

ADC32RF5x デュアル・チャンネル、14 ビット、2.6~3GSPS RF サンプリング・データ・コンバータ

1 特長

- 14 ビット、デュアル・チャンネル 2.6/3GSPS ADC
- ノイズ・スペクトル密度:
 - NSD = -155.6dBFS/Hz (AVG なし)
 - NSD = -158.1dBFS/Hz (2x AVG)
 - NSD = -160.4dBFS/Hz (4x AVG)
- シングル・コア (非インターリーブ) ADC アーキテクチャ
- アパーチャ・ジッタ: 50fs
- 低いクローズイン残留位相ノイズ:
 - 127dBc/Hz (10kHz オフセット時)
- スペクトラム性能 ($f_{IN} = 1\text{GHz}$, -4dBFS 時):
 - 2 倍の内部平均化
 - SNR: 62.3dBFS
 - SFDR HD2, 3: 63dBc
 - SFDR の最大スプリアス: 85dBFS
- スペクトラム性能 ($f_{IN} = 1.8\text{GHz}$, -4dBFS 時):
 - 2 倍の内部平均化
 - SNR: 63dBFS
 - SFDR HD2, 3: 68dBc
 - SFDR の最大スプリアス: 86dBFS
- 入力フルスケール: 1.1~1.35Vpp (2~3.5dBm)
- コード・エラー・レート (CER): 10^{-15}
- フルパワー入力帯域幅 (-3dB): 2.75GHz
- JESD204B シリアル・データ・インターフェイス
 - 最大レーン速度: 13Gbps
 - サブクラス 1 の確定的レイテンシをサポート
- デジタル・ダウンコンバータ
 - ADC チャンネルごとに最大 4 つの DDC
 - 複雑な出力: 4 倍~128 倍のデシメーション (間引き)
 - 48 ビット NCO による位相コヒーレント周波数ホッピング
 - 高速周波数ホッピング: 1us 未満
- 消費電力: 2.6W/チャンネル (2x AVG)
- 電源: 1.8V, 1.2V

2 アプリケーション

- フェーズド・アレイ・レーダー
- スペクトル・アナライザ
- ソフトウェア無線 (SDR)
- 電子戦
- 高速デジタルイザ
- ケーブル・インフラストラクチャ
- 通信インフラ

3 概要

ADC32RF5x は、シングル・コアの 14 ビット、2.6GSPS~3GSPS、デュアル・チャンネル A/D コンバータ (ADC) であり、最大 3GHz の入力周波数での RF サンプリングをサポートします。このデザインは、信号対雑音比 (SNR) を最大化し、-155dBFS/Hz のノイズ・スペクトル密度を実現します。追加の内蔵 ADC とオンチップ信号平均化を使用すると、ノイズ密度は -161dBFS/Hz に向上します。

各 ADC チャンネルは、位相コヒーレント周波数ホッピングをサポートする 48 ビット NCO を使用する、クワッドバンドのデジタル・ダウンコンバータ (DDC) に接続できます。NCO 周波数制御に GPIO ピンを使用すると、1 μ s 未満で周波数ホッピングを実現できます。

ADC32RF54 および ADC32RF55 は、サブクラス 1 の確定的レイテンシを持つ JESD204B シリアル・データ・インターフェイスをサポートし、最大 13Gbps のデータ・レートを使用します。

電力効率の優れた ADC アーキテクチャは、3Gsp/s で 2.1W/ch の消費電力を実現し、低サンプリング・レートで電力スケールングを実現します。

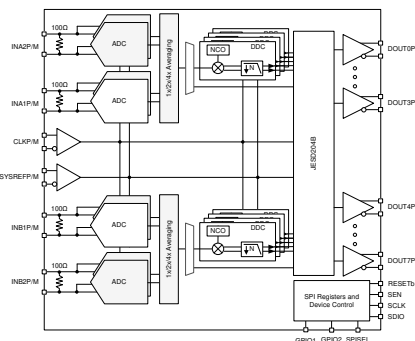

パッケージ情報

部品番号	パッケージ(1)	パッケージ・サイズ(2)
ADC32RF5x	VQFN (64)	9mm × 9mm

- 利用可能なすべてのパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。
- パッケージ・サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

表 3-1. デバイスの比較

部品番号	サンプリング・レート
ADC32RF55	3.0GSPS
ADC32RF54	2.6GSPS

5 Pin Configuration and Functions

图 5-1. RTD Package, 64 Pin VQFN (Top View)

表 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
ANALOG INPUTS			
INA1P	14	I	Differential analog input for channel A. 100 Ω (default) or 50 Ω differential internal termination.
INA1M	15		

表 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
INA2P	18	I	Differential analog input for alternate channel A input. This input is used for additional ADC averaging for channel A. 100 Ω (default) or 50 Ω differential internal termination. Should be connected to GND if unused.
INA2M	19		
INB1P	35	I	Differential analog input for channel B. 100 Ω (default) or 50 Ω differential internal termination.
INB1M	34		
INB2P	31	I	Differential analog input for alternate channel B input. This input is used for additional ADC averaging for channel B. 100 Ω (default) or 50 Ω differential internal termination. Should be connected to GND if unused.
INB2M	30		
VCM	26	O	Common-mode voltage output for the analog inputs.
CLOCK, SYNCHRONIZATION			
CLKP	23	I	Differential sampling clock input. 100 Ω differential internal termination.
CLKM	24		
SYSREFP	27	I	Differential external synchronization input.
SYSREFM	28		
CONTROL			
RESET	11	I	Hardware reset. Active low. This pin has an internal 21 kΩ pullup resistor to AVDD18.
SEN	57	I	Serial interface enable. Active low. This pin has an internal 21 kΩ pull-up resistor to AVDD18.
SCLK	55	I	Serial interface clock input. This pin has an internal 21 kΩ pull-down resistor.
SDIO	56	I/O	Serial interface data input and output. This pin has an internal 21 kΩ pull-down resistor.
GPIO1	39	I	GPIO control pin. This pin is configured through SPI interface for power down or NCO control function.
GPIO2	38	I	GPIO control pin. This pin is configured through SPI interface for power down or NCO control function.
SPISEL	10	I	Determines SPI control: either normal SPI for register writes or fast access to NCO selection only for fast frequency hopping.
DIGITAL DATA INTERFACE			
DOUT0P	4	O	JESD204B high-speed serial data output interface pins for channel A.
DOUT0M	5		
DOUT1P	1		
DOUT1M	2		
DOUT2P	63		
DOUT2M	64		
DOUT3P	60		
DOUT3M	61		
DOUT4P	45	O	JESD204B high-speed serial data output interface pins for channel B.
DOUT4M	44		
DOUT5P	48		
DOUT5M	47		
DOUT6P	50		
DOUT6M	49		
DOUT7P	53		
DOUT7M	52		
POWER SUPPLY			
AVDD18	17,20,29,32, 58	I	Analog 1.8-V power supply
AVDD12	13,16,21,33, 36	I	Analog 1.2-V power supply
CLKVDD	25	I	Clock 1.2-V power supply. Very sensitive to power supply noise. Directly impacts close in aperture phase noise.
DVDD	3,7,9,40,42, 46,54,59	I	Digital 1.2-V power supply
AGND	12,37	I	Analog ground, shorted to thermal pad.
CLKGND	22	I	Clock ground.

表 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
DGND	6,8,41,43,51,62	I	Digital ground.

(1) I = Input, O = Output, I/O = Input or Output.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
Supply voltage range, AVDD18		−0.3	2.1	V
Supply voltage range, AVDD12/CLKVDD/DVDD		−0.3	1.4	V
Voltage applied to input pins	INA1P/M, INB1P/M, INA2P/M, INB2P/M	−0.6	1.2	V
	CLKP/M	−0.3	VDDCLK + 0.3	
	SYSREFP/M	−0.3	AVDD12 + 0.6	
	GPIO1/2, PDN, RESET, SCLK, SEN, SDIO, SPISEL	−0.3	AVDD18 + 0.2	
Peak RF input power (INx1P/M, INx2P/M)	Differential 100 Ω termination.		12	dBm
Junction temperature, T _J			125	°C
Storage temperature, T _{stg}		−65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 1000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
AVDD18	1.8 V analog supply	1.75	1.8	1.85	V
AVDD12	1.2 V analog supply	1.175	1.2	1.225	
CLKVDD	1.2 V clock supply	1.175	1.2	1.225	
DVDD	1.2 V digital supply	1.175	1.2	1.225	
T _A	Operating free-air temperature	−40		85	°C
T _J	Operating junction temperature			105 ⁽¹⁾	°C

- (1) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		ADC32RF5x	UNIT
		RTD (QFN)	
		64 Pins	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	20.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	6.8	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	5.2	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.1	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	5.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.5	°C/W

(1) For more information about thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

6.5 Electrical Characteristics - Power Consumption

Maximum and minimum values are specified over the operating free-air temperature range and nominal supply voltages. Typical values are specified at $T_A = 25^\circ\text{C}$, ADC sampling rate = 3.0 GSPS, Bypass mode, 50% clock duty cycle, AVDD18 = 1.8 V, AVDD12, AVDDCLK, DVDD = 1.2 V and –1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
FS = 3.0 GSPS						
I _{AVDD18}	Supply current, 1.8 V analog supply	Bypass mode, 12-bit output, LMFS = 82820		275		mA
I _{AVDD12}	Supply current, 1.2 V analog supply			930		
I _{CLKVDD}	Supply current, 1.2 V clock supply			125		
I _{DVDD}	Supply current, 1.2 V digital supply			2050		
P _{DIS}	Power dissipation			4.2		W
I _{AVDD18}	Supply current, 1.8 V analog supply	2x averaging, LMFS = 82820		370		mA
I _{AVDD12}	Supply current, 1.2 V analog supply			1270		
I _{CLKVDD}	Supply current, 1.2 V clock supply			130		
I _{DVDD}	Supply current, 1.2 V digital supply			2440		
P _{DIS}	Power dissipation			5.25		W
I _{AVDD18}	Supply current, 1.8 V analog supply	4x averaging, LMFS = 82820		560	620	mA
I _{AVDD12}	Supply current, 1.2 V analog supply			1920	2200	
I _{CLKVDD}	Supply current, 1.2 V clock supply			150	190	
I _{DVDD}	Supply current, 1.2 V digital supply			3020	4200	
P _{DIS}	Power dissipation			7.1		W
FS = 2.6 GSPS						
I _{AVDD18}	Supply current, 1.8 V analog supply	Bypass mode, LMFS = 8224		230		mA
I _{AVDD12}	Supply current, 1.2 V analog supply			770		
I _{CLKVDD}	Supply current, 1.2 V clock supply			120		
I _{DVDD}	Supply current, 1.2 V digital supply			1550		
P _{DIS}	Power dissipation			3.4		W
I _{AVDD18}	Supply current, 1.8 V analog supply	2x averaging, LMFS = 8224		320		mA
I _{AVDD12}	Supply current, 1.2 V analog supply			1050		
I _{CLKVDD}	Supply current, 1.2 V clock supply			130		
I _{DVDD}	Supply current, 1.2 V digital supply			1700		
P _{DIS}	Power dissipation			4.1		W
I _{AVDD18}	Supply current, 1.8 V analog supply	4x averaging, LMFS = 8224		490	600	mA
I _{AVDD12}	Supply current, 1.2 V analog supply			1600	1900	
I _{CLKVDD}	Supply current, 1.2 V clock supply			150	185	
I _{DVDD}	Supply current, 1.2 V digital supply			2100	3400	
P _{DIS}	Power dissipation			5.5		W
POWER DOWN MODES						
P _{DIS}	Power down mode power consumption			190		mW

