3 说明

MSP430FR267x 是用于电容式触控检测的超低功耗 MSP430™ 微控制器，采用 CapTIvate 触控技术，适用于按钮、滑块、滚轮及邻近应用。采用 CapTIvate 技术的 MSP430 MCU 提供市面上最高集成度和自主性的电容式触控解决方案，具有高可靠性和抗噪能力以及最低功耗。TI 的电容式触控技术支持在同一设计方案中同时使用自电容式和互电容式电极，最大限度地提高了灵活性。采用 CapTIvate 技术的 MSP430 MCU 可以穿透厚玻璃、塑料外壳、金属和木材，在恶劣的环境（包括潮湿、油腻和脏污环境）中工作。

TI 电容式触控感应 MSP430 MCU 由一个由各种软、硬件资源组成的生态系统提供支持，并配套提供有参考设计和代码示例，可帮助您快速开展设计。开发套件包括 MSP-CAPT-FR2633 CapTIvate 技术开发套件。TI 还提供免费的软件，如 CapTIvate 设计中心，工程师可以在其中通过简单易用的 GUI 和 MSP430Ware™ 软件，以及包括 CapTIvate 技术指南在内的综合性文档快速进行应用开发。我们为 MSP430 MCU 提供广泛的在线配套资料（例如内务处理型示例系列、MSP Academy 培训），也通过 TI E2E™ 支持论坛提供在线支持。

TI MSP430 系列低功耗微控制器包含多种器件，其中配备了不同的外设集以满足各类应用的需求。此架构与多种低功耗模式配合使用，是延长便携式测量应用电池寿命的最优选择。该 MCU 具有一个强大的 16 位 RISC CPU、16 位寄存器和常数发生器，有助于获得最大编码效率。数控振荡器 (DCO) 可使 MCU 在不到 10 µs（典型值）的时间内从低功耗模式唤醒至活动模式。

(1) Pin Types: I = Input, O = Output, I/O = Input or Output, P = Power
(2) Because this pin is multiplexed with the JTAG function, TI recommends disabling the pin interrupt function while in JTAG debug to prevent collisions.

(3) This is the default functionality that can be remapped by the USCIBxRMP or USCIA0RMP bit of the SYSCFG2 or SYCFG3 register. Only one selected port is valid at any time.
(4) This is the remapped functionality controlled by the USCIBxRMP or USCIA0RMP bit of the SYSCFG2 or SYCFG3 register. Only one selected port is valid at any time.
(5) This is the default functionality that can be remapped by the TAxRMP bit of the SYSCFG3 register. Only one selected port is valid at any time.
(6) This is the remapped functionality controlled by the TAxRMP bit of the SYSCFG3 register. Only one selected port is valid at any time.

7.4 Pin Multiplexing

Pin multiplexing for this MCU is controlled by both register settings and operating modes (for example, if the MCU is in test mode). For details of the settings for each pin and diagrams of the multiplexed ports, see 节 9.11.

7.5 Buffer Types

表 7-3 defines the pin buffer types that are listed in 表 7-1

表 7-3. Buffer Types

BUFFER TYPE (STANDARD)	NOMINAL VOLTAGE	HYSTERESIS	PU OR PD	NOMINAL PU OR PD STRENGTH (μA)	OUTPUT DRIVE STRENGTH (mA)	OTHER CHARACTERISTICS
LVCMOS	3.0 V	Y(1)	Programmable	See 节 8.12.4	See 节 8.12.4	
Analog	3.0 V	N	N/A	N/A	N/A	See analog modules in 节 8 for details.
Power (DVCC)	3.0 V	N	N/A	N/A	N/A	SVS enables hysteresis on DVCC.
Power (AVCC)	3.0 V	N	N/A	N/A	N/A	

(1) Only for input pins.

7.6 Connection of Unused Pins

表 7-4 lists the correct termination of unused pins.

表 7-4. Connection of Unused Pins

PIN(1)	POTENTIAL	COMMENT
Px.0 to Px.7	Open	Switched to port function, output direction (PxDIR.n = 1)
$\overline{\text{RST}}$/NMI	DV_{CC}	47-kΩ pullup or internal pullup selected with 10-nF (or 1.1-nF) pulldown(2)
TEST	Open	This pin always has an internal pulldown enabled.

(1) Any unused pin with a secondary function that is shared with general-purpose I/O should follow the Px.0 to Px.7 unused pin connection guidelines.
(2) The pulldown capacitor should not exceed 1.1 nF when using MCUs with Spy-Bi-Wire interface in Spy-Bi-Wire mode with TI tools like FET interfaces or GANG programmers.

