具有阻抗检测功能的 SP2T 开关 支持 USB、UART 微型 USB 开关

查询样品: TSU6111

特性

- 双 **SP2T**
  - **USB** 和**UART**路径支持 **USB 2.0**高速接口
- 智能检测
  - 插入/拔出检测
  - **USB** 充电器检测
  - 阻抗检测
  - 检测功能与**CEA-936A** 兼容 **(4**线协议**, UART**接口**)**
- 充电器检测
  - 与 **USB BCDv1.1** 兼容
  - **VBUS** 检测
  - 数据接触检测
  - 一级和二级检测
- 兼容附件
  - **USB** 电缆
  - **UART** 线缆
  - **USB** 充电器 **BCDv1.1**
- 附加特性
  - 与主机处理器的**I^2C** 接口
  - 支持在制造中 **(JIG, BOOT)**使用的控制信号
  - 配件连接、断开中断
- 最大电压
  - **28v VBUS** 等级
- 控制输入符合 **1.8 V** 逻辑要求
  - **2000-V** 人体模式 **(A114-B, Class II)**
  - **1000 V** 充电器件模型（**C101**）
- **ESD** 性能 **DP/DM/ID/VBUS** 接 **GND**
  - **±8kV** 接触放电 **(IEC 61000-4-2)**
- 在 **VBUS/DP/DM**上的电涌保护
  - 无外部组件的**USB**连接器引脚

应用

- 手机与智能电话
- 平板电脑
- 数码相机与摄像机
- 全球卫星定位**(GPS)**导航系统
- 支持**USB/UART**的微型**USB**接口

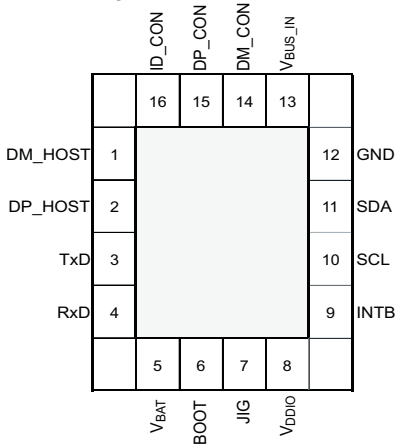
说明

TSU6111 支持阻抗检测的差分高性能自动SP2T开关。 这个开关特有阻抗检测, 这一功能能够检测通过DP和DM附件的多种配件。 充电器检测满足USB 充电器规范 v1.1。 V_{BUS_IN} 支持 28V 允差电压以避免外部保护。

这个设备通过附加的V_{BAT} 或者V_{BUS_IN}进行供电。

此开关有自动检测逻辑控制或者通过I^2C 接口手动控制。 当USB, UART JIG线缆在开发和制造期间被用来进行测试时，JIG和BOOT针脚启用。 TSU6111 支持开漏 JIG输出 (低电平有效)。

QFN-RSV PIN-OUT



Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

PIN FUNCTIONS

PIN		I/O	DESCRIPTION
NO.	NAME		
1	DM_HOST	I/O	USB DM connected to host
2	DP_HOST	I/O	USB DP connected to host
3	TxD	I/O	UART Tx
4	RxD	I/O	UART Rx
5	VBAT	I	Connected to battery
6	BOOT	O	BOOT mode out (push-pull)
7	JIG	O	JIG detection (TSU6111 open-drain active low)
8	VDDIO	O	I/O voltage reference
9	INTB	O	Interrupt to host (push-pull)
10	SCL	I	I2C clock
11	SDA	I/O	I2C data
12	GND		Ground
13	VBUS_IN	I	VBUS connected to USB receptacle
14	DM_CON	I/O	USB DM connected to USB receptacle
15	DP_CON	I/O	USB DP connected to USB receptacle
16	ID_CON	I/O	USB ID connected to USB receptacle

SUMMARY OF TYPICAL CHARACTERISTICS

T_A = 25°C	USB Path
Number of channels	2
ON-state resistance (r_{on})	8 Ω
ON-state resistance match (Δr_{on})	0.5 Ω
ON-state resistance flatness ($r_{on(flat)}$)	0.5 Ω
Turn-on/turn-off time (t_{ON}/t_{OFF})	95 µs/ 3.5 µs
Bandwidth (BW)	920 MHz
OFF isolation (O_{ISO})	–26 dB at 250 MHz
Crosstalk (X_{TALK})	–32 dB at 250 MHz
Leakage current ($I_{IO(ON)}$)	50 nA