6.6 Electrical Characteristics - DC Specifications

Maximum and minimum values are specified over the operating free-air temperature range and nominal supply voltages. Typical values are specified at $T_A = 25^\circ\text{C}$, ADC sampling rate = 3.0 GSPS, Bypass mode, 50% clock duty cycle, AVDD18 = 1.8 V, AVDD12, AVDDCLK, DVDD = 1.2 V and -1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DC ACCURACY						
DNL	Differential nonlinearity	$F_{IN} = 10\text{ MHz}$		± 0.85		LSB
INL	Integral nonlinearity	$F_{IN} = 10\text{ MHz}$		± 3.5		LSB
V_{OS_ERR}	Offset error			± 2		%FSR
$GAIN_{ERR}$	Gain error			± 3		%FSR
$GAIN_{Match}$	Gain matching across channels			± 0.2		dB
ADC ANALOG INPUTS (INA1P/M, INB1P/M, INA2P/M, INB2P/M)						
FS	Input full scale	Differential, non-average mode		1.1		V _{pp}
	Input full scale	Differential, 2x or 4x average mode		1.35		
V_{ICM}	Input common mode voltage		250	350	450	mV
Z_{IN}	Differential input impedance	Differential at 100 MHz		100		Ω
V_{OCM}	Output common mode voltage			350		mV
BW	Analog Input Bandwidth (-3 dB)	1x, 2x AVG, RSW=1		2.75		GHz
		4x AVG, RSW=1		2.1		
Phase imbalance, analog input				± 2		deg
Amplitude imbalance, analog input				± 0.5		dB
CMRR	Common mode rejection ratio	$F_{IN} = 100\text{ MHz}$		25		dB
CLOCK INPUT (CLKP/M)						
Input clock frequency		ADC32RF54	500		2600	MHz
		ADC32RF55	500		3000	MHz
V_{ID}	Differential input voltage			1	2.4	V _{pp}
V_{ICM}	Input common mode voltage		0.65	0.75	0.85	V
Z_{IN}	Differential input impedance	Differential at 2.6 GHz		100		Ω
Clock duty cycle			45	50	55	%
SYSREF INPUT (SYSREFP/M)						
V_{ID}	Differential input voltage		600	800	1000	mV _{pp}
V_{ICM}	Input common mode voltage	Input common mode voltage	1.05	1.2	1.4	V
Z_{IN}	Differential input impedance			100		Ω
DIGITAL INPUTS (RESET, PDN, SCLK, SEN, SDIO, GPIO1/2, SPISEL)						
V_{IH}	High-level input voltage		0.8			V
V_{IL}	Low-level input voltage				0.4	V
C_I	Input capacitance			0.6		pF
DIGITAL OUTPUT (SDIO)						
V_{OH}	High-level output voltage	$I_{LOAD} = -400\text{ }\mu\text{A}$	AVDD18 - 0.1	AVDD18		V
V_{OL}	Low-level output voltage	$I_{LOAD} = 400\text{ }\mu\text{A}$			0.1	V

6.6 Electrical Characteristics - DC Specifications (continued)

Maximum and minimum values are specified over the operating free-air temperature range and nominal supply voltages. Typical values are specified at $T_A = 25^\circ\text{C}$, ADC sampling rate = 3.0 GSPS, Bypass mode, 50% clock duty cycle, AVDD18 = 1.8 V, AVDD12, AVDDCLK, DVDD = 1.2 V and -1-dBFS differential input, unless otherwise noted

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
CML SERDES OUTPUTS: DOUT[0:7]P/M						
V_{OD}	Serdes transmitter output amplitude	differential peak-peak		700		mVpp
V_{OCM}	Serdes transmitter output common mode			425		mV
Z_{TX}	Serdes transmitter single ended termination impedance			50		Ω
	Transmitter short-circuit current	Transmitter pins shorted to any voltage between -0.25 V and 1.45 V	-100		100	mA

6.7 Electrical Characteristics - ADC32RF54 AC Specifications (Dither DISABLED)

Maximum and minimum values are specified over the operating free-air temperature range and nominal supply voltages. Typical values are specified at $T_A = 25^\circ\text{C}$, ADC sampling rate = 2.6 GSPS, Bypass mode, No digital averaging, 50% clock duty cycle, AVDD18 = 1.8V, AVDD12, AVDDCLK, DVDD = 1.2V and -1-dBFS differential input, Dither disabled, unless otherwise noted

PARAMETER		TEST CONDITIONS	AIN = -1 dBFS			UNIT
			MIN ⁽¹⁾	TYP	MAX	
NSD	Noise Spectral Density	$f_{IN} = 900\text{ MHz}$, $A_{IN} = -20\text{ dBFS}$ no averaging		-155.5		dBFS/Hz
		$f_{IN} = 900\text{ MHz}$, $A_{IN} = -20\text{ dBFS}$ 2x averaging		-158.1		
		$f_{IN} = 900\text{ MHz}$, $A_{IN} = -20\text{ dBFS}$ 4x averaging		-160.9		
NF	Noise Figure	$f_{IN} = 900\text{ MHz}$, $A_{IN} = -20\text{ dBFS}$ no averaging		20.4		dB

7 Detailed Description

7.1 Overview

The ADC32RF5x is a single core (non-interleaved) 14-bit, 2.6 GSPS to 3 GSPS, dual channel analog to digital converter (ADC). The design maximizes signal-to-noise ratio (SNR) and delivers a noise spectral density of -155 dBFS/Hz. Additional internal ADCs can be used for on-chip averaging (2x and 4x) to further improve the noise density to as low as -161 dBFS/Hz.

The analog signal input is non-buffered to save power consumption with a nominal differential input impedance of 100 Ω. The full power input bandwidth is 2.75 GHz (-3 dB) and the device supports direct RF sampling with input frequencies in the through the L-band. The device is designed for low residual phase noise to support high performance radar applications. The sampling clock input has a dedicated power supply input which requires a very clean power supply.

Each ADC channel can be connected to a quad-band digital down-converter (DDC) using a 48-bit NCO which supports phase coherent frequency hopping. Using the GPIO pins for NCO frequency control, frequency hopping can be achieved in less than 1 μs. The digital down converters support a wide range of instantaneous bandwidth (IBW) coverage - from single wide band mode with 4x complex decimation to up to four narrow bandwidth channels with as high as 128x complex decimation.

The ADC32RF5x supports the JESD204B serial data interface with subclass 1 deterministic latency using data rates up to 13.0 Gbps. In bypass mode, 14-bit output is supported up to a sampling rate of 2.6 Gsps. From 2.6 to 3 Gsps a 12-bit interface with more efficient data packing can be used at expense of quantization noise. When using decimation the output is 16-bit.

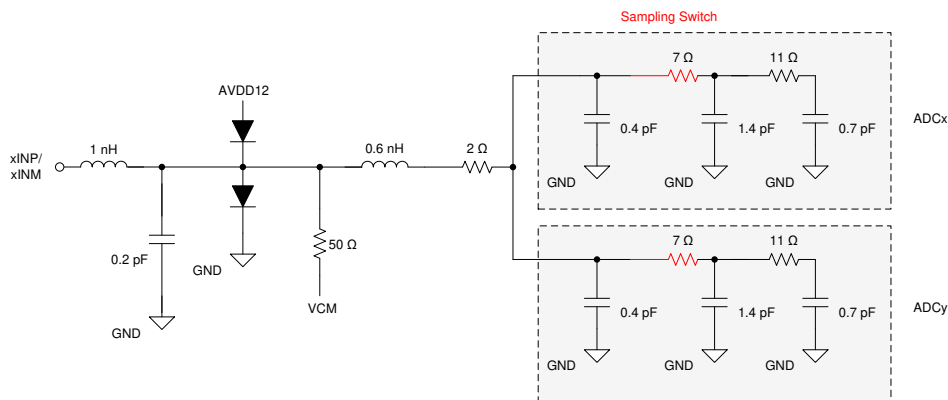

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Inputs

The ADC32RF5x provides up to four internal ADCs per channel for purpose of averaging in order to improve the noise performance. Two ADCs internally are connected to the same differential input pins as shown in the equivalent input schematic (see [7-1](#)). The analog inputs have a differential 100 Ω split termination with internal biasing. This can be changed to differential 50 Ω termination via SPI register write. When only a single ADC is used, there is a minor parasitic capacitance remaining from the unused ADC.

7-1. Equivalent Input Schematic

7.3.1.1 Input Bandwidth and Full-Scale

The input bandwidth (-3 dB) and input fullscale are dependent on what input termination and averaging mode are chosen as shown in the summary in [7-1](#). With 4x averaging enabled, the -3 dB bandwidth reduces to ~ 2.1 GHz and 100 Ω differential termination - the bandwidth can be increased by changing the input termination to 50 Ω differential.

7-1. Digital averaging vs Full Power Input Bandwidth (-3 dB)

# of ADCs averaged	ADC inputs used for averaging	Input Bandwidth (-3 dB)	Selected differential input termination	Effective differential input termination	Input Full-scale
Default	INx1	2.75 GHz	100 Ω	100 Ω	+ 2 dBm
2	INx1	2.75 GHz	100 Ω	100 Ω	+ 3.5 dBm
4	INx1, INx2	2.1 GHz	100 Ω	50 Ω	+ 6.6 dBm

The full power input bandwidth plots with input RESET switch disabled (RSW0) and enabled (RSW1) are shown in [7-2](#).

7-2. Input Bandwidth - Reset switch DIS

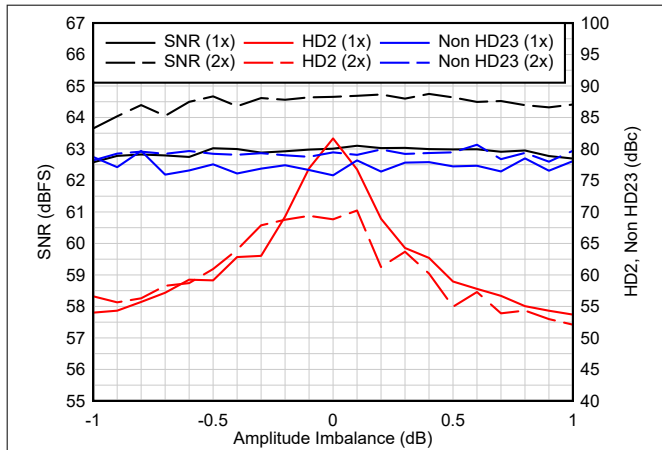

The RESET switch is enabled by default and can be disabled with the following register writes:

表 7-2. Register Write Example for Configuring the RESET Switch

ADDR	DATA	DESCRIPTION
0x05	0x40	Select ANALOG page
0x6D	0xC0	Disable RESET Switch (to enable: 0x00)
0x6E	0x08	Disable RESET Switch (to enable: 0x00)

7.3.1.2 Input Imbalance

The AC performance is sensitive to amplitude and phase imbalance of the analog inputs, as shown in 7-3 and 7-4 for 1x and 2x internal averaging ($F_S = 2.6$ GSPS, $F_{IN} = 0.9$ GHz, $A_{IN} = -1$ dBFS, dither = DIS) and 7-5 and 7-6 ($F_S = 3.0$ GSPS, $F_{IN} = 0.9$ GHz, $A_{IN} = -1$ dBFS, dither = DIS).

7-3. Amplitude Imbalance - 2.6 GSPS

7-4. Phase Imbalance - 2.6 GSPS

7-5. Amplitude Imbalance - 3.0 GSPS

7-6. Phase Imbalance - 3.0 GSPS

7.3.1.3 Overrange Indication

The ADC provides two options (configured using SPI) to indicate if input fullscale overrange occurred:

- Fast Overrange on GPIO1/2 pins: indication is available after ~ 6 clock cycles and the overrange indication flag stays high (sticky) until it is cleared via SPI register writes. Note: OVRA and OVRB or OR-ed together and given on GPIO1 and 2.
- Overrange embedded in JESD stream: in this configuration the overrange indicator replaces the LSB of the output data of the corresponding channel. The indicator is output ahead of the data and is updated every clock cycle.

表 7-3. JESD OVR Latency

Decimation	# of Bands	OVR Latency (incl JESD, in sampling clock cycles)
DDC Bypass	-	140-144
8	Single (real and complex), dual	44
	Quad	33
16	Single (real and complex), dual	80
	Quad	58
32	Single (real and complex), dual	152
	Quad	108
64	Single (real and complex), dual	296
	Quad	208
128	Single (real and complex), dual	584
	Quad	408

The overrange output flag (GPIO or JESD) is the output of individual overrange flags of all ADCs per channel being used. For example, in non-averaged mode the overrange indication per channel is for a single ADC while in 4x average mode the overrange flag of all 4 ADCs are OR-ed together. 表 7-4 shows how to configure the OVR using SPI registers.

表 7-4. Programming example to configure the OVR to GPIO or JESD

0x31	0x06	Set OVR to non-sticky			

7.3.1.4 Analog out-of-band dither

The ADC32RF5x provides optional (enabled via SPI writes) analog out-of-band, large amplitude dither. It has a bandwidth of ~ 20 MHz located at DC and an adjustable amplitude with a maximum dither power of ~ -20 dBFS (PAR ~ 9 dB). The dither is completely rolled-off into the noise floor within ~ 100 MHz as illustrated in [Figure 7-7](#). Since the dither is large amplitude, it is recommended for the signal input not to exceed -2.5 dBFS to avoid input saturation. The dither signal also couples to the input signal and, depending on input frequency, can degrade the close in phase noise.

