BQ25628 / BQ25629 I²C 制御、1 セル、2A、最大 18V 入力、降圧バッテリ チャージャ、NVDC パワー パス管理および OTG 出力付き

1 特長

- シングル セル バッテリ向けの高効率、1.5MHz、同期スイッチング モード降圧チャージャ
  - 5V 入力から 90% を上回る効率で 25mA の出力電流を供給
  - 5mA～310mA、5mA ステップの充電終了
  - フレキシブルな JEITA プロファイルにより温度範囲全体にわたって安全に充電
- BATFET 制御によりシャットダウン、出荷モード、完全システム リセットをサポート
  - バッテリのみモードで 1.5μA の静止電流
  - 出荷モードで 0.15μA のバッテリ リーク電流
  - シャットダウンで 0.1μA のバッテリ リーク電流
- 昇圧モード動作によるアクセサリへの電源供給をサポート
  - 3.84V～5.2V の出力をサポートする昇圧モード
  - 5V の PMID 向けに、90% を上回る昇圧効率で 100mA の昇圧電流を供給
- 幅広い入力電源をサポート
  - 3.9V～18V の広い入力動作電圧範囲、26V の絶対最大入力電圧
  - 入力電圧レギュレーション (VINDPM) と入力電流レギュレーション (IINDPM) によりソース電力を最大化
  - バッテリ電圧を自動的に追従する VINDPM
- 15mΩ の BATFET による高効率のバッテリ動作
- Narrow VDC (NVDC) パワー パス管理
  - 消耗したバッテリまたはバッテリ未接続でもシステムを即時オン
  - アダプタが全負荷になったときのバッテリ補完
- フレキシブルな自律または I²C 制御モード
- 電圧、電流、温度を監視するための 12 ビット ADC を内蔵
- 高精度
  - ±0.4% の充電電圧レギュレーション
  - ±5% の充電電流レギュレーション
  - ±5% の入力電流レギュレーション
- 安全
  - サーマル レギュレーションおよびサーマル シャットダウン
  - 入力、システム、バッテリの過電圧保護
  - バッテリ、コンバータの過電流保護
  - 充電安全タイマ
- 安全関連認証:
  - IEC 62368-1 CB 認証

2 アプリケーション

- 民生用ウェアラブル、スマートウォッチ
- ポータブル・スピーカ、TWS イヤホン
- 補聴器または TWS 充電ケース

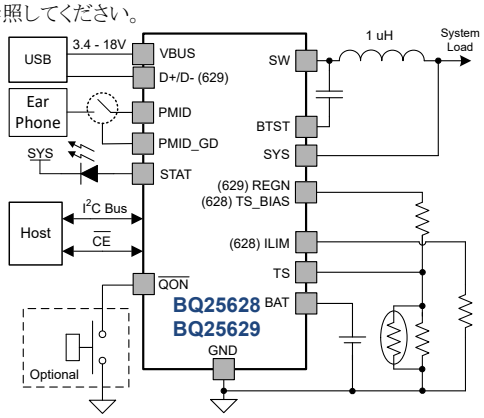
3 概要

BQ25628 および BQ25629 は高度に統合されたデバイスであり、シングル セルのリチウムイオンおよびリチウムポリマー バッテリのために、2A スイッチモードのバッテリ充電管理およびシステム パワー パスの管理を行います。このソリューションは、内蔵電流検出、ループ補償、入力逆電流ブロック FET (RBFET、Q1)、ハイサイド スイッチング FET (HSFET、Q2)、ローサイド スイッチング FET (LSFET、Q3)、およびシステムとバッテリの間にあるバッテリ FET (BATFET、Q4) を高度に統合しています。システム電圧が設定可能な最小値を下回らないように、本デバイスは精密な VDC パワー パス管理機能を使用して、システム電圧をバッテリ電圧よりわずかに高い値にレギュレートします。低インピーダンスのパワー パスはスイッチ モード動作効率を最適化し、バッテリ充電時間を短縮し、放電フェーズ中のバッテリ寿命を延長します。また、非常に小さい 0.15μA の出荷モード電流はバッテリの保存性を高めます。充電およびシステムの設定に I²C シリアル インターフェイスを使用できるため、BQ25628 および BQ25629 は真に柔軟なソリューション提供します。

製品情報

部品番号	パッケージ(1)	本体サイズ (公称)
BQ25628	RYK (WQFN 18)	2.50mm × 3.00mm
BQ25629	RYK (WQFN 18)	2.50mm × 3.00mm

(1) 供給されているすべてのパッケージについては、セクション 14 を参照してください。



BQ25628/629 のアプリケーション概略図

Table of Contents

4 概要 (続き)

BQ25628 は、デフォルトの入力電流制限値を設定するための ILIM ピンと、サーミスタのバイアスを制御するための TS_BIAS ピンを備えています。BQ25629 は、標準の USB ホスト ポート、USB 充電ポートなど、幅広い入力ソースをサポートしています。本デバイスは、入力の電流および電圧レギュレーションに関する USB 2.0 および USB 3.0 の電源仕様に準拠しており、USB On-the-Go (OTG) 動作における最大 2.0A の電源定格仕様を満たしています。

パワー パス管理により、システムはバッテリ電圧より少し高くなるように、かつプログラム可能な最低システム電圧より低くならないようにレギュレートされます。この機能により、システムはバッテリが完全に消耗したとき、または取り外したときでも、動作を継続できます。入力の電流または電圧が制限値に達すると、パワー パス管理機能が自動的に充電電流を低下させます。システム負荷が引き続き増大すると、バッテリは放電を開始し、システムの電力要件が満たされるまで放電を続けます。この補助モードにより入力ソースの過負荷を防止します。

BQ25628 および BQ25629 は、アダプタから直接、またはバッテリから (昇圧またはバイパス OTG モードを使用して)、PMID に接続されたアクセサリに電力を供給します。昇圧 OTG では、コンバータ内の昇圧動作を通じて、バッテリからレギュレートされた電圧を PMID 側に供給します。バイパス OTG は、バッテリから PMID への直接パスを提供し、最高の効率を実現します。BQ25628 および BQ25629 は、アダプタが取り外された際に自動的に昇圧 OTG モードに移行させ、アダプタが取り付けられた際には順方向充電に復帰させることが可能です。このいずれかの構成により、ホストの介入なしで PMID に電力を供給します。順方向充電、昇圧 OTG、バイパス OTG では、PMID_GD 信号は、PMID の電圧と電流が許容範囲内であることを示します。範囲外の電圧または電流が検出された場合は、接続されているアクセサリを PMID から切断することで、PMID_GD を使用して外部 PMOS FET を駆動し、これらのアクセサリを保護できます。

BQ25628 および BQ25629 は、ホストによる制御なしで、充電サイクルの開始から完了までを実行できます。バッテリ電圧を検知することで、本デバイスは 4 種類の段階 (トリクル充電、予備充電、定電流 (CC) 充電、定電圧 (CV) 充電) でバッテリを充電します。充電サイクルの終わりに、充電電流があらかじめ設定されたスレッショルドを下回り、かつバッテリ電圧が再充電スレッショルドを上回ると、充電器は自動的に処理を終了します。終了は、TS ピンの全温度範囲でサポートされています。

BQ25628 および BQ25629 は、負温度係数サーミスタによるバッテリの監視、充電安全タイマ、過電圧および過電流保護など、バッテリ充電とシステム運用のための多様な安全機能を備えています。接合部温度がプログラム可能なスレッショルド値を超えると、サーマル レギュレーションにより充電電流が低下します。STAT 出力は、充電状態と任意のフォルト状態を通知します。その他の安全機能としては、充電モードと OTG 昇圧モードでのバッテリ温度センシング、サーマル シャットダウン、入力 UVLO および過電圧保護も装備しています。$\overline{\text{INT}}$ 出力は、フォルトの発生とステータスの変化をホストに通知します。

BQ25628 および BQ25629 は 18 ピン、2.5mm × 3.0mm の WQFN パッケージで供給されます。

5 Device Comparison

表 5-1. Device Comparison

FUNCTION	BQ25618	BQ25628	BQ25629
Input Voltage Range	4V - 13.5V	3.9V - 18V	3.9V - 18V
Part Configuration	I2C	I2C	I2C
Programmable Charge Voltage	3.5 - 4.3V (100mV per step); 4.3 - 4.52V (10mV per step)	3.5 - 4.8V (10mV per step)	3.5 - 4.8V (10mV per step)
D+/D- USB Detection	No	No	Yes
ILIM Pin	No	Yes	No
TS Profile	JEITA	JEITA	JEITA
Quiescent Battery Current	9.5µA	1.5µA	1.5µA
OTG	Yes	Yes	Yes
OTG Voltage Range	4.6V/4.75V/5V/5.15V	3.84V - 5.2V (80mV per step)	3.84V - 5.2V (80mV per step)
Package	2x2.4mm^2 WCSP (30)	2.5x3mm^2 QFN (18)	2.5x3mm^2 QFN (18)

6 Pin Configuration and Functions

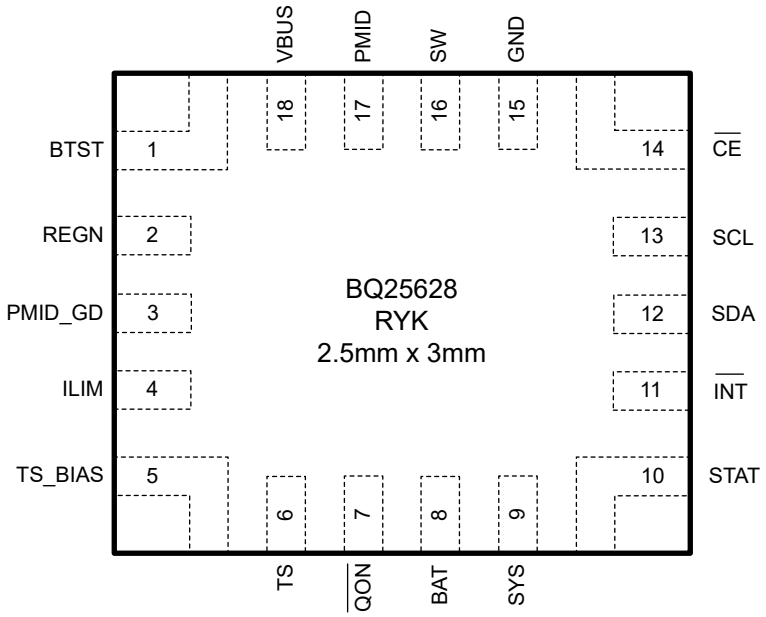


図 6-1. BQ25628 Pinout, 18-Pin WQFN Top View

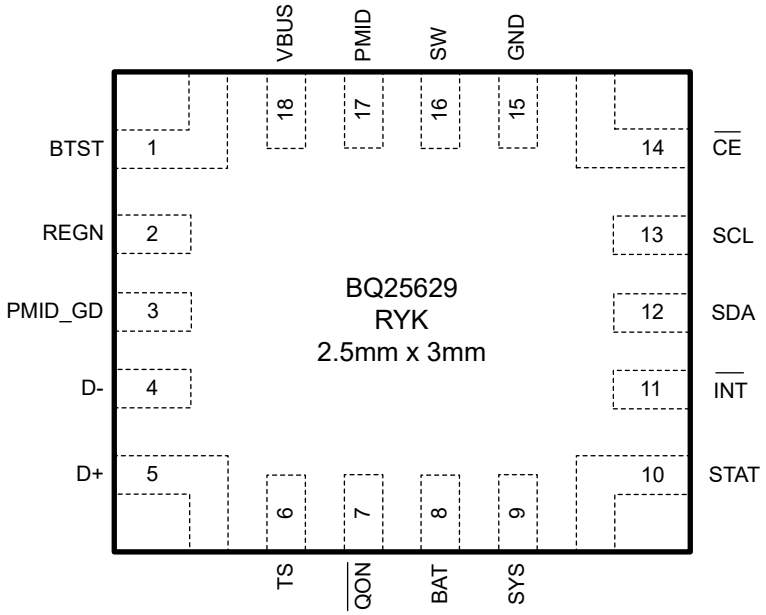

図 6-2. BQ25629 Pinout, 18-Pin WQFN Top View

表 6-1. Pin Functions

NAME		NO.	TYPE(1)	DESCRIPTION
BQ25628	BQ25629			
BTST		1	P	**High Side Switching MOSFET Gate Driver Power Supply –** Connect a 10 V or higher rating, 47-nF ceramic capacitor between SW and BTST as the bootstrap capacitor for driving high side switching MOSFET (Q2).

表 6-1. Pin Functions (続き)

NAME		NO.	TYPE(1)	DESCRIPTION
BQ25628	BQ25629			
REGN		2	P	**The Charger Internal Linear Regulator Output –** Internally, REGN is connected to the anode of the boost-strap diode. Connect a 10 V or higher rating, 4.7-µF ceramic capacitor from REGN to power ground, The capacitor should be placed close to the IC. The REGN LDO output is used for the internal MOSFETs gate driving voltage and for biasing the external TS pin thermistor in BQ25629.
PMID_GD		3	DO	**Open Drain Active High PMID Good Indicator –** Connect to the pull up rail REGN through 10-kΩ resistor. HIGH indicates PMID output voltage is good. This signal can be used to drive external PMOS FET to disconnect the PMID under charging load when boost mode output voltage is too high or output current is too high.
ILIM	D-	4	AIO	**Input Current Limit Setting Input Pin –** ILIM pin sets the input current limit as I_{INREG} = K_{ILIM} / R_{ILIM}, where R_{ILIM} is connected from ILIM pin to GND. The input current is limited to the lower of the two values set by ILIM pin and IINDPM register bits. The ILIM pin can also be used to monitor input current. The input current is proportional to the voltage on ILIM pin and can be calculated by I_{IN} = (K_{ILIM} x V_{ILIM}) / (R_{ILIM} x 0.8). The ILIM pin function is disabled when EN_EXTILIM bit is set to 0.
				Negative Line of the USB Data Line Pair – D+/D- based USB host/charging port detection. The detection includes data contact detection (DCD), primary and secondary detection in BC1.2.
TS_BIAS	D+	5	P	**Bias for the TS Resistor Voltage Divider –** Provides the bias voltage for the TS resistor voltage divider.
			AIO	**Positive Line of the USB Data Line Pair –** D+/D- based USB host/charging port detection. The detection includes data contact detection (DCD), primary and secondary detection in BC1.2.
TS		6	AI	**Temperature Qualification Voltage Input –** Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from TS pin bias reference (REGN in BQ25629, TS_BIAS in BQ25628) to TS, then to GND. Charge suspends when TS pin voltage is out of range. Recommend a 103AT-2 10-kΩ thermistor.
$\overline{QON}$		7	DI	**BATFET Enable or System Power Reset Control Input –** If the charger is in ship mode, a logic low on this pin with t_{SM_EXIT} duration forces the device to exit ship mode. If the charger is not in ship mode, a logic low on this pin with t_{QON_RST} initiates a full system power reset if either V_{VBUS} < V_{VBUS_UVLO} or BATFET_CTRL_WVBUS = 1. $\overline{QON}$ has no effect during shutdown mode. The pin contains an internal pull-up to maintain default high logic.
BAT		8	P	**The Battery Charging Power Connection –** Connect to the positive terminal of the battery pack. The internal BATFET is connected between SYS and BAT.
SYS		9	P	**The Charger Output Voltage to System –**The Buck converter output connection point to the system. The internal BATFET is connected between SYS and BAT.
STAT		10	DO	**Open Drain Charge Status Output –** It indicates various charger operations. Connect to the pull up rail via 10-kΩ resistor. LOW indicates charging in progress. HIGH indicates charging completed or charging disabled. When any fault condition occurs, STAT pin blinks at 1Hz. Setting DIS_STAT = 1 disables the STAT pin function, causing the pin to be pulled HIGH. Leave floating if unused.
$\overline{INT}$		11	DO	**Open Drain Interrupt Output. –** Connect to the pull up rail via 10-kΩ resistor. The $\overline{INT}$ pin sends an active low, 256-µs pulse to the host to report the charger device status and faults.
SDA		12	DIO	**I²C Interface Data –** Connect SDA to the logic rail through a 10-kΩ resistor.
SCL		13	DI	**I²C Interface Clock –** Connect SCL to the logic rail through a 10-kΩ resistor.
$\overline{CE}$		14	DI	**Active Low Charge Enable Pin –** Battery charging is enabled when EN_CHG bit is 1 and $\overline{CE}$ pin is LOW. $\overline{CE}$ pin must be pulled HIGH or LOW, do not leave floating.
GND		15	P	**Ground Return**
SW		16	P	**Switching Node Connecting to Output Inductor –** Internally SW is connected to the source of the n-channel HSFET and the drain of the n-channel LSFET. Connect the 47-nF bootstrap capacitor from SW to BTST.
PMID		17	P	**HSFET Drain Connection –** Internally PMID is connected to the drain of the reverse blocking MOSFET (RBFET) and the drain of HSFET.
VBUS		18	P	**Charger Input Voltage –** The internal n-channel reverse block MOSFET (RBFET) is connected between VBUS and PMID with VBUS on source.