ELECTRICAL SPECIFICATION

over operating free-air temperature range (unless otherwise noted)

PARAMETERS		TEST CONDITIONS	MIN	MAX	UNIT
DIGITAL SIGNALS – I2C INTERFACE (SCL and SDA)					
V_{DDIO}	Logic and I/O supply voltage		1.65	3.6	V
V_{IH}	High-level input voltage		V_{DDIO} × 0.7	V_{DDIO}	V
V_{IL}	Low-level input voltage		0	V_{DDIO} × 0.3	V
V_{OH}	High-level output voltage	I_{OH} = –3 mA	V_{DDIO} × 0.7		V
V_{OL}	Low-level output voltage	I_{OL} = 3 mA		0.4	V
f_{SCL}	SCL frequency			400	kHz
JIG OUTPUT (TSU6111 – OPEN-DRAIN OUTPUT, ACTIVE LOW)					
V_{OL}	Low-level output voltage	I_{OL} = 10 mA, V_{BAT} = 3.0 V		0.5	V
INTB AND BOOT (PUSH-PULL OUTPUT)					
V_{OH}	High-level output voltage	I_{OH} = –4 mA , V_{DDIO} = 1.65 V	1.16		V
V_{OL}	Low-level output voltage	I_{OL} = 4 mA , V_{DDIO} = 1.65 V		0.33	V
TOTAL SWITCH CURRENT CONSUMPTION					
$I_{DD(Standby)}$	V_{BAT} Standby current consumption	V_{BUS_IN} = 0 V, Idle state		30	µA
$I_{DD(Operating)}$	V_{BAT} Operating current consumption	V_{BUS_IN} = 0 V, USB switches ON		75	µA

ELECTRICAL CHARACTERISTICS(1)

VBAT = 3 V to 4.4 V, VDDIO = 2.8 V, TA = –40°C to 85°C (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG SWITCH							
V_{USBIO}	Analog signal range			0		V_{BAT}	V
r_{ON}	ON-state resistance	DM_HT, DP_HT, DM_CON, DP_CON	V_I = 0 V to 3.6 V, I_O = –2 mA, V_{BAT} = 3.0 V		8	15	Ω
Δr_{ON}	ON-state resistance match between channels	DM_HT, DP_HT, DM_CON, DP_CON	V_I = 0.4 V, I_O = –2 mA, V_{BAT} = 3.0 V		0.5	2	Ω
$r_{ON(flat)}$	ON-state resistance flatness	DM_HT, DP_HT, DM_CON, DP_CON	V_I = 0 V to 3.6 V, I_O = –2 mA, V_{BAT} = 3.0 V		0.5	2	Ω
$I_{IO(OFF)}$	V_I or V_O OFF leakage current		V_I = 0.3 V, V_O = 2.7 V or V_I = 2.7 V, V_O = 0.3 V, V_{BAT} = 4.4 V, Switch OFF		45	200	nA
$I_{IO(ON)}$	V_O ON leakage current		V_I = OPEN, V_O = 0.3 V or 2.7 V, V_{BAT} = 4.4 V, Switch ON		50	200	nA
DYNAMIC							
t_{ON}	Turn-ON time	From receipt of I^2C ACK bit	V_I or V_O = V_{BAT}, R_L = 50 Ω, C_L = 35 pF		95		µs
t_{OFF}	Turn-OFF time	From receipt of I^2C ACK bit	V_I or V_O = V_{BAT}, RL = 50 Ω, C_L = 35 pF		3.5		µs
$C_{I(OFF)}$	V_I OFF capacitance		DC bias = 0 V or 3.6 V, f = 10 MHz, Switch OFF		4		pF
$C_{O(OFF)}$	V_O OFF capacitance		DC bias = 0 V or 3.6 V, f = 10 MHz, Switch OFF		7		pF
$C_{I(ON)}$, $C_{O(ON)}$	V_I, V_O ON capacitance		DC bias = 0 V or 3.6 V, f = 10 MHz, Switch ON		9		pF
BW	Bandwidth		R_L = 50 Ω, Switch ON		920		MHz
O_{ISO}	OFF Isolation		f = 240 MHz, R_L = 50 Ω, Switch OFF		–26		dB
X_{TALK}	Crosstalk		f = 240 MHz, R_L = 50 Ω		–32		dB