Figure 7-7. Analog out-of-band dither

In the frequency domain the dither signal shows up like individual tones as shown in [Figure 7-8](#). The dither update frequency can be adjusted with the dither divider setting. The dither update frequency is: $F_S / 4 / 2047 / \text{'Dither Divider'}$. In the frequency spectrum there will be 2 larger dither spurs at $F_{IN} \pm F_S / 4 / \text{'Dither Divider'}$.

By default, the divider is set to 50, which translates to a dither spur spacing of ~ 7 kHz. A divider setting of 32 translates to a dither spacing of ~ 11 kHz as shown in [Figure 7-9](#). The lower the divider setting, the higher the dither tone frequency. [Figure 7-9](#) also shows that the dither energy reduces as the offset frequency increases - less dither energy reduces the higher harmonic spur improvement.

Figure 7-8. Dither Close-Up

Figure 7-9. Dither vs Dither Divider Setting

The analog dither needs to be enabled in multiple locations. Different dither amplitudes should be used depending on internal averaging used as shown in [表 7-5](#).

表 7-5. Recommended Dither Amplitude Settings

Mode	Amplitude	Dither Amp1	Dither Amp2
1x AVG	+/-1024 codes	0	0
1x AVG	+/-768 codes	0	-4
2x/4x AVG	+/-1024 codes	3	0
2x/4x AVG	+/-768 codes	0	0

The internal analog dither can be enabled via the following register writes. The dither divider is set in register 0xB1 as actual -1 (e.g. a divider of 48 would be programmed as 47, default is 0x00 which is divider = 50). See [表 7-6](#).

表 7-6. Register Write Example for Configuring the Internal Dither

ADDR	DATA	DESCRIPTION	ADDR	DATA	DESCRIPTION

0x91	0x40		0x20	0x00	
0xAF	0x10		0x04	0x00	

7.3.2 Sampling Clock Input

The internal sampling clock path was designed for lowest residual phase noise contribution. The sampling clock circuitry requires a dedicated low noise power supply for best performance. The internal residual clock phase noise is also sensitive to clock amplitude. For best performance, the clock amplitude should be larger than 1 V_{PP}. The phase noise ideally improves by 3 dB per 2x averaging, however at higher input frequencies the clock path contribution reduces the improvement.

表 7-7. Internal Aperture Clock Phase Noise
(F_S = 3 Gsps, V_{IN} = 1 V_{PP})

Frequency Offset (MHz)	Amplitude (dBc/Hz)
0.001	-117
0.01	-127
0.1	-137
1	-147
10	-154
250	-160

The clock input and ADC sampling circuitry also have an amplitude noise component which modulates on to the sampled input signal. Unlike phase noise, the amplitude noise does not scale with input frequency, it is only affected by the sampling reset switch as shown in 7-10 and 7-11. This noise component can dominate the close in noise performance at lower input frequencies.

7-10. Amplitude Noise vs Input Frequency

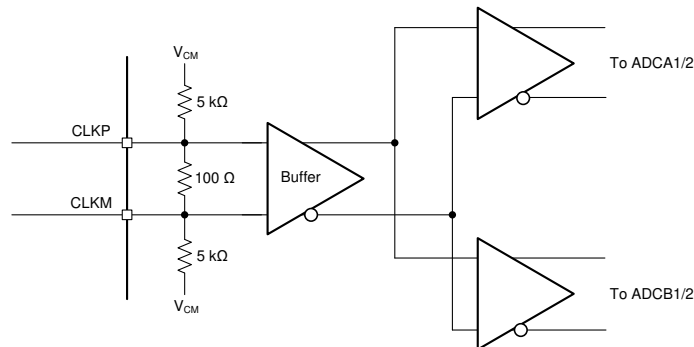

7-11. Amplitude and Phase noise at 10 kHz offset vs Input Frequency

The internal aperture jitter is also dependent on the amplitude of the external clock input signal. [7-12](#) and [7-13](#) show the expected SNR performance with dither on/off across clock amplitude ($F_S = 2.6$ GSPS).

The sampling clock input is internally terminated to $100\ \Omega$ differentially and provides a return loss better than 10 dB at 3 GHz (see [7-14](#)). The clock input consists of a single clock input buffer followed by a dedicated clock buffer for ADCA1/2 as well as ADCB1/2. When averaging multiple ADCs, there are some close in clock buffer noise which is correlated; and thus, does not improve with averaging.

7-14. Internal Clock Input Routing

7.3.3 SYSREF

The SYSREF input signal is used to reset internal digital blocks and align them to the internal multi-frame clock in order to achieve deterministic latency subclass 1. The SYSREF input signal can be AC or DC coupled (selected via SPI register option) as shown in [Figure 7-15](#). The ADC32RF5x has internal 100-Ω termination for DC coupling and internal biasing when using AC coupling.

A register mask can be used to only give SYSREF to the NCO (see NCO section) in the decimation filter block, and leave all other blocks such as JESD interface unaffected.

When giving a periodic SYSREF signal, its frequency is required to be a sub-harmonic of the internal local multi-frame clock (LMFC). The LMFC frequency is determined by the selected decimation, frames per multi-frame setting (K), samples per frame (S) and the device sampling frequency (FS).

表 7-8. LMFC and SYSREF settings for different operating modes

Operating Mode	LMFS Mode	LMFC Clock Frequency	SYSREF Frequency
DDC Bypass Mode	82820	$FS / (20 * K)$	$FS / (N * 20 * K)$
	8224	$FS / (4 * K)$	$FS / (N * 4 * K)$
Decimation	Various	$FS / (D * S * K)$	$FS / (N * D * S * K)$

where N is an integer value (1, 2, 3...)

After enabling SYSREF input, the internal SYSREF input ignores any incoming SYSREF pulse after the first 16 pulses.

图 7-15. SYSREF Input Circuitry and Edge Alignment

The internal synchronization using the external SYSREF signal can be enabled with the following register writes (see [Table 7-9](#))

表 7-9. Register Write Example for Enabling SYSREF Synchronization

AC coupling with internal biasing of the SYSREF input can be enabled with the following SPI register writes (see [Table 7-10](#))

表 7-10. Register Write Example for Enabling SYSREF AC Coupling

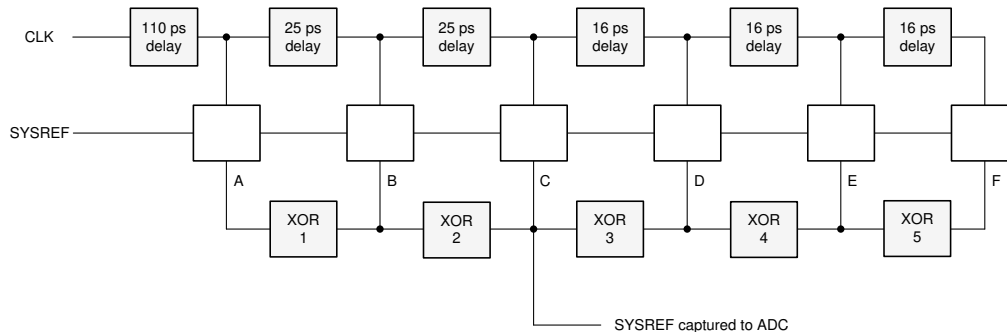

ADDR	DATA	DESCRIPTION
0x05	0x40	Select ANALOG page
0xB4	0x01	Enable external AC coupling with internal biasing on SYSREF

7.3.3.1 SYSREF Capture Detection

The SYSREF input signal rising edge should be edge aligned with the rising edge of the sampling clock in order to maximize the setup and hold times. The ADC32RF5x includes an internal SYSREF monitoring circuitry to detect possible metastability resulting in a clock cycle slip; and thus, misalignment across devices.

The sampling clock gets delayed by ~160 ps and then captures the SYSREF signal. The SYSREF monitoring circuitry captures the SYSREF signal ±50 ps (-50, -25, +16, +32, +48 ps) around the main SYSREF capture. In ideal conditions no SYSREF transition happens within the 100 ps SYSREF capture window and all XOR flags show "0". If a SYSREF/clock misalignment happens and the SYSREF transition falls within the SYSREF monitoring window, then one of the XOR flags (which monitor adjacent SYSREF captures within the window) shows a "1" and the SYSREF can be adjusted externally.

The SYSREF monitor registers are not *sticky* registers, which are updated at every rising edge of SYSREF.

7-16. SYSREF Detection Circuitry

7-17 shows a misaligned SYSREF signal where the SYSREF signal arrives much later than the sampling clock rising edge. The SYSREF window feature checks if the SYSREF transition is within ±50 ps of the instant when the SYSREF signal gets captured by the sampling clock.

In this example, the delayed SYSREF signal transitions between the "B" and "C" flip flop which raises the XOR2 flag. The XOR flags get reported in register 0x22F in the digital page. In this example, Register 0x22F reads back 0x8B, as shown in [Table 7-11](#).

7-17. Detection of SYSREF Transition Within Capture Window

表 7-11. SYSREF Window Register Example (0x22F)

ADDR	D7	D6	D5	D4	D3	D2	D1	D0

	1	0	0	0	1	0	1	1

7.3.4 ADC Foreground Calibration

The internal ADC architecture is sensitive to temperature changes. The devices contains two additional internal ADC cores. One for channel A1/2, and one for channel B1/2 which are used when one of the ADCs is in calibration. The ADCs are calibrated as pairs where one ADC at a time is connected to the internal calibration DAC. The calibration is configured via SPI register writes and can be executed using SPI register writes or using the GPIO1 pin. When executed, the calibration takes $\sim 23 \text{ ms} \times 3 \text{ GSPS} / F_S$ per ADC pair ($\sim 11.5 \text{ ms} \times 3 \text{ GSPS} / F_S$ per ADC). The example in [Figure 7-18](#) shows 2x internal averaging where 4 ADC cores (#1, #2 for chA1 and #6, #7 for chB1) are used in operation and ADCs #5 and #10 for calibration.

Figure 7-18. Internal ADC setup for 2x averaging mode

7.3.4.1 Calibration Control

Figure 7-19 shows a timing diagram of the calibration control using GPIO1 pin.

When GPIO1 transitions to LOW logic state:

- an ADC pair gets swapped out within ~ 120 ns
- a new calibration gets triggered immediately

If GPIO1 is being held low when the calibration of an ADC pair is completed, the next ADC pair is switched and a new calibration is triggered. The order in which ADC pair are calibrated is configured via SPI to serial or random.

When using 2x averaging for example, the calibration is executed for 3 ADC pairs to make sure all ADCs in use have been recently calibrated.

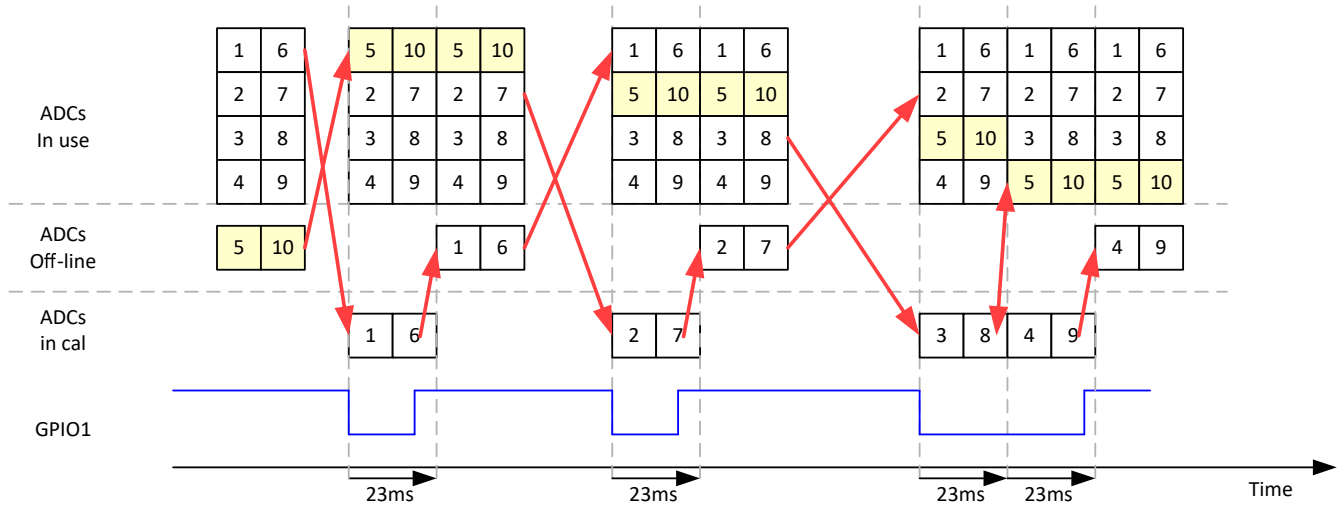

Figure 7-19. Timing Diagram - Calibration (4x AVG Example)

Figure 7-20 shows the ADC switch happens approximate 120 ns after the logic level change on GPIO1 is detected.

