

# ISO7710 高速、堅牢な EMC 強化型 1 チャネル・デジタル・アイソレータ

## 1 特長

- 100Mbps のデータレート
- 堅牢な絶縁バリア:
  - 1500V<sub>RMS</sub> の動作電圧で 30 年を超える予測寿命
  - 最高 5000V<sub>RMS</sub> の絶縁定格
  - 最高 12.8kV のサージ耐量
  - CMTI: ±100kV/μs (代表値)
- 幅広い電源電圧範囲: 2.25V~5.5V
- 2.25V から 5.5V への電圧レベル変換
- デフォルト出力が HIGH (ISO7710) と LOW (ISO7710F) のオプション
- 幅広い温度範囲: -55°C~125°C
- 低消費電力: 1.7mA (標準値、1Mbps 時)
- 小さい伝搬遅延: 標準値 11ns (5V 電源)
- 堅牢な電磁両立性 (EMC)
  - システム レベルでの ESD、EFT、サージ耐性
  - 絶縁バリアの両側で ±8kV の IEC 61000-4-2 接触放電保護
  - 低い放射
- パッケージはワイド SOIC (DW-16) およびナロー SOIC (D-8) を選択可能
- 車載用バージョンを利用可能: [ISO7710-Q1](#)
- 安全関連認証
  - DIN EN IEC 60747-17 (VDE 0884-17) に準拠した強化絶縁
  - UL 1577 部品認定プログラム
  - IEC 62368-1、IEC 61010-1、IEC 60601-1、GB 4943.1 認定

## 2 アプリケーション

- 産業用オートメーション
- モーター制御
- 電源
- 太陽光インバータ
- 医療用機器

## 3 概要

ISO7710 デバイスは、高性能の 1 チャネル デジタル アイソレータであり、UL 1577 準拠で 5000V<sub>RMS</sub> (DW パッケージ) および 3000V<sub>RMS</sub> (D パッケージ) の絶縁定格を備えています。デバイスは VDE、TUV、CSA、CQC 認定も取得しています。

ISO7710 デバイスは電磁気耐性が高く、エミッションが少なく、低消費電力を実現し、CMOS または LVCMOS デジタル I/O が絶縁されています。この絶縁チャンネルにはロジック入力および出力バッファがあり、二重の容量性二酸化ケイ素 (SiO<sub>2</sub>) 絶縁バリアによって分離されています。入力電力または入力信号が失われた場合のデフォルト出力は、接尾辞 F のないデバイスでは HIGH、接尾辞 F のあるデバイスでは LOW です。詳細は「[デバイスの機能モード](#)」のセクションを参照してください。

このデバイスを絶縁電源と組み合わせて使用することで、RS-485、RS-232、CAN などのデータバスやその他の回路のノイズ電流がローカル グランドに入り込む、あるいはノイズに敏感な回路に干渉するまたは損傷を与える、といったことを防止できます。ISO7710 デバイスは、革新的なチップ設計およびレイアウト技法により電磁気互換性が大幅に強化されているため、システムレベルの ESD、EFT、サージ、および放射のコンプライアンスを容易に達成できます。ISO7710 デバイスには、ワイド ボディ (DW) の 16 ピン SOIC パッケージのものと、ナロー ボディ (D) の 8 ピン SOIC パッケージのものが用意されています。

## 5 Specifications

## 5.1 Absolute Maximum Ratings

See<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{CC1}, V_{CC2}$	Supply Voltage <sup>(2)</sup>	-0.5	6	V
V	Voltage at INx, OUTx	-0.5	$V_{CCX} + 0.5$ <sup>(3)</sup>	V
$I_O$	Output current	-15	15	mA
$T_J$	Junction temperature		150	°C
$T_{stg}$	Storage temperature	-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak voltage values
- (3) Maximum voltage must not exceed 6 V.

## 5.2 ESD Ratings

			VALUE	UNIT
$V_{ESD}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±6000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1500	
		Contact discharge per IEC 61000-4-2; Isolation barrier withstand test <sup>(3) (4)</sup>	±8000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (3) IEC ESD strike is applied across the barrier with all pins on each side tied together creating a two-terminal device.
- (4) Testing is carried out in air or oil to determine the intrinsic contact discharge capability of the device.