(1) V_O is equal to the asserted voltage on DP_CON and DM_CON pins. V_I is equal to the asserted voltage on DP_HT and DM_HT pins. I_O is equal to the current on the DP_CON and DM_CON pins. I_I is equal to the current on the DP_HT and DM_HT pins.

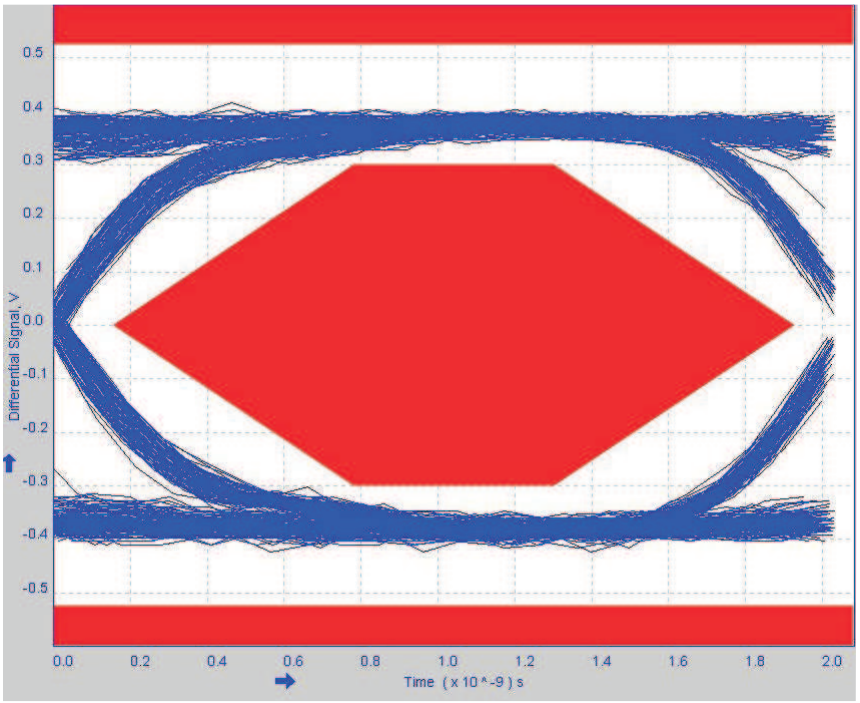
GENERAL OPERATION

The TSU6111 will automatically detect accessories plugged into the phone via the mini/micro USB 5 pin connector. The type of accessory detected will be stored in I2C registers within the TSU6111 for retrieval by the host. The TSU6111 has a network of switches that can be automatically opened and closed base on the accessory detection. See the Table 1 for details of which switches are open during each mode of operation. For flexibility, the TSU6111 also offers a manual switching mode allowing the host processor to decide which switches should be opened and closed and execute the settings through the I^2C interface.

STANDBY MODE

Standby mode is the default mode upon power up and occurs when no accessory has been detected. During this mode, the VBUS and ID lines are continually monitored through comparators to determine when an accessory is inserted. Power consumption is minimal during standby mode.

EYE DIAGRAM USB 2.0 HIGH SPEED



Copyright © 2011, Texas Instruments Incorporated

ACCESSORY ID DETECTION

If V_{BUS_IN} is high and the attachment is not a charger, then determine the impedance on the ID pin. If V_{BUS_IN} is low and an accessory is attached, then use an ADC for impedance sensing on the ID pin to identify which accessory is attached.

IMPEDANCE BUCKETS FOR EACH ACCESSORY

In order to implement ID detection, each accessory should contain below ID impedance resistor value which is 5% tolerance accuracy.

