

AN-1859 LP38512MR-ADJ Evaluation Board

1 Introduction

This board is designed to allow the evaluation of the LP38512MR-ADJ Voltage Regulator. Each board is assembled and tested in the factory. This evaluation board has the PSOP-8 package mounted, and the output voltage is set to 1.20V.

2 General Description

The LP38512MR-ADJ is an adjustable LDO linear regulator capable of supplying up to 1.5A of output current, and incorporates an Enable function.

The device has been designed to work with 10 μ F input and output ceramic capacitors. Footprints areas for C_{IN} and C_{OUT} will allow for a variety of sizes.

3 Operation

The input voltage, applied between V_{IN} and GND, should be at least 2.25V, or at least 500 mV greater than V_{OUT} , whichever value is larger. The input voltage should be no greater than 5.5V, which is the high end of the Operating Rating voltage.

Loads can be connected to V_{OUT} with reference to GND.

V_{OUT} and V_{IN} test points are provided on the board to allow accurate measurements directly onto the input and output pins of the device, eliminating any voltage drop on the PCB traces or connecting wires to the load.

4 Setting V_{OUT}

The output voltage is set using the external resistive divider R1 and R2. The output voltage is given by the formula:

$$V_{OUT} = V_{ADJ} \times (1 + (R1 / R2)) \quad (1)$$

It is recommended that the values selected for R1 and R2 are such that the parallel value is less than 1.00 k Ω . This is to prevent internal parasitic capacitances on the ADJ pin from interfering with the F_z pole set by R1 and C_{FF} .

$$((R1 \times R2) / (R1 + R2)) \leq 1.00 \text{ k}\Omega \quad (2)$$

[Table 1](#) lists some suggested, best fit, standard $\pm 1\%$ resistor values for R1 and R2, and a standard $\pm 10\%$ capacitor values for C_{FF} , for a range of V_{OUT} values. Other values of R1, R2, and C_{FF} are available that will give similar results.

Refer to *AN-1378 Method for Calculating Output Voltage Tolerances in Adjustable Regulators Application Report* ([SNVA112](#)) for additional information on how resistor tolerances affect the calculated V_{OUT} value.

The LP38512MR-ADJ Evaluation board is assembled with a 1.40 k Ω $\pm 1\%$ resistor for R1, and a 1.00 k Ω $\pm 1\%$ resistor for R2. This sets V_{OUT} to 1.20V.

$$V_{OUT} = 500 \text{ mV} \times (1 + (1.40 \text{ k}\Omega / 1.00 \text{ k}\Omega)) \quad (3)$$

Table 1. Suggested Components

V_{OUT}	R1	R2	C_{FF}	F_z
0.80V	1.07 k Ω	1.78 k Ω	4700 pF	31.6 kHz
1.00V	1.00 k Ω	1.00 k Ω	4700 pF	33.8 kHz
1.20V	1.40 k Ω	1.00 k Ω	3300 pF	34.4 kHz
1.50V	2.00 k Ω	1.00 k Ω	2700 pF	29.5 kHz
1.80V	2.94 k Ω	1.13 k Ω	1500 pF	36.1 kHz
2.00V	1.02 k Ω	340 Ω	4700 pF	33.2 kHz
2.50V	1.02 k Ω	255 Ω	4700 pF	33.2 kHz
3.00V	1.00 k Ω	200 Ω	4700 pF	33.8 kHz
3.30V	2.00 k Ω	357 Ω	2700 pF	29.5 kHz

5 Selecting C_{FF}

A capacitor placed across the gain resistor R1 will provide additional phase margin to improve load transient response of the device. This capacitor, C_{FF} , in parallel with R1, will form a zero in the loop response given by the formula:

$$F_z = (1 / (2 \times \pi \times C_{FF} \times R1)) \quad (4)$$

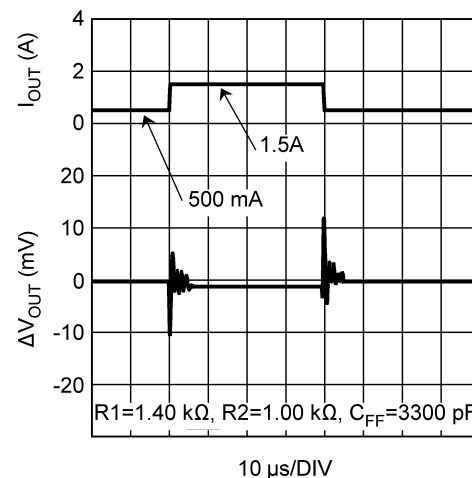

The value for C_{FF} should be selected to set a zero frequency (F_z) between 25 kHz and 50 kHz using the formula:

$$C_{FF} = 1 / (2 \times \pi \times F_z \times R1) \quad (5)$$

The closest standard 10% value is usually adequate for C_{FF} .

The LP38512MR-ADJ Evaluation board is assembled with a 3300 pF capacitor for C_{FF} . This sets F_z to approximately 34 kHz.

$$F_z = (1 / (2 \times \pi \times 3300 \text{ pF} \times 1.40\text{k}\Omega)) = 34.4 \text{ kHz} \quad (6)$$

6 Enable Function

ON/OFF control is provided by supplying a logic level signal to the Enable pin. A minimum V_{EN} value of 1.2V is typically required at this pin to enable the LDO output. The LDO output will be shutdown when the V_{EN} value is typically 0.6V or less. The V_{EN} threshold incorporates approximately 100 mV of hysteresis.

In applications where the LP38512MR-ADJ is operated continuously the Enable pin can be connected directly to V_{IN} . The Enable pin has no default bias and must not be left floating. The Enable pin must be actively driven to the appropriate voltage level.

Figure 4. Enable Thresholds

7 Power Dissipation

The PSOP-8 package alone has a junction to ambient thermal resistance (θ_{JA}) rating of 168°C/W when mounted to the minimum land area (EIA/JESD51-3). When mounted on the LP38512MR-ADJ Evaluation Board the θ_{JA} rating is approximately 40°C/W.

The exposed DAP is soldered to the copper area immediately under the package. The top copper surface area is extended to additional copper area on the bottom of the board by five thermal vias placed inside the DAP land area.

With the 40°C/W thermal rating the LP38512MR-ADJ evaluation board will dissipate a maximum of 2.5W with $T_A = 25^\circ\text{C}$.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
