB}$ | Junction-to-board characterization parameter | 22.3 | 37.3 | 9.9 | °C/W |
| $R_{θJC(bot)}$ | Junction-to-case (bottom) thermal resistance | 12.1 | 13.8 | 2.8 | °C/W |

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

# 7 Detailed Description

## 7.1 Overview

The TPS7B81-Q1 is a 40-V, 150-mA, low-dropout (LDO) linear regulator with ultralow quiescent current. This voltage regulator consumes only 3 µA of quiescent current at light load, and is quite suitable for the automotive always-on application.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Device Enable (EN)

The EN pin is a high-voltage-tolerant pin. A high input activates the device and turns the regulation on. Connect this pin to an external microcontroller or a digital circuit to enable and disable the device, or connect to the IN pin for self-bias applications.

### 7.3.2 Undervoltage Shutdown

This device has an integrated undervoltage lockout (UVLO) circuit to shut down the output if the input voltage ($V_{IN}$) falls below an internal UVLO threshold ($V_{(UVLO)}$). This feature ensures that the regulator does not latch into an unknown state during low-input-voltage conditions. If the input voltage has a negative transient that drops below the UVLO threshold and recovers, the regulator shuts down and powers up with a normal power-up sequence when the input voltage is above the required level.

### 7.3.3 Current Limit

This device features current-limit protection to keep the device in a safe operating area when an overload or output short-to-ground condition occurs. This feature protects the device from excessive power dissipation. For example, during a short-circuit condition on the output, the fault protection limits the current through the pass element to $I_{(LIM)}$ to protect the device from excessive power dissipation.

### 7.3.4 Thermal Shutdown

This device incorporates a thermal shutdown (TSD) circuit as protection from overheating. For continuous normal operation, the junction temperature must not exceed the TSD trip point. If the junction temperature exceeds the TSD trip point, the output turns off. When the junction temperature falls below the TSD trip point minus the thermal shutdown hysteresis, the output turns on again.

版权 © 2019–2020, Texas Instruments Incorporated

## 7.4 Device Functional Modes

### 7.4.1 Operation With $V_{IN}$ Lower Than 3 V

The device normally operates with input voltages above 3 V. The device can also operate at lower input voltages; the maximum UVLO voltage is 2.7 V. The device does not operate at input voltages below the actual UVLO voltage.

### 7.4.2 Operation With $V_{IN}$ Larger Than 3 V

When $V_{IN}$ is greater than 3 V, if $V_{IN}$ is also higher than the output set value plus the device dropout voltage, $V_{OUT}$ is equal to the set value. Otherwise, $V_{OUT}$ is equal to $V_{IN}$ minus the dropout voltage.

**表 1. Device Functional Mode Comparison**

| OPERATING MODE | PARAMETER | | | |
|---|---|---|---|---|
| Normal mode | $V_{IN} > V_{OUT(nom)} + V_{(Dropout)}$ and $V_{IN} \geq 3$ V | $V_{EN} > V_{IH}$ | $I_{OUT} < I_{CL}$ | $T_J < 160°C$ |
| Dropout mode | $3V \leq V_{IN} < V_{OUT(nom)} + V_{(Dropout)}$ | $V_{EN} > V_{IH}$ | $I_{OUT} < I_{CL}$ | $T_J < 160°C$ |
| Disabled mode (any true condition disables the device) | $V_{IN} < V_{(IN, UVLO)}$ | $V_{EN} < V_{IL}$ | — | $T_J > 160°C$ |

# 8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

## 8.1 Application Information

The TPS7B81-Q1 is a 150-mA, 40-V, low-dropout (LDO) linear regulator with ultralow quiescent current. The PSpice transient model is available for download on the product folder and can be used to evaluate the basic function of the device.

### 8.1.1 Power Dissipation

Circuit reliability demands that proper consideration is given to device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must be as free as possible of other heat-generating devices that cause added thermal stresses.

As a first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. $P_D$ can be approximated using 公式 1:

$$P_D = (V_{IN} – V_{OUT}) \times I_{OUT} \quad (1)$$

An important note is that power dissipation can be minimized, and thus greater efficiency achieved, by proper selection of the system voltage rails. Proper selection allows the minimum input-to-output voltage differential to be obtained. The low dropout of the device allows for maximum efficiency across a wide range of output voltages.

The main heat conduction path for the device is through the thermal pad on the package. As such, the thermal pad must be soldered to a copper pad area under the device. This pad area contains an array of plated vias that conduct heat to any inner plane areas or to a bottom-side copper plane.