Table 1. Accessory ID and Switch States

Power-On Reset

When power (from 0 V) is applied to VBAT, an internal power-on reset holds the TSU6111 in a reset condition until V_{BAT} has reached V_{POR}. At that point, the reset condition is released, and the TSU6111 registers and I2C state machine initialize to their default states.

After the initial power-up phase, VBAT must be lowered to below 0.2 V and then back up to the operating voltage (V_{DDIO}) for a power-reset cycle.

Software Reset

The TSU6111 has software reset feature.

- Hold low both I^2C_SCL and I^2C_SDA more than 30ms will reset digital logic of the TSU6111.

After reset digital logic, INTB will keep low until INT_Mask bit of Control register (0x02) is cleared.

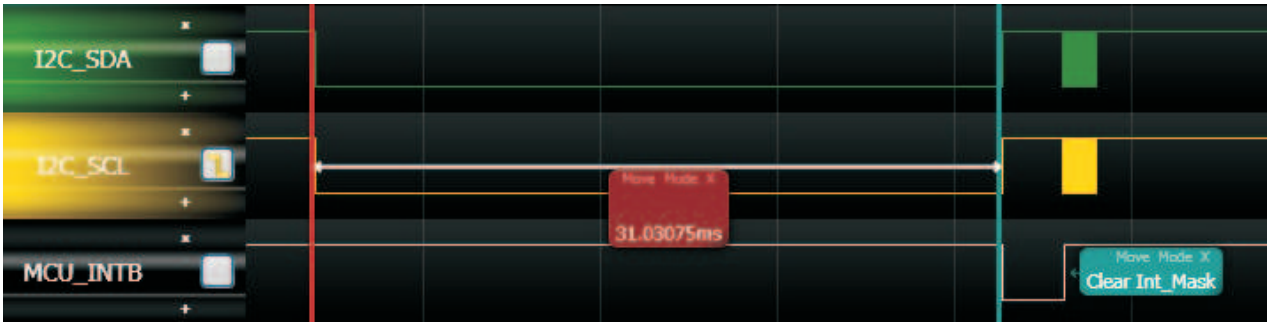

Figure 1. Software Reset

Standard I2C Interface Details

The bidirectional I^2C bus consists of the serial clock (SCL) and serial data (SDA) lines. Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

I^2C communication with this device is initiated by the master sending a START condition, a high-to-low transition on the SDA input/output while the SCL input is high (see Figure 2). After the start condition, the device address byte is sent, MSB first, including the data direction bit (R/W). This device does not respond to the general call address. After receiving the valid address byte, this device responds with an ACK, a low on the SDA input/output during the high of the ACK-related clock pulse.

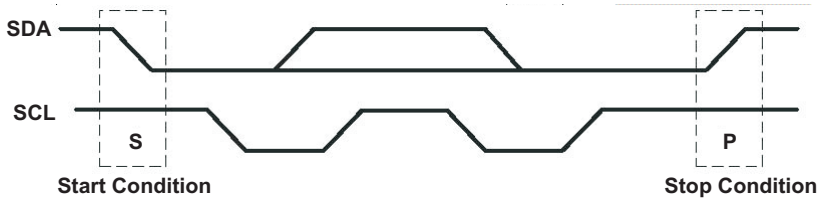

Figure 2. Definition of Start and Stop Conditions

The data byte follows the address ACK. The R/W bit is kept low for transfer from the master to the slave. The data byte is followed by an ACK sent from this device. Data are output only if complete bytes are received and acknowledged. The output data is valid at time (tpv) after the low-to-high transition of SCL, during the clock cycle for the ACK.

On the I^2C bus, only one data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high pulse of the clock period, as changes in the data line at this time are interpreted as control commands (START or STOP) (see Figure 3).

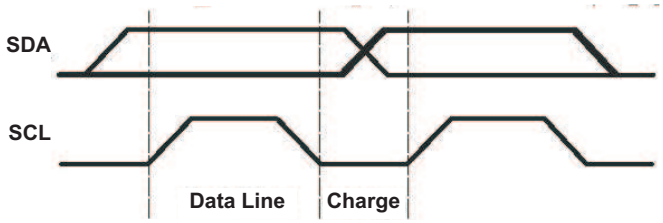

Figure 3. Bit Transfer

A Stop condition, a low-to-high transition on the SDA input/output while the SCL input is high, is sent by the master (see Figure 2).