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) This applies I/Os worked in CapTIvate mode.
(3) All voltages referenced to V_{SS}.
(4) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

8.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

8.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage applied at DVCC pin(1) (2)	CapTIvate in VREG electrode charge mode (default)(3) (4)	1.8(5)		3.6	V
		CapTIvate in DVCC electrode charge mode(4)	2.7		3.6	
V_{SS}	Supply voltage applied at DVSS pin			0		V
T_A	Operating free-air temperature		– 40		105	°C
T_J	Operating junction temperature		– 40		115	°C
C_{DVCC}	Recommended capacitor at DVCC(6)		4.7	10		µF
f_{SYSTEM}	Processor frequency (MCLK frequency)(5) (7)	No FRAM wait states (NWAITSx = 0)	0		8	MHz
		With FRAM wait states (NWAITSx = 1)(8)	0		16(9)	
f_{ACLK}	ACLK frequency				40	kHz
f_{SMCLK}	SMCLK frequency				16(9)	MHz

(1) Supply voltage changes faster than 0.2 V/µs can trigger a BOR reset even within the recommended supply voltage range. Following the data sheet recommendation for capacitor C_{DVCC} limits the slopes accordingly.
(2) TI recommends that power to the DVCC pin must not exceed the limits specified in *Recommended Operating Conditions*. Exceeding the specified limits can cause malfunction of the device including erroneous writes to RAM and FRAM.
(3) Modules may have a different supply voltage range specification. See the specification of the respective module in this data sheet.
(4) CapTIvate electrode charge mode is selectable from within the CapTIvate Design Center GUI and the CapTIvate Software Library. The default operating mode is VREG..
(5) The minimum supply voltage is defined by the SVS levels. Refer to the SVS threshold parameters in 节 8.12.1.1.
(6) A capacitor tolerance of ±20% or better is required. A low-ESR ceramic capacitor of 100 nF (minimum) should be placed as close as possible (within a few millimeters) to the respective pin pair.
(7) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.

(8) Wait states only occur on actual FRAM accesses (that is, on FRAM cache misses). RAM and peripheral accesses are always executed without wait states.
(9) If clock sources such as HF crystals or the DCO with frequencies >16 MHz are used, the clock must be divided in the clock system to comply with this operating condition.

$C_{L,eff}$	Integrated effective load capacitance(6)	See (7)			1		pF

$f_{Fault,LFXT}$	Oscillator fault frequency (10)	XTS = 0(8)		0		3500	Hz

(1) To improve EMI on the LFXT oscillator, observe the following guidelines:
- Keep the trace between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
- Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(2) See the *MSP430 32-kHz Crystal Oscillators* application note for details on crystal section, layout, and testing.
(3) When LFXTBYPASS is set, LFXT circuits are automatically powered down. Input signal is a digital square wave with parametrics defined in the Schmitt-trigger inputs section of this data sheet. Duty cycle requirements are defined by $DC_{LFXT, SW}$.
(4) Maximum frequency of operation of the entire device cannot be exceeded.
(5) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the LFXTDRIVE settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but should be evaluated based on the actual crystal selected for the application:
- For LFXTDRIVE = {0}, $C_{L,eff}$ = 3.7 pF
- For LFXTDRIVE = {1}, 6 pF $\leqslant C_{L,eff} \leqslant$ 9 pF
- For LFXTDRIVE = {2}, 6 pF $\leqslant C_{L,eff} \leqslant$ 10 pF
- For LFXTDRIVE = {3}, 6 pF $\leqslant C_{L,eff} \leqslant$ 12 pF

(6) Includes parasitic bond and package capacitance (approximately 2 pF per pin).
(7) Requires external capacitors at both terminals to meet the effective load capacitance specified by crystal manufacturers. Recommended effective load capacitance values supported are 3.7 pF, 6 pF, 9 pF, and 12.5 pF. Maximum shunt capacitance of 1.6 pF. The PCB adds additional capacitance, so it must also be considered in the overall capacitance. Verify that the recommended effective load capacitance of the selected crystal is met.
(8) Measured with logic-level input frequency but also applies to operation with crystals.
(9) Includes start-up counter of 1024 clock cycles.
(10) Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag. A static condition or stuck at fault condition sets the flag.

9 Detailed Description

9.1 Overview

The MSP430FR267x ultra-low-power MCUs are FRAM-based MCUs with integrated high-performance charge-transfer CapTIvate technology in ultra-low-power high-reliability high-flexibility MCUs. The MSP430FR267x MCU features up to 16 self-capacitance or 64 mutual-capacitance electrodes, proximity sensing, and high accuracy up to 1-fF detection. The MCUs also include five 16-bit timers, four eUSCIs that support UART, SPI, and I^2C, a hardware multiplier, an RTC module, and a high-performance 12-bit ADC, an enhanced comparator with built in 6-bit DAC for internal voltage reference ..

9.2 CPU

The MSP430™ CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock.

Four of the registers, R0 to R3, are dedicated as program counter (PC), stack pointer (SP), status register (SR), and constant generator (CG), respectively. The remaining registers are general-purpose registers.

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be handled with all instructions.

9.3 Operating Modes

The MSP430 has one active mode and several software-selectable low-power modes of operation (see 表 9-1). An interrupt event can wake the MCU from low-power mode LPM0, LPM3 or LPM4, service the request, and restore the MCU back to the low-power mode on return from the interrupt program. Low-power modes LPM3.5 and LPM4.5 disable the core supply to minimize power consumption.

Note

XT1CLK and VLOCLK can be active during LPM4 mode if requested by low-frequency peripherals, such as RTC, WDT, and CapTIvate .

The BSL lets users program the FRAM or RAM using either the UART serial interface or the I^2C interface. Access to the MCU memory through the BSL is protected by an user-defined password. Use of the BSL requires four pins (see 表 9-4 and 表 9-5). The BSL entry requires a specific entry sequence on the $\overline{\text{RST}}$/NMI/SBWTDIO and TEST/SBWTCK pins. This device can support the blank device detection automatically to invoke the BSL with bypass this special entry sequence for saving time and on board programmable. For the complete description of the feature of the BSL, see the *MSP430™ FRAM Devices Bootloader (BSL) User's Guide*.