Figure 7-20. Timing Diagram Shows the ADC Switch

7.3.4.2 ADC Switch

During the ADC transition, the amplitude drops for 1-2 samples as shown in [Figure 7-21](#). The gain variation from one ADC to the next is $\sim < 0.05$ dB while the phase change is less 0.01 deg as shown in [Figure 7-22](#).

Figure 7-21. Output Code vs ADC Sample

Figure 7-22. Amplitude and Phase vs Time

7.3.4.3 Calibration Configuration

The ADC32RF5x provides 3 different options to configure the internal foreground calibration:

- Calibrate all ADCs one time using SPI trigger (after initial power up or during operation) - see [Table 7-12](#)
- Continuous calibration - see [Table 7-13](#)
- Calibrate 2 ADC pairs at a time using GPIO trigger - see [Table 7-14](#)

The status of the calibration can be read back from register 0x298 (CALIBRATION page). Successful calibration reads back 0x0E on the 4 LSB of that register.

7.3.5 Decimation Filter

The ADC32RF5x provides up to four digital down converters per ADC channel, see [Figure 7-23](#). The decimation filters provide a flexible option to cover a wide range of instantaneous bandwidths (IBW) as shown in [Table 7-15](#). Single band decimation supports a wide bandwidth up to complex decimation by 4x while up to four narrow band channels with up to 128x complex decimation are supported in quad band decimation mode.

Figure 7-23. Digital Decimation Filter Options

Table 7-15. Summary of Different Decimation Filter Band Options

# of DDCs	Minimum Complex Decimation	Maximum Complex Decimation
1	4	128
2	8	128
4	16	128

The decimation filter can be configured to two different operating modes:

- **Complex Decimation:** This mode provides complex output with ~ 80% passband bandwidth using a 48-bit phase coherent NCO.

During the complex mixing operation the digital output is reduced by 6-dB. This reduces the fullscale from 0-dBFS to -6-dBFS. This 6-dB change applies to signals and noise and thus no dynamic range is lost.

- **Real Decimation:** In real decimation mode, the complex mixer is bypassed (NCO is set to 0 for lowest power consumption), and the digital filter acts as a low pass filter. There is no frequency shifting and the output passband bandwidth is ~ 40%.

Since the JESD204B interface is common across ADC channel A and B, the decimation ratio as well as the # of DDCs/ADC has to be the same across channels A and B.

By default, the output of values of the decimation filter are rounded to 16-bit resolution. In order to avoid quantization noise limitation when using high order of decimation (that is /64 or /128), a special 20-bit output mode can be enabled (see [20-bit Output Mode](#)).

[Table 7-16](#) provides an overview of the available complex decimation settings and resulting complex and real output bandwidths.

Table 7-16. Complex Decimation Setting vs Output Bandwidth

Decimation Factor N (complex)	Complex Output Bandwidth per DDC	$F_S = 3 \text{ Gsps}$		Real Output Bandwidth per DDC	$F_S = 3 \text{ Gsps}$	
		Complex Output Rate per DDC	Complex Output Bandwidth per DDC		Real Output Rate per DDC	Real Output Bandwidth per DDC
4	$0.8 \times F_S / 4$	750 Msps	600 MHz	$0.4 \times F_S / 4$	750 Msps	300 MHz
8	$0.8 \times F_S / 8$	375 Msps	300 MHz	$0.4 \times F_S / 8$	375 Msps	150 MHz
16	$0.8 \times F_S / 16$	187.5 Msps	150 MHz	$0.4 \times F_S / 16$	187.5 Msps	75 MHz
32	$0.8 \times F_S / 32$	93.75 Msps	75 MHz	$0.4 \times F_S / 32$	93.75 Msps	37.5 MHz
64	$0.8 \times F_S / 64$	46.875 Msps	37.5 MHz	$0.4 \times F_S / 64$	46.875 Msps	18.75 MHz
128	$0.8 \times F_S / 128$	23.4375 Msps	18.75 MHz	$0.4 \times F_S / 128$	23.4375 Msps	9.375 MHz

7.3.5.1 Decimation Filter Response

This section provides the different decimation filter responses with a normalized ADC sampling rate. The complex filter pass band is ~ 80% (-1 dB) with a minimum of 85 dB stop band rejection.

0xA2		Select JESD PLL INPUT3 settings

7.3.5.3 20-bit Output Mode

The device includes a 20-bit output resolution mode which can be used for high order decimation (that is. 64x, 128x) in order to avoid SNR degradation due to quantization noise limitation. In this mode the output data is transmitted at 2x the output rate. The 20-bit sample from the DDC gets expanded to 32-bit by adding 12x 0s, and occupies 2 consecutive 16-bit samples. This doubles the number of octets 'F' and the proper LMFS mode and JESD PLL settings have to be selected.

For example, a single band complex decimation would go from LMFS = 2441 (16-bit output mode) to LMFS = 2481 (20-bit output mode) as illustrated in 表 7-18.

表 7-18. JESD Frame Assembly Comparison between 16-bit and 20-bit Output Mode

LMFS = 2441				LMFS = 2481								
xI ₀ [15:8]	xI ₀ [7:0]	xQ ₀ [15:8]	xQ ₀ [7:0]	xI ₀ [31:24]	xI ₀ [23:16]	xI ₀ [15:8]	xI ₀ [7:0]	xQ ₀ [31:24]	xQ ₀ [23:16]	xQ ₀ [15:8]	xQ ₀ [7:0]	
				20-bit sample I				0000 0000000	20-bit sample Q			0000 0000000

The 20-bit output mode is enabled by setting D7 in 0x2C (DIGITAL page) and selecting viable decimation and LMFS mode.

7.3.5.4 Dynamic Switching

The ADC32RF5x supports a dynamic switch mode between two decimation filter configurations without the need to resynchronize the JESD204B interface. This enables support for single, wideband DDC and 4 narrow band DDCs that can be switched in between with minimum impact on latency.

Two different configurations are supported in the dynamic switching mode. Each configuration maintains the # of serdes lanes and serdes output rate during the switch. 表 7-19 shows the specific supported configurations for LMFS and decimation settings for a 2 lane and a 1 lane setup. Since the amount of output data in quad band mode is four times larger compared to single band, the decimation factor in quad band mode needs to be reduced by a factor of four compared to the single band case.

表 7-19. Dynamic switch configuration modes

	Single Band DDC		Quad Band DDC	
	LMFS	Complex Decimation	LMFS	Complex Decimation
2 lanes	2-4-16-4	/16	2-16-16-1	/64
1 lane	1-4-32-4	/32	1-16-32-1	/128

There is no information in the JESD204B output data stream indicating if the output data is quad band or single band. The JESD204B receiving device controls the switching and thus needs to decode the incoming data for quad band or single band mode. The LMFS value transmitted ILA when the JESD204B link is established is always from the quad band mode in order to avoid ILA errors at the start of the link.

The dynamic switch is configured with these register writes:

表 7-20. Dynamic switch configuration writes

2 Lanes: 2-4-16-4 to 2-16-16-1		1 Lane: 1-4-32-4 to 1-16-32-1

7.3.5.5 Numerically Controlled Oscillator (NCO)

Each digital down-converter (DDC) uses a 48-bit numerically controlled oscillator (NCO) to fine tune the frequency placement prior to the digital filtering. Different NCO frequencies for each DDC are programmed using SPI register writes and the desired NCO frequency can be selected using SPI or the GPIO pins. When using the GPIO pins for NCO frequency control, frequency hopping can be achieved in less than 1 μ s. The digital NCO is designed to have a SFDR of at least 100 dB. The number of available, programmable NCO frequencies depends on # of DDC bands used as illustrated in 表 7-23.

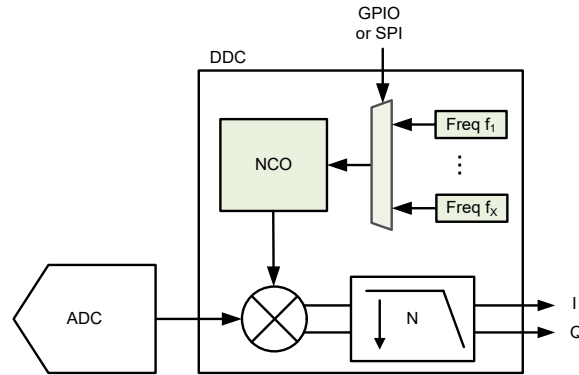

図 7-38. NCO Block Diagram

表 7-23. Available # of Frequencies per NCO Depending on # of DDCs Used

# of DDCs used	# of Frequencies per NCO
1	8
2	4
4	4

There are two NCO operating modes (0x180 in DDC page): phase continuous and infinite phase coherent.

Phase Continuous NCO: During a NCO frequency change, the NCO phase gradually adjusts to the new frequency as shown in 図 7-39. The *dashed* line shows the phase of original f_1 frequency.

Infinite Phase Coherent NCO: With a phase coherent NCO, all frequencies are synchronized to a single event using SYSREF. This enables an infinite amount of frequency hops without the need to reset the NCO as phase coherency is maintained between frequency hops. This is illustrated in 図 7-39 (right). When returning to the original frequency f_1 , the NCO phase appears as if the NCO had never changed frequencies.

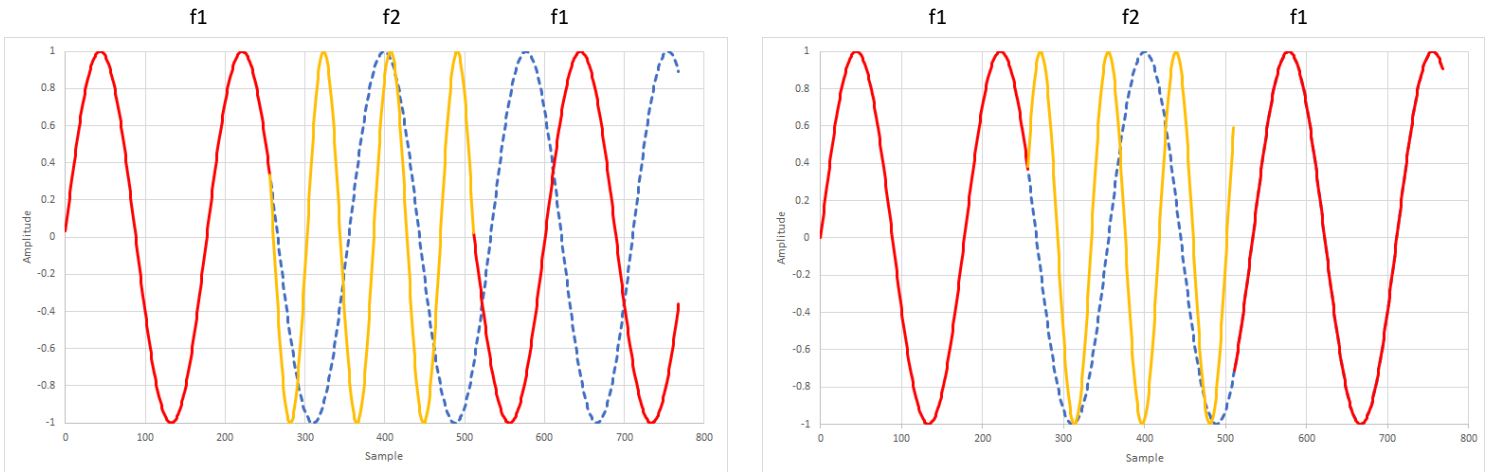

图 7-39. Phase Continuous (left) and Infinite Phase Coherent (right) NCO Frequency Switching

The oscillator generates a complex exponential sequence of:

$$e^{j\omega n} \text{ (default) or } e^{-j\omega n} \tag{1}$$

where: frequency (ω) is specified as a signed number by the 48-bit register setting

The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to $f_{IN} + f_{NCO}$. The NCO frequency can be tuned from $-F_S/2$ to $+F_S/2$ and is processed as a signed, 2s complement number.