(1) AI = Analog input, AO = Analog Output, AIO = Analog input Output, DI = Digital input, DO = Digital Output, DIO = Digital input Output, P = Power

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Voltage range (with respect to GND)	VBUS (converter not switching)	–2	26	V
	PMID (converter not switching)	–0.3	26	V
	BAT, SYS (converter not switching)	–0.3	6	V
	SW	–2 (50ns)	21	V
	BTST (when converter switching)	–0.3	27	V
	$\overline{CE}$, STAT, SCL, SDA, $\overline{INT}$, REGN, $\overline{QON}$	–0.3	6	V
	D+, D-, ILIM, TS, TS_BIAS , PMID_GD	–0.3	6	V
Output Sink Current	$\overline{INT}$, STAT, PMID_GD		6	mA
Differential Voltage	BTST-SW	–0.3	6	V
	PMID-VBUS	–0.3	6	V
	SYS-BAT	–0.3	6	V
T_J	Junction temperature	–40	150	°C
T_{stg}	Storage temperature	–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{VBUS}	Input voltage	3.9		18	V
V_{BAT}	Battery voltage			4.8	V
I_{VBUS}	Input current			3.2	A
I_{SW}	Output current (SW)			3.5	A
I_{BAT}	Fast charging current			2	A
	RMS discharge current (continuously)			6	A
	Peak discharge current (up to 50ms)			10	A
I_{REGN}	Maximum REGN Current			20	mA
T_A	Ambient temperature	–40		85	°C
T_J	Junction temperature	–40		125	°C
L_{SW}	Inductor for the switching regulator	0.68		2.2	µH
C_{VBUS}	VBUS capacitor (without de-rating)	1			µF
C_{PMID}	PMID capacitor (without de-rating)	10			µF
C_{SYS}	SYS capacitor (without de-rating)	20		500	µF

7.3 Recommended Operating Conditions (続き)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
C_{BAT}	BAT capacitor (without de-rating)	10			µF

7.4 Thermal Information

THERMAL METRIC(1)		BQ25628, BQ25629 RYK (QFN) 18 pins	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	60.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	42.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	13.0	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	1.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	12.8	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

7.5 Electrical Characteristics

$V_{VBUS\_UVLOZ} < V_{VBUS} < V_{VBUS\_OVP}$, T_J = -40°C to +125°C, and T_J = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
QUIESCENT CURRENTS						
I_{Q_BAT}	Quiescent battery current (BAT, SYS, SW) when the charger is in the battery only mode, BATFET is enabled, ADC is disabled	VBAT = 4V, No VBUS, BATFET is enabled, I2C enabled, ADC disabled, system is powered by battery. -40 °C < T_J < 60 °C		1.5	3	µA
$I_{Q\_BAT\_ADC}$	Quiescent battery current (BAT, SYS, SW) when the charger is in the battery only mode, BATFET is enabled, ADC is enabled	VBAT = 4V, No VBUS, BATFET is enabled, I2C enabled, ADC enabled, system is powered by battery. -40 °C < T_J < 60 °C		260		µA
$I_{Q\_BAT\_SD}$	Quiescent battery current (BAT) when the charger is in shutdown mode, BATFET is disabled, ADC is disabled	VBAT = 4V, No VBUS, BATFET is disabled, I2C disabled, in shutdown mode, ADC disabled, T_J < 60 °C		0.1	0.2	µA
$I_{Q\_BAT\_SHIP}$	Quiescent battery current (BAT) when the charger is in ship mode, BATFET is disabled, ADC is disabled	VBAT = 4V, No VBUS, BATFET is disabled, I2C disabled, in ship mode, ADC disabled, T_J < 60 °C		0.15	0.5	µA
I_{Q_VBUS}	Quiescent input current (VBUS)	VBUS = 5V, VBAT = 4V, charge disabled, converter switching, ISYS = 0A, PFM enabled		450		µA
$I_{Q\_VBUS\_HIZ}$	Quiescent input current (VBUS) in HIZ	VBUS = 5V, VBAT = 4V, HIZ mode, ADC disabled		5	20	µA
		VBUS = 15V, VBAT = 4V, HIZ mode, ADC disabled		20	35	µA
I_{Q_BOOST}	Quiescent battery current (BAT, SYS, SW) in boost mode	VBAT = 4.2V, VPMID = 5V, Boost mode enabled, converter switching, PFM enabled, I_{VPMID} = 0A		220		µA
$I_{Q\_BYP\_OTG}$	Quiescent battery current (BAT, SYS) in bypass OTG mode	VBAT = 4V, bypass OTG mode enabled, IPMID = 0A		500	850	µA
VBUS / VBAT SUPPLY						
V_{VBUS_OP}	VBUS operating range		3.9		18	V
V_{VBUS_UVLO}	VBUS falling to turn off I2C, no battery	VBUS falling	3.0	3.15	3.3	V

7.5 Electrical Characteristics (続き)

V_{VBUS_UVLOZ} < V_{VBUS} < V_{VBUS_OVP}, T_J = -40°C to +125°C, and T_J = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{VBUS_UVLOZ}	VBUS rising for active I2C, no battery	VBUS rising	3.2	3.35	3.5	V
V_{VBUS_OVP}	VBUS overvoltage rising threshold	VBUS rising, VBUS_OVP = 0	6.1	6.4	6.7	V
V_{VBUS_OVPZ}	VBUS overvoltage falling hreshold	VBUS rising, VBUS_OVP = 0	5.8	6.0	6.2	V
V_{VBUS_OVP}	VBUS overvoltage rising threshold	VBUS rising, VBUS_OVP = 1	18.2	18.5	18.8	V
V_{VBUS_OVPZ}	VBUS overvoltage falling threshold	VBUS falling, VBUS_OVP = 1	17.4	17.7	18.0	V
V_{PMID_OVP}	Forward mode PMID OVP to drive PMID_GD low	V_{PMID} rising	5.5	5.75	6.0	V
V_{PMID_OVPZ}	Forward mode PMID voltage threshold to exit OVP and drive PMID_GD high	V_{PMID} falling	5.25	5.5	5.75	V
V_{SLEEP}	Enter Sleep mode threshold	(VBUS - VBAT), VBUS falling	9	45	85	mV
V_{SLEEPZ}	Exit Sleep mode threshold	(VBUS - VBAT), VBUS rising	115	220	340	mV
V_{BAT_UVLOZ}	BAT voltage for active I2C, turn on BATFET, no VBUS	VBAT rising	2.3	2.4	2.5	V
V_{BAT_UVLO}	BAT voltage to turnoff I2C, turn off BATFET, no VBUS	VBAT falling, VBAT_UVLO = 0	2.1	2.2	2.3	V
		VBAT falling, VBAT_UVLO = 1	1.7	1.8	1.9	V
V_{BAT_OTG}	BAT voltage rising threshold to enable OTG mode	VBAT rising, VBAT_OTG_MIN = 0	2.9	3.0	3.1	V
		VBAT rising, VBAT_OTG_MIN = 1	2.5	2.6	2.7	V
V_{BAT_OTGZ}	BAT voltage falling threshold to disable OTG mode	VBAT falling, VBAT_OTG_MIN = 0	2.7	2.8	2.9	V
		VBAT falling, VBAT_OTG_MIN = 1	2.3	2.4	2.5	V
$V_{POORSRC}$	Bad adapter detection threshold	VBUS falling	3.6	3.7	3.75	V
$I_{POORSRC}$	Bad adapter detection current source			10		mA
POWER-PATH MANAGEMENT						
$V_{SYS\_REG\_ACC}$	Typical system voltage regulation	ISYS = 0A, VBAT > VSYSMIN, Charge Disabled. Offset above VBAT		50		mV
		ISYS = 0A, V_{BAT} < VSYSMIN, Charge Disabled. Offset above VSYSMIN		230		mV
V_{SYSMIN_RNG}	VSYSMIN register range		2.56		3.84	V
$V_{SYSMIN\_REG\_STEP}$	VSYSMIN register step size			80		mV
$V_{SYSMIN\_REG\_ACC}$	Minimum DC system voltage output	ISYS = 0A, V_{BAT} < VSYSMIN = B00h (3.52V), Charge Disabled	3.52	3.75		V
V_{SYS_SHORT}	VSYS short voltage falling threshold to enter forced PFM			0.9		V
V_{SYS_SHORTZ}	VSYS short voltage rising threshold to exit forced PFM			1.1		V
BATTERY CHARGER						
V_{REG_RANGE}	Typical charge voltage regulation range		3.50		4.80	V
V_{REG_STEP}	Typical charge voltage step			10		mV
V_{REG_ACC}	Charge voltage accuracy	T_J = 25°C	–0.3		0.3	%
		T_J = –10°C - 85°C	–0.4		0.4	%
I_{CHG_RANGE}	Typical charge current regulation range		0.04		2.00	A
I_{CHG_STEP}	Typical charge current regulation step			40		mA

7.5 Electrical Characteristics (続き)

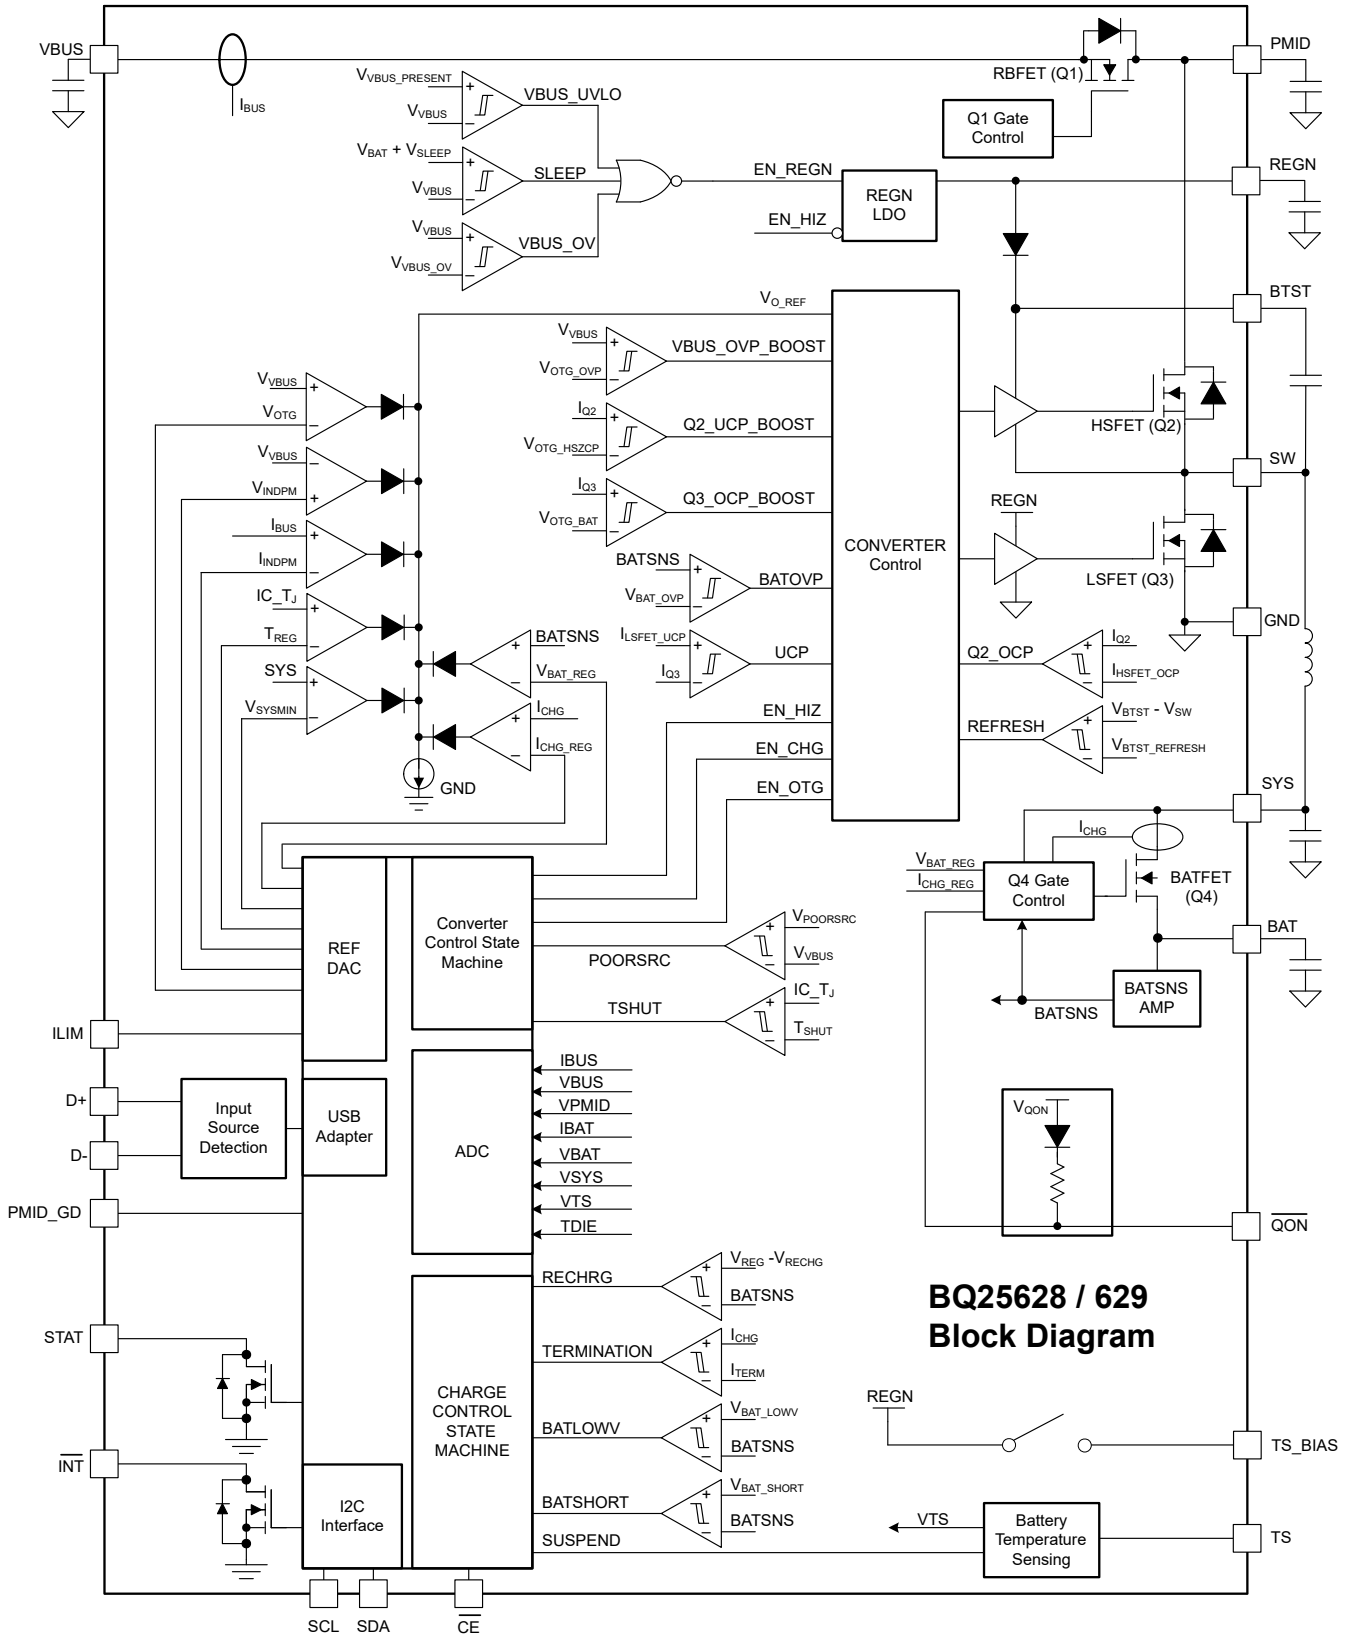
8 Detailed Description

8.1 Overview

The BQ25628 and BQ25629 are highly-integrated 2-A switch-mode battery charger for single-cell Li-ion and Li-polymer batteries. The device includes input reverse-blocking FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), battery FET (BATFET, Q4), and bootstrap diode for the high-side gate driver.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Power-On-Reset (POR)

The BQ25628 and BQ25629 power internal bias circuits from the higher voltage of VBUS and BAT. When either voltage rises above its undervoltage lockout (UVLO) threshold, all registers are reset to their POR values and the I^2C interface is enabled for communication. A non-maskable $\overline{INT}$ pulse is generated, after which the host can access all of the registers.