9.6 JTAG Standard Interface

The MSP low-power microcontrollers support the standard JTAG interface, which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin enables the JTAG signals. In addition to these signals, the $\overline{\text{RST}}$/NMI/SBWTDIO is required to interface with MSP430 development tools and device programmers. 表 9-6 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For details on using the JTAG interface, see *MSP430 Programming With the JTAG Interface User's Guide*.

9.7 Spy-Bi-Wire Interface (SBW)

The MSP low-power microcontrollers support the 2-wire SBW interface. SBW can be used to interface with MSP development tools and device programmers. 表 9-7 lists the SBW interface pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For details on using the SBW interface, see the *MSP430 Programming With the JTAG Interface User's Guide*.

9.8 FRAM

The FRAM can be programmed using the JTAG port, SBW, the BSL, or in-system by the CPU. Features of the FRAM include:

- Byte and word access capability
- Programmable wait state generation
- Error correction coding (ECC)

9.9 Memory Protection

The device features memory protection for user access authority and write protection, including options to:

- Secure the whole memory map to prevent unauthorized access from JTAG port or BSL, by writing JTAG and BSL signatures using the JTAG port, SBW, the BSL, or in-system by the CPU.
- Enable write protection to prevent unwanted write operation to FRAM contents by setting the control bits in the System Configuration 0 register. For detailed information, see the SYS chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide*.

9.10 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. All peripherals can be handled by using all instructions in the memory map. For complete module description, see the *MP430FR4xx and MP430FR2xx Family User's Guide*.

9.10.1 Power-Management Module (PMM)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device. The PMM also includes supply voltage supervisor (SVS) and brownout protection. The brownout reset circuit (BOR) is implemented to provide the proper internal reset signal to the device during power on and power off. The SVS circuitry detects if the supply voltage drops below a user-selectable safe level. SVS circuitry is available on the primary supply.

The device contains two on-chip reference: 1.5 V for internal reference and 1.2 V for external reference.

The 1.5-V reference is internally connected to ADC channel 13. DVCC is internally connected to ADC channel 15. When DVCC is set as the reference voltage for ADC conversion, the DVCC can be easily represent as 方程式 1 by using ADC sampling 1.5-V reference without any external components support.

$$DVCC = (1023 \times 1.5\ V) \div 1.5\text{-V reference ADC result} \quad (1)$$

A 1.2-V reference voltage can be buffered, when EXTREFEN = 1 on PMMCTL2 register, and it can be output to P1.4/../A1/VREF+ , meanwhile the ADC channel 1 can also be selected to monitor this voltage. For more detailed information, see the *MSP430FR4xx and MSP430FR2xx Family User's Guide*.

9.10.2 Clock System (CS) and Clock Distribution

The clock system includes a 32-kHz crystal oscillator (XT1), an internal very-low-power low-frequency oscillator (VLO), an integrated 32-kHz RC oscillator (REFO), an integrated internal digitally controlled oscillator (DCO) that may use frequency-locked loop (FLL) locking with internal or external 32-kHz reference clock, and an on-chip asynchronous high-speed clock (MODOSC). The clock system is designed for cost-effective designs with minimal external components. A fail-safe mechanism is included for XT1. The clock system module offers the following clock signals.

- Main Clock (MCLK): The system clock used by the CPU and all relevant peripherals accessed by the bus. All clock sources except MODOSC can be selected as the source with a predivider of 1, 2, 4, 8, 16, 32, 64, or 128.
- Sub-Main Clock (SMCLK): The subsystem clock used by the peripheral modules. SMCLK derives from the MCLK with a predivider of 1, 2, 4, or 8. This means SMCLK is always equal to or less than MCLK.
- Auxiliary Clock (ACLK): This clock is derived from the external XT1 clock, internal VLO or internal REFO clock up to 40 kHz.

All peripherals may have one or several clock sources depending on specific functionality. 表 9-8 lists the clock distribution used in this device.

9.10.3 General-Purpose Input/Output Port (I/O)

Up to 43 I/O ports are implemented.

- P1, P3, P4, and P5 implement 8 bits each. P2 implements 6 bits excluding the I/Os multiplexed with XIN and XOUT. P6 implements 3 bits.
- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Programmable pullup or pulldown on all ports.
- Edge-selectable interrupt and LPMx.5 wake-up input capability are available for all GPIOs (up to 43)
- Read and write access to port-control registers is supported by all instructions.
- Ports can be accessed byte-wise or word-wise as a pair.
- CapTIvate functionality is supported on all CAPx.y pins.

Note

Configuration of digital I/Os after BOR reset

To prevent any cross currents during start-up of the device, all port pins are high-impedance with Schmitt triggers and module functions disabled. To enable the I/O functions after a BOR reset, the ports must be configured first and then the LOCKLPM5 bit must be cleared. For details, see the *Configuration After Reset* section in the Digital I/O chapter of the MP430FR4xx and MP430FR2xx Family User's Guide.

9.10.4 Watchdog Timer (WDT)

The primary function of the WDT module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals. 表 9-9 lists the system clocks that can be used to source the WDT.

9.10.5 System (SYS) Module

The SYS module handles many of the system functions within the device. These features include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader entry mechanisms, and configuration management (device descriptors). The SYS module also includes a data exchange mechanism through SBW called a JTAG mailbox mail box that can be used in the application. 表 9-10 summarizes the interrupts that are managed by the SYS module.