### 5.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{CC1}, V_{CC2}$	Supply voltage	2.25		5.5	V
$V_{CC(UVLO+)}$	UVLO threshold when supply voltage is rising		2	2.25	V
$V_{CC(UVLO-)}$	UVLO threshold when supply voltage is falling	1.7	1.8		V
$V_{HYS(UVLO)}$	Supply voltage UVLO hysteresis	100	200		mV
$I_{OH}$	High level output current	$V_{CC2} = 5\text{ V}$		-4	mA
		$V_{CC2} = 3.3\text{ V}$		-2	
		$V_{CC2} = 2.5\text{ V}$		-1	
$I_{OL}$	Low level output current	$V_{CC2} = 5\text{ V}$		4	mA
		$V_{CC2} = 3.3\text{ V}$		2	
		$V_{CC2} = 2.5\text{ V}$		1	
$V_{IH}$	High level Input voltage	$0.7 \times V_{CC1}$		$V_{CC1}$	V
$V_{IL}$	Low level Input voltage	0		$0.3 \times V_{CC1}$	V
$DR^{(1)}$	Data Rate	0		100	Mbps
$T_A$	Ambient temperature	-55	25	125	°C

(1) 100 Mbps is the maximum specified data rate, although higher data rates are possible.

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to verify that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.
- (2) This coupler is designed for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air to determine the surge immunity of the package

- (4) Testing is carried out in oil to determine the intrinsic surge immunity of the isolation barrier.
- (5) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (6) All pins on each side of the barrier tied together creating a two-terminal device.

## 5.8 Safety Limiting Values

Safety limiting<sup>(1)</sup> intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

T <sub>S</sub>	Maximum safety temperature <sup>(1)</sup>			150	°C

- (1) The maximum safety temperature, T<sub>S</sub>, has the same value as the maximum junction temperature, T<sub>J</sub>, specified for the device. The I<sub>S</sub> and P<sub>S</sub> parameters represent the safety current and safety power respectively. The maximum limits of I<sub>S</sub> and P<sub>S</sub> should not be exceeded. These limits vary with the ambient temperature, T<sub>A</sub>.

The junction-to-air thermal resistance, R<sub>θJA</sub>, in the [Section 5.4](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. Use these equations to calculate the value for each parameter:

T<sub>J</sub> = T<sub>A</sub> + R<sub>θJA</sub> × P, where P is the power dissipated in the device.

T<sub>J(max)</sub> = T<sub>S</sub> = T<sub>A</sub> + R<sub>θJA</sub> × P<sub>S</sub>, where T<sub>J(max)</sub> is the maximum allowed junction temperature.

P<sub>S</sub> = I<sub>S</sub> × V<sub>I</sub>, where V<sub>I</sub> is the maximum input voltage.

## 7 Detailed Description

### 7.1 Overview

The ISO7710 device has an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon dioxide based isolation barrier. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage. The device also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions due the high frequency carrier and IO buffer switching. The conceptual block diagram of a digital capacitive isolator, [Figure 7-1](#), shows a functional block diagram of a typical channel.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

The ISO7710 device is available in two default output state options to enable a variety of application uses. 表 7-1 lists the device features.

### 7.3.1 Electromagnetic Compatibility (EMC) Considerations

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO7710 device incorporates many chip-level design improvements for overall system robustness. Some of these improvements include:

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads.
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by providing purely differential internal operation.

## 7.4 Device Functional Modes

表 7-2 lists the functional modes of ISO7710 device.