The NCO frequency setting is set by the 48-bit register value given and calculated as:

$$\text{NCO frequency (0 to } +F_S/2\text{): } \text{NCO} = f_{NCO} \times 2^{48} / F_S \tag{2}$$

$$\text{NCO frequency } (-F_S/2 \text{ to } 0\text{): } \text{NCO} = (f_{NCO} + F_S) \times 2^{48} / F_S \tag{3}$$

where:

- NCO = NCO register setting (decimal value)
- f_{NCO} = Desired NCO frequency (MHz)
- F_S = ADC sampling rate (MSPS)

The NCO programming is illustrated with this example:

- ADC sampling rate $F_S = 3000$ MSPS
- Desired NCO frequency = 920 MHz

$$\text{NCO frequency setting} = f_{NCO} \times 2^{48} / F_S = 920 \text{ MHz} \times 2^{48} / 3000 \text{ MSPS} = 86,318,992,857,935 \tag{4}$$

表 7-24 shows the register writes to set frequency 1 of NCO1 of DDCA to that frequency:

表 7-24. Example Register Writes to Change NCO Frequency

0x181	0x30	

7.3.5.6 NCO Frequency Programming

There are 4 separate NCOs per channel - one for each band (such as, NCO1 = band 1) and 4 different frequencies can be programmed per NCO as shown in [Figure 7-40](#). The NCO frequencies are located in the DDCA/B pages (0x05 0x08 for channel A and 0x05 0x10 for channel B) in registers 0x100 to 0x17D. Depending on # of bands used, the frequencies for each NCO are selected in registers 0x3B and 0x41 (DIGITAL page) as shown in [Table 7-25](#). If the NCO frequencies are the same for channel A and channel B, they can be written to both DDCA and DDCB pages simultaneously by selecting both pages (0x05 0x18).

Channel A		Channel B	
NCO1 1: 0x100..0x105 2: 0x108..0x10D 3: 0x110..0x115 4: 0x118..0x11D	NCO3 1: 0x140..0x145 2: 0x148..0x14D 3: 0x150..0x155 4: 0x158..0x15D	NCO1 1: 0x100..0x105 2: 0x108..0x10D 3: 0x110..0x115 4: 0x118..0x11D	NCO3 1: 0x140..0x145 2: 0x148..0x14D 3: 0x150..0x155 4: 0x158..0x15D
NCO2 1: 0x120..0x125 2: 0x128..0x12D 3: 0x130..0x135 4: 0x138..0x13D	NCO4 1: 0x160..0x165 2: 0x168..0x16D 3: 0x170..0x175 4: 0x178..0x17D	NCO2 1: 0x120..0x125 2: 0x128..0x12D 3: 0x130..0x135 4: 0x138..0x13D	NCO4 1: 0x160..0x165 2: 0x168..0x16D 3: 0x170..0x175 4: 0x178..0x17D

Figure 7-40. Multi-Band NCO

Single band DDC uses the frequencies of both NCO1 and NCO2 for a combined 8 different frequencies for NCO1 using 3 bit control (NCO2 CHx [1] and NCO1 CHx [1:0]). The NCO2 selection bit (D3) decides if frequencies from NCO1 or NCO2 are being used. In dual and quad band DDC operating mode, there are 4 frequencies per NCO available and selected using 2 register bits (NCOx CHx [1:0]). The NCO frequency selection registers are shown in [Table 7-25](#).

Table 7-25. NCO Frequency Selection SPI Interface Registers

# OF BANDS	ADDR	D7	D6	D5	D4	D3	D2	D1	D0
SINGLE	0x3B	0	0	0	0	NCO2 CHA [1]	0	NCO1 CHA [1:0]	
	0x41	0	0	0	0	NCO2 CHB [1]	0	NCO1 CHB [1:0]	
DUAL	0x3B	0	0	0	0	NCO2 CHA [1:0]		NCO1 CHA [1:0]	
	0x41	0	0	0	0	NCO2 CHB [1:0]		NCO1 CHB [1:0]	
QUAD	0x3B	NCO4 CHA [1:0]		NCO3 CHA [1:0]		NCO2 CHA [1:0]		NCO1 CHA [1:0]	
	0x41	NCO4 CHB [1:0]		NCO3 CHB [1:0]		NCO2 CHB [1:0]		NCO1 CHB [1:0]	

To select a different frequency for the NCO, two registers (0x3B and 0x41) in the DIGITAL page have to be updated. Assuming a SPI clock frequency of 10 MHz (100 ns period), programming two registers (2x (16 bit address and 8 bit data) = 48 bit) means that the NCO frequency would be updated in ~ 5 us.

When updating the currently being used NCO frequency to a new frequency, the following command has to be written in order to load the new frequency into the NCO - 0x181 0x00/0x30 in each of the DDCA/B pages.

Table 7-26. Example Register Writes

ADDR	DATA	DESCRIPTION
0x05	0x02	Select DIGITAL page
0x3B	0x01	Select frequency 2 for NCO1 of channel A.
0x235	0xFF	Select NCO using SPI
0x05	0x08	Select DDCA page
0x10D...0x108	0x..	Write new frequency in frequency 2 of NCO1 of channel A

表 7-26. Example Register Writes (continued)

ADDR	DATA	DESCRIPTION
0x181	0x00	Update NCO with current frequencies from the register map.
0x181	0x30	

The NCO phase accumulators can be reset using the external SYSREF signal. A SYSREF mask can be setup such the SYSREF signal only goes to the NCO and the remaining device remains unaffected. The following register writes configure the SYSREF mask to only affect the NCO. After completion, the SYSREF mask should be set back to default.

表 7-27. Example Register Writes to configure the SYSREF MASK

ADDR	DATA	DESCRIPTION
0x05	0x02	Select DIGITAL page
0x357	0xA2	SYSREF mask settings (0x00 is mask default)
0x358	0x02	SYSREF mask settings (0x00 is mask default)

7.3.5.7 Fast Frequency Hopping

The ADC32RF5x supports several different options to update the NCO frequencies. Fast frequency hopping can be achieved in one of the following ways:

- Using the GPIO1/2 pins to select the NCO frequency
- Using the GPIO1/2, SPISEL and SCLK/SDIO pins to select the NCO frequency
- Using the GPIO1/2 pins to program the NCO frequency selection (Fast SPI)

NCO CONTROL	SCLK	SDIO	SPISEL	GPIO1	GPIO2	NCO SEL MODE
Regular SPI (default)	SPI Interface		0	used for other purpose		00
GPIO1/2	SPI Interface		0	used for NCO control		00
GPIO1/2, SPISEL, SCLK/SDIO	NCO CONTROL		1	used for NCO control		00
FAST SPI	SPI Interface		1	SDIO	SCLK	10

The internal NCO is switched quickly; however, the switching time depends primarily on the time it takes to flush out the decimation filter as shown in [表 7-28](#).

表 7-28. NCO Switching Time ($F_S = 2.6$ GSPS) vs Decimation Setting

Decimation Setting	NCO Switching Time
/4	~ 250 ns
/8	~ 350 ns
/16	~ 600 ns
/32	~ 1 us
/64	~ 2 us
/128	~ 4 us

7.3.5.7.1 Fast frequency hopping Using the GPIO1/2 pins

The NCO frequency is selected as shown in 表 7-29. This mode is enabled with the following register write:

1. Set 0x234 to 0x03 (NCO SEL MODE = 0, GPIO MODE = 3)

表 7-29. NCO Frequency Selection Using GPIO1/2 Pins

# OF BANDS	GPIO2	GPIO1	GPIO2	GPIO1	GPIO2	GPIO1	GPIO2	GPIO1
SINGLE	0	0	0	0	0	0	NCO1 CHA [1:0]	
	0	0	0	0	0	0	NCO1 CHB [1:0]	
DUAL	0	0	0	0	NCO2 CHA [1:0]		NCO1 CHA [1:0]	
	0	0	0	0	NCO2 CHB [1:0]		NCO1 CHB [1:0]	
QUAD	NCO4 CHA [1:0]		NCO3 CHA [1:0]		NCO2 CHA [1:0]		NCO1 CHA [1:0]	
	NCO4 CHB [1:0]		NCO3 CHB [1:0]		NCO2 CHB [1:0]		NCO1 CHB [1:0]	

7.3.5.7.2 Fast frequency hopping using GPIO1/2, SEN and SDIO pins

This mode is enabled by setting the SPISEL to logic high and using the following register write:

1. Set 0x234 to 0x63 (NCO SEL MODE = 3, GPIO MODE = 3)

表 7-30. NCO Frequency Selection SPI Interface Registers

# OF BANDS	SDIO	SEN	GPIO2	GPIO1	SDIO	SEN	GPIO2	GPIO1
SINGLE	0	0	0	0	NCO2 CHA [1]	0	NCO1 CHA [1:0]	
	0	0	0	0	NCO2 CHB [1]	0	NCO1 CHB [1:0]	
DUAL	0	0	0	0	NCO2 CHA [1:0]		NCO1 CHA [1:0]	
	0	0	0	0	NCO2 CHB [1:0]		NCO1 CHB [1:0]	
QUAD	NCO4 CHA [1:0]		NCO3 CHA [1:0]		NCO2 CHA [1:0]		NCO1 CHA [1:0]	
	NCO4 CHB [1:0]		NCO3 CHB [1:0]		NCO2 CHB [1:0]		NCO1 CHB [1:0]	

7.3.5.7.3 Fast Frequency Hopping Using the Fast SPI

In this mode, the GPIO1/2 pins are used as a "fast SPI" input which only updates the NCO selection registers. No register address information needs to be sent. GPIO1 pin is SDIO and GPIO2 pin is SCLK.

This mode is enabled by setting the SPISEL to logic high and using the following register write:

1. Set 0x234 to 0x43 (NCO SEL MODE = 2, GPIO MODE = 3)

The NCO frequencies are selected as shown in 表 7-31.

表 7-31. NCO Frequency Programming Using FAST SPI

# OF BANDS	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

DUAL	0	0	0	0	NCO2 CHB [1:0]		NCO1 CHB [1:0]		0	0	0	0	NCO2 CHA [1:0]		NCO1 CHA [1:0]	
QUAD	NCO4 CHB [1:0]		NCO3 CHB [1:0]		NCO2 CHB [1:0]		NCO1 CHB [1:0]		NCO4 CHA [1:0]		NCO3 CHA [1:0]		NCO2 CHA [1:0]		NCO1 CHA [1:0]	

7.3.6 JESD204B Interface

The ADC32RF5x uses the JESD204B high-speed serial interface to transfer data from the ADC to the receiving logic device. ADC32RF5x serialized lanes are capable of operating up to 13 Gbps, slightly above the JESD204B max lane rate. A maximum of 8 lanes can be used to allow lower lane rates for interfacing with speed limited logic devices. [Figure 7-41](#) shows a simplified block diagram of the JESD204B interface.

Figure 7-41. JESD204B Block Diagram

7.3.6.1 JESD204B Initial Lane Alignment (ILA)

The receiving device starts the initial lane alignment process by deasserting the $\overline{\text{SYNC}}$ signal. When a logic low state is detected on the $\overline{\text{SYNC}}$ input, the ADC starts transmitting comma characters (K28.5) in order to establish the code group synchronization, as shown in [Figure 7-42](#). When synchronization is completed, the receiving device reasserts the $\overline{\text{SYNC}}$ signal and the ADC starts the initial lane alignment sequence with the next local multi-frame clock (LMFC) boundary. The ADC transmits four multi-frames, each containing K frame (K is SPI programmable). Each of the multi-frames contains the frame start and frame end symbols. The second multi-frame also contains the JESD204B link configuration data.