9.10.6 Cyclic Redundancy Check (CRC)

The 16-bit cyclic redundancy check (CRC) module produces a signature based on a sequence of data values and can be used for data checking purposes. The CRC generation polynomial is compliant with CRC-16-CCITT standard of $x^{16} + x^{12} + x^5 + 1$.

9.10.7 Enhanced Universal Serial Communication Interface (eUSCI_A0, eUSCI_B0)

The eUSCI modules are used for serial data communications. The eUSCI_A module supports either UART or SPI communications. The eUSCI_B module supports either SPI or I^2C communications. Additionally, eUSCI_A supports automatic baud-rate detection and IrDA. The eUSCI_A and eUSCI_B are connected either from P1 port or P2 port, it can be selected from the USCIA0RMP or USCIBxRMP bits of SYSCFG2 and SYSCFG3. 表 9-11 lists the pin configurations that are required for each eUSCI mode.

9.10.8 Timers (TA0, TA1, TA2, TA3 and TB0)

The TA0, TA1, TA2 and TA3 modules are 16-bit timers and counters with three capture/compare registers each. Each timer supports multiple captures or compares, PWM outputs, and interval timing (see 表 9-12 and 表 9-13). Each timer has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers. The CCR0 registers on both TA0 and TA2 are not externally connected and can only be used for hardware period timing and interrupt generation. In Up mode, they can be used to set the overflow value of the counter.

The interconnection of Timer0_A3 and Timer1_A3 can be used to modulate the eUSCI_A pin of UCA0TXD/ UCA0SIMO in either ASK or FSK mode, with which a user can easily acquire a modulated infrared command for directly driving an external IR diode. The IR functions are fully controlled by SYS configuration register 1

including IREN (enable), IRPSEL (polarity select), IRMSEL (mode select), IRDSSEL (data select), and IRDATA (data) bits. For more information, see the SYS chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide*.

The Timer_B module feature the function to put Timer_B all outputs into a high impedance state when the selected source is triggered. The source can be selected from external pin or internal of the device, it is controlled by TBxTRG in SYS. For more information, see the SYS chapter in the *MP430FR4xx and MP430FR2xx Family User's Guide*.

9.10.9 Hardware Multiplier (MPY)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The MPY module supports signed multiplication, unsigned multiplication, signed multiply-and-accumulate, and unsigned multiply-and-accumulate operations.

9.10.10 Backup Memory (BAKMEM)

The BAKMEM supports data retention during LPM3.5. This device provides up to 32 bytes that are retained during LPM3.5.

9.10.11 Real-Time Clock (RTC)

The RTC is a 16-bit modulo counter that is functional in AM, LPM0, LPM3, and LPM3.5. This module may periodically wake up the CPU from LPM0, LPM3 and LPM3.5 based on timing from a low-power clock source such as the XT1 and VLO clocks. RTC also can be sourced from ACLK controlled by RTCCKSEL in SYSCFG2. In AM, RTC can be driven by SMCLK to generate high-frequency timing events and interrupts. The RTC overflow events trigger:

- Timer0_B3 CCI1B
- ADC conversion trigger when ADCSHSx bits are set as 01b

9.10.12 12-Bit Analog-to-Digital Converter (ADC)

The 12-bit ADC module supports fast 12-bit analog-to-digital conversions with single-ended input. The module implements a 12-bit SAR core, sample select control, reference generator and a conversion result buffer. A window comparator with a lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

The ADC supports 12 external inputs and four internal inputs (see 表 9-19).

9.10.13 eCOMP0

This device features one enhanced comparator. The enhanced comparator is an analog voltage comparator with a built-in 6-bit DAC as an internal voltage reference. The integrated 6-bit DAC can be set to 64 steps for the comparator reference voltage. This module has 4-level programmable hysteresis and configurable power modes: high-power and low-power modes.

The eCOMP0 supports a propagation delay up to 1 µs in high-power mode. In low-power mode, eCOMP0 supports 3.2-µs delay with 1.5-µA leakage at room temperature, which can be an ideal wake-up source in LPM3 for a voltage monitor.

eCOMP0 contains a programmable 6-bit DAC that can use the internal shared reference (1.5 V, 2.0 V, or 2.5 V) for a high-precision comparison threshold. In addition to the internal shared reference, a low-power 1.2-V

reference is fixed at channel 2 of both the inverting and noninverting paths and allows the DAC to be turned off to reduce power consumption.

The eCOMP0 supports external inputs and internal inputs (see 表 9-21) and outputs (see 表 9-22)

9.10.14 CapTIvate Technology

The CapTIvate module measures changes in the capacitance of a sensing electrode with a charge-transfer measurement method. It is functional in AM, LPM0, LPM3, and LPM4. The CapTIvate module can periodically wake the CPU from LPM0, LPM3, or LPM4 based on a CapTIvate timer source such as ACLK or VLO clock. The CapTIvate module supports the following touch-sensing capability:

- 16 CapTIvate I/Os supporting up to 16 electrodes in self-capacitance mode or 64 electrodes in mutual-capacitance mode
- 4 CapTIvate measurement blocks to enable parallel scanning of up to 4 electrodes simultaneously (one electrode per block)
- Each CapTIvate block can be individually configured in self or mutual mode, and each CapTIvate I/O can be used for either self or mutual capacitance electrodes.
- Support synchronizing the start of a conversion to an external trigger, such as a zero-crossing event
- Includes a wake-on-touch state machine with processing logic to perform filter calculations and threshold detection
- Includes hardware accelerated oversampling and frequency hopping to enable reduced CPU loading in applications that require noise immunity
- Noise-attenuating charge transfer circuit with adjustable input impedance enabling robustness in the presence of conducted and radiated noise with low CPU post-processing requirements
- Selectable electrode charge voltage (DVCC or CapTIvate VREG), allowing the designer to optimize for high sensitivity in the presence of conducted and radiated noise or stability across DVCC supply voltage variation
- Adjustable on-chip sampling capacitor size to support calibration of low-capacitance electrodes

To learn more about MSP MCUs featuring CapTIvate™ technology, see the *CapTIvate™ Technology Guide*.

9.10.15 Embedded Emulation Module (EEM)

The EEM supports real-time in-system debugging. The EEM on these devices has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

- EEM version: S

(1) CRC value covers the checksum from 0x1A04h to 0x1AF7h by applying CRC-CCITT-16 polynomial of $x^{16} + x^{12} + x^5 + 1$.
(2) This value can be directly loaded into the DCO bits in the CSCTL0 register to get an accurate 24-MHz frequency at room temperature, especially when MCU exits from LPM3 and below. TI also suggests to use a predivider to decrease the frequency if the temperature drift might result an overshoot faster than 24 MHz.
(3) ADC gain: the gain correction factor is measured at 2.4 V and room temperature using ADCSREFx = 0x7, an external reference without internal buffer. V_{R+}= V_{eref+}, V_{R-}= V_{eref-}. Other settings can result in different factors.
(4) ADC offset: the offset correction factor is measured at 2.4 V and room temperature using ADCSREFx = 0x7, an external reference without internal buffer. V_{R+}= V_{eref+}, V_{R-}= V_{eref-}. Other settings can result in different factors

9.14 Identification

9.14.1 Revision Identification

The device revision information is included as part of the top-side marking on the device package. The device-specific errata sheet describes these markings.

The hardware revision is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the Hardware Revision entries in 节 9.12.

9.14.2 Device Identification

The device type can be identified from the top-side marking on the device package. The device-specific errata sheet describes these markings.

A device identification value is also stored in the Device Descriptor structure in the Info Block section. For details on this value, see the Device ID entries in 节 9.12.

9.14.3 JTAG Identification

Programming through the JTAG interface, including reading and identifying the JTAG ID, is described in MSP430 Programming With the JTAG Interface.

10 Applications, Implementation, and Layout

Note

以下应用部分中的信息不属于 TI 器件规格的范围，TI 不担保其准确性和完整性。TI 的客 户应负责确定器件是否适用于其应用。客户应验证并测试其设计，以确保系统功能。

10.1 Device Connection and Layout Fundamentals

This section discusses the recommended guidelines when designing with the MSP430 devices. These guidelines are to make sure that the device has proper connections for powering, programming, debugging, and optimum analog performance.

10.1.1 Power Supply Decoupling and Bulk Capacitors

TI recommends connecting a combination of a 10-µF plus a 100-nF low-ESR ceramic decoupling capacitor to the DVCC and DVSS pins. Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimeters). Additionally, TI recommends separated grounds with a single-point connection for better noise isolation from digital-to-analog circuits on the board and to achieve high analog accuracy.

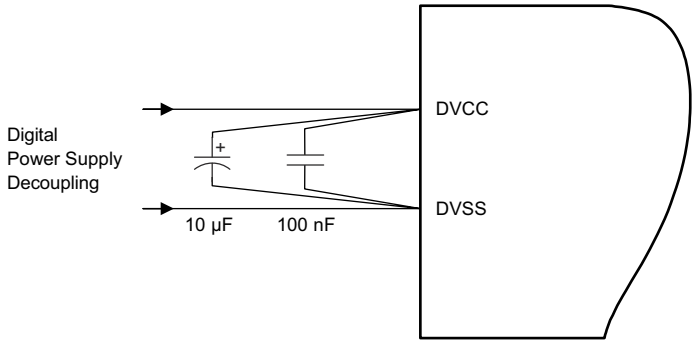

图 10-1. Power Supply Decoupling

10.1.2 External Oscillator

This device supports only a low-frequency crystal (32 kHz) on the XIN and XOUT pins. External bypass capacitors for the crystal oscillator pins are required.

It is also possible to apply digital clock signals to the XIN input pin that meet the specifications of the respective oscillator if the appropriate XT1BYPASS mode is selected. In this case, the associated XOUT pin can be used for other purposes. If the XIN and XOUT pins are not used, they must be terminated according to 节 7.6.

图 10-2 shows a typical connection diagram.