表 7-2. Function Table

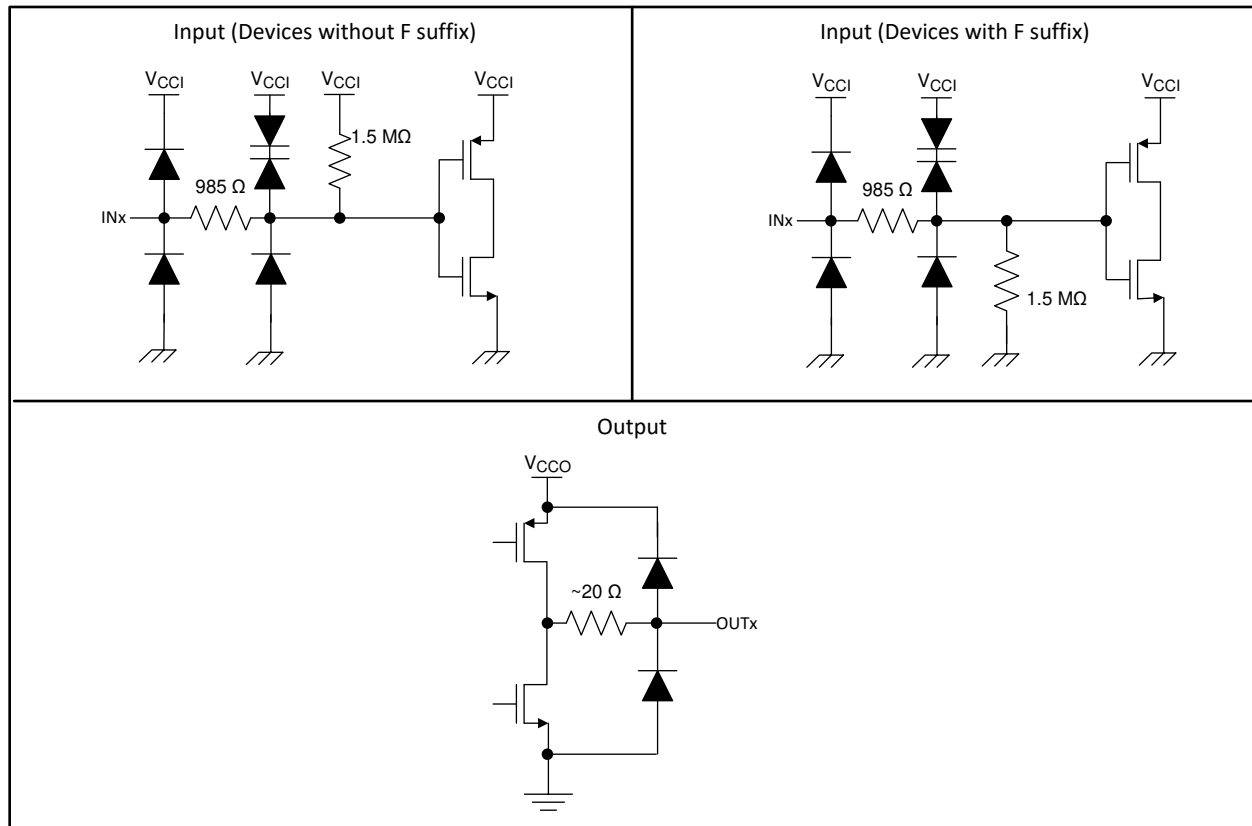

V <sub>CC1</sub> <sup>(1)</sup>	V <sub>CC2</sub>	INPUT (IN) <sup>(3)</sup>	OUTPUT (OUT)	COMMENTS
PU	PU	H	H	Normal Operation: A channel output assumes the logic state of the input.
		L	L	
		Open	Default	Default mode: When IN is open, the corresponding channel output goes to the default logic state. Default is <i>High</i> for ISO7710 and <i>Low</i> for ISO7710F.
PD	PU	X	Default	Default mode: When V <sub>CC1</sub> is unpowered, a channel output assumes the logic state based on the selected default option. Default is <i>High</i> for ISO7710 and <i>Low</i> for ISO7710F. When V <sub>CC1</sub> transitions from unpowered to powered-up, a channel output assumes the logic state of the input. When V <sub>CC1</sub> transitions from powered-up to unpowered, channel output assumes the selected default state.
X	PD	X	Undetermined	When V <sub>CC2</sub> is unpowered, a channel output is undetermined <sup>(2)</sup> . When V <sub>CC2</sub> transitions from unpowered to powered-up, a channel output assumes the logic state of the input

(1) PU = Powered up (V<sub>CC</sub> ≥ 2.25 V); PD = Powered down (V<sub>CC</sub> ≤ 1.7 V); X = Irrelevant; H = High level; L = Low level

(2) The outputs are in undetermined state when 1.7 V < V<sub>CC1</sub>, V<sub>CC2</sub> < 2.25 V.

