

LMV98x-N 小型、低消費電力、1.8V RRIOオペアンプ、シャットダウン機能付き

1 特長

- 1.8V、2.7V、5Vでの仕様を保証
- 出力スイング
 - 600Ω負荷: レールから80mV
 - 2kΩ負荷: レールから30mV
- レールを200mV超える V_{CM}
- 消費電流(チャネルごとに): 100μA
- ゲイン帯域幅積: 1.4MHz
- 最大 V_{OS} : 4mV
- 600Ω負荷でのゲイン: 101dB
- 超小型のパッケージ: DSBGA 1.0mm×1.5mm
- シャットダウンからのターンオン時間: 19μs
- デュアルでの独立したシャットダウン
- 温度範囲: -40°C～125°C

2 アプリケーション

- 産業用および車載用
- 消費者向け通信機器
- フィットネス用トラッカー
- ウェアラブル
- 携帯電話/スマートフォン
- ポータブル・オーディオ
- 携帯用およびバッテリー駆動の電子機器
- 消費電流の監視
- バッテリー監視

3 概要

LMV98x-Nは低電圧、低消費電力のオペアンプです。LMV98x-Nは1.8V～5Vの電源電圧で動作し、入力と出力がレール・ツー・レールです。LMV98x-Nの入力同相モード電圧範囲は電源を200mV超えるため、電源電圧の範囲を超えるユーザー拡張機能が可能になります。出力は無負荷でレール・ツー・レールのスイングが可能であり、1.8V電源で600Ω負荷のとき、レールから105mV以内です。LMV98x-Nは1.8Vでの動作に最適化されているため、2つのボタン電池や単一セルのリチウムイオン・バッテリーを使用するバッテリー駆動システムに理想的です。

LMV98x-Nにはシャットダウン・ピンがあり、デバイスをディセーブルして消費電流を減らすために使用できます。 \overline{SHDN} ピンがLOWのとき、デバイスはシャットダウン中です。シャットダウン時は出力が高インピーダンスになります。

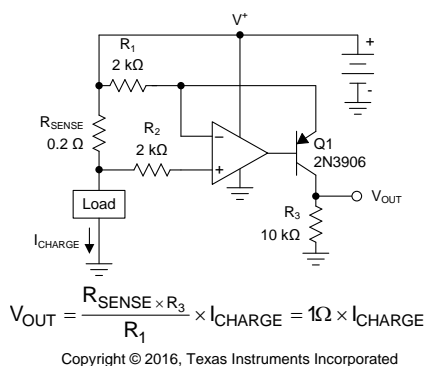

LMV98x-Nは速度/電力比が非常に優れており、1.8Vの電源電圧と小さな消費電流で、1.4MHzのゲイン帯域幅積を実現しています。LMV98x-Nは、600Ωの負荷と1000pFまでの容量性負荷を、最小のリングングで駆動できます。LMV98x-NはDCゲインが101dBと高いため、低周波数のアプリケーションに適しています。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
LMV981-N	DSBGA (6)	1.50mm×1.30mm
	SC70 (6)	2.00mm×1.25mm
	SOT-23 (6)	2.90mm×1.60mm

5 Description (continued)

LMV981-N is offered in space-saving, 6-pin DSBGA, SC70, and SOT-23 packages. The 6-pin DSBGA package has only a 1.006 mm × 1.514 mm × 0.945 mm footprint. LMV982-N is offered in a space-saving, 10-pin VSSOP package. These small packages are ideal solutions for area constrained PCBs and portable electronics such as cellular phones and PDAs.

6 Pin Configuration and Functions

Pin Functions: LMV981-N

PIN			TYPE ⁽¹⁾	DESCRIPTION

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Supply voltage ($V^+ - V^-$)		5.5	V
Differential input voltage	\pm Supply voltage		
Voltage at input/output pins	$V^+ + 0.3$	$V^- - 0.3$	V
Junction temperature ⁽³⁾		150	°C
Storage temperature, T_{stg}	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) For soldering specifications, see TI application report, [Absolute Maximum Ratings for Soldering](#) (SNOA549).
- (3) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly into a PCB.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
	Machine model ⁽²⁾	± 200	

- (1) Human Body Model, applicable std. MIL-STD-883, Method 3015.7. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC)

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage	1.8	5	V
Temperature	–40	125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMV981-N			LMV982-N	UNIT
		YZR (DSBGA)	DCK (SC70)	DBV (SOT-23)	DGS (VSSOP)	
		6 PINS	6 PINS	6 PINS	10 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	138.2	229.1	209.9	182.8	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	1.2	116.1	181.2	73.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	23.4	53.3	53.2	103.3	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	5	8.8	55.5	12.8	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	23.2	52.7	52.6	101.9	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

- (1) Electrical characteristics table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in limited self-heating of the device such that $T_J = T_A$. No ensured specification of parametric performance is indicated in the electrical tables under conditions of internal self heating where $T_J > T_A$. [Absolute Maximum Ratings](#) indicated junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) All limits are specified by testing or statistical analysis.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) For ensured temperature ranges, see input common-mode voltage range specifications.