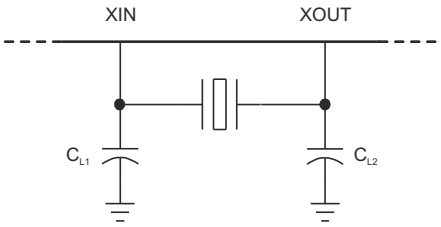

图 10-2. Typical Crystal Connection

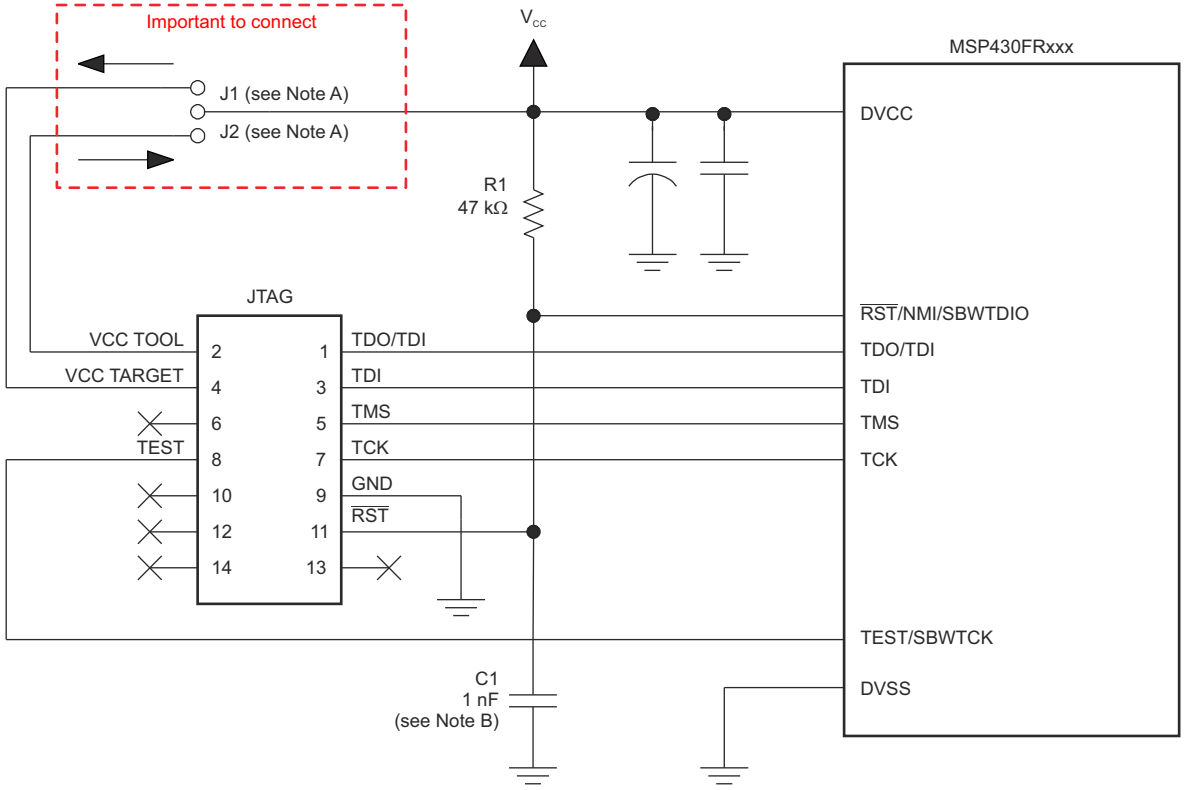
See MSP430 32-kHz Crystal Oscillators for more information on selecting, testing, and designing a crystal oscillator with the MSP430 devices.

10.1.3 JTAG

With the proper connections, the debugger and a hardware JTAG interface (such as the MSP-FET or MSP-FET430UIF) can be used to program and debug code on the target board. In addition, the connections also support the MSP-GANG production programmers, thus providing an easy way to program prototype boards, if desired. 图 10-3 shows the connections between the 14-pin JTAG connector and the target device required to support in-system programming and debugging for 4-wire JTAG communication. 图 10-4 shows the connections for 2-wire JTAG mode (Spy-Bi-Wire).

The connections for the MSP-FET and MSP-FET430UIF interface modules and the MSP-GANG are identical. Both can supply V_{CC} to the target board (through pin 2). In addition, the MSP-FET and MSP-FET430UIF interface modules and MSP-GANG have a V_{CC} sense feature that, if used, requires an alternate connection (pin 4 instead of pin 2). The V_{CC} sense feature detects the local V_{CC} present on the target board (that is, a battery or other local power supply) and adjusts the output signals accordingly. 图 10-3 and 图 10-4 show a jumper block that supports both scenarios of supplying V_{CC} to the target board. If this flexibility is not required, the desired V_{CC} connections may be hard-wired to eliminate the jumper block. Pins 2 and 4 must not be connected at the same time.