8.3.2 Device Power Up from Battery

If only the battery is present and the VBAT is above depletion threshold (V_{BAT_UVLOZ}), the BQ25628 and BQ25629 perform a power-on reset then turns on the BATFET to connect the battery to system. The REGN LDO output remains off to minimize the quiescent current. The low RDSON of BATFET and the low quiescent current on BAT minimize the conduction loss and maximize the battery run time.

8.3.3 Device Power Up from Input Source

When a valid input source is plugged in with VBAT < V_{BAT_UVLOZ}, the BQ25628 and BQ25629 perform a power-on reset then checks the input source voltage to turn on the REGN LDO and all the bias circuits. It detects and sets the input current limit before the buck converter is started. The power up sequence from input source is as listed:

1. REGN LDO power up (セクション 8.3.3.1)
2. Poor source qualification (セクション 8.3.3.2)
3. Input voltage limit threshold setting (セクション 8.3.3.5)
4. Converter power-up (セクション 8.3.3.6)

8.3.3.1 REGN LDO Power Up

The REGN LDO regulator supplies internal bias circuits as well as the HSFET and LSFET gate drive. The REGN LDO also provides bias rail to TS external resistors. The pull-up rail of STAT can be connected to REGN as well. The REGN is enabled when all the below conditions are valid:

- VBUS above V_{VBUS_UVLOZ}
- VBUS above V_{BAT} + V_{SLEEPZ}
- EN_HIZ = 0
- After 220-ms delay is completed

If any one of the above conditions is not valid, the REGN LDO and the converter power stage remain off with the converter disabled. In this state, the battery supplies power to the system.

8.3.3.2 Poor Source Qualification

After the REGN LDO powers up, the device checks the current capability of the input source. The input source has to meet the following requirements in order to move forward to the next power on steps.

1. VBUS voltage below V_{VBUS_OVP}
2. VBUS voltage above $V_{POORSRC}$ when pulling $I_{POORSRC}$

Once these conditions are met, the device proceeds to input source type detection.

8.3.3.3 D+/D– Detection Sets Input Current Limit (BQ25629)

After the REGN LDO is powered, the adapter has been qualified as a good source, and AUTO_INDET_EN bit = 1 (POR default), BQ25629 runs input source detection through D+/D– lines to detect USB Battery Charging Specification 1.2 (BC1.2) input sources (CDP / SDP / DCP) and non-standard adapters. The detection algorithm runs automatically each time that VBUS is plugged in, updating the IINDPM according to 表 8-2. If AUTO_INDET_EN = 0, the detection algorithm is not run and IINDPM remains unchanged. The host can force the detection algorithm to run and update IINDPM by setting FORCE_INDET to 1.

The USB BC1.2 is able to identify Standard Downstream Port (SDP), Charging Downstream Port (CDP), and Dedicated Charging Port (DCP). When the Data Contact Detection (DCD) timer of 500ms is expired, the non-standard adapter detection is applied to set the input current limit.

The secondary detection is used to distinguish two types of charging ports (CDP and DCP). Most of the time, a CDP requires the portable device (such as smart phone, tablet) to send back an enumeration within 2.5 seconds of CDP plug-in. Otherwise, the port reverts back to SDP even though the D+/D– detection indicates CDP.

Upon the completion of input source type detection, the following registers are changed:

1. Input Current Limit (IINDPM) register is changed to set current limit
2. VBUS_STAT bits are updated to indicate the detected input source type

After detection completes, the host can over-write the IINDPM register to change the input current limit if needed.

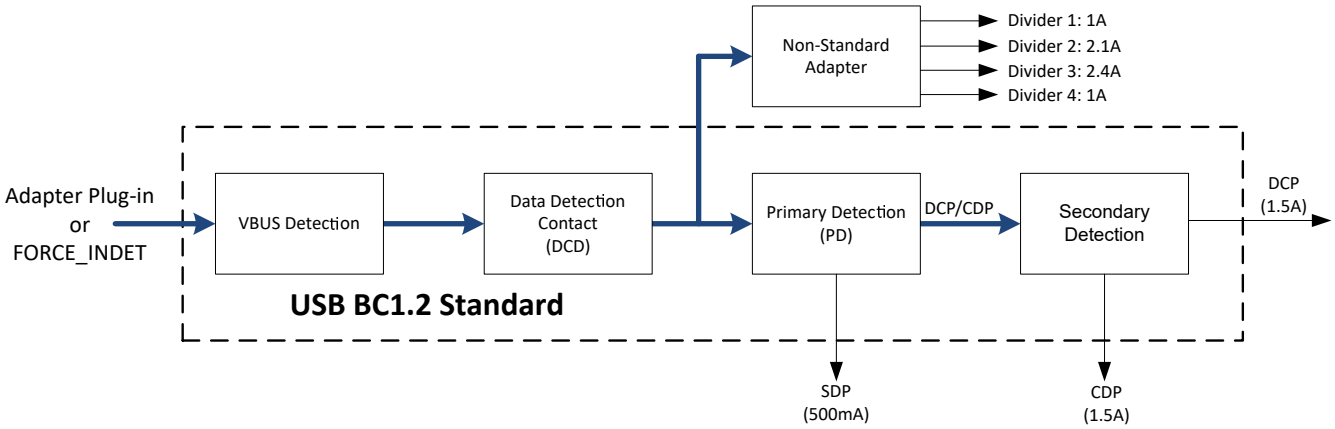


図 8-1. D+/D– Detection Flow

If DCP is detected (VBUS_STAT = 011), BQ25629 turns on $V_{D+D-\_0p6V\_SRC}$ on D+ if EN_DCP_BIAS is set to 1. Setting EN_DCP_BIAS to 0 while VBUS_STAT = 011 disables the $V_{D+D-\_0p6V\_SRC}$ on D+ pin, and setting EN_DCP_BIAS to 1 while VBUS_STAT = 011 enables the $V_{D+D-\_0p6V\_SRC}$ on D+ pin. The EN_HIZ bit has priority over EN_DCP_BIAS.

The non-standard detection is used to distinguish vendor specific adapters based on their unique dividers on the D+/D- pins. Comparators detect the voltage applied on each pin and determine the input current limit according to 表 8-1.

表 8-1. Non-Standard Adapter Detection

NON-STANDARD ADAPTER	D+ THRESHOLD	D– THRESHOLD	INPUT CURRENT LIMIT (A)
Divider 1	V_{D+} within V_{D+D-_2p0}	V_{D-} within V_{D+D-_2p8}	1
Divider 2	V_{D+} within V_{D+D-_2p8}	V_{D-} within V_{D+D-_2p0}	2.1
Divider 3	V_{D+} within V_{D+D-_2p8}	V_{D-} within V_{D+D-_2p8}	2.4

表 8-2. Input Current Limit Setting from D+/D– Detection

D+/D– DETECTION	INPUT CURRENT LIMIT (IINLIM)	VBUS_STAT
USB SDP (USB500)	500 mA	0x1
USB CDP	1.5 A	0x2
USB DCP	1.5 A	0x3
Divider 1	1 A	0x5
Divider 2	2.1 A	0x5
Divider 3	2.4 A	0x5

表 8-2. Input Current Limit Setting from D+/D– Detection (続き)

D+/D– DETECTION	INPUT CURRENT LIMIT (IINLIM)	VBUS_STAT
Unknown 5-V Adapter	500mA	0x4

8.3.3.4 ILIM Pin (BQ25628 Only)

The ILIM pin clamps the input current limit to IINREG = K_{ILIM} / R_{ILIM}, where R_{ILIM} is connected from the ILIM pin to GND. The ILIM pin can be used to limit the input current limit from 100 mA - 3.2 A. The input current is limited to the lower of the two values set by the ILIM pin and IINDPM register bits. The ILIM pin can also be used to monitor input current. The input current is proportional to the voltage on the ILIM pin and can be calculated by IIN = (K_{ILIM} x V_{ILIM}) / (R_{ILIM} x 0.8). The ILIM pin function is disabled when the EN_EXTILIM bit is set to 0. In BQ25628, if the ILIM pin voltage exceeds V_{ILIM_OCP} (900mV), the device detects input over current. The converter drives PMID_GD high and clears the OTG_FAULT_STAT bit to 0.

An RC filter in parallel with R_{ILIM} is required when the input current setting on the ILIM pin is either:

- below 400 mA or
- above 2 A when using a 2.2-µH inductor

The value for the RC filter is 1.2 kΩ and 330 nF, respectively.

8.3.3.5 Input Voltage Limit Threshold Setting (VINDPM Threshold)

The BQ25628 and BQ25629 support a wide range of input voltage limit (3.8 V – 16.8 V). Its POR default VINDPM threshold is set at 4.6 V. The BQ25628 and BQ25629 also support dynamic VINDPM tracking, which tracks the battery voltage to ensure a sufficient margin between input and battery voltages for proper operation of the buck converter. This function is enabled via the VINDPM_BAT_TRACK register bit. When enabled, the actual input voltage limit is the higher of the VINDPM register or $V_{INDPM\_BAT\_TRACK}$ (VBAT + 400-mV typical offset.)

8.3.3.6 Converter Power-Up

After the input current and voltage limits are set, the converter is enabled and the HSFET and LSFET start switching. If battery charging is disabled, the BATFET turns off. Otherwise, the BATFET stays on to charge the battery. Converter startup requires the following conditions:

- VBUS has passed poor source qualification (refer to セクション 8.3.3.2)
- VBUS > V_{BAT} + V_{SLEEPZ}
- V_{VBUS} < V_{VBUS_OVP}
- EN_HIZ = 0
- V_{SYS} < V_{SYS_OVP}
- T_J < T_{SHUT}

The BQ25628 and BQ25629 provide soft start when the system rail is ramped up by setting IINDPM to its lowest programmable value and stepping up through each available setting until reaching the value set by IINDPM register. Concurrently, the system short protection limits the output current to approximately 0.5 A when the system rail is below V_{SYS_SHORT}.

The device uses a highly efficient 1.5-MHz, fixed frequency pulse width modulated (PWM) step-down switching regulator. The internally compensated feedback loop keep tight control of the switching frequency under all conditions of input voltage, battery voltage, charge current and temperature, simplifying output filter design.

The device switches to pulse frequency modulation (PFM) control at light load condition. The PFM_FWD_DIS and PFM_OTG_DIS bit can be used to disable the PFM operation in buck and boost respectively.

8.3.4 Power Path Management

The BQ25628 accommodate a wide range of input sources from a USB, wall adapter, wireless charger, to car charger. They provide automatic power path selection to supply the system from an input source, battery, or both.

8.3.4.1 Narrow VDC Architecture

The BQ25628 use the Narrow VDC architecture (NVDC) with BATFET separating system from battery. The minimum system voltage is set by VSYSMIN register setting. Even with a fully depleted battery, the system is regulated to the minimum system voltage. If charging is enabled, the BATFET operates in linear mode (LDO mode). The default minimum system voltage at POR is 3.52 V.

As the battery voltage rises above the minimum system voltage, the BATFET is turned fully on. When battery charging is disabled and V_{BAT} is above the minimum system voltage setting, or charging is terminated, the system is regulated 50 mV (typical) above battery voltage.

8.3.4.2 Dynamic Power Management

To meet the USB maximum current limit and avoid overloading the adapter, the device features Dynamic Power Management (DPM), which continuously monitors the input current and input voltage. When the input source is overloaded, either the current exceeds the input current limit (IINDPM) or the voltage falls below the input voltage limit (VINDPM). The device then reduces the charge current until the input current falls below the input current limit and the input voltage rises above the input voltage limit.

When the charge current is reduced to zero, but the input source is still overloaded, the system voltage starts to drop. Once the system voltage falls below the battery voltage by V_{SUPP}, the device automatically enters the supplement mode where the BATFET turns on and the battery starts discharging so that the system is supported from both the input source and battery.

8.3.4.3 High Impedance Mode

The host may place the BQ25628 into high impedance mode by writing EN_HIZ = 1. In high impedance mode, RBFET (Q1), HSFET (Q2) and LSFET (Q3) are turned off. The RBFET and HSFET block current flow to and from VBUS, putting the VBUS pin into a high impedance state. The BATFET (Q4) is turned on to connect the BAT to SYS. During high impedance mode, REGN is disabled and the digital clock is slowed to conserve power.

BQ25628 drives PMID_GD low in high-impedance mode.

8.3.5 Battery Charging Management

The BQ25628 and BQ25629 charge a 1-cell Li-Ion battery with up to a 2.0-A charge current. The 15-mΩ BATFET improves charging efficiency and minimizes the voltage drop during discharging.

8.3.5.1 Autonomous Charging Cycle

When battery charging is enabled (EN_CHG bit = 1 and $\overline{CE}$ pin is LOW), the BQ25628 and BQ25629 autonomously complete a charging cycle without host involvement. The device default charging parameters are listed in 表 8-3. The host can always control the charging operations and optimize the charging parameters by writing to the corresponding registers through I^2C.

表 8-3. Charging Parameter Default Setting

	VREG	VRECHG	ITRICKLE	IPRECHG	ICHG	ITERM	TOPOFF TIMER
BQ25628	4.2 V	VREG - 100 mV	10 mA	30 mA	320 mA	20 mA	Disabled
BQ25629	4.2 V	VREG - 100 mV	10 mA	30 mA	320 mA	20 mA	Disabled

A new charge cycle starts when the following conditions are valid:

- Converter starts per the conditions in セクション 8.3.3.6
- EN_CHG = 1
- $\overline{CE}$ pin is low
- No thermistor fault on TS
- No safety timer fault

The BQ25628 and BQ25629 automatically terminate the charging cycle when the charging current is below termination threshold, battery voltage is above recharge threshold, and device not is in DPM or thermal

regulation. When a fully charged battery is discharged below VRECHG, the device automatically starts a new charging cycle. After charging terminates, toggling $\overline{CE}$ pin or EN_CHG bit also initiates a new charging cycle.

The STAT output indicates the charging status. Refer to セクション 8.3.8.2 for details of STAT pin operation. In addition, the status register (CHG_STAT) indicates the different charging phases: 00-charging disabled or terminated, 01-constant current, 10 constant voltage, 11-topoff charging.

8.3.5.2 Battery Charging Profile

The BQ25628 and BQ25629 charge the battery in five phases: trickle charge, pre-charge, constant current, constant voltage and an optional top-off charging phase. At the beginning of a charging cycle, the device checks the battery voltage and regulates current and voltage accordingly.

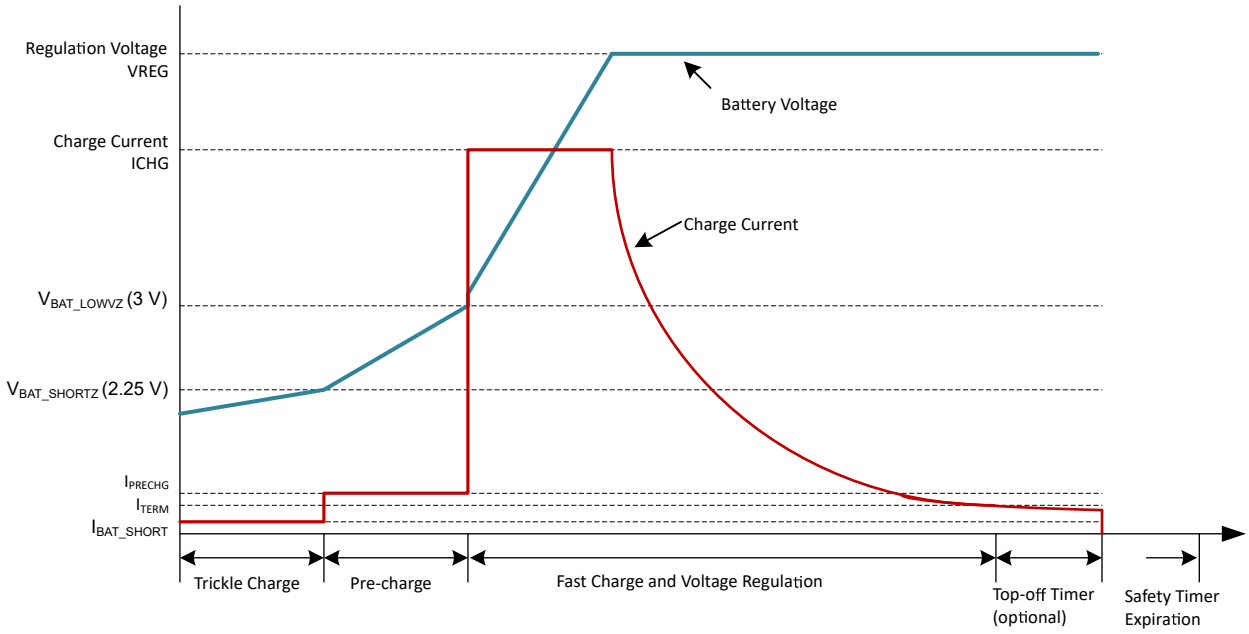

図 8-2. Battery Charging Profile

8.3.5.3 Charging Termination

The BQ25628 and BQ25629 terminate a charge cycle when the battery voltage is above recharge threshold, and the current is below ITERM. To avoid early termination, the BQ25628 and BQ25629 do not terminate while IINDPM, VINDPM or thermal regulation loops are active. After the charging cycle is completed, the BATFET turns off. The converter keeps running to power the system, and the BATFET can turn on again to engage supplement mode. Termination can be permanently disabled by writing 0 to EN_TERM bit prior to charge termination.