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one ACK bit. The transmitter must release the SDA line before the receiver can send an ACK bit.

A slave receiver that is addressed must generate an ACK after the reception of each byte. The device that acknowledges has to pull down the SDA line during the ACK clock pulse so that the SDA line is stable low during the high pulse of the ACK-related clock period (see Figure 4). Setup and hold times must be taken into account.

Copyright © 2011, Texas Instruments Incorporated

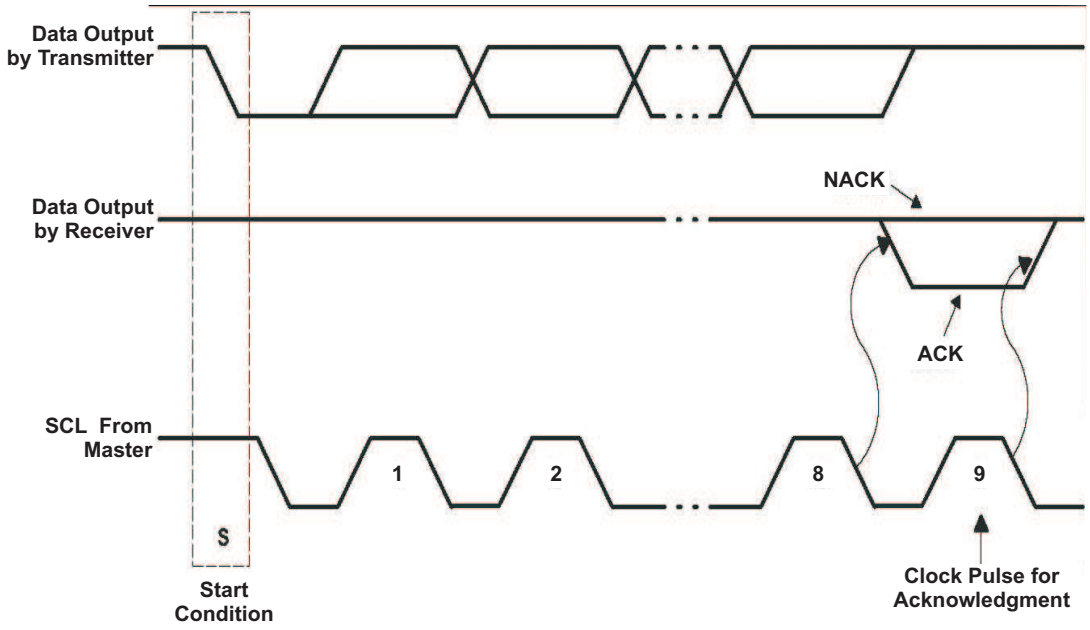

Figure 4. Acknowledgment on I²C Bus

Writes

Data is transmitted to the TSU6111 by sending the device slave address and setting the LSB to a logic 0 (see Figure 5 for device address). The command byte is sent after the address and determines which register receives the data that follows the command byte. The next byte is written to the specified register on the rising edge of the ACK clock pulse.