(3) A strongly driven input signal can weakly power the floating V<sub>CC</sub> via an internal protection diode and cause undetermined output.

## 8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The ISO7710 device is a high-performance, single-channel digital isolator. The device uses single-ended CMOS-logic switching technology. The supply voltage range is from 2.25 V to 5.5 V for both supplies,  $V_{CC1}$  and  $V_{CC2}$ . When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is,  $\mu\text{C}$  or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

### 8.2 Typical Application

The ISO7710 device can be used with Texas Instruments' mixed signal microcontroller, CAN transceiver, transformer driver, and low-dropout voltage regulator to create an Isolated CAN Interface as shown below.

図 8-1. Isolated CAN Interface

### 8.2.1 Design Requirements

To design with this device, use the parameters listed in 表 8-1.

表 8-1. Design Parameters

PARAMETER	VALUE
Supply voltage, $V_{CC1}$ and $V_{CC2}$	2.25 V to 5.5 V
Decoupling capacitor between $V_{CC1}$ and GND1	0.1 $\mu$ F
Decoupling capacitor from $V_{CC2}$ and GND2	0.1 $\mu$ F

### 8.2.2 Detailed Design Procedure

Unlike optocouplers, which require components to improve performance, provide bias, or limit current, the ISO7710 device only requires two external bypass capacitors to operate.

図 8-2. Typical ISO7710 Circuit Hook-up

### 8.2.3 Application Curve

The following typical eye diagram of the ISO7710 device indicates low jitter and wide open eye at the maximum data rate of 100 Mbps.

図 8-3. ISO7710 Eye Diagram at 100 Mbps PRBS, 5-V Supplies and 25°C

### 8.2.3.1 Insulation Lifetime

Insulation lifetime projection data is collected by using industry-standard Time Dependent Dielectric Breakdown (TDDB) test method. In this test, all pins on each side of the barrier are tied together creating a two-terminal device and high voltage applied between the two sides; See [Figure 8-4](#) for TDDB test setup. The insulation breakdown data is collected at various high voltages switching at 60 Hz over temperature. For reinforced insulation, VDE standard requires the use of TDDB projection line with failure rate of less than 1 part per million (ppm). Even though the expected minimum insulation lifetime is 20 years at the specified working isolation voltage, VDE reinforced certification requires additional safety margin of 20% for working voltage and 50% for lifetime which translates into minimum required insulation lifetime of 30 years at a working voltage that's 20% higher than the specified value.

[Figure 8-5](#) shows the intrinsic capability of the isolation barrier to withstand high voltage stress over the lifetime of the device. Based on the TDDB data, the intrinsic capability of the insulation is 1500 V<sub>RMS</sub> with a lifetime of 36 years. Other factors, such as package size, pollution degree, material group, and more can further limit the working voltage of the component. The working voltage of DW-16 package is specified up to 1500 V<sub>RMS</sub> and D-8 package up to 450 V<sub>RMS</sub>. At the lower working voltages, the corresponding insulation lifetime is much longer than 36 years.

**Figure 8-4. Test Setup for Insulation Lifetime Measurement**

図 8-5. Insulation Lifetime Projection Data

### 8.3 Power Supply Recommendations

To help provide reliable operation at data rates and supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at the input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors must be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501](#) or [SN6505A](#). For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501 Transformer Driver for Isolated Power Supplies](#) or [SN6505 Low-Noise 1-A Transformer Drivers for Isolated Power Supplies](#).

### 8.4 Layout

#### 8.4.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see 图 8-6). Layer stacking must be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep the planes symmetrical.. This makes the stack mechanically stable and prevents warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

### 8.4.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

**PACKAGE OUTLINE**  
**SOIC - 1.75 mm max height**

SMALL OUTLINE INTEGRATED CIRCUIT

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15], per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm, per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm, per side.
5. Reference JEDEC registration MS-013.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