At low termination currents, due to the comparator offset, the actual termination current may be 10 mA to 20 mA higher than the termination target. In order to compensate for comparator offset, a programmable top-off timer can be applied after termination is detected. The top-off timer follows safety timer constraints, such that if the safety timers suspend, so does the top-off timer. Similarly, if the safety timers count at half-clock rate, so does the top-off timer. Refer to セクション 8.3.5.5 for the list of conditions. The host can read CHG_STAT to find out the termination status.

Top-off timer gets reset by any of the following conditions:

1. Charging cycle stop and restart (toggle CE pin, toggle EN_CHG bit, charged battery falls below recharge threshold or adapter removed and replugged)
2. Termination status low to high
3. REG_RST register bit is set

The top-off timer settings are read in after is detected by the charger. Programming a top-off timer value after termination has no effect unless a recharge cycle is initiated. CHG_FLAG is set to 1 when entering top-off timer segment and again when the top-off timer expires.

8.3.5.4 Thermistor Qualification

The BQ25628 and BQ25629 provide a single thermistor input for battery temperature monitoring. The TS pin input of the battery temperature can be ignored by the charger if TS_IGNORE = 1. When the TS pin feedback is ignored, the charger considers the TS to always be valid for charging mode and OTG mode, and TS_STAT always reports 000. The TS pin may be left floating if TS_IGNORE is set to 1.

When TS_IGNORE=1, the TS_ADC channel is disabled, with TS_ADC_DIS forced to 1; Attempting to write to 0 is ignored.

When TS_IGNORE = 0, the charger adjusts the charging profile based on the TS pin feedback information according to the configurable profile described in セクション 8.3.5.4.1. When the battery temperature crosses from one temperature range to another, TS_STAT is updated accordingly, and the charger sets the FLAG bit for the newly-entered temperature range. If TS_MASK is set to 0, any change to TS_STAT, including a transition to TS_NORMAL, generates an $\overline{INT}$ pulse.

8.3.5.4.1 Advanced Temperature Profile in Charge Mode

To improve the safety of charging Li-ion batteries, JEITA guideline was released on April 20, 2007. The guideline emphasized the importance of avoiding a high charge current and high charge voltage at certain low and high temperature ranges. As battery technology continues to evolve, battery manufacturers have released temperature safety specifications that extend beyond the JEITA standard. The BQ25628 and BQ25629 feature a highly flexible temperature-based charging profile to meet these advanced specifications while remaining backwards compatible with the original JEITA standard. 図 8-3 shows the programmability for charger behavior under different battery temperature (TS) operating regions.

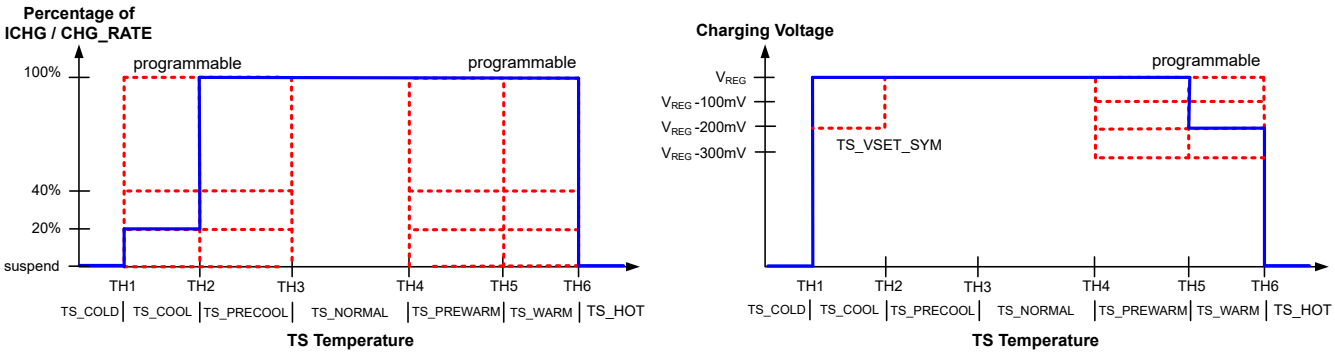

図 8-3. TS Charging Values

Charging safety timer is adjusted within the temperature zones to reflect changes to the charging current. When IPRECHG and ICHG are reduced to 20% or 40% in the cool or warm temperature zones, the charging safety timer counts at half rate. If charging is suspended, the safety timer is suspended, the STAT pin blinks and CHG_STAT is set to 00 (not charging or charge terminated.)

8.3.5.4.2 TS Pin Thermistor Configuration

The typical TS resistor network is illustrated below.

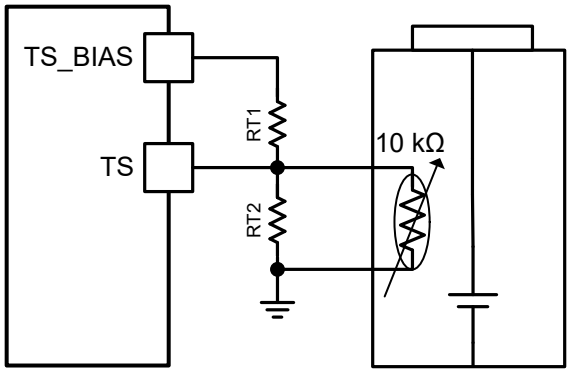

図 8-4. TS Resistor Network

The value of RT1 and RT2 are determined from the resistance of the thermistor at 0 and 60ºC (RTH_{0degC} and RTH_{60degC}) and the corresponding voltage thresholds V_{TS_0degC} and V_{TS_60degC} (expressed as percentage of REGN with value between 0 and 1). For the most accurate thermistor curve fitting, use the rising threshold for V_{TS_COLD} at 0ºC and the falling threshold for V_{TS_HOT} at 60ºC, regardless of the actual register settings for TS_TH1_TH2_TH3 and TS_TH4_TH5_TH6.

$$RT2 = \frac{RTH_{0degC} \times RTH_{60degC} \times \left(\frac{1}{V_{TS\_0degC}} - \frac{1}{V_{TS\_60degC}}\right)}{RTH_{60degC} \times \left(\frac{1}{V_{TS\_60degC}} - 1\right) - RTH_{0degC} \times \left(\frac{1}{V_{TS\_0degC}} - 1\right)} \quad (1)$$

$$RT1 = \frac{\frac{1}{V_{TS\_0degC}} - 1}{\frac{1}{R_{T2}} + \frac{1}{RTH_{0degC}}} \quad (2)$$

Assuming a 103AT NTC thermistor on the battery pack, the RT1 and RT2 are calculated to be 5.23 kΩ and 30.1 kΩ respectively.

If the thermistor is biased from TS_BIAS, the maximum current should be checked against $I_{TS\_BIAS\_FAULT}$. For the worst-case condition of thermistor at 0-Ω impedance (very hot), the bias current is :

$$I_{BIAS\_MAX} = \frac{V_{REGN}}{RT1} \quad (3)$$

For 5.30-kΩ RT1, this has a maximum I_{BIAS} of 0.94 mA, which is well below the minimum $I_{TS\_BIAS\_FAULT}$ threshold. The 103AT NTC thermistor is the recommended thermistor and has 10-kΩ nominal impedance. Using a lower impedance thermistor will change the value of R1 and may produce a bias current that exceeds the TS_BIAS pin fault threshold. TS_STAT[2:0] is set to 111.

8.3.5.4.3 Cold/Hot Temperature Window in OTG Mode

For battery protection during boost OTG and bypass OTG modes, BQ25628 and BQ25629 monitor the battery temperature to be within the TS_TH_OTG_COLD to TS_TH_OTG_HOT register settings. For a 103AT NTC thermistor with RT1 of 5.23 kΩ and RT2 of 30.1 kΩ, TS_TH_OTG_COLD default is -10°C and TS_TH_OTG_HOT default is 60°C. When temperature is outside of this range, the OTG mode is suspended with REGN remaining on. In addition, VBUS_STAT bits are set to 000, TS_STAT is set to 001 (TS_OTG_COLD) or 010 (TS_OTG_HOT), and TS_FLAG is set. In bypass OTG, PMID_GD drives low and the HSFET is disabled. Once the battery temperature returns to normal temperature, the boost OTG or bypass OTG is restarted and TS_STAT returns to 000 (TS_NORMAL).

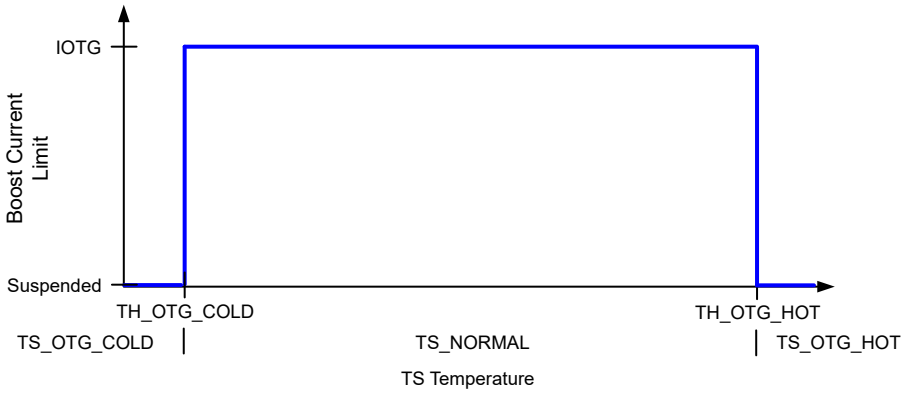

図 8-5. TS Pin Thermistor Sense Threshold in Boost Mode

8.3.5.4.4 JEITA Charge Rate Scaling

The TS_ISET_PRECOOL, TS_ISET_COOL, TS_ISET_PREWARM and TS_ISET_WARM cool and warm charge current fold backs are based on a 1C charging rate. The 1C rate is the battery capacity in mA-hours divided by 1 hour, so that a 500 mA-hour battery would have a 1C charging rate of 500 mA. The same battery would have a 2C charging rate of 1,000 mA. In order to convert the charging foldback, the host must set the CHG_RATE register to the C rate for the battery. This scales the foldback accordingly.

When TS_ISET_PRECOOL, TS_ISET_COOL, TS_ISET_PREWARM or TS_ISET_WARM is set to either 00 (suspend) or 11 (unchanged), the CHG_RATE setting has no effect. A summary is provided in 表 8-4.

表 8-4. ICHG Fold Back

TS_ISET_PRECOOL, TS_ISET_COOL, TS_ISET_PREWARM or TS_ISET_WARM	CHG_RATE	FOLD-BACK CURRENT AS PERCENTAGE OF ICHG
00	Any	0% (Suspended)
01 (20%)	00 (1C)	20%
	01 (2C)	10%
	10 (4C)	5%
	11 (6C)	3.3%
10 (40%)	00 (1C)	40%
	01 (2C)	20%
	10 (4C)	10%
	11 (6C)	6.6%
11	Any	100%

8.3.5.4.5 TS_BIAS Pin

The The BQ25628 has the TS_BIAS pin to isolate the battery temperature sensing thermistor and associated resistor-divider from REGN. The 103AT thermistor with typical resistor-divider network requires about 400 µA to bias. The BQ25628 provides the TS_BIAS pin, which is internally connected to the REGN LDO via a back-to-back MOSFET switch. When no temperature measurement is being taken, the switch is disabled to disconnect the thermistor and resistor-divider from the REGN LDO, saving the 400-µA bias current from being expended unnecessarily.

The TS_BIAS pin has short-circuit protection. If a short is detected on the TS_BIAS pin, the switch is disabled to disconnect the short from REGN. If this condition occurs, TS_STAT register is set to 0x3. Charging and OTG modes are suspended until the short is removed.

8.3.5.5 Charging Safety Timers

The BQ25628 and BQ25629 have three built-in safety timers to prevent extended charging cycle due to abnormal battery conditions. The fast charge safety timer and pre-charge safety timers are set through I^2C CHG_TMR and PRECHG_TMR fields, respectively. The trickle charge timer is fixed at 1 hour.

The trickle charging, pre-charging and fast charging safety timers can be disabled by setting EN_SAFETY_TMRS = 0. EN_SAFETY_TMRS can be enabled anytime regardless of which charging stage the charger is in. Each timer starts to count as soon as the following two conditions are simultaneously true: EN_SAFETY_TMRS=1 and the corresponding charging stage is active.

When either the fast charging, trickle charging or pre-charging safety timer expires, the SAFETY_TMR_STAT and SAFETY_TMR_FLAG bits are set to 1.

Events that cause a reduction in charging current also cause the charging safety timer to count at half-clock rate if TMR2X_EN bit is set.

During faults which suspend charging, the charge, pre-charge and trickle safety timers are also suspended, regardless of the state of the TMR2X_EN bit. Once the fault goes away, charging resumes and the safety timer resumes from where it stopped.

The charging safety timer and the charging termination can be disabled at the same time. Under this condition, the charging keeps running until it is disabled by the host.

8.3.6 USB On-The-Go (OTG)

8.3.6.1 Boost OTG Mode

BQ25628 and BQ25629 support boost converter operation to deliver power from the battery to PMID. The output voltage is set in VOTG. VBUS_STAT is set to 111 upon a successful entry into boost OTG. The boost operation is enabled when the following conditions are met:

1. BAT above V_{BAT_OTG}
2. VBUS less than $V_{BAT}+V_{SLEEP}$
3. Boost mode operation is enabled (EN_OTG = 1)
4. $V_{TS\_OTG\_HOT} < V_{TS} < V_{TS\_OTG\_COLD}$
5. $V_{REGN} > V_{REGN\_OK}$
6. 30 ms delay after EN_OTG = 1
7. Boost mode regulation voltage in REG0x0C is greater than 105% of battery voltage.

8.3.6.2 Bypass OTG Mode

In addition to boost OTG mode, the BQ25628 and BQ25629 provide bypass mode to directly connect the battery to PMID pin through BATFET and HSFET. The low impedance path in bypass mode achieves the highest efficiency when powering up external accessories, and maximizes the battery run time. During bypass OTG mode, the status register VBUS_STAT is set to 111.

Bypass OTG mode is entered when:

- $V_{BAT} > V_{BAT\_OTG}$
- $V_{VBUS} < V_{BAT}+V_{SLEEP}$
- OTG mode has been enabled (EN_OTG=1) and bypass mode is enabled (EN_BYPASS_OTG=1).
- $V_{TS\_OTG\_HOT} < V_{TS} < V_{TS\_OTG\_COLD}$
- $V_{REGN} > V_{REGN\_OK}$
- 30 ms delay after EN_OTG = EN_BYPASS_OTG = 1, bypass OTG is enabled by turning on HSFET and BATFET.

Any of the following conditions will exit from bypass OTG. Unless otherwise indicated, exit from bypass mode leads into battery-only mode by setting EN_OTG = EN_BYPASS_OTG = 0:

- OTG mode is disabled (EN_OTG=0)

- Bypass OTG mode is disabled (EN_BYPASS_OTG = 0) will cause exit into boost OTG mode if EN_OTG remains at 1.
- Entry into shutdown, ship mode or system power reset will exit from bypass OTG by setting EN_OTG = EN_BYPASS_OTG = 0 and then enter into shutdown, ship mode or system power reset as selected.

BQ25628 and BQ25629 can be configured to automatically transition between charging mode and bypass OTG mode by setting EN_CHG = 1, EN_OTG = 1 and EN_BYPASS_OTG = 1. When the adapter plugs in, and all conditions to start a new charge cycle are valid, the device automatically transitions to charging mode. If the adapter is removed and bypass enable conditions are valid, the device automatically transitions to bypass OTG mode to power the accessories connected to PMID.

8.3.6.3 PMID Voltage Indicator (PMID_GD)

In BQ25628 and BQ25629, accessory devices can be connected to charger PMID pin to get power either from the adapter through Q1 direct path or from battery boost mode. An optional external PMOS FET can be placed between the PMID pin and accessory input to disconnect the power path during over-current and over-voltage conditions. PMID_GD is used to drive this external PMOS FET through an inverter. PMID_GD HIGH turns on an inverter to pull the PMOS FET gate low to turn on PMOS FET, and PMID_GD LOW turns off the PMOS FET.

Upon adapter plug-in, PMID_GD goes from LOW to HIGH when VBUS rises above V_{BAT} but below V_{PMID_OVP} and passes poor source detection. An adapter voltage that is greater than V_{PMID_OVP} but less than V_{VBUS_OVP} will drive PMID_GD low, but will charge the battery if all other conditions are valid. In this state, the external PMOS FET will stay off to protect the accessory from over-voltage fault.