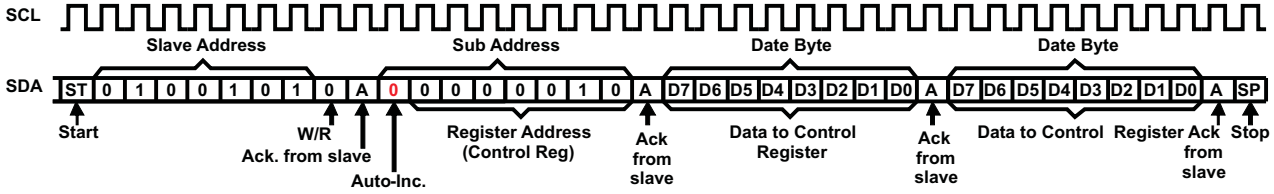

Figure 5. Repeated Data Write to a Single Register

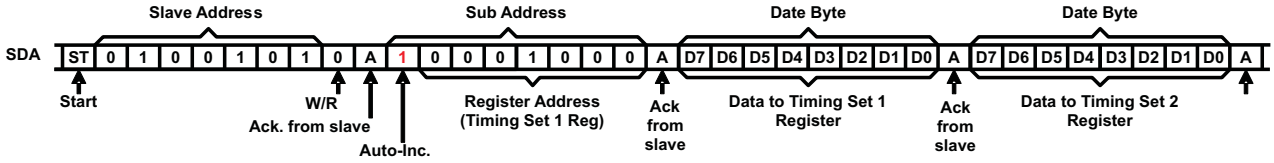

Figure 6. Burst Data Write to Multiple Registers

Copyright © 2011, Texas Instruments Incorporated

Reads

The bus master first must send the TSU6111 slave address with the LSB set to logic 0. The command byte is sent after the address and determines which register is accessed. After a restart, the device slave address is sent again but, this time, the LSB is set to logic 1. Data from the register defined by the command byte then is sent by the TSU6111. Data is clocked into the SDA output shift register on the rising edge of the ACK clock pulse. See Figure 7.

