3 概要

ISO7240x、ISO7241x、ISO7242x の各デバイスは、複数のチャネル構成と出力インエーブル機能を備えたクワッドチャネル デジタル アイソレータです。これらのデバイスは、テキサス インストルメンツ独自の二酸化ケイ素 (SiO₂) 絶縁バリアで分離されたロジック入出力バッファを備えています。これらのデバイスは、絶縁型電源と組み合わせて使用することで、高電圧を遮断し、グランドを絶縁し、ノイズ電流がローカル グランドに入り込んでノイズに敏感な回路に干渉したり損傷を与えたりすることを防止します。

ISO7240x ファミリのデバイスは、同じ方向に 4 チャネルを備えています。ISO7241x ファミリのデバイスは、同じ方向に 3 チャネル、反対方向に 1 チャネルを備えています。ISO7242x ファミリのデバイスは、各方向に 2 チャネルを備えています。

接尾辞 C (C オプション) のデバイスには、TTL 入力スレッショルドと、遷移パルスがデバイスの出力に渡されるのを防ぐノイズ フィルタが入力に備わっています。接尾辞 M (M オプション) のデバイスには、CMOS V_{CC}/2 入力スレッショルドが備わっていますが、入力ノイズ フィルタはなく、追加の伝搬遅延も発生しません。

ISO7240CF デバイスは、ピン 7 に入力ディセーブル機能を備え、CTRL ピン (ピン 10) に High または Low が選択可能なフェイルセーフ出力機能を備えています。フェイルセーフ出力は、CTRL ピンにロジック High が印加された場合、またはピンが未接続のままである場合、ロジック High になります。CTRL ピンにロジック Low 信号が印加されると、フェイルセーフ出力はロジック Low 出力状態になります。ISO7240CF デバイスの入力ディセーブル機能により、絶縁バリアを通過してデータが出力に渡されるのを防ぎます。入力がディセーブルされるか、V_{CC1} がパワーダウンスすると、出力は CTRL ピンによって設定されます。

これらのデバイスは、どちらの側でも 3.3V または 5V 電源から電力を供給でき、任意の組み合わせが可能です。信号入力ピンは、使用される電源電圧レベルに関係なく 5V 許容です。

これらのデバイスは、-40°C ~ +125°C の周囲温度範囲で動作するように特性評価されています。

- Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- Apparent charge is electrical discharge caused by a partial discharge (pd).
- All pins on each side of the barrier tied together creating a two-terminal device

5.8 Safety Limiting Values

Safety limiting⁽¹⁾ intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S	Safety input, output, or supply current	R _{θJA} = 168°C/W, V _I = 5.5 V, T _J = 170°C, T _A = 25°C, see 5-2			156	mA
		R _{θJA} = 168°C/W, V _I = 3.6 V, T _J = 170°C, T _A = 25°C, see 5-2			239	
T _S	Safety temperature				150	°C

- The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air [thermal impedance](#) of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

7 Detailed Description

7.1 Overview

The ISO724x family of devices transmit digital data across a silicon dioxide based isolation barrier. The digital input signal (IN) of the device is sampled by a transmitter and at every data edge the transmitter sends a corresponding differential signal across the isolation barrier. When the input signal is static, the refresh logic periodically sends the necessary differential signal from the transmitter. On the other side of the isolation barrier, the receiver converts the differential signal into a single-ended signal which is output on the OUT pin through a buffer. If the receiver does not receive a data or refresh signal, the timeout logic detects the loss of signal or power from the input side and drives the output to the default level.

8.1 Application Information

The ISO724x family of devices uses a single-ended TTL or CMOS-logic switching technology. The supply voltage range is from 3.15 V to 5.5 V for both supplies, V_{CC1} and V_{CC2} . When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is, μ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

8.2 Typical Application

8.2.1 Isolated Data Acquisition System for Process Control

The ISO724x family of devices can be used with Texas Instruments' precision analog-to-digital converter and mixed signal microcontroller to create an advanced isolated data acquisition system as shown in [図 8-1](#).

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO724x family of devices only require two external bypass capacitors to operate.

8.3 Power Supply Recommendations

To help provide reliable operation at data rates and supply voltages, a 0.1-µF bypass capacitor is recommended at input and output supply pins (VCC1 and VCC2). The capacitors must be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501](#) device. For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501 Transformer Driver for Isolated Power Supplies](#).

8.4 Layout

8.4.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 8-10](#)). Layer stacking must be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of the inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in².
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links typically have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep the planes symmetrical. This makes the stack mechanically stable and prevents warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to [Digital Isolator Design Guide](#).

8.4.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