When the adapter is removed, PMID_GD goes LOW before battery boost mode starts. In battery boost mode, the device regulates PMID voltage to the VOTG register setting as a stable power supply to the accessory devices. PMID_GOOD goes from LOW to HIGH when PMID voltage rises above V_{OTG_UVPZ}. Once PMID voltage is out of this range, PMID_GOOD goes LOW to disconnect the accessory device from PMID. During boost mode, any of the conditions to exit boost mode will also drive PMID_GD from HIGH to LOW. See セクション 8.3.6.1 for a list of these conditions.

If the device enters bypass OTG mode, the PMID_GD goes from LOW to HIGH when HSFET (Q2) is enabled. During bypass OTG mode, any conditions to exit will also drive PMID_GD from HIGH to LOW. See セクション 8.3.6.2 for a list of these conditions.

8.3.7 Integrated 12-Bit ADC for Monitoring

The BQ25628 and BQ25629 provide an integrated 12-bit ADC for the host to monitor various system parameters.

To enable the ADC, the ADC_EN bit must be set to ‘1’. The ADC is disabled by default (ADC_EN = 0) to conserve power. The ADC is allowed to operate if either VBUS > VPOORSRC or VBAT > VBAT_LOWV is valid. If ADC_EN is set to ‘1’ before VBUS or VBAT reach their respective valid thresholds, then ADC_EN stays '0'. When the charger enters HIZ mode, the ADC is temporarily suspended.

At battery only condition, if the TS_ADC channel is enabled, the ADC only operates when the battery voltage is higher than 3.2 V (the minimal value to turn on REGN), otherwise, the ADC operates when the battery voltage is higher than V_{BAT_LOWV}.

The ADC_DONE_STAT, ADC_DONE_FLAG bits are set when a conversion is complete in one-shot mode only. During continuous conversion mode, the ADC_DONE_STAT, ADC_DONE_FLAG bits have no meaning and remain at 0. In one-shot mode, the ADC_EN bit is set to 0 at the completion of the conversion, at the same time as the ADC_DONE_FLAG bit is set. In continuous mode, the ADC_EN bit remains at 1 until the user disables the ADC by setting it to 0.

8.3.8 Status Outputs (STAT, $\overline{INT}$)

8.3.8.1 Interrupts and Status, Flag and Mask Bits

The device incorporates an interrupt pin ($\overline{INT}$) to inform a host microcontroller of status changes without requiring microcontroller polling. Each reported event has a status field, a flag bit and a mask bit. The status field

reports the status at the time that it is read. The flag bit is latched and, once set to 1, will remain at 1 until the host reads the bit, which will clear it to 0. The mask bit determines whether or not an interrupt pulse will be generated when the flag bit is set.

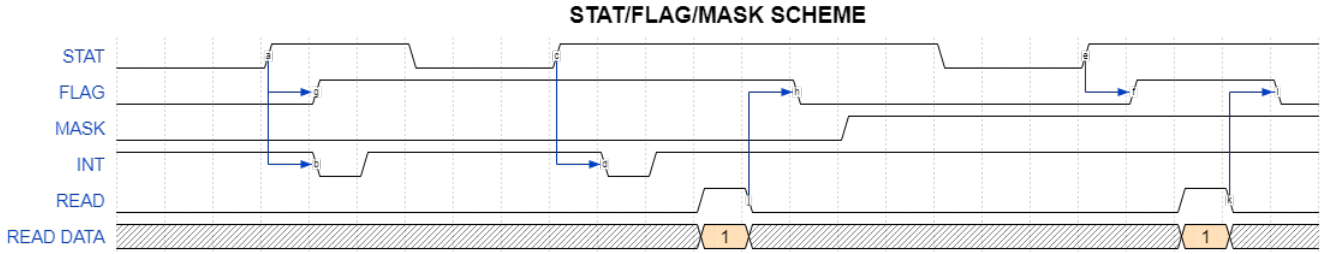

図 8-6. Relationship Between STAT, FLAG, and MASK

The flag bit is set upon certain transitions of the status field. These transitions also generate an $\overline{INT}$ pulse if the associated mask bit is set to 0. Because the $\overline{INT}$ is generated from the status field transition and not the flag bit, an $\overline{INT}$ pulse is sent to the host even if the associated flag is already set to 1 when the status transition occurs. Details of this behavior are shown in 図 8-6.

The default behavior is to generate a 256-µs $\overline{INT}$ pulse when any flag bit is set to 1. These pulses may be masked out on a flag-by-flag basis by setting a flag's mask bit to 1. Setting the mask bit does not affect the transition of the flag bit from 0 to 1, only the generation of the 256-µs $\overline{INT}$ pulse.

8.3.8.2 Charging Status Indicator (STAT)

The BQ25628 indicates charging state on the open drain STAT pin. The STAT pin can drive an LED. The STAT pin function can be disabled via the DIS_STAT bit.

表 8-5. STAT Pin State

CHARGING STATE	STAT INDICATOR
Charging in progress (including recharge)	LOW
Not charging, no fault detected. (Includes charging complete, Charge Disabled, no adapter present, in OTG mode.)	HIGH
Charge suspend	Blinking at 1 Hz

8.3.8.3 Interrupt to Host ($\overline{INT}$)

In many applications, the host does not continually poll the charger status registers. Instead, the INT pin may be used to notify the host of a status change with a 256-µs $\overline{INT}$ pulse. Upon receiving the interrupt pulse, the host may read the flag registers (Charger_Flag_X and FAULT_Flag_X) to determine the event that caused the interrupt, and for each flagged event, read the corresponding status registers (Charger_Status_X and FAULT_Status_X) to determine the current state. Once set to 1, the flag bits remain latched at 1 until they are read by the host, which clears them. The status bits, however, are updated whenever there is a change to status and always represent the current state of the system.

All of the $\overline{INT}$ events can be masked off to prevent $\overline{INT}$ pulses from being sent out when they occur, with the exception of the initial power-up interrupt. Interrupt events are masked by setting their mask bit in registers (Charger_Mask_X and FAULT_Mask_X). Events always cause the corresponding flag bit to be set to 1, regardless of whether or not the interrupt pulse has been masked.

8.3.9 BATFET Control

The BQ25628 and BQ25629 have an integrated, bi-directionally blocking BATFET that can be turned off to remove leakage current from the battery to the system. The BATFET is controlled by the BATFET_CTRL register bits, and supports shutdown mode, ship mode and system power reset.

表 8-6. BATFET Control Modes

MODE	BATFET	I²C	ENTRY, NO ADAPTER	ENTRY, WITH ADAPTER, BATFET_CTRL_WVBUS = 0	ENTRY, WITH ADAPTER, BATFET_CTRL_WVBUS = 1	EXIT
Normal	On	Active	N/A	N/A	N/A	N/A
Ship mode	Off	Off	Writing BATFET_CTRL = 10 turns off BATFET after BATFET_DLY and enters ship mode.	Writing BATFET_CTRL = 10 has no effect while adapter is present. When both BATFET_DLY has expired and the adapter is removed, the device turns off BATFET and enters ship mode. Writing BATFET_CTRL = 00 before adapter is removed aborts ship mode.	Writing BATFET_CTRL = 10 turns off BATFET after BATFET_DLY. When both BATFET_DLY has expired and adapter is removed, the device enters ship mode. Writing BATFET_CTRL = 00 before adapter is removed turns BATFET on and aborts ship mode.	$\overline{QON}$ or adapter plug-in
System reset	On to Off to On	Active	Writing BATFET_CTRL = 11 initiates system reset after BATFET_DLY. Holding $\overline{QON}$ low for t_{QON_RST} initiates immediate reset (BATFET_DLY is not applied.)	Writing BATFET_CTRL = 11 is ignored and BATFET_CTRL resets to 00. Holding $\overline{QON}$ low for t_{QON_RST} is ignored.	Writing BATFET_CTRL = 11 initiates system reset after BATFET_DLY. Holding $\overline{QON}$ low for t_{QON_RST} initiates immediate reset. Converter is placed in HIZ during system reset and exits HIZ when system reset completes.	N/A
Shutdown mode	Off	Off	Writing BATFET_CTRL = 01 turns off BATFET after BATFET_DLY and enters shutdown.	Writing BATFET_CTRL = 01 with adapter present is ignored, regardless of BATFET_CTRL_WVBUS setting, and BATFET_CTRL is reset to 00.		Adapter plug-in

8.3.9.1 Shutdown Mode

For the lowest battery leakage current, the host can shut down the BQ25628 and BQ25629 by setting the register bits BATFET_CTRL to 01. In this mode, the BATFET is turned off to prevent the battery from powering the system, the I²C is disabled and the charger is totally shut down. The BQ25628 and BQ25629 can only be woken up by plugging in an adapter. When the adapter is plugged in, the BQ25628 and BQ25629 start back up with all register settings in their POR default.

After the host sets BATFET_CTRL to 01, the BATFET turns off after waiting either 25 ms or 12.5 s as configured by BATFET_DLY register bit. Shutdown mode can only be entered when $V_{VBUS} < V_{VBUS\_UVLO}$, regardless of the BATFET_CTRL_WVBUS setting, which has no effect on shutdown mode entry. If the host writes BATFET_CTRL = 01 with $V_{VBUS} > V_{VBUS\_UVLOZ}$, the request is ignored and the BATFET_CTRL bits are set back to 00.

If the host writes BATFET_CTRL to 01 while boost OTG or bypass OTG is active, the BQ25628 and BQ25629 first exit from boost OTG by setting EN_OTG = 0 or exits from bypass OTG by setting EN_OTG = EN_BYPASS_OTG = 0 and then enters shutdown mode.

$\overline{QON}$ has no effect during shutdown mode. The internal pull-up on the $\overline{QON}$ pin is disabled during shutdown to prevent leakage through the pin.

8.3.9.2 Ship Mode

The host may place the BQ25628 and BQ25629 into ship mode by setting BATFET_CTRL = 10. In ship mode, the BATFET is turned off to prevent the battery from powering the system, and the I²C is disabled. Ship mode has slightly higher quiescent current than shutdown mode, but $\overline{QON}$ may be used to exit from ship mode. The BQ25628 and BQ25629 are taken out of ship mode by either of these methods:

- Pulling the $\overline{QON}$ pin low for t_{SM_EXIT}
- $V_{VBUS} > V_{VBUS\_UVLOZ}$ (adapter plug-in)

When the BQ25628 and BQ25629 exit from ship mode, the registers are reset to their POR values.

Ship mode is only entered when the adapter is not present. Setting BATFET_CTRL = 10 while $V_{VBUS} > V_{VBUS\_UVLOZ}$ (adapter present) either disables the BATFET or has no immediate effect depending on the setting of BATFET_CTRL_WVBUS.

8.3.9.3 System Power Reset

The BATFET functions as a load switch between battery and system when the converter is not running. By changing the state of BATFET from on to off, systems connected to SYS can be power cycled. Any of the following conditions initiates a system power reset:

- BATFET_CTRL_WVBUS = 1 and $\overline{QON}$ is pulled low for tQON_RST
- BATFET_CTRL_WVBUS = 1 and BATFET_CTRL = 11
- BATFET_CTRL_WVBUS = 0 and VBUS < V_{VBUS_UVLO} simultaneously with $\overline{QON}$ pulled low for tQON_RST
- BATFET_CTRL_WVBUS = 0 and VBUS < V_{VBUS_UVLO} and BATFET_CTRL = 11

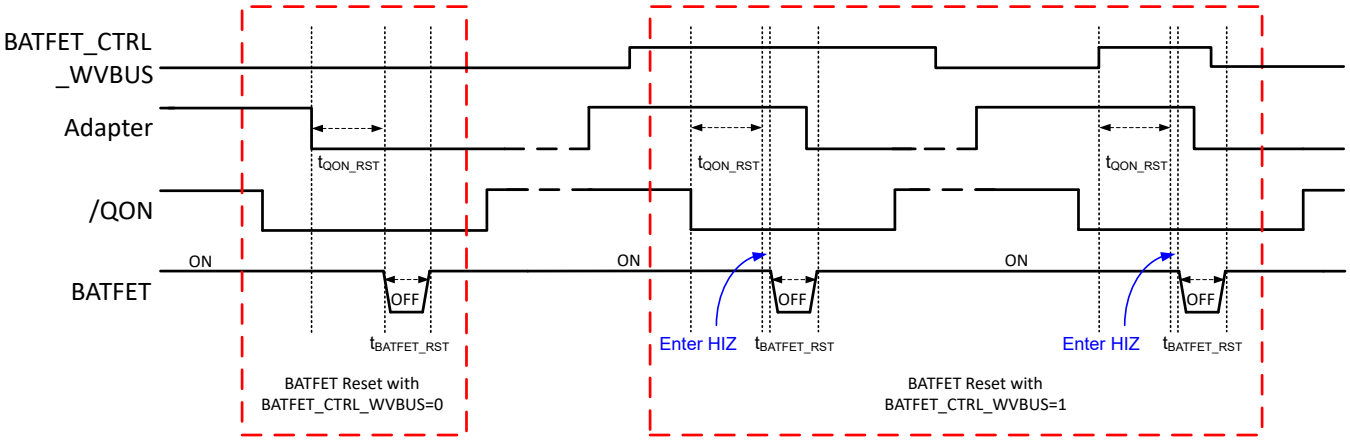

図 8-7. System Power Reset Timing

When BATFET_CTRL_WVBUS is set to 1, system power reset proceeds if either BATFET_CTRL is set to 11 or $\overline{QON}$ is pulled low for t_{QON_RST}, regardless of whether VBUS is present or not . There is a delay of t_{BATFET_DLY} before initiating the system power reset. If $\overline{QON}$ is pulled low, there is no delay after the tQON_RST completes, regardless of BATFET_DLY setting.

The system power reset can be initiated from the battery only condition, from OTG mode or from the forward charging mode with adapter present. If the system power is reset when the charger is in boost OTG mode, the boost OTG mode is first stopped by setting EN_OTG = 0. If the system power is reset when the charger is in bypass OTG mode, the bypass OTG mode will first be terminated by setting EN_OTG = EN_BYPASS_OTG = 0.

8.3.10 Protections

8.3.10.1 Voltage and Current Monitoring in Battery Only and HIZ Modes

The BQ25628 monitors a reduced set of voltages and currents when operating from battery without an adapter or when operating from battery in high impedance mode.

8.3.10.1.1 Battery Undervoltage Lockout

In battery-only mode, the BQ25628 disables the BATFET if V_{BAT} falls below V_{BAT_UVLO}, separating the system from the battery. I^2C is disabled as well. Upon exit from the undervoltage lockout condition when either V_{BAT} rises above V_{BAT_UVLOZ} or V_{VBUS} rises above V_{VBUS_UVLOZ}, I^2C will be re-enabled and the registers are reset to their POR values.

8.3.10.1.2 Battery Overcurrent Protection

The BQ25628 has a two-level battery overcurrent protection. The I_{BAT_PK} threshold is set by IBAT_PK and provides a fast (100 µs) protection for the battery discharging. I_{BATFET_OCP} provides a slower (50 ms), fixed-threshold protection for the BATFET. If the battery discharge current becomes higher than either threshold for its protection timer, the BAT_FAULT_STAT and BAT_FAULT_FLAG fault register bits are set to 1, and the BATFET enters hiccup mode with 100-ms off-time and ~1% on-time. The BAT_FAULT_STAT will return to 0 once the BATFET is disabled for the hiccup mode. Once the BATFET is turned back on, the I_{BAT_PK} and I_{BATFET_OCP} thresholds are re-evaluated. In boost OTG mode, if the battery discharging current is higher than either I_{BAT_PK} or I_{BATFET_OCP} for their respective protection timers, the charger exits OTG mode by clearing the EN_OTG bit.

8.3.10.2 Voltage and Current Monitoring in Buck Mode

8.3.10.2.1 Input Overvoltage

If VBUS voltage rises above V_{VBUS_OVP}, the converter stops switching to protect the internal power MOSFETs and I_{PMID_LOAD} discharge current is applied to bring down VBUS voltage. VBUS_FAULT_FLAG and VBUS_FAULT_STAT are set to 1. When VBUS falls back below V_{VBUS_OVPZ}, VBUS_FAULT_STAT will transition to 0 and the converter will resume switching.

8.3.10.2.2 System Overvoltage Protection (SYSOVP)

When VSYS rises above the V_{SYS_OVP} threshold (around 250 mV above VBAT when not charging) in forward converter operation, the converter stops switching to limit voltage overshoot and applies I_{SYS_LOAD} to pull down the system voltage. VSYS_FAULT_FLAG and VSYS_FAULT_STAT are set to 1. Once VSYS drops below V_{SYS_OVP}, the converter resumes switching, the 30 mA discharge current is removed and VSYS_FAULT_STAT transitions to 0.