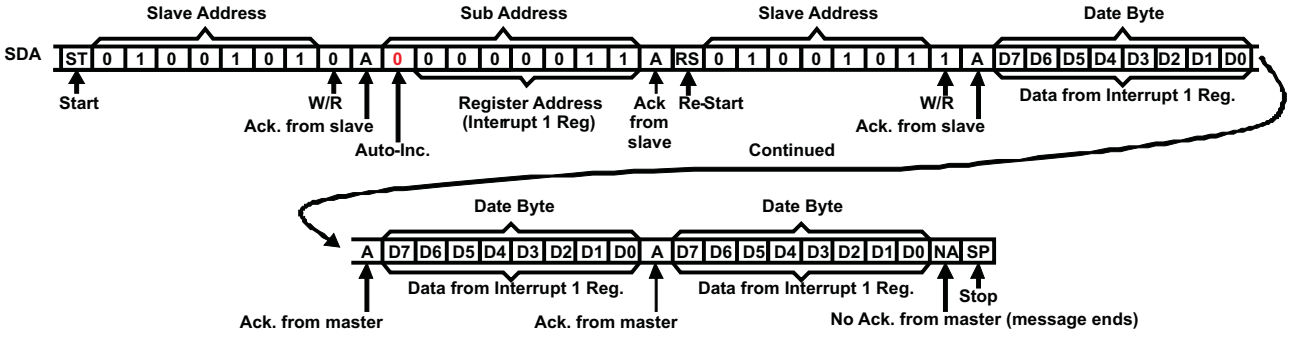

Figure 7. Repeated Data Read from a Single Register – Combined Mode

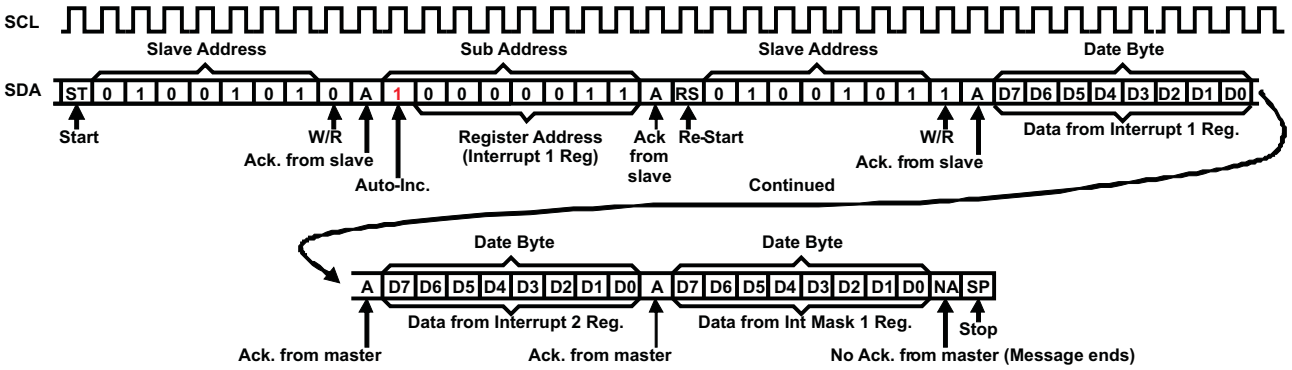

Figure 8. Burst Data Read from Multiple Registers – Combined Mode

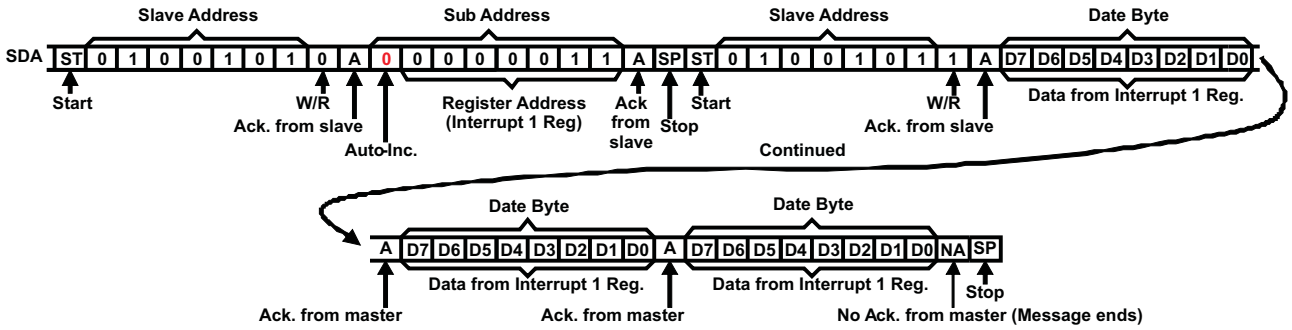

Figure 9. Repeated Data Read from a Single Register – Split Mode

Copyright © 2011, Texas Instruments Incorporated

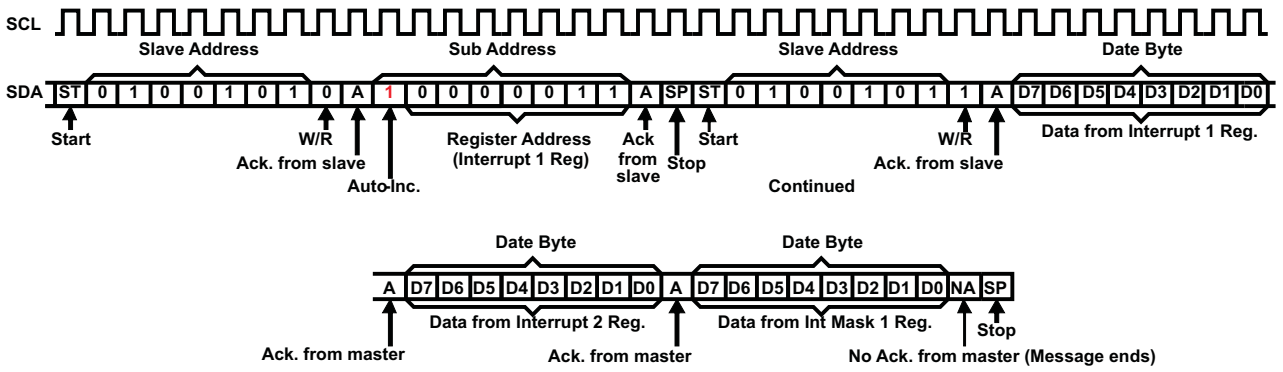

Figure 10. Burst Data Read from Multiple Registers – Split Mode

Notes (Applicable to Figure 5–Figure 10):

- SDA is pulled low on Ack. from slave or Ack. from master.
- Register writes always require sub-address write before first data byte.
- Repeated data writes to a single register continue indefinitely until Stop or Re-Start.
- Repeated data reads from a single register continue indefinitely until No Ack. from master.
- Burst data writes start at the specified register address, then advance to the next register address, even to the read-only registers. For these registers, data write appears to occur, though no data are changed by the writes. After register 14h is written, writing resumes to register 01h and continues until Stop or Re-Start.
- Burst data reads start at the specified register address, then advance to the next register address. Once register 14h is read, reading resumes from register 01h and continues until No Ack. from master.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TSU6111RSVR	ACTIVE	UQFN	RSV	16	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	ZTC	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