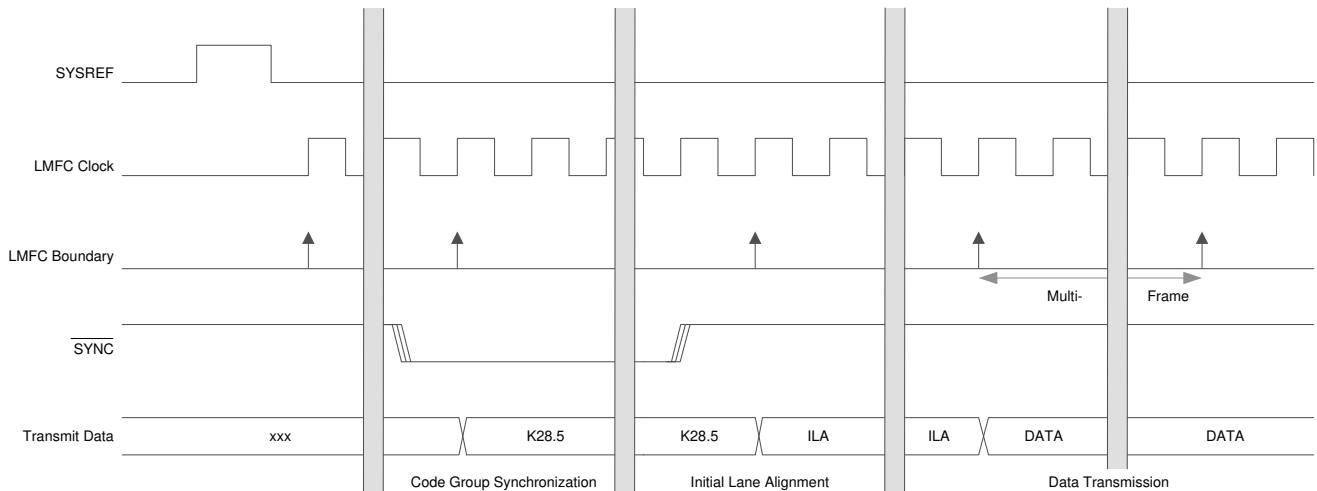

Figure 7-42. JESD204B Internal Timing Diagram

7.3.6.1.1 $\overline{\text{SYNC}}$ Signal

The $\overline{\text{SYNC}}$ signal can be issued using one of two different methods:

- One of the GPIO1/2 pins can be configured via SPI to become the $\overline{\text{SYNC}}$ input pin (address 0x234 in the digital page)
- The synchronization command can be issued via SPI register write (address 0x21 in the JESD page)

When using the GPIO1/2 pins for the $\overline{\text{SYNC}}$ signal input, the device also supports the option to invert the signal polarity (address 0x236 in the digital page).

7.3.6.2 JESD204B Frame Assembly

The JESD204B standard defines the following parameters:

- L: number of lanes per link
- M: number of converters per device
- F: number of octets per frame clock period
- S: number of samples per frame

7.3.6.3 JESD204B Frame Assembly in Bypass Mode

表 7-32 lists the available JESD204B formats and corresponding valid sampling rate ranges for the ADC32RF5x. The sampling rates are limited by the minimum and maximum SERDES line rate as well as ADC sampling clock frequencies. The JESD204B frame assembly for the different lanes is shown in 表 7-33.

When internal digital averaging is used, the output resolution is automatically adjusted from 14-bit to 16-bit to avoid quantization noise limitation.

表 7-32. JESD Mode Options: Bypass Mode

DECIMATION SETTING D (complex)	OUTPUT RESOLUTION (Bits)	L	M	F	S	MIN F _S (Gsp/s)	MAX F _S (Gsp/s)	RATIO [f _{SERDES} /F _S]
Bypass	12 ⁽¹⁾	8	2	8	20	0.5	3.0	4
	14/16 ⁽²⁾	8	2	2	4	0.5	2.6	5
		4	2	2	2	0.5	1.3	10

(1) In full rate output, two LSBs are truncated to a 12-bit output.

(2) When using digital averaging the output resolution changes to 16-bit.

7.3.7 SERDES Output MUX

The SERDES output block contains one digital mux per SERDES output lane with a 3-bit register. This allows routing any of the 8 digital streams to any output serdes transmitter as shown in the example in [图 7-43](#). The MUX can be used to reorder lanes as well as duplicate lane outputs (for example in LMFS = 1-4-8-1 mode the same output stream could be duplicated on all 8 lanes).

图 7-43. SERDES output mux for DOUT0

By default after power, the active SERDES lanes start on lane DOUT0 as shown for the complex decimation dual band example in [表 7-45](#). After power up, the output is transmitted on lanes DOUT0..3. Using the digital output muxes, the output data for channel B is shifted from lanes DOUT2,3 to DOUT4,5. All SERDES transmitters are powered up and enabled by default. After configuring the output mux unused lanes can be powered down to save power consumption.

表 7-45. JESD Sample Frame Assembly: Complex Decimation - Dual Band with LMFS = 4841

OUTPUT LANE	Default				Using MUX			
DOUT0	A1I ₀ [15:8]	A1I ₀ [7:0]	A1Q ₀ [15:8]	A1Q ₀ [7:0]	A1I ₀ [15:8]	A1I ₀ [7:0]	A1Q ₀ [15:8]	A1Q ₀ [7:0]

DOUT7								

[表 7-46](#) shows the register writes to shift the output lanes from default as illustrated in [表 7-45](#).

表 7-46. Example register writes to shift the output serdes lanes using the SERDES Output MUX

ADDR	DATA	DESCRIPTION
0x05	0x04	Select JESD page
0x81	0x54	Select internal JESD streams 4 and 5 to lanes DOUT2 and DOUT3
0x82	0x32	Select internal JESD streams 2 and 3 to lanes DOUT4 and DOUT5

7.3.8 Test Pattern

The ADC32RF5x provides two different options to output test patterns instead of the actual output data of the ADC in order to simplify the serial interface and system debug of the JESD204B digital interface link. The output data path is shown in [Figure 7-44](#).

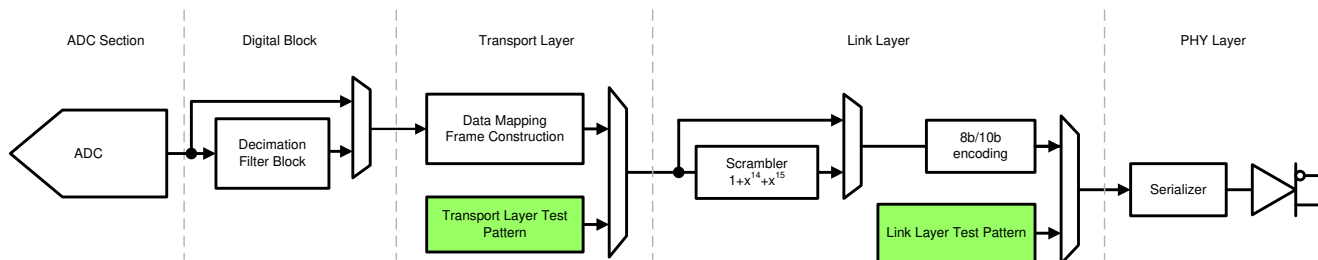

Figure 7-44. Test Pattern Options

The available test patterns in each block are described in [Table 7-47](#). Both test pattern blocks replace output data from the digital block, and not from the ADC; therefore, it is available in decimation or decimation bypass mode. The test patterns are synchronized with the SYSREF signal.

Table 7-47. Test Pattern Overview

TEST PATTERN LOCATION	TYPE	8b/10b encoded	REGISTER PAGE	REGISTER
TRANSPORT LAYER	CUSTOM PATTERN	Yes	JESD 0x05 0x04	0x2E, D0
	TOGGLE 1010 PATTERN	Yes		0x2E, D1
	RAMP PATTERN	Yes		0x2E, D2
LINK LAYER	JESD204B TEST PATTERNS	Depends		0x2D, D2-D0
	PRBS PATTERN ($2^7..2^{31}$)	No		0x2F, D6-D4

The RAMP pattern provides two different output options. Internally each ADC data bus consists of parallel data streams (1 stream per serdes lane). The RAMP pattern is generated for each stream and a different starting value can be set for each stream. By default, the starting values are 0. For example, a LMFS mode using 4 lanes/ADC would show a *slow* ramp which increments once every 4 clock cycles with starting values set to 0 and ramp increment = 1. Also, a RAMP pattern which increments every clock cycle can be set using different starting values (such as 0, 1, 2, 3) for the 4 streams/lanes and setting the RAMP increment to 4. The follow table shows how to enable the RAMP test pattern.

Table 7-48. RAMP Test Pattern

ADDR	DATA	DESCRIPTION
0x05	0x04	Select JESD page
0x32	0x01	Set lane DOUT1 starting value = 1
0x34	0x02	Set lane DOUT2 starting value = 2
0x36	0x03	Set lane DOUT3 starting value = 3
0x42	0x01	Set lane DOUT5 starting value = 1
0x44	0x02	Set lane DOUT6 starting value = 2
0x46	0x03	Set lane DOUT7 starting value = 3
0x2E	0x34	Enable RAMP pattern, RAMP increment = 4

7.3.8.1 Transport Layer

The transport layer maps the ADC output data into 8-bit octets and constructs the JESD204B frames using the LMFS parameters. Tail bits or 0's are added when needed. Alternatively, test patterns can be substituted instead of the ADC data with the JESD frame, as shown in [Table 7-47](#).

7.3.8.2 Link Layer

The link layer contains the scrambler and the 8b/10b encoding of any data passed on from the transport layer. Additionally, the link layer controls the initial lane alignment sequence that can be manually restarted. The link layer test patterns are intended for testing the quality of the link (jitter testing and so forth). The test patterns do not pass through the 8b/10b encoder and contain the options listed in [表 7-47](#).

7.3.8.3 Internal Capture Memory Buffer

The ADC includes a small internal capture memory buffer which can store up to 64 samples. Once a strobe is given to the memory using SPI register write, the memory will store the next continuous 64 samples of one ADC channel (selected via SPI register write) and stop. The samples are captured from the ADC cores (prior to averaging or decimation). These samples can be read back using the SPI interface without involving the JESD204B interface at all.

This mode allows debug of the analog front end during the initial bring-up phase even if the JESD204B interface is not operational yet.

表 7-49. Register writes to enable the internal sample capture buffer

ADDR	DATA	DESCRIPTION
0x05	0x02	Select DIGITAL page
0x34		Select ADC channel (D5/D4) and give strobe (D6). The 64 samples are stored in 0x800 to 0x87F in the digital page

7.4 Device Functional Modes

The device offers two different operating modes: bypass mode (1x AVG) and digital averaging (2x/4x AVG). Both operating modes use the same digital back end and JESD204B output configurations.

7.4.1 Digital Averaging

The ADC32RF5x provides a total of eight internal single core 3.0 Gsps ADCs. Normal bypass mode uses only two ADC cores (one ADC per channel). However, the additional six ADCs can be used to trade off further noise density improvement against additional power consumption. [图 7-45](#) shows the internal block diagrams for the digital averaging modes. In averaging mode the output resolution is increased to 16-bit to avoid quantization noise limitation.

In 2x averaging mode (left), one external input is connected to the INx1 input where two ADC cores internally average the input signal. In 4x averaging (right), the signal has to be split externally and connected to both the INx1 and INx2 inputs where four ADC cores internally average the signal.

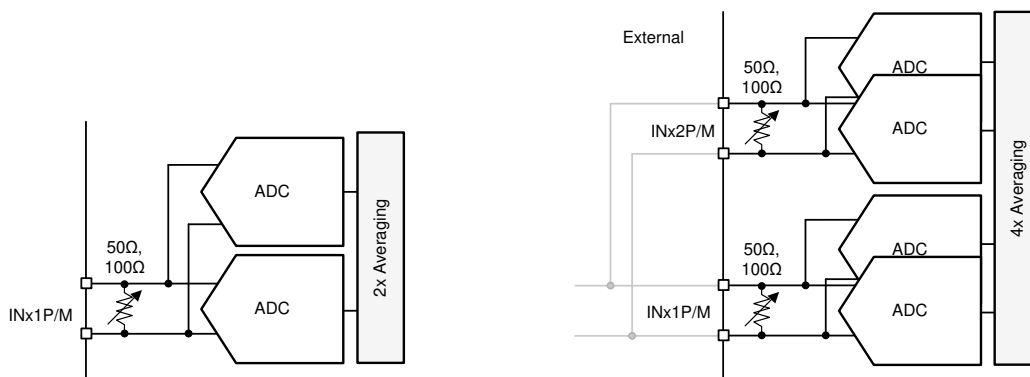

图 7-45. Internal digital averaging (left: 2x, right: 4x)

[表 7-50](#) provides a trade-off comparison of the 3 different averaging mode options vs the default, non-averaged mode.