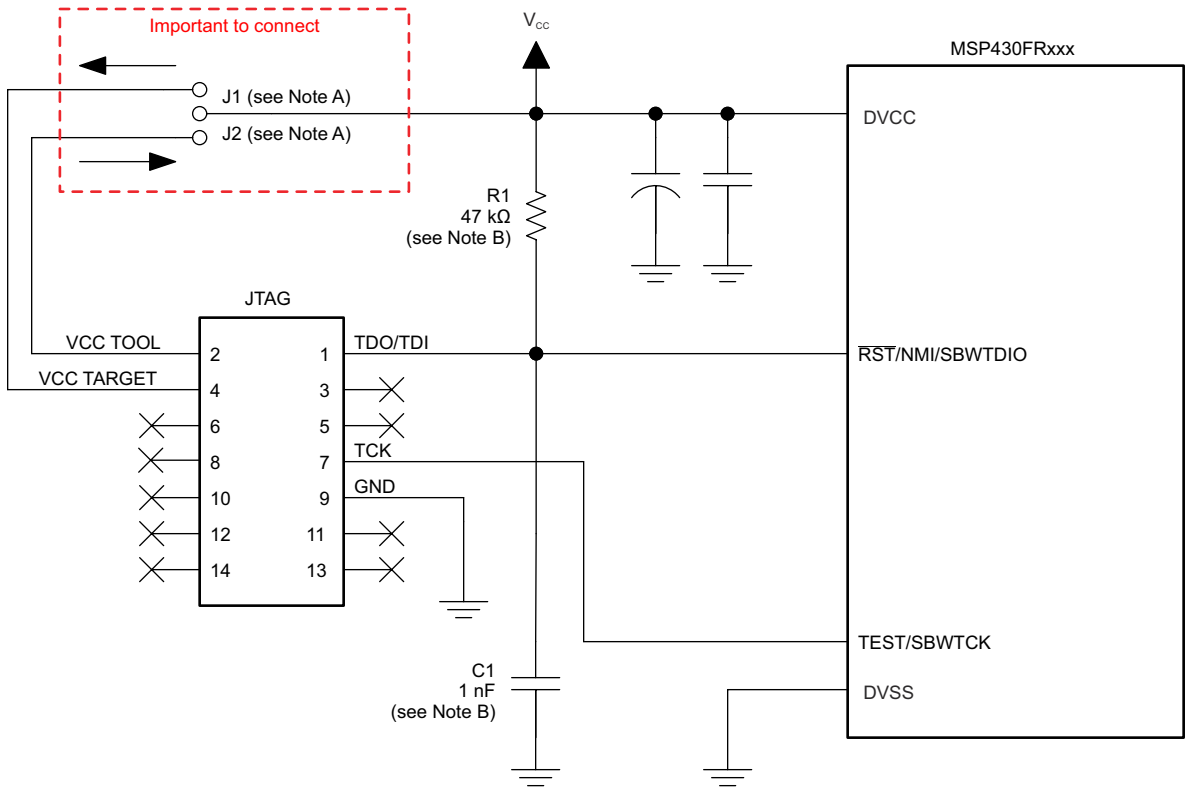
For additional design information regarding the JTAG interface, see the MSP430 Hardware Tools User's Guide.



A. If a local target power supply is used, make connection J1. If power from the debug or programming adapter is used, make connection J2.

B. The upper limit for C1 is 1.1 nF when using current TI tools.

图 10-3. Signal Connections for 4-Wire JTAG Communication



A. Make connection J1 if a local target power supply is used, or make connection J2 if the target is powered from the debug or programming adapter.

B. The device RST/NMI/SBWTDIO pin is used in 2-wire mode for bidirectional communication with the device during JTAG access, and any capacitance that is attached to this signal may affect the ability to establish a connection with the device. The upper limit for C1 is 1.1 nF when using current TI tools.

图 10-4. Signal Connections for 2-Wire JTAG Communication (Spy-Bi-Wire)

10.1.4 Reset

The reset pin can be configured as a reset function (default) or as an NMI function in the Special Function Register (SFR), SFRRPCR.

In reset mode, the RST/NMI pin is active low, and a pulse applied to this pin that meets the reset timing specifications generates a BOR-type device reset.

Setting SYSNMI causes the RST/NMI pin to be configured as an external NMI source. The external NMI is edge sensitive, and its edge is selectable by SYSNMIIES. Setting the NMIIE enables the interrupt of the external NMI. When an external NMI event occurs, the NMIIFG is set.

The RST/NMI pin can have either a pullup or pulldown that is enabled or not. SYSRSTUP selects either pullup or pulldown, and SYSRSTRE causes the pullup (default) or pulldown to be enabled (default) or not. If the RST/NMI pin is unused, it is required either to select and enable the internal pullup or to connect an external 47-kΩ pullup resistor to the RST/NMI pin with a 10-nF pulldown capacitor. The pulldown capacitor should not exceed 1.1 nF when using devices with Spy-Bi-Wire interface in Spy-Bi-Wire mode or in 4-wire JTAG mode with TI tools like FET interfaces or GANG programmers.

See the MP430FR4xx and MP430FR2xx Family User's Guide for more information on the referenced control registers and bits.

10.1.5 Unused Pins

For details on the connection of unused pins, see 节 7.6.

10.1.6 General Layout Recommendations

- Proper grounding and short traces for external crystal to reduce parasitic capacitance. See MSP430 32-kHz Crystal Oscillators for recommended layout guidelines.
- Proper bypass capacitors on DVCC and reference pins, if used.
- Avoid routing any high-frequency signal close to an analog signal line. For example, keep digital switching signals such as PWM or JTAG signals away from the oscillator circuit.
- Proper ESD level protection should be considered to protect the device from unintended high-voltage electrostatic discharge. See MSP430 System-Level ESD Considerations for guidelines.

10.1.7 Do's and Don'ts

During power up, power down, and device operation, DVCC must not exceed the limits specified in 节 8.1, *Absolute Maximum Ratings*. Exceeding the specified limits may cause malfunction of the device including erroneous writes to RAM and FRAM.

10.2 Peripheral- and Interface-Specific Design Information

10.2.1 ADC Peripheral

10.2.1.1 Partial Schematic

图 10-5 shows the recommended decoupling circuit when an external voltage reference is used.