8.3.10.2.3 Forward Converter Cycle-by-Cycle Current Limit

The converter has cycle-by-cycle peak overcurrent protection in the switching MOSFETs. In forward mode, if the current through Q2 exceeds I_{HSFET_OCP}, the converter will immediately turn off the high-side gate drive for the remainder of the switching cycle. Normal switching resumes on the next switching cycle.

8.3.10.2.4 System Short

When the SYS voltage falls below V_{SYS_SHORT}, the charger enters PFM operation to limit the output current to approximately 0.5 A or less. SYS_FAULT_STAT and SYS_FAULT_FLAG bits are set to 1. If V_{SYS} rises above V_{SYS_SHORTZ}, the converter exits forced PFM mode, and the SYS_FAULT_STAT bit is set to 0.

8.3.10.2.5 Battery Overvoltage Protection (BATOVP)

When V_{BAT} transitions above V_{BAT_OVP}, the BQ25628 disables charging by disabling the BATFET and applies I_{BAT_LOAD} current source to discharge excess BAT voltage. If battery voltage remains above the threshold , BAT_FAULT_FLAG is set to 1 and BAT_FAULT_STAT transitions to 1. Once V_{BAT} falls below V_{BAT_OVPZ}, charging resumes and BAT_FAULT_STAT transitions back to 0.

8.3.10.2.6 Sleep and Poor Source Comparators

The sleep comparator is used to suspend the converter if the adapter voltage is insufficient to maintain buck converter operation while charging the battery. If V_{VBUS} falls below V_{BAT} + V_{SLEEP} , the converter stops switching, and VBUS_FAULT_STAT and VBUS_FAULT_FLAG are set to 1. If V_{VBUS} rises back above V_{BAT} + V_{SLEEPZ} , the converter restarts, .

If V_{VBUS} falls below $V_{POORSRC}$, the converter stops switching (if not already suspended and high due to the sleep comparator), and the VBUS_STAT transitions to 000 and the device transitions to battery-only mode. If V_{VBUS} rises above $V_{POORSRC}$, it is a new adapter attach, and poor source qualification will be run. VBUS_STAT will be determined by the adapter attach sequence as outlined in セクション 8.3.3.

8.3.10.2.7 PMID OVP and VBUS Overcurrent

BQ25628 monitors two additional parameters in forward charging mode to protect circuitry attached at PMID: PMID overvoltage and VBUS Overcurrent. The PMID OVP comparator protects circuitry attached to the PMID pin by driving PMID_GD low to disable an optional external pass FET. If V_{PMID} rises above V_{PMID_OVP} the converter drives PMID_GD low. BQ25628 sets OTG_FAULT_STAT and OTG_FAULT_FLAG = 1. When V_{PMID} drops below V_{PMID_OVPZ}, the converter drives PMID_GD high and clears the OTG_FAULT_STAT bit to 0.

The VBUS overcurrent comparator monitors the input current. A short circuit at PMID will pull excessive current from VBUS that cannot be blocked by the IINDPM regulation loop in the converter. When I_{VBUS} exceeds I_{VBUS_OCP} or ILIM pin voltage exceeds V_{ILIM_OCP} (900mV), the converter drives PMID_GD low, and BQ25628 sets OTG_FAULT_STAT and OTG_FAULT_FLAG = 1.

8.3.10.3 Voltage and Current Monitoring in Boost Mode

BQ25628 closely monitors VBUS, SYS and BAT voltages, as well as VBUS, BAT and LSFET currents to ensure safe boost mode operation.

8.3.10.3.1 Boost Mode Overvoltage Protection

When the BQ25628 is in OTG mode, Q1 is off to block power from PMID to VBUS. BQ25628 uses two comparators to sense OVP during OTG mode. The PMID_OTG_OVP comparator monitors for an overvoltage condition at PMID (V_{PMID} > $V_{BOOST\_PMID\_OVP}$.) The VBUS_OTG_OVP comparator monitors for an overvoltage condition at VBUS (V_{VBUS} > $V_{OTG\_VBUS\_OVP}$.) Even though RBFET is turned off during OTG mode on the BQ25628, an overvoltage at VBUS may result in an overvoltage at PMID via propagation across the RBFET body diode.

If an overvoltage persists, the status is updated and the converter powers down into a fault condition. Overvoltage on PMID or VBUS will result in OTG_FAULT_STAT and OTG_FAULT_FLAG set to 1.

If V_{VBUS} > V_{BAT}+V_{SLEEP}, BQ25628 will exit boost OTG and enter adapter qualification. If VBUS passes adapter qualification (poor source detection), it will then enter forward charging mode. Even though the V_{VBUS} > V_{OTG_OVP} overvoltage condition does not cause an exit from boost OTG, an adapter plugin will trip the longer deglitch of the sleep comparator, and BQ25628 will exit from boost OTG for this reason.

8.3.10.3.2 Boost Mode Duty Cycle Protection

After an initial startup blanking period, BQ25628 monitors the PMID voltage during boost OTG mode to ensure that PMID voltage remains sufficiently above VSYS to maintain the minimum duty cycle. If V_{PMID} falls below V_{BOOST_DUTY} (105% V_{SYS} typical), the converter stops and enters hiccup mode.

If the boost converter cannot recover from hiccup mode, EN_OTG bit is cleared and the device exits boost mode. The host may attempt to restart boost OTG mode by setting EN_OTG = 1.

8.3.10.3.3 Boost Mode PMID Undervoltage Protection

During boost OTG mode, BQ25628 converter monitors PMID for undervoltage. If the PMID voltage falls below V_{OTG_UVP}, the converter stops and enters hiccup mode.

If the boost converter cannot recover from hiccup mode, EN_OTG bit is cleared and the device exits boost mode. The host may attempt to restart boost OTG mode by setting EN_OTG = 1.

8.3.10.3.4 Boost Mode Battery Undervoltage

If V_{BAT} falls below V_{BAT_OTGZ} during OTG mode, the charger exits OTG mode by setting EN_OTG = 0, and BAT_FAULT_STAT and BAT_FAULT_FLAG are set to 1. Setting EN_OTG = 1 while V_{BAT} < V_{BAT_OTG} will not

enter OTG and the EN_OTG bit will be cleared to 0. When the battery is charged above V_{BAT_OTG}, OTG mode may be entered by setting EN_OTG = 1.

8.3.10.3.5 Boost Converter Cycle-by-Cycle Current Limit

The converter has cycle-by-cycle peak overcurrent protection in the switching MOSFETs. In OTG mode, if the current through Q3 exceeds I_{LSFET_OCP}, the converter will immediately turn off the low-side gate drive for the remainder of the switching cycle. Normal switching resumes on the next switching cycle.

8.3.10.3.6 Boost Mode SYS Short

If VSYS falls below VSYS_SHORT in boost OTG mode, BQ25628 immediately stops the boost converter, enters hiccup mode, and sets SYS_FAULT_FLAG to 1.

If the boost converter cannot recover from hiccup mode, EN_OTG bit is cleared and the device exits boost mode. The host may attempt to restart boost OTG mode by setting EN_OTG = 1.

8.3.10.4 Voltage and Current Monitoring in Bypass Mode

BQ25628 monitors many of the same voltages and currents in bypass OTG mode as it does in boost OTG mode. Additionally, bypass mode implements reverse-current protection as described in the following subsection.

8.3.10.4.1 Bypass Mode Overvoltage Protection

When the BQ25628 is in bypass OTG mode, Q1 is off to block power from PMID to VBUS. BQ25628 uses two comparators to sense OVP. The PMID_OTG_OVP comparator monitors for an overvoltage condition at PMID (V_{PMID} > $V_{BYPASS\_PMID\_OVP}$.) The VBUS_OTG_OVP comparator monitors for an overvoltage condition at VBUS (V_{VBUS} > $V_{OTG\_VBUS\_OVP}$.) Even though RBFET is turned off during OTG mode on the BQ25628, an overvoltage at VBUS may result in an overvoltage at PMID via propagation across the RBFET body diode.

If an overvoltage persists on VBUS BQ25628 exits bypass OTG by setting EN_OTG = EN_BYPASS_OTG = 0.

If overvoltage persists on PMID bypass OTG is suspended, and the device enters hiccup mode. If the device cannot recover from hiccup mode, bypass OTG mode is exited by setting EN_OTG = EN_BYPASS_OTG = 0.

If V_{VBUS} > V_{BAT}+V_{SLEEP}, BQ25628 will exit bypass OTG and enter adapter qualification. If VBUS passes adapter qualification (poor source detection), it will then enter forward charging mode. Even though the V_{VBUS} > V_{OTG_OVP} overvoltage condition does not cause an exit from bypass OTG, an adapter plugin will trip the longer deglitch of the sleep comparator, and BQ25628 will exit from bypass OTG for this reason.

8.3.10.4.2 Bypass Mode Battery OCP

BQ25628 has a two-level battery overcurrent protection. The I_{BAT_PK} threshold is set by IBAT_PK and provides a fast (100 µs) protection for the battery discharging. I_{BATFET_OCP} provides a slower (50 ms), fixed-threshold protection for the BATFET. During bypass OTG mode, if the battery discharge current becomes higher than either threshold, the BAT_FAULT_STAT and BAT_FAULT_FLAG fault register bits are set to 1, and BQ25628 exits from bypass OTG mode into battery-only mode by setting EN_OTG = EN_BYPASS_OTG = 0. The BATFET remains on when BQ25628 transitions into battery-only mode. If I_{BAT} remains above the I_{BAT_PK} / I_{BATFET_OCP} threshold after exiting bypass OTG, then the BATFET is turned off. The host may re-enable bypass OTG mode by setting EN_OTG = EN_BYPASS_OTG = 1.

8.3.10.4.3 Bypass Mode Reverse-Current Protection

In bypass mode, BQ25628 monitors I_{HSFET} for reverse-current into the battery. If current from PMID into the battery exceeds I_{BYPASS_RCP} , OTG_FAULT_STAT and OTG_FAULT_FLAG are set to 1, and PMID_GD is driven low and HSFET is disabled in order to suspend bypass OTG mode and the device enters hiccup mode. If the device cannot recover from hiccup mode then the converter exits bypass OTG mode by setting EN_BYPASS_OTG = 0.

8.3.10.4.4 Bypass Mode Battery Undervoltage

In bypass mode, if V_{BAT} falls below V_{BAT_OTG}, the battery is considered depleted. OTG mode is exited by setting EN_OTG = EN_BYPASS_OTG = 0, and BAT_FAULT_STAT and BAT_FAULT_FLAG are set to 1. Setting EN_OTG = EN_BYPASS_OTG = 1 while $V_{BAT} < V_{BAT\_OTG}$ will not enter OTG and the EN_OTG and EN_BYPASS_OTG bits will be cleared to 0. When the battery is charged above V_{BAT_OTG}, OTG mode may be entered by setting EN_OTG = 1.

8.3.10.4.5 Bypass Mode SYS Short

If VSYS falls below VSYS_SHORT in bypass OTG mode, BQ25628 immediately drives PMID_GD low and disables HSFET, and the device enters hiccup mode. If the device cannot recover from hiccup mode, bypass OTG mode will be exited. The host may attempt to restart bypass OTG mode by setting EN_OTG = EN_BYPASS_OTG = 1.

8.3.10.4.6 Bypass Mode REGN Fault

If V_{REGN} falls below V_{REGN_OK} during bypass OTG mode, PMID_GD is driven low and HSFET is disabled, and the device enters hiccup mode. If the device cannot recover from hiccup mode it exits bypass OTG mode by setting EN_BYPASS_OTG = 0. The host may re-enter boost OTG mode by setting EN_OTG = EN_BYPASS_OTG = 1.

8.3.10.5 Thermal Regulation and Thermal Shutdown

8.3.10.5.1 Thermal Protection in Buck Mode

The BQ25628 monitors the internal junction temperature T_J to avoid overheating the chip and limits the IC junction temperature in buck mode. When the internal junction temperature exceeds the T_{REG} thermal regulation limit (TREG register configuration), the device lowers the charging current. During thermal regulation, the safety timer runs at half the clock rate, and the TREG_FLAG and TREG_STAT bits are set to 1. Additionally, the device has thermal shutdown to turn off the converter and BATFET when IC junction temperature exceeds T_{SHUT}. The fault bit TSHUT_FLAG is set to 1 and TSHUT_STAT transitions to 1. The BATFET and converter are re-enabled when IC temperature is T_{SHUT_HYS} below T_{SHUT}, and TSHUT_STAT transitions to 0.

8.3.10.5.2 Thermal Protection in Boost Mode

The device monitors the internal junction temperature to provide thermal shutdown during boost mode. When IC junction temperature exceeds T_{SHUT}, the boost mode is disabled by setting EN_OTG bit low and BATFET is turned off, and TSHUT_FLAG is set to 1. When IC junction temperature is below T_{SHUT} - T_{SHUT_HYS}, the BATFET is enabled automatically to allow system to restore and the host can re-enable EN_OTG bit to recover.

8.3.10.5.3 Thermal Protection in Battery-Only Mode

The BQ25628 monitors the internal junction temperature T_J to avoid overheating the chip and limits the IC junction temperature in battery-only mode. The device has thermal shutdown to turn off the BATFET when IC junction temperature exceeds T_{SHUT}. The fault bit TSHUT_FLAG is set to 1 and TSHUT_STAT transitions to 1. The BATFET is re-enabled when IC temperature is T_{SHUT_HYS} below T_{SHUT}, and TSHUT_STAT transitions to 0.

8.4 Device Functional Modes

8.4.1 Host Mode and Default Mode

The device is a host controlled charger, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous charger with no host or while host is in sleep mode. When the charger is in default mode, WD_STAT bit becomes HIGH, WD_FLAG is set to 1, and an $\overline{INT}$ is asserted low to alert the host (unless masked by WD_MASK). The WD_FLAG bit would read as 1 upon the first read and then 0 upon subsequent reads. When the charger is in host mode, WD_STAT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired. All the registers are in the default settings.

In default mode, the device keeps charging the battery with default 1-hour trickle charging safety timer, 2-hour pre-charging safety timer and the 12-hour fast charging safety timer. At the end of the 1-hour or 2-hour or 12-hour timer expired, the charging is stopped and the buck converter continues to operate to supply system load.

A write to any I^2C register transitions the charger from default mode to host mode, and initiates the watchdog timer. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD_RST bit before the watchdog timer expires (WD_STAT bit is set), or disable watchdog timer by setting WATCHDOG bits = 00.

When the watchdog expires, the device returns to default mode. The ICHG value is divided in half when the watchdog timer expires, and a number of other fields are reset to their POR default values as shown in the notes column of the register tables in セクション 8.6. When watchdog timer expires, WD_STAT and WD_FLAG is set to 1, and an $\overline{INT}$ is asserted low to alert the host (unless masked by WD_MASK).

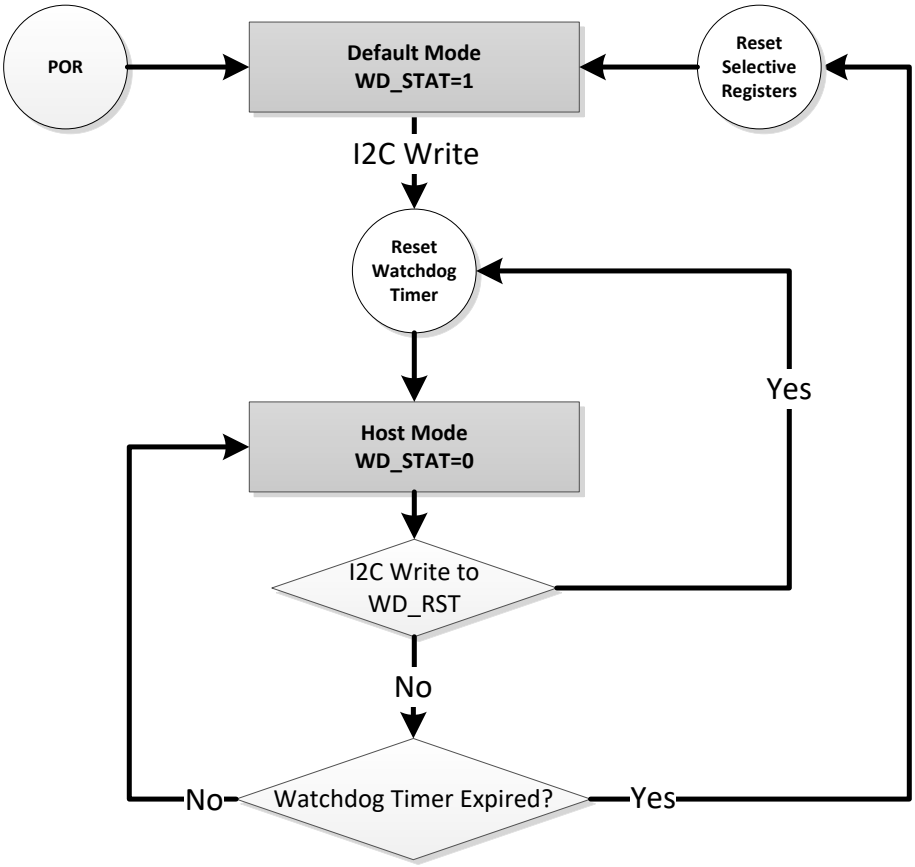

図 8-8. Watchdog Timer Flow Chart

8.4.2 Register Bit Reset

Beside a register reset by the watchdog timer in default mode, the register and the timer can be reset to the default value by writing the REG_RST bit to 1. The register bits, which can be reset by the REG_RST bit, are noted in the Register Map section. After the register reset, the REG_RST bit goes back from 1 to 0 automatically.