表 7-50. Digital Averaging vs Full Power Input Bandwidth (-3 dB)

# of ADCs averaged	ADC inputs used for averaging	Input Bandwidth (-3 dB)	Selected differential input termination	Noise density	Power/ch (W)
Default	INx1	2.75 GHz	100 Ω	-156 dBFS/Hz	~2.1
2	INx1	2.75 GHz	100 Ω	-158 dBFS/Hz	~2.6
4	INx1, INx2	2.1 GHz	100 Ω	-160 dBFS/Hz	~3.5

Digital averaging improves decorrelated noise contributions by 3 dB per 2x AVG (ideal) while correlated noise does not improve with averaging. Some of the dominant noise sources are correlated, that is, clock jitter (external or first clock input buffer), or power supply noise. While others (such as, ADC thermal noise, clock distribution buffers) are decorrelated. [表 7-51](#) illustrates a performance example comparison across averaging options.

SNR: When operating close to ADC fullscale, some of the SNR limitation is due to jitter and hence the SNR improvement will not reach 3 dB (2x AVG) or 6 dB (4x AVG). As the input fullscale is reduced, the clock jitter contribution to SNR becomes less and the SNR improvement is approaching the ideal 3 dB per 2x AVG. The same phenomenon can be observed when using digital decimation. As the decimation factor increases, the close-in (correlated noise) becomes the more dominating noise unless the input signal amplitude is reduced.

SFDR: The amplitude of low order harmonics (HD2-HD5) and IMD3 typically is similar across ADCs; thus, the improvement with averaging is small.

表 7-51. Performance Comparison Example with 1x/2x/4x Averaging with $F_S = 2.6$ GSPS, $F_{IN} = 1$ GHz and Dither EN

Parameter	Input Amplitude (dBFS)	1x AVG	2x AVG	4x AVG
SNR (dBFS)	-4	62.8	64.9	67.2
	-10	63.9	66.3	68.2
	-20	64.0	66.4	69.4
HD2 (dBc)	-4	66	62	71
	-10	74	74	75
	-20	70	70	80
HD3 (dBc)	-4	73	76	78
	-10	80	78	80
	-20	74	71	72
Non HD23 (dBFS)	-4	86	84	83
	-10	90	91	92
	-20	96	100	97
IMD3 (dBc)	-10 dBFS/tone	77	73	71
	-20 dBFS/tone	78	79	72

7.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI); however, it can operate in a default configuration without requiring the SPI interface. Furthermore, the power down function as well as NCO frequency hopping or JESD synchronization are possible via pin control (GPIO1/2 pins).

7.5.1 GPIO Pin Control

There are several commands which can be executed using SPI programming or GPIO pins. 表 7-52 provides an overview of the commands available using GPIO pins.

表 7-52. GPIO Pin Command Options

FEATURE	DESCRIPTION
JESD SYNC	Support for single ended CMOS or differential LVDS
NCO Control	Fast frequency hopping with 3 different control options
Fast Overrange	GPIO1 indicates overrange for channel A and GPIO2 for channel B. In this mode the overrange indication is 'sticky' - the flag stays high until it is cleared using SPI commands.
Calibration Freeze	Freezes swapping of calibration ADC

7.5.2 Configuration Using the SPI Interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 20 MHz down to ~ 1 MHz and also with a non-50% SCLK duty cycle.

7.5.2.1 Register Write

The internal registers can be programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16-bit address) and bits A[14:12] in address field to 0.
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8-bit data that are latched in on the SCLK rising edges

Figure 7-46 shows the timing requirements for the serial register write operation.

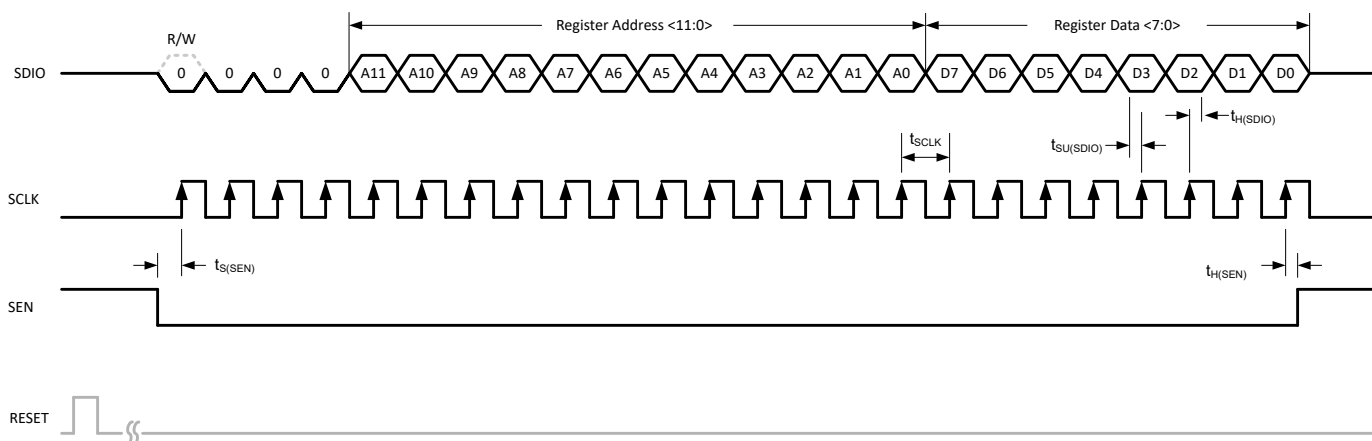

Figure 7-46. Serial Register Write Timing Diagram

7.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1. This setting disables any further writes to the registers. Set A[14:12] in address field to 0.
3. Initiate a serial interface cycle specifying the address of the register (A[11:0]) whose content must be read
4. The device outputs the contents (D[7:0]) of the selected register on the SDIO pin
5. The external controller can latch the contents at the SCLK falling edge

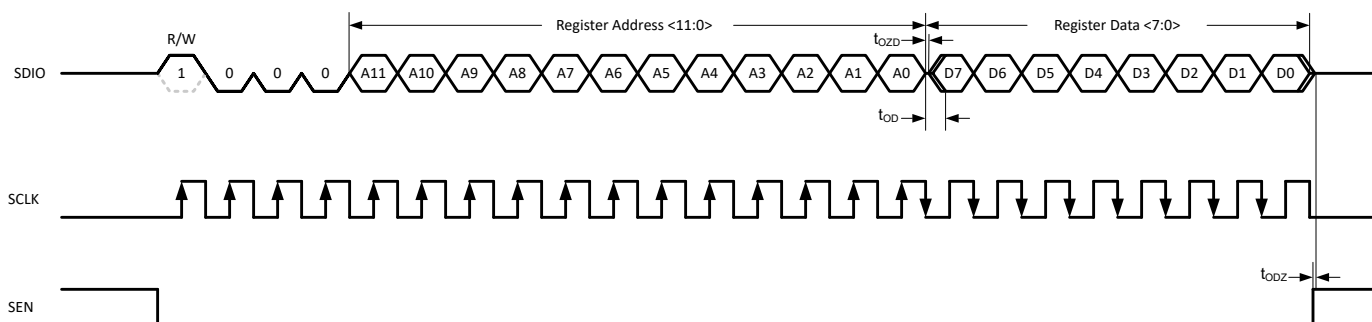

Figure 7-47. Serial Register Read Timing Diagram

Bit	Field	Type	Reset	Description
7	1	R/W	1	Must write 1
6-2	SYSREF X1..5	R/W	0	These bits are the XOR flags from the SYSREF window monitoring circuitry. The sampling clock gets delayed internally by ~ 160 ps and used to capture the SYSREF signal. If a SYSREF signal transition happens within +/- 50 ps of the SYSREF capture the appropriate XOR flag gets raised. These bits are not sticky - they get overwritten with the next SYSREF rising edge. X1: Window from 110 ps to 135 ps after the rising sampling clock edge X2: Window from 135 ps to 160 ps after the rising sampling clock edge X3: Window from 160 ps to 176 ps after the rising sampling clock edge X4: Window from 176 ps to 192 ps after the rising sampling clock edge X5: Window from 192 ps to 208 ps after the rising sampling clock edge 0: No SYSREF transition detected 1: SYSREF transition detected within given window
1	SYSREF OR	R/W	0	This bit is the output of the five SYSREF XOR flags logically OR'ed together. 0: no SYSREF flag raised 1: one of the five SYSREF XOR flags is raised.
0	1	R/W	1	Must write 1

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The ADC32RF5x can be used in a wide range of applications including radar, frequency domain digitizer and spectrum analyzer, test and communications equipment and software-defined radios (SDRs). The Typical Applications section describe one configuration that meets the needs of a number of these applications.

8.2 Typical Applications

8.2.1 Wideband RF Sampling Receiver

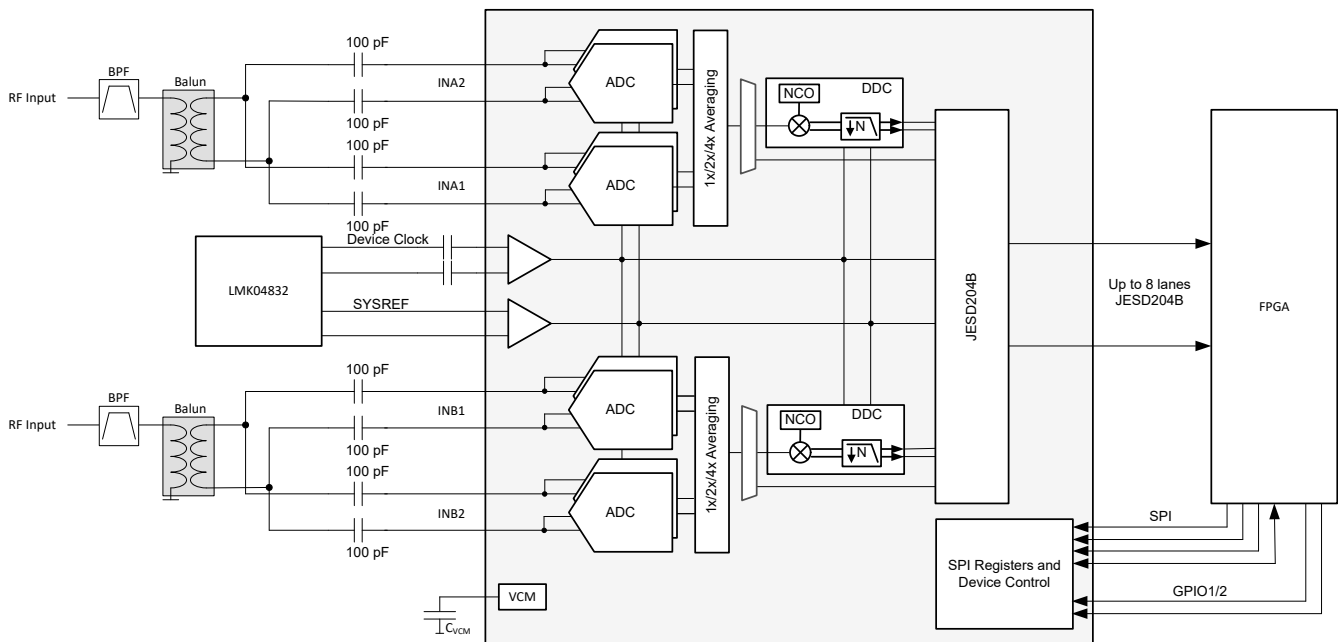

図 8-1. Typical Configuration for Wideband RF Sampling

8.2.1.1 Design Requirements

8.2.1.1.1 Input Signal Path

Appropriate band limiting filters should be used to reject unwanted frequencies in the receive signal path.

A 1:2 (for 100 ohm effective termination impedance) or a 1:1 (for 50 ohm effective termination impedance) balun transformer is needed to convert the single ended RF input to differential for input to the ADC. The balun outputs should be AC coupled with 100 pF capacitors. The balun should have good amplitude (< 0.5 dB) and phase balance (less than 2 deg) within the frequency range of interest. A back-to-back balun configuration often times gives better SFDR performance. 表 8-1 lists a number of recommended baluns for different impedance ratios and frequency ranges.

The S-parameters of the ADC input can be used in order to design the front end matching network.