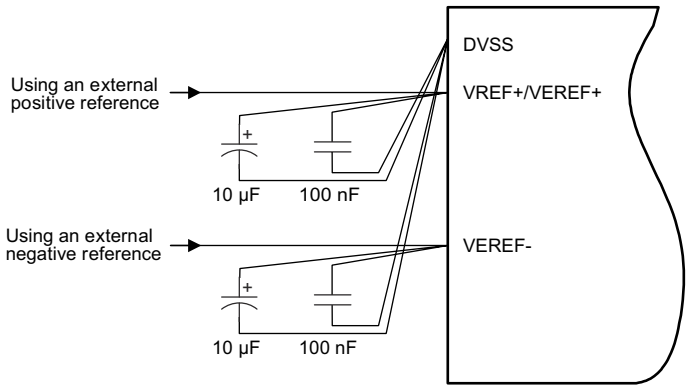


图 10-5. ADC Grounding and Noise Considerations

10.2.1.2 Design Requirements

As with any high-resolution ADC, appropriate printed-circuit-board layout and grounding techniques should be followed to eliminate ground loops, unwanted parasitic effects, and noise.

Ground loops are formed when return current from the ADC flows through paths that are common with other analog or digital circuitry. If care is not taken, this current can generate small unwanted offset voltages that can add to or subtract from the reference or input voltages of the ADC. The general guidelines in 节 10.1.1 combined with the connections shown in 图 10-5 prevent this.

Quickly switching digital signals and noisy power supply lines can corrupt the conversion results, so keep the ADC input trace shielded from those digital and power supply lines. Putting the MCU in low-power mode during the ADC conversion improves the ADC performance in a noisy environment. If the device includes the analog power pair inputs (AVCC and AVSS), TI recommends a noise-free design using separate analog and digital ground planes with a single-point connection to achieve high accuracy.

图 10-5 shows the recommended decoupling circuit when an external voltage reference is used. The internal reference module has a maximum drive current as described in the sections *ADC Pin Enable* and *1.2-V Reference Settings* of the MSP430FR4xx and MSP430FR2xx Family User's Guide.

The reference voltage must be a stable voltage for accurate measurements. The capacitor values that are selected in the general guidelines filter out the high- and low-frequency ripple before the reference voltage

enters the device. In this case, the 10-µF capacitor buffers the reference pin and filters low-frequency ripple. A 100-nF bypass capacitor of filters high-frequency noise.

10.2.1.3 Layout Guidelines

Components that are shown in the partial schematic (see 图 10-5) should be placed as close as possible to the respective device pins to avoid long traces, because they add additional parasitic capacitance, inductance, and resistance on the signal.

Avoid routing analog input signals close to a high-frequency pin (for example, a high-frequency PWM), because the high-frequency switching can be coupled into the analog signal.

10.2.2 CapTIvate Peripheral

This section provides a brief introduction to the CapTIvate technology with examples of PCB layout and performance from the design kit. A more detailed description of the CapTIvate technology and the tools needed to be successful, application development tools, hardware design guides, and software library, can be found in the CapTIvate™ Technology Guide.

10.2.2.2

To learn more on how to design the CapTIvate Technology, see the Capacitive Touch Design Flow for MSP430™ MCUs With CapTIvate™ Technology application report.

10.2.2.3 Measurements

The following measurements are taken from the CapTIvate Technology Design Center, using the CAPTIVATE-PHONE and CAPTIVATE-BSWP panels. Unless otherwise stated, the settings used are the out-of-box settings, which can be found in the example projects. The intent of these measurements is to show performance in a configuration that is readily available and reproducible.

10.2.2.3.1 SNR

The Sensitivity, SNR, and Design Margin in Capacitive Touch Applications application report provides a specific view for analyzing the signal-to-noise ratio of each element.

10.2.2.3.2 Sensitivity

To show sensitivity, in terms of farads, the internal reference capacitor is used as the change in capacitance. In the mutual-capacitance case, the 0.1-pF capacitor is used. In the self-capacitance case, the 1-pF reference capacitor is used. For simplicity, the results for only button 1 on both the CAPTIVATE-PHONE and CAPTIVATE-BSWP panels are reported in 表 10-1.

表 10-1. Button Sensitivity

CONVERSION COUNT	CONVERSION GAIN	CAPTIVATE-PHONE BUTTON 1		CAPTIVATE-BSWP BUTTON 1	
		CONVERSION TIME (µs)	COUNTS FOR 0.1-pF CHANGE	CONVERSION TIME (µs)	COUNTS FOR 1-pF CHANGE
100	100	25	6	50	8
200	200	50	10	100	16
200	100	50	21	100	31
800	400	200	70	400	112
800	200	200	140	400	202
800	100	200	257	400	333

An alternative measure in sensitivity is the ability to resolve capacitance change over a wide range of base capacitance. 表 10-2 shows example conversion times (for a self-mode measurement of discrete capacitors) that can be used to achieve the desired resolution for a given parasitic load capacitance.

表 10-2. Button Sensitivity

(1) These measurements were taken with the CapTIvate MCU processor board with the 470-Ω series resistors replaced with 0-Ω resistors.
(2) 0-V discharge voltage is used.

10.2.2.3.3 Power

The low-power mode LPM3 and LPM4 specifications in 节 8.7 are derived from the CapTIvate technology design kit as indicated in the notes.

11.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. 图 11-1 provides a legend for reading the complete device name.