8.5 Programming

8.5.1 Serial Interface

The BQ25628 and BQ25629 uses an I^{2}C compatible interface for flexible charging parameter programming and instantaneous device status reporting. I^{2}C is a bi-directional 2-wire serial interface. Only two open-drain bus lines are required: a serial data line (SDA), and a serial clock line (SCL).

The device has 7-bit I^{2}C address 0x6A, receiving control inputs from a host device such as a micro-controller or digital signal processor through register addresses 0x02 – 0x38. The host device initiates all transfers and the charger responds. Register reads outside of these addresses return 0xFF. When the bus is free, both SDA and SCL lines are HIGH.

The I^{2}C interface supports standard mode (up to 100 kbits/s), fast mode (up to 400 kbits/s) and fast mode plus (up to 1 Mbits/s.) These lines are pulled up to a reference voltage via pull-up resistor. The device I^{2}C detection thresholds support a communication reference voltage from 1.2 V to 5 V.

Due to the ultra low I_Q when the device operates in low power mode, it is necessary ensure a minimum of 90µs between a START command and any subsequent START command on the I^{2}C bus. The recommended minimum t_{buf} (bus free time between a STOP and START condition) depends on the I^{2}C mode:

- Standard mode (100 kbits/s):
  - No additional requirements
- Fast mode (400 kbits/s):
  - Increase I^{2}C t_{buf} to at least 68 µs
  - If using repeated start commands, ensure I^{2}C tsu:STA is at least 68 µs
- Fast mode plus (1 Mbits/s):
  - Increase I^{2}C t_{buf} to at least 81 µs
  - If using repeated start commands, ensure I^{2}C tsu:STA is at least 81 µs

These recommendations assume a successful I^{2}C transaction. It is also necessary to ensure a minimum 90µs time between two START commands in the case of a NACK.

8.5.1.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. One clock pulse is generated for each data bit transferred.

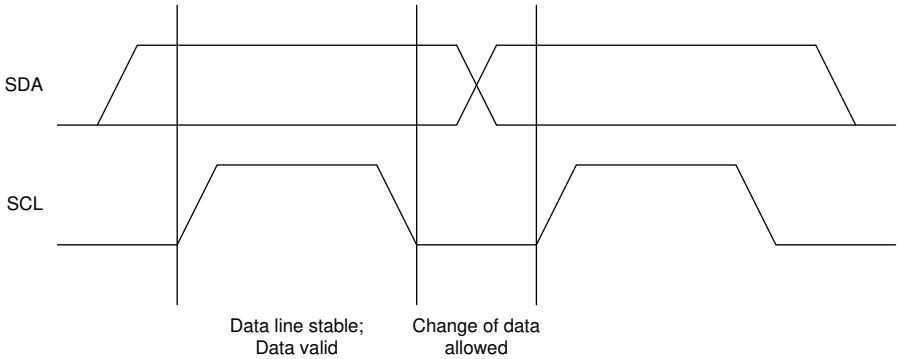

図 8-9. Bit Transfer on the I^{2}C Bus

8.5.1.2 START and STOP Conditions

All transactions begin with a START (S) and are terminated with a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

START and STOP conditions are always generated by the host. The bus is considered busy after the START condition, and free after the STOP condition.

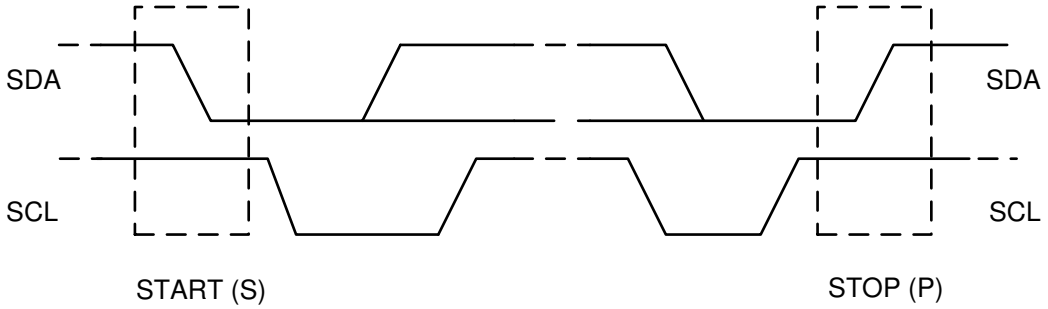

図 8-10. START and STOP Conditions on the I²C Bus

8.5.1.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an ACKNOWLEDGE (ACK) bit. Data is transferred with the Most Significant Bit (MSB) first. If target cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the SCL line low to force the host into a wait state (clock stretching). Data transfer then continues when the target is ready for another byte of data and releases the SCL line.

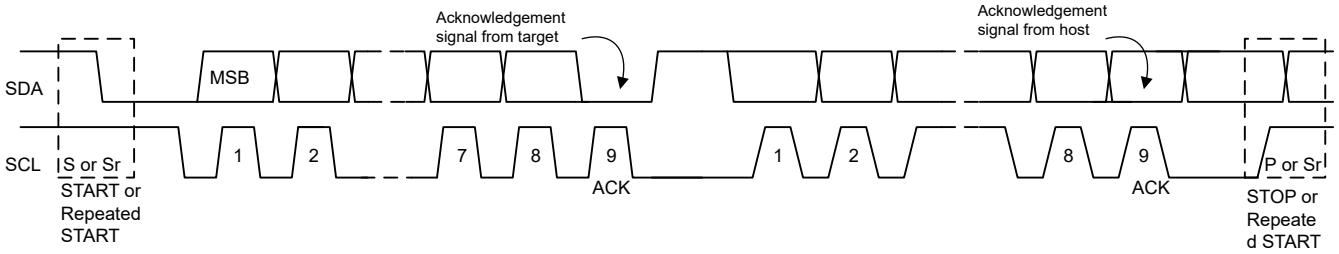

図 8-11. Data Transfer on the I²C Bus

8.5.1.4 Acknowledge (ACK) and Not Acknowledge (NACK)

The ACK signaling takes place after each transmitted byte. The ACK bit allows the target to signal the host that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge 9th clock pulse, are generated by the host.

The host releases the SDA line during the acknowledge clock pulse so the target can pull the SDA line LOW and it remains stable LOW during the HIGH period of this 9th clock pulse.

A NACK is signaled when the SDA line remains HIGH during the 9th clock pulse. The host can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

8.5.1.5 Target Address and Data Direction Bit

After the START signal, a target address is sent. This address is 7 bits long, followed by the 8 bit as a data direction bit (bit R/ $\overline{W}$). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ). The device 7-bit address is defined as

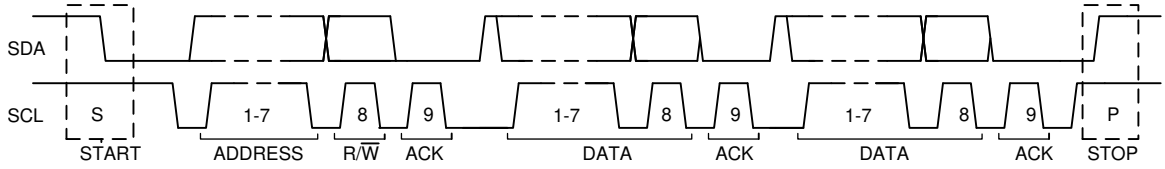

図 8-12. Complete Data Transfer on the I²C Bus

8.5.1.6 Single Write and Read

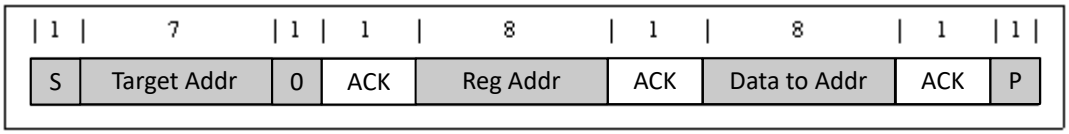

図 8-13. Single Write

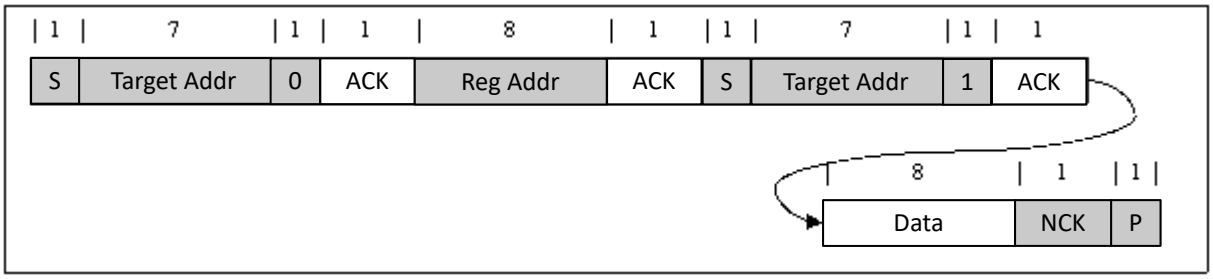

図 8-14. Single Read

If the register address is not defined, the charger IC sends back NACK and returns to the idle state.

8.5.1.7 Multi-Write and Multi-Read

The charger device supports multi-byte read and multi-byte write of all registers. These multi-byte operations are allowed to cross register boundaries. For instance, the entire register map may be read in a single operation with a 39-byte read that starts at register address 0x01.

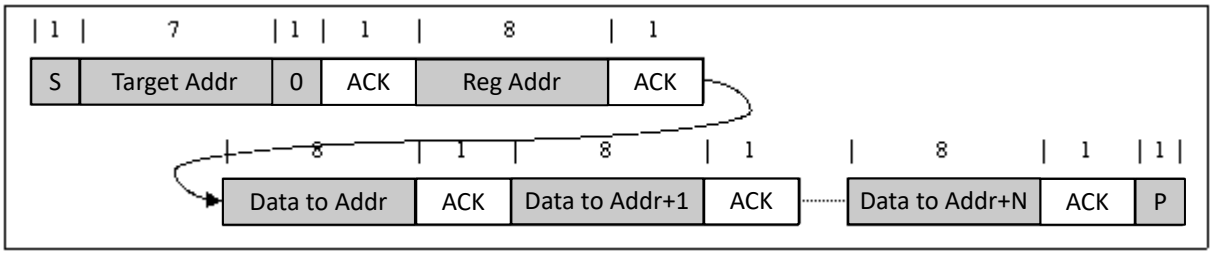

図 8-15. Multi-Write

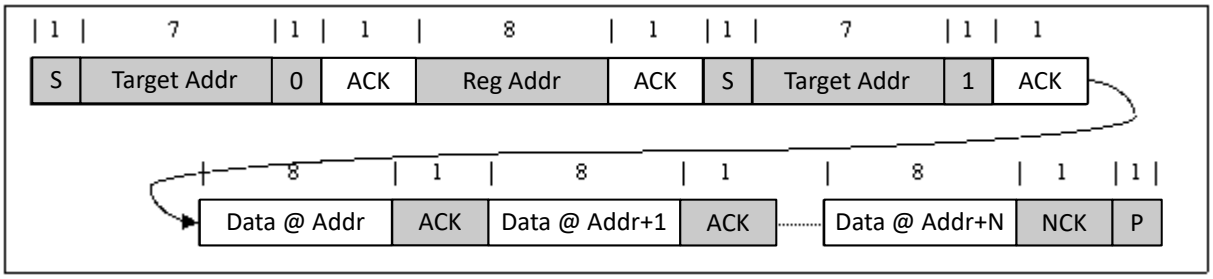

図 8-16. Multi-Read

8.6 Register Maps

I^{2}C Device Address: 0x6A.

8.6.1 Register Programming

The BQ25628 and BQ25629 contain 8-bit and 16-bit registers. When writing to 16-bit registers, I^{2}C transactions follow the little endian format, starting at the address of the least significant byte and writing both register bytes in a single 16-bit transaction.

8.6.2 BQ25628 Registers

表 8-7 lists the memory-mapped registers for the BQ25628 registers. All register offset addresses not listed in 表 8-7 should be considered as reserved locations and the register contents should not be modified.

9 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

9.1 Application Information

A typical application consists of the device configured as an I^2C controlled power path management device and a single cell battery charger for Li-Ion and Li-polymer batteries used in a wide range of smartphone and other portable devices. It integrates an input reverse-block FET (RBFET, Q1), high-side switching FET (HSFET, Q2), low-side switching FET (LSFET, Q3), and battery FET (BATFET Q4) between the system and battery. The device also integrates a bootstrap diode for the high-side gate drive.