表 8-1. Recommended Baluns

PART NUMBER	MANUFACTURER	IMPEDANCE RATIO	AMPLITUDE BALANCE (dB)	PHASE BALANCE (°)	FREQUENCY RANGE
BAL-0009SMG	Marki Microwave	1:2	0.6	5	0.5 MHz to 9 GHz
TCM2-43X+	Minicircuits	1:2	0.5	7	10 MHz to 4 GHz
TCM2-33WX+	Minicircuits	1:2	0.7	4	10 MHz to 3 GHz
TC1-1-13M+	Minicircuits	1:1	0.5	2-3	10 MHz to 3 GHz

8.2.1.1.2 Clocking

The device clock inputs must be AC-coupled to the device to provide the rated performance. The clock source must have low jitter (integrated phase noise) for the ADC to meet the stated SNR performance, especially when operating at higher input frequencies. The clock signal may need to be filtered with a band pass filter in order to remove some of the broad band clock noise.

The JESD204B data converter system (ADC and FPGA) requires additional SYSREF and device clocks. The LMK04828 or LMK04832 devices are suitable to generate these clocks. Depending on the ADC clock frequency and jitter requirements. The device may also be used as a system clock synthesizer or as a device clock and SYSREF distribution device when using multiple ADC32RF5x devices in a system.

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Sampling Clock

In order to maximize the SNR performance of the ADC a very low jitter (< 50 fs) sampling clock is required. [8-2](#) shows the estimated SNR performance vs input frequency vs external clock jitter. The internal ADC aperture jitter also has some dependency to the clock amplitude (gets more sensitive with higher input frequency) as shown in [8-3](#).

When using averaging and/or decimation, the SNR for a single ADC core should be estimated first before adding the SNR improvement from internal averaging and/or decimation.

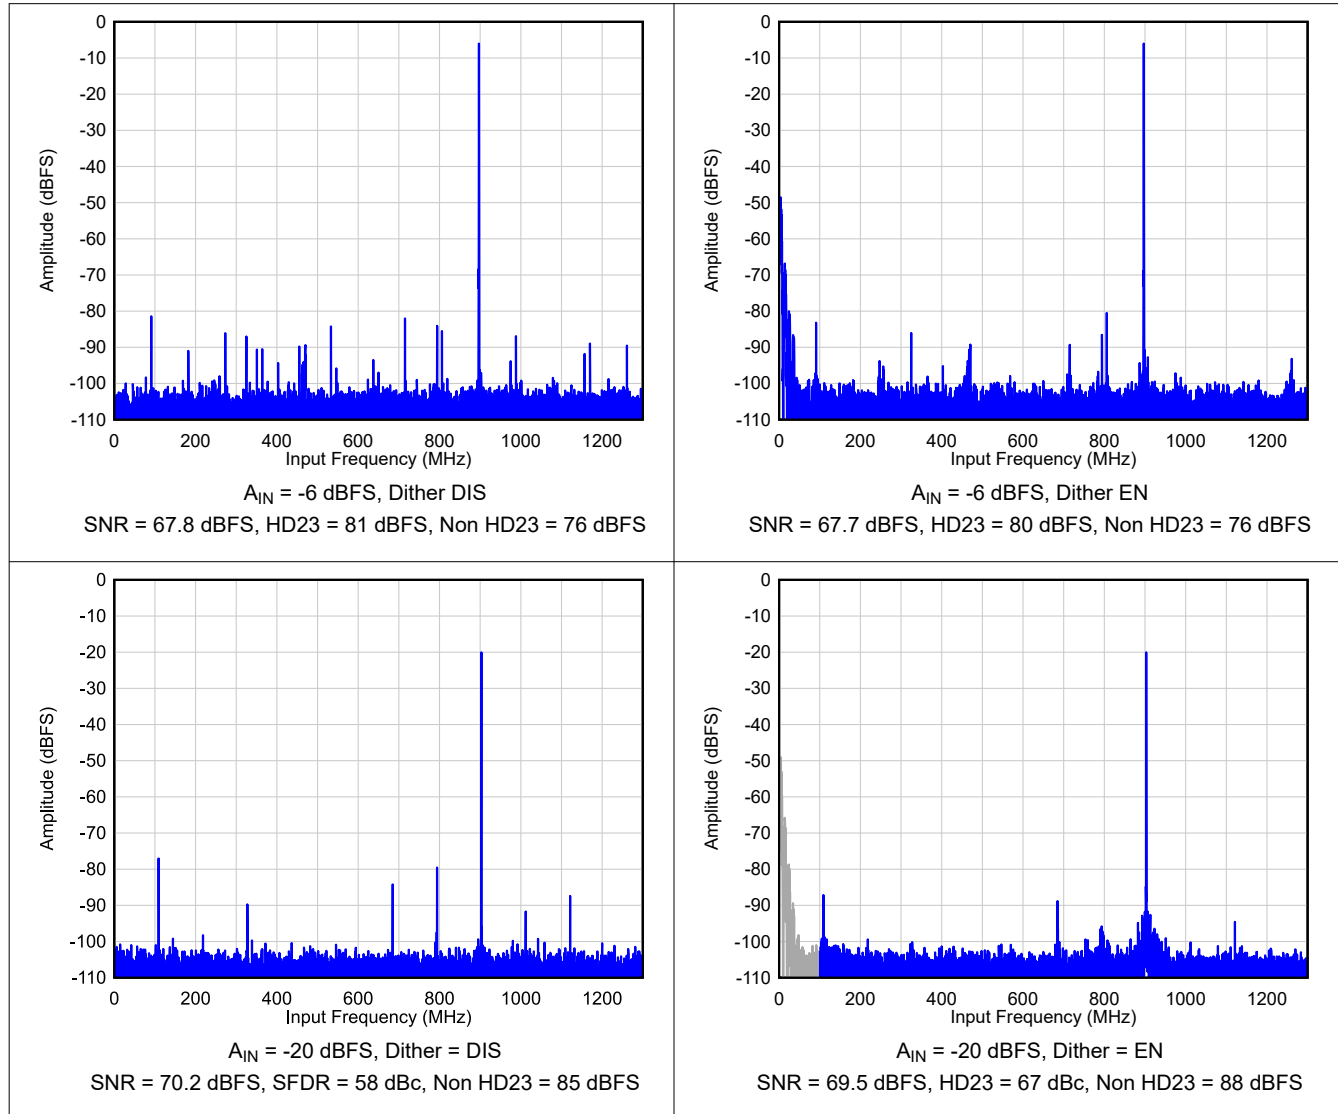

8-2. SNR vs T_{Jitter} vs F_{IN} (1x AVG)

8-3. SNR vs Clock Amplitude (dither off)

8.2.1.3 Application Curves

The following application curves demonstrate performance and results only of the ADC using a balun front end and configured to 4x internal averaging. The input frequency is 900 MHz ($F_S = 2.6$ GSPS) and input amplitudes of -6 and -20 dBFS are shown with dither enabled/disabled.

8.3 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a low pulse on the RESET pin, as shown in [Figure 8-4](#).

1. Apply 1.2 V DVDD digital power supply
2. Apply remaining 1.2 V power supplies (AVDD12, CLKVDD), in no specific order
3. Apply 1.8 V AVDD18 power supply
4. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses.
5. Begin programming the internal registers using the SPI interface.

Figure 8-4. Initialization of Serial Registers After Power-Up

Table 8-2. Power-Up Timing

		MIN	TYP	MAX	UNIT
t_1	Power-on delay: delay from power up to active high RESET pulse	1			ms
t_2	Reset pulse width: active low RESET pulse width	100			ns
t_3	Register write delay: delay from RESET disable to SEN active	45k			Clock cycles

8.3.1 Initial Device Configuration After Power-Up

The following section outlines the sequence of register writes for the device configuration after initial power-up.

表 8-3. Summary of Programming Steps After Initial Power-Up

Step	Section	Description
1	RESET	Hardware and software RESET in order to reset all registers to known state
2	DEVICE CONFIG	Configures the digital operating modes like averaging, test pattern output, input termination, internal dither and decimation.
3	JESD	Configures the JESD204B interface
4	SYSREF	Enables SYSREF input and resets internal circuits based on external SYSREF signal.
5	JESD	Clears and configures some of the JESD registers
6	TRIM	Set trim settings for best analog performance
7	CALIB CONFIG	Configure the calibration settings
8	SYSREF	Issue SYSREF for trim settings to go into effect
9	RUN CALIB	Run power up calibration
10	JESD	Synchronize the JESD interface with the receiver

The following sections outlines the detailed register writes for the device configuration after initial power up. This includes all the register writes (fields in grey) which are not documented in the register summary table. The register examples are given for 2x internal averaging, DDC bypass mode (LMFS = 8224).

8.3.1.1 STEP 1: RESET

After the initial power up, both hardware and software reset are required.

表 8-4. Register Programming Sequence for Software RESET

ADDRESS	DATA	DESCRIPTION

8.4 Power Supply Recommendations

The ADC32RF5x requires four different power-supplies. The AVDD18, AVDD12 and CLKVDD rail provides power for the internal analog and clocking circuits of the ADC. The DVDD rail powers the digital logic (including averaging and decimation filter) and the JESD204B digital interface.

Power sequencing is required as shown in [Initialization Set Up](#). The AVDD18, AVDD12 and especially the CLKVDD power supply must be low noise in order to achieve data sheet performance. For applications operating near DC, the 1/f noise contribution of the power supply needs to be considered as well.

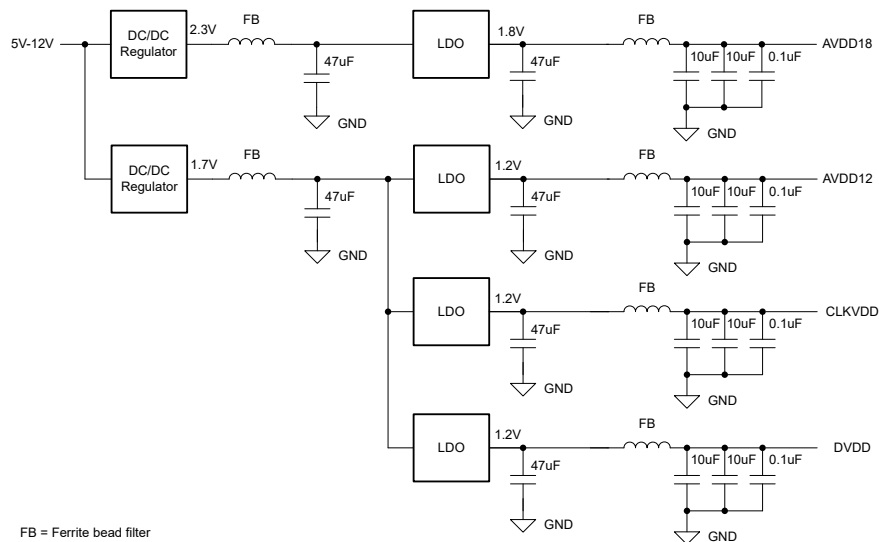

Power supply decoupling capacitors (0.1 μF) as close to the pins as possible on the top layer are recommended.

8-5. Power Supply Rejection Ratio (PSRR) vs Frequency

The recommended power supply architecture for a low noise design is to first use a high-efficiency step down switching regular, followed by a second stage of regulation using a low noise LDO for each power rail as shown in [8-6](#). This provides additional switching noise reduction and improved voltage accuracy.

TI WEBENCH® Power Designer can be used to select and design the individual power-supply elements. Recommended switching regulators for the first stage include the LMS3635, and similar devices. Recommended low dropout (LDO) linear regulators include the TPS7A8400, and similar devices.

8-6. Power Supply Design Example

AVDD12 or CLKVDD should not be shared with the DVDD in order to prevent digital switching noise from coupling into the analog domain.

8.5 Layout

8.5.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals
 - Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
 - Traces should be routed using loosely coupled 100- Ω differential traces.
 - Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.
2. Digital JESD204B output interface
 - Traces should be routed using tightly coupled 100- Ω differential traces.
3. Power and ground connections
 - Provide low resistance connection paths to all power and ground pins.
 - Use power and ground planes instead of traces.
 - Avoid narrow, isolated paths which increase the connection resistance.
 - Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

8.5.2 Layout Example

The following screen shot shows the top layer of the ADC32RF5x EVM.

- The input signal traces are routed as differential signals on the top layer avoiding vias. Care is taken to maintain symmetry between positive and negative input with matched trace length in order to minimize phase imbalance.
 - ☒ 8-7 shows the layout example for 1x and 2x averaging configuration
 - ☒ 8-8 shows the layout example for 4x averaging configuration
- JESD204B output interface lanes are routed differential and length matched
- Bypass caps are close to the power pins on the top layer avoiding vias.

9.3 商標

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

9.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

9.5 用語集

[テキサス・インスツルメンツ用語集](#) この用語集には、用語や略語の一覧および定義が記載されています。

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