The maximum power dissipation determines the maximum allowable junction temperature ($T_J$) for the device. Power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB, device package, and the temperature of the ambient air ($T_A$), according to 公式 2. The equation is rearranged for output current in 公式 3.

$$T_J = T_A + R_{\theta JA} \times P_D \quad (2)$$

$$I_{OUT} = (T_J – T_A) / [R_{\theta JA} \times (V_{IN} – V_{OUT})] \quad (3)$$

Unfortunately, this thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The $R_{\theta JA}$ recorded in the v table is determined by the JEDEC standard, PCB, and copper-spreading area, and is only used as a relative measure of package thermal performance. Note that for a well-designed thermal layout, $R_{\theta JA}$ is actually the sum of the package junction-to-case (bottom) thermal resistance ($R_{\theta JCbot}$) plus the thermal resistance contribution by the PCB copper.

图 25 through 图 30 show the functions of $R_{\theta JA}$ and $\psi_{JB}$ vs. copper area and thickness. These plots are generated with a 101.6 mm x 101.6 mm x 1.6mm PCB of two and four layers. For the four layer board, inner planes use 1 oz copper thickness. Outer layers are simulated with both 1 oz and 2 oz copper thickness. A 2 x 1 array of thermal vias of 300 μm drill diameter and 25 μm Cu plating is located beneath the thermal pad of the device. The thermal vias connect the top layer, the bottom layer and, in the case of the 4-layer board, the first inner GND plane. Each of the layers has a copper plane of equal area.

## Application Information (接下页)

#### *8.1.1.1 Estimating Junction Temperature*

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the LDO when in-circuit on a typical PCB board application. These metrics are not strictly speaking thermal resistances, but rather offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of the copper-spreading area. The key thermal metrics ($\Psi_{JT}$ and $\Psi_{JB}$) are given in the *Thermal Information* table and are used in accordance with 公式 4.

$$\Psi_{JT}: T_J = T_T + \Psi_{JT} \times P_D$$
$$\Psi_{JB}: T_J = T_B + \Psi_{JB} \times P_D \quad (4)$$

where:

- $P_D$ is the power dissipated as explained in 公式 1
- $T_T$ is the temperature at the center-top of the device package, and
- $T_B$ is the PCB surface temperature measured 1 mm from the device package and centered on the package edge

## 8.2 Typical Application

图 31 shows a typical application circuit for the TPS7B81-Q1. Different external component values can be used, depending on the end application. An application may require a larger output capacitor during fast load steps to prevent a large drop on the output voltage. TI recommends using a low-equivalent series resistance (ESR) ceramic capacitor with an X5R- or X7R-type dielectric.

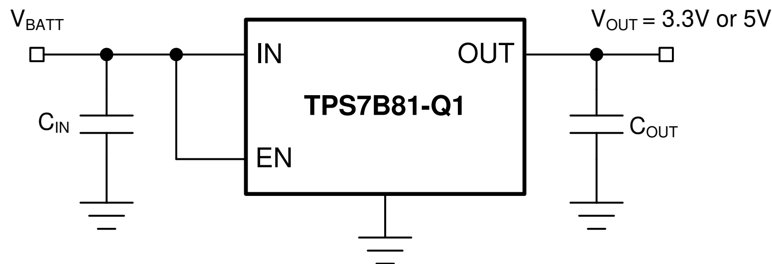

**图 31. TPS7B81-Q1 Typical Application Schematic**

### 8.2.1 Design Requirements

Use the parameters listed in 表 2 for this design example.

**表 2. Design Requirements Parameters**

| PARAMETER | VALUE |
|---|---|
| Input voltage range | 3 V to 40 V |
| Output voltage | 5 V or 3.3 V |
| Output current | 150 mA maximum |

### 8.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
- Output voltage
- Output current

#### *8.2.2.1 Input Capacitor*

Although an input capacitor is not required for stability, good analog design practice is to connect a 10-μF to 22-μF capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple rejection, and PSRR. The voltage rating must be greater than the maximum input voltage.

#### 8.2.2.2 Output Capacitor

To ensure the stability of the TPS7B81-Q1, the device requires an output capacitor with a value in the range from 1 µF to 200 µF and with an ESR range between 0.001 Ω and 5 Ω. TI recommends selecting a ceramic capacitor with low ESR to improve the load transient response.