9.2 Typical Application

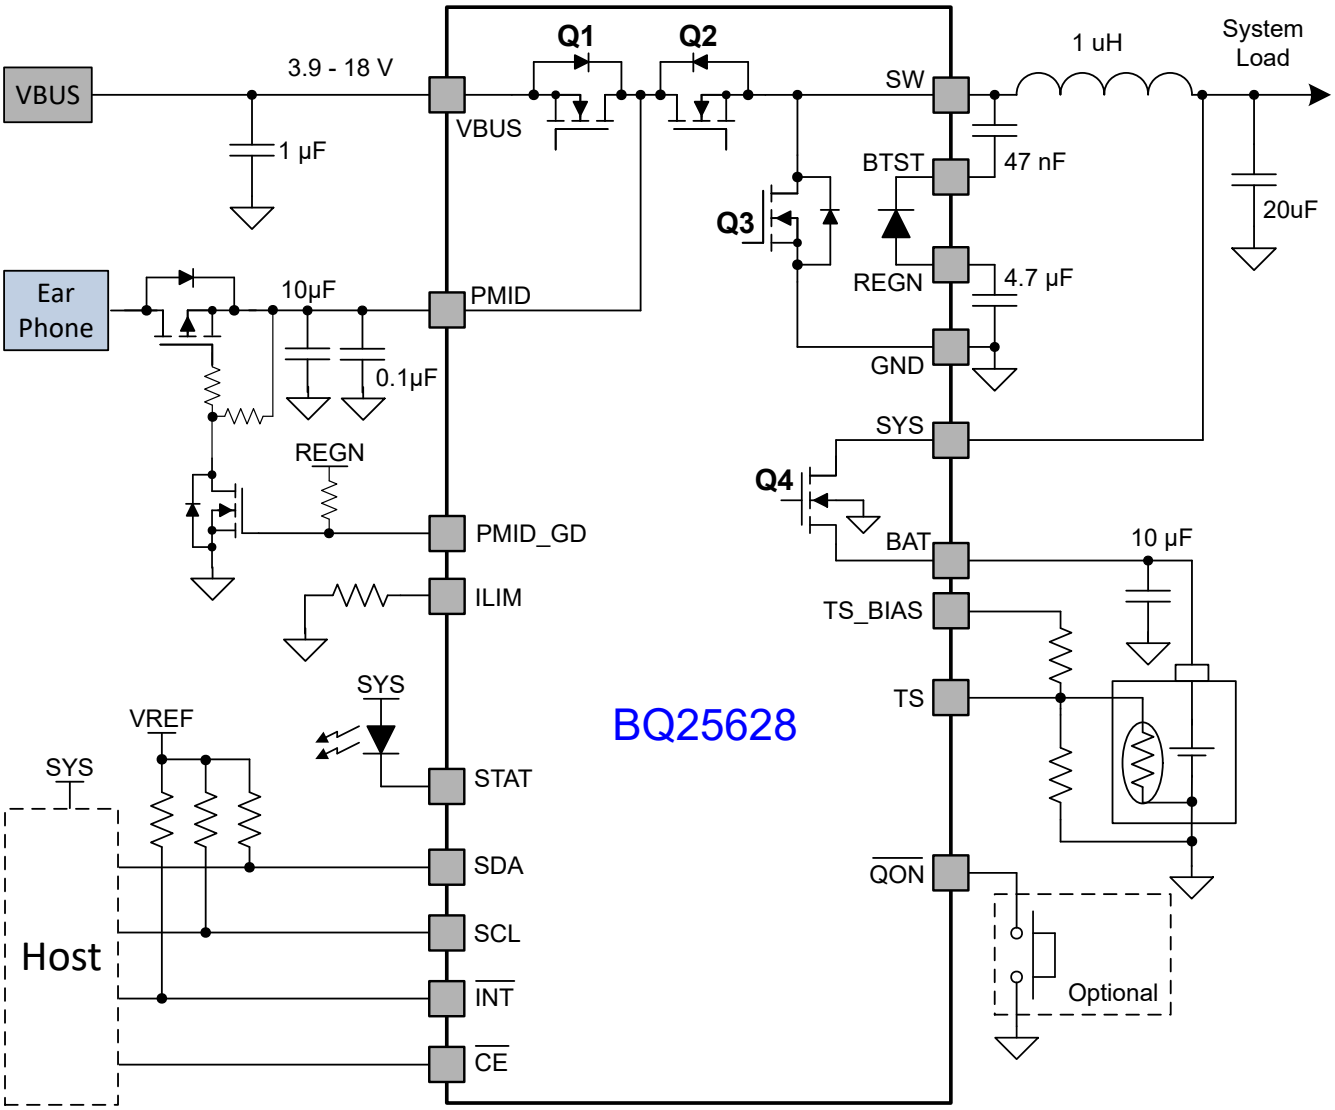

図 9-1. BQ25628 Application Diagram

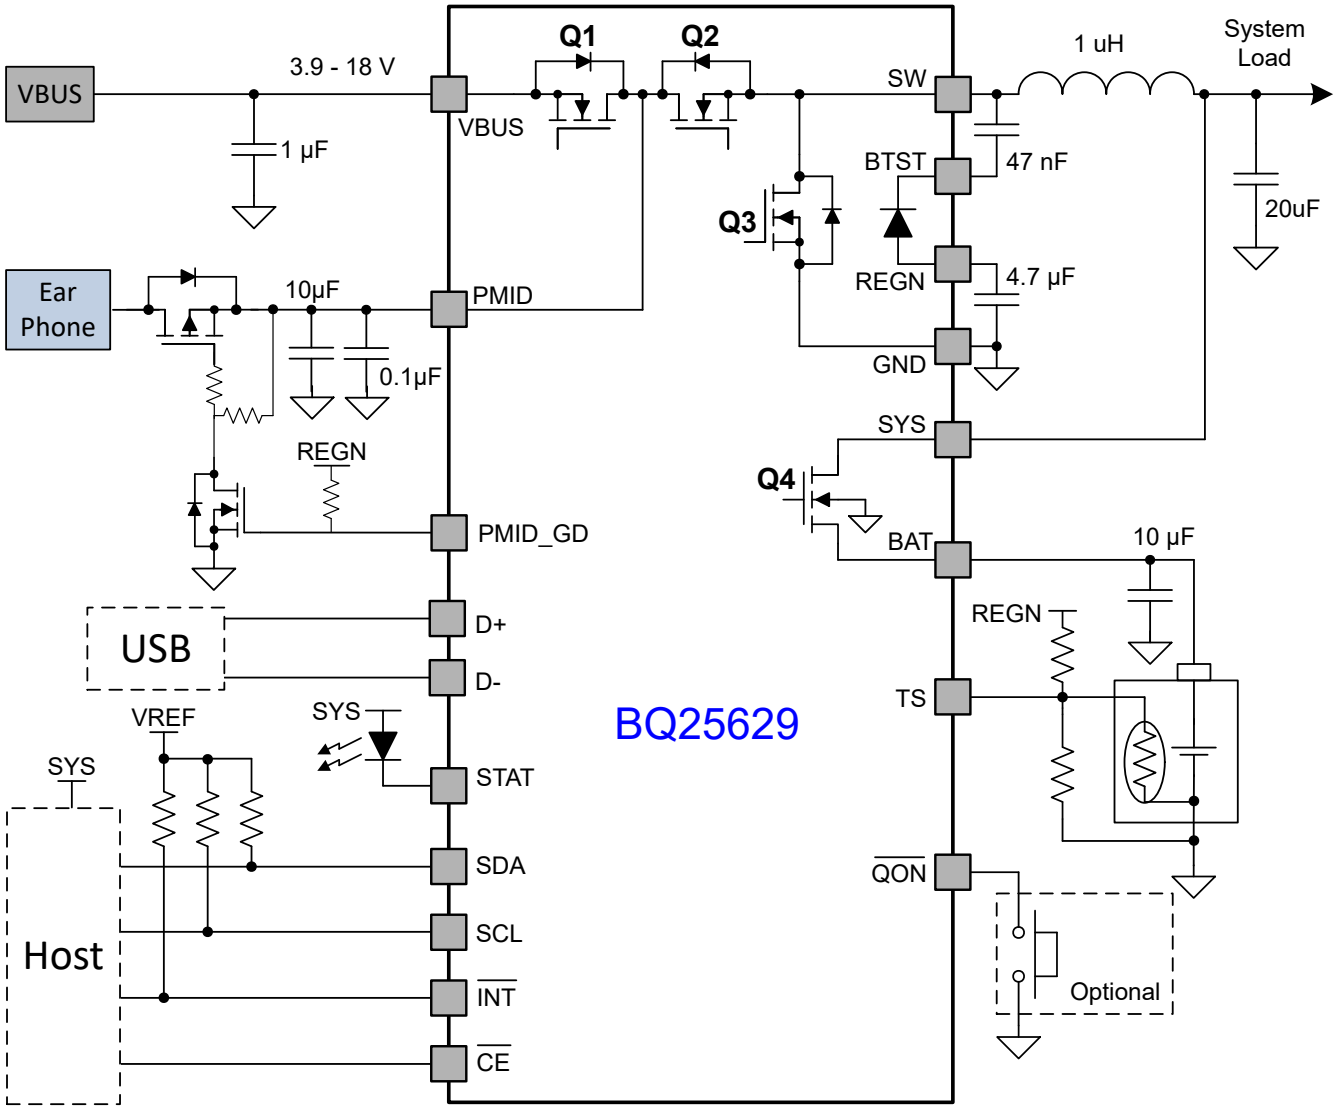

図 9-2. BQ25629 Application Diagram

9.2.1 Design Requirements

表 9-1. Design Requirements

PARAMETER	VALUE
VBUS range	3.9 -18.0 V
Input current limit (REG0x06-0x07)	3200 mA
Fast charge current (REG0x02-0x03)	320 mA
Minimum system voltage (REG0x0E-0x0F)	3520 mV
Battery regulation voltage (REG0x04-0x05)	4200 mV

9.2.2 Detailed Design Procedure

9.2.2.1 Inductor Selection

The 1.5-MHz switching frequency allows the use of small inductor and capacitor values to maintain an inductor saturation current higher than the charging current (I_{CHG}) plus half the ripple current (I_{RIPPLE}):

$$I_{SAT} \geq I_{CHG} + (1/2)\ I_{RIPPLE} \quad (4)$$

The inductor ripple current depends on the input voltage (V_{VBUS}), the duty cycle ($D = V_{BAT}/V_{VBUS}$), the switching frequency (f_S) and the inductance (L).

$$I_{RIPPLE} = \frac{V_{IN} \times D \times (1 - D)}{fs \times L} \quad (5)$$

The maximum inductor ripple current occurs when the duty cycle (D) is approximately 0.5. Usually inductor ripple is designed between 20% and 40% of the maximum charging current as a trade-off between inductor size and efficiency.

9.2.2.2 Input Capacitor

Design input capacitance to provide enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the charging current when duty cycle is 0.5. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current I_{Cin} occurs where the duty cycle is closest to 50% and can be estimated using 式 6.

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (6)$$

Low ESR ceramic capacitor such as X7R or X5R is preferred for input decoupling capacitor and should be placed as close as possible to the drain of the high-side MOSFET (PMID) and source of the low-side MOSFET (GND). Voltage rating of the capacitor must be higher than normal input voltage level. A rating of 25-V or higher capacitor is preferred for 15 V input voltage. 10-µF ceramic capacitor is suggested for typical of 2.0A charging current.

9.2.2.3 Output Capacitor

Ensure that the output capacitance has enough ripple current rating to absorb the output switching ripple current. 式 7 shows the output capacitor RMS current I_{COUT} calculation.

$$I_{COUT} = \frac{I_{RIPPLE}}{2 \times \sqrt{3}} \approx 0.29 \times I_{RIPPLE} \quad (7)$$

The output capacitor voltage ripple can be calculated as follows:

$$\Delta V_{SYS} = \frac{V_{SYS}}{8 \times L \times C_{SYS} \times f_{SW}^2}\left(1 - \frac{V_{SYS}}{V_{VBUS}}\right) \quad (8)$$

At certain input and output voltage and switching frequency, the voltage ripple can be reduced by increasing the output filter LC.

The charger device has internal loop compensation optimized for ≥ 10-µF ceramic output capacitor. The preferred ceramic capacitor is 10-V rating, X7R or X5R.

図 9-16. Boost Mode Load Transient

10 Power Supply Recommendations

In order to provide an output voltage on SYS, the device requires a power supply between 3.9 V and 18.0 V input with at least 100-mA current rating connected to VBUS or a single-cell Li-Ion battery with voltage > $V_{BATUVLO}$ connected to BAT.

11 Layout

11.1 Layout Guidelines

The switching node rise and fall times should be minimized for lowest switching loss. Proper layout of the components to minimize high frequency current path loop (see 図 11-1) is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Follow this specific order carefully to achieve the proper layout.

1. For lowest switching noise during forward/charge mode, place the decoupling capacitor CPMID1 and then bulk capacitor CPMID2 positive terminals as close as possible to PMID pin. Place the capacitor ground terminal close to the GND pin using the shortest copper trace connection or GND plane on the same layer as the IC. See 図 11-2.
2. For lowest switching noise during reverse/OTG mode, place the CSYS1 and CSYS2 output capacitors' positive terminals near the SYS pin. The capacitors' ground terminals must be via'd down through multiple vias to an all ground internal layer that returns to IC GND pin through multiple vias under the IC. See 図 11-2.
3. Since REGN powers the internal gate drivers, place the CREGN capacitor positive terminal close to REGN pin to minimize switching noise. The capacitor's ground terminal must be via'd down through multiple vias to an all ground internal layer that returns to IC GND pin through multiple vias under the IC. See 図 11-2.
4. Place the CVBUS and CBAT capacitors positive terminals as close to the VBUS and BAT pins as possible. The capacitors' ground terminals must be via'd down through multiple vias to an all ground internal layer that returns to IC GND pin through multiple vias under the IC. See 図 11-2.
5. Place the inductor input pin near the positive terminal of the SYS pin capacitors. Due to the PMID capacitor placement requirements, the inductor's switching node terminal must be via'd down with multiple via's to a second internal layer with a wide trace that returns to the SW pin with multiple vias. See 図 11-3. Using multiple vias ensures that the via's additional resistance is negligible compared to the inductor's dc resistance and therefore does not impact efficiency. The vias additional series inductance is negligible compared to the inductor's inductance.
6. Place the BTST capacitor on the opposite side from the IC using vias to connect to the BTST pin and SW node. See 図 11-4.
7. A separate analog GND plane for non-power related resistors and capacitors is not required if those components are placed away from the power components traces and planes.
8. Ensure that the I2C SDA and SCL lines are routed away from the SW node.

Additionally, it is important that the PCB footprint and solder mask for the BQ25628 cover the entire length of each of the pins. GND, SW, PMID, SYS and BAT pins extend further into the package than the other pins. Using the entire length of these pins reduces parasitic resistance and increases thermal conductivity from the package into the board.

13 Revision History

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

Changes from Revision B (February 2024) to Revision C (February 2025)	Page
• Removed 1.5A and 3A IBAT_PK Settings	8
• Changed T_{ADC_CONV} Typical values	8
• Corrected description of IBUS_ADC	8
• Deleted "The converter is in constant-voltage regulation" from セクション 8.3.5.3	25
• Changed recommended values of RT1 and RT2 in セクション 8.3.5.4.2	26
• Changed recommended values of RT1 and RT2 in セクション 8.3.5.4.3	27

- Updated description of ADC behavior in HIZ Mode in セクション 8.3.7 30
- Updated references to BATFET_DLY timing in セクション 8.3.9.1 32
- Changed 'VBUS_OVP_STAT' to 'VBUS_FAULT_STAT' in セクション 8.3.10.2.1 34
- Updated wait times related to I2C communication in セクション 8.5.1 39
- Deleted IBAT_PK 1.5A and 3A Settings in Register Map 42
- Added Notes column to Register Map 42

Changes from Revision A (January 2024) to Revision B (February 2024) **Page**

- Changed T_{TOP_OFF} Typical and Maximum Limit 16
- Changed T_{SAFETY_TRKCHG} Typical and Maximum Limit 16
- Changed T_{SAFETY_PRECHG} Typical and Maximum Limit 16
- Changed T_{SAFETY} Typical and Maximum Limit 16
- Changed T_{BATFET_DLY} Typical Value 16
- Changed T_{SM_EXIT} Typical and Maximum Limit 16
- Changed T_{QON_RST} Typical and Maximum Limit 16
- Changed T_{BATFET_RST} Typical Value 16
- Changed T_{LP_WDT} Typical Value 16
- Changed T_{WDT} Typical Value 16
- Added I^2C timing requirements for fast mode and fast mode plus in セクション 8.5.1 39
- Changed TOPOFF_TMR values in Charge_Control_0 Register Description, PRECHG_TMR and CHG_TMR values in Charge_Timer_Control Register Description, and WATCHDOG values in Charger_Control_1 Register Description 42
- Updated behavior of IBAT_ADC in IBAT_ADC Register Description 42

Changes from Revision * (December 2022) to Revision A (January 2024) **Page**

- 充電終了機能に「5mA～310mA、5mA ステップ」を追加 1
- IEC 62368-1 CB 認証を追加 1
- BQ25628/629 のアプリケーション概略図を変更 1
- 「概要 (続き)」のテキストを変更 3
- Changed D+/D- USB Detection from Yes to No for BQ25618 in セクション 5 4
- Changed t_{RST} to t_{QON_RST} in $\overline{QON}$ pin description 5
- Added Maximum limit to $V_{POORSRC}$ 8
- Updated V_{TS_COLD}, V_{TS_COLDZ}, V_{TS_COOL}, V_{TS_COOLZ}, V_{TS_WARM}, V_{TS_WARMZ}, V_{TS_HOT}, and V_{TS_HOTZ}. Updated VBUS_ADC, VPMID_ADC, and TDIE_ADC. Removed $t_{PMID\_OVP\_PROP}$ and $t_{PMID\_OVP\_FALL}$ 8
- Changed IBAT_ADC LSB from 2mA to 4mA 8
- Removed typical specs for $t_{VBUS\_OVP\_PROP}$, $T_{POORSRC\_RETRY}$, $t_{POORSRC\_RESTART}$, t_{VBUS_PD}, t_{TERM_DGL}, t_{RECHG_DGL} 16
- Clarified register conditions for T_{TOP_OFF} specifications 16
- Clarified behavior of JEITA Charge Rate Scaling 28
- Deleted *When the charger enters HIZ mode, the ADC is disabled.* from セクション 8.3.7 30
- Added セクション 8.3.8.1 30
- Added セクション 8.3.10 33
- Changed VBUS_ADC from 19850mV and 1388h to 18000mV and 11B6h in REG0x2C_VBUS_ADC Register Field Descriptions 42
- Changed VPMID_ADC from 19850mV and 1388h to 18000mV and 11B6h in REG0x2E_VPMID_ADC Register Field Descriptions 42
- Changed TDIE_ADC from 150°C and 12Ch to 140°C and 118h in REG0x36_TDIE_ADC Register Field Descriptions 42

- Changed Q1_FULLON, BATFET_CTRL_WVBUS bit access type from R to RW and TDIE_ADC bit access type from RW to R.....42
- Changed bit 11 to Reserved, ICHG Reset from X to 8h in Register Fields and Descriptions for REG0x02_Charge_Current_Limit register.....42
- Changed bit 8 to Reserved in Register Fields and Descriptions for REG0x10_Pre-charge_Control register..42
- Changed bit 8 to Reserved in Register Fields and Descriptions for REG0x12_Termination_Control register 42
- Changed 図 9-3 73
- Changed 図 9-4 73
- Changed 図 9-11 73

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

重要なお知らせと免責事項

テキサス・インスツルメンツは、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、テキサス・インスツルメンツ製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した テキサス・インスツルメンツ製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとします。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている テキサス・インスツルメンツ製品を使用するアプリケーションの開発の目的でのみ、テキサス・インスツルメンツはその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。テキサス・インスツルメンツや第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、テキサス・インスツルメンツおよびその代理人を完全に補償するものとし、テキサス・インスツルメンツは一切の責任を拒否します。

テキサス・インスツルメンツの製品は、テキサス・インスツルメンツの販売条件、または ti.com やかかる テキサス・インスツルメンツ製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。テキサス・インスツルメンツがこれらのリソースを提供することは、適用されるテキサス・インスツルメンツの保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、テキサス・インスツルメンツはそれらに異議を唱え、拒否します。

郵送先住所:Texas Instruments, Post Office Box 655303, Dallas, Texas 75265