### 8.2.3 Application Curve

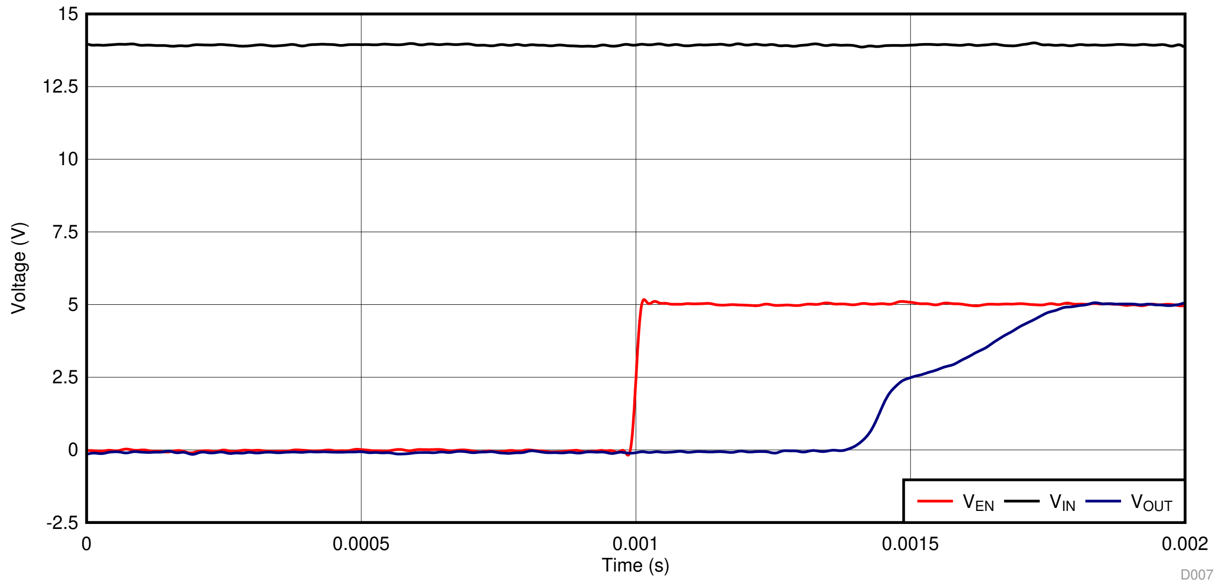

图 32. TPS7B81-Q1 Power-Up Waveform (5 V)

## 9 Power Supply Recommendations

The device is designed to operate from an input-voltage supply range from 3 V to 40 V. The input supply must be well regulated. If the input supply is located more than a few inches from the TPS7B81-Q1, TI recommends adding a capacitor with a value greater than or equal to 10 µF with a 0.1-µF bypass capacitor in parallel at the input.

# 10 Layout

## 10.1 Layout Guidelines

Layout is an important step for LDO power supplies, especially for high-voltage and large-output-current supplies. If the layout is not carefully designed, the regulator can fail to deliver enough output current because of thermal limitations. To improve the thermal performance of the device, and to maximize the current output at high ambient temperature, spread the copper under the thermal pad as far as possible and put enough thermal vias on the copper under the thermal pad. 图 33 shows an example layout.

## 10.2 Layout Example

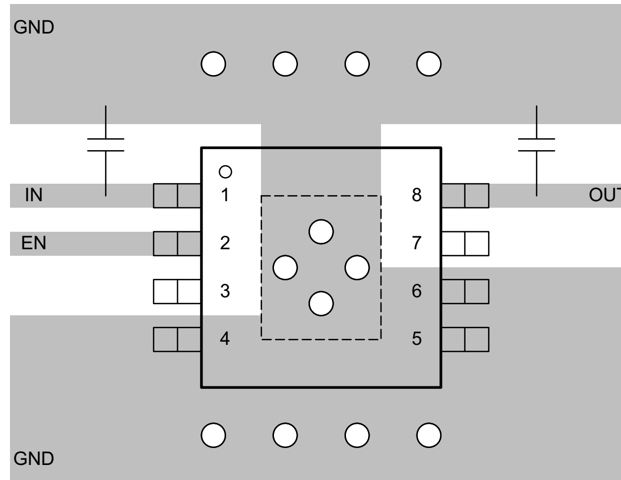

**图 33. TPSB81-Q1 Example Layout Diagram**

# 11 器件和文档支持

## 11.1 接收文档更新通知

要接收文档更新通知，请导航至 ti.com.cn 上的器件产品文件夹。单击右上角的*通知我*进行注册，即可每周接收产品信息更改摘要。有关更改的详细信息，请查看任何已修订文档中包含的修订历史记录。

## 11.2 支持资源

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

## 11.3 商标

PowerPAD, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

## 11.4 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。 精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

## 11.5 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

# 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。数据如有变更，恕不另行通知，且不会对此文档进行修订。如需获取此数据表的浏览器版本，请查阅左侧的导航栏。

(1) The marketing status values are defined as follows:
**ACTIVE:** Product device recommended for new designs.
**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.
**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

[6] Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