Electrical Characteristics – DC, 1.8 V (continued)

$T_J = 25^\circ\text{C}$, $V^+ = 1.8\text{ V}$, $V^- = 0\text{ V}$, $V_{CM} = V^+/2$, $V_O = V^+/2$, $R_L > 1\text{ M}\Omega$, and $\overline{\text{SHDN}}$ tied to V^+ (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS		MIN ⁽²⁾	TYP ⁽³⁾	MAX ⁽²⁾	UNIT
V_O	Output swing	$R_L = 600\ \Omega$ to 0.9 V , $V_{IN} = \pm 100\text{ mV}$	$T_J = 25^\circ\text{C}$	1.65	1.72		V
					0.077	0.105	
			$T_J = -40^\circ\text{C}$ to 125°C	1.63		0.12	
		$R_L = 2\text{ k}\Omega$ to 0.9 V , $V_{IN} = \pm 100\text{ mV}$	$T_J = 25^\circ\text{C}$	1.75	1.77		
					0.024	0.035	
			$T_J = -40^\circ\text{C}$ to 125°C	1.74		0.04	
I_O	Output short circuit current ⁽⁵⁾	Sourcing, $V_O = 0\text{ V}$, $V_{IN} = 100\text{ mV}$	$T_J = 25^\circ\text{C}$	4	8		mA
			$T_J = -40^\circ\text{C}$ to 125°C	3.3			
		Sinking, $V_O = 1.8\text{ V}$, $V_{IN} = -100\text{ mV}$	$T_J = 25^\circ\text{C}$	7	9		
			$T_J = -40^\circ\text{C}$ to 125°C	5			
T_{on}	Turnon time from shutdown				19		μs
V_{SHDN}	Turnon voltage to enable part				1		V
	Turnoff voltage				0.55		

(5) Applies to both single-supply and split-supply operation. Continuous short-circuit operation at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of 150°C . Output currents in excess of 45 mA over long term may adversely affect reliability.

7.6 Electrical Characteristics – AC, 1.8 V

$T_J = 25^\circ\text{C}$, $V^+ = 1.8\text{ V}$, $V^- = 0\text{ V}$, $V_{CM} = V^+/2$, $V_O = V^+/2$, $R_L > 1\text{ M}\Omega$, and $\overline{\text{SHDN}}$ tied to V^+ (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS	MIN ⁽²⁾	TYP ⁽³⁾	MAX ⁽²⁾	UNIT
SR	Slew rate ⁽⁴⁾			0.35		V/ μs
GBW	Gain-bandwidth product			1.4		MHz
Φ_m	Phase margin			67		°
G_m	Gain margin			7		dB
e_n	Input-referred voltage noise	$f = 10\text{ kHz}$, $V_{CM} = 0.5\text{ V}$		60		nV/ $\sqrt{\text{Hz}}$
i_n	Input-referred current noise	$f = 10\text{ kHz}$		0.08		pA/ $\sqrt{\text{Hz}}$
THD	Total harmonic distortion	$f = 1\text{ kHz}$, $A_V = +1$, $R_L = 600\ \Omega$, $V_{IN} = 1\text{ V}_{PP}$		0.023%		
Amp-to-amp isolation ⁽⁵⁾				123		dB

- (1) Electrical characteristics table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in limited self-heating of the device such that $T_J = T_A$. No ensured specification of parametric performance is indicated in the electrical tables under conditions of internal self heating where $T_J > T_A$. *Absolute Maximum Ratings* indicated junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.
- (2) All limits are specified by testing or statistical analysis.
- (3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and also depend on the application and configuration. The typical values are not tested and are not ensured on shipped production material.
- (4) Connected as voltage follower with input step from V^- to V^+ . Number specified is the slower of the positive and negative slew rates.
- (5) Input referred, $R_L = 100\text{ k}\Omega$ connected to $V^+/2$. Each amp excited in turn with 1 kHz to produce $V_O = 3\text{ V}_{PP}$ (for supply voltages $< 3\text{ V}$, $V_O = V^+$).

8 Detailed Description

8.1 Overview

The LMV98x-N are low-voltage, low-power operational amplifiers (op-amp) operating from 1.8-V to 5.5-V supply voltages and have rail-to-rail input and output with shutdown. LMV98x-N input common-mode voltage extends 200 mV beyond the supplies which enables user enhanced functionality beyond the supply voltage range.

8.2 Functional Block Diagram

(each amplifier)

8.3 Feature Description

The differential inputs of the amplifier consist of a noninverting input (+IN) and an inverting input (–IN). The amplifier amplifies only the difference in voltage between the two inputs, which is called the differential input voltage. The output voltage of the op-amp V_{OUT} is given by [Equation 1](#):

$$V_{OUT} = A_{OL} (IN^+ - IN^-)$$

where

- A_{OL} is the open-loop gain of the amplifier, typically around 100 dB (100,000x, or 10 μ V per volt). (1)

8.4 Device Functional Modes

8.4.1 Input and Output Stage

The rail-to-rail input stage of this family provides more flexibility for the designer. The LMV98x-N use a complimentary PNP and NPN input stage in which the PNP stage senses common-mode voltage near V^- and the NPN stage senses common-mode voltage near V^+ . The transition from the PNP stage to NPN stage occurs 1 V below V^+ . Because both input stages have their own offset voltage, the offset of the amplifier becomes a function of the input common-mode voltage and has a crossover point at 1 V below V^+ .

Device Functional Modes (continued)

Copyright © 2016, Texas Instruments Incorporated

Figure 28. Simplified Schematic Diagram

This V_{OS} crossover point can create problems for both DC- and AC-coupled signals if proper care is not taken. Large input signals that include the V_{OS} crossover point causes distortion in the output signal. One way to avoid such distortion is to keep the signal away from the crossover. For example, in a unity gain buffer configuration with $V_S = 5\text{ V}$, a 5-V peak-to-peak signal contains input-crossover distortion while a 3-V peak-to-peak signal centered at 1.5 V does not contain input-crossover distortion as it avoids the crossover point. Another way to avoid large signal distortion is to use a gain of -1 circuit which avoids any voltage excursions at the input terminals of the amplifier. In that circuit, the common-mode DC voltage can be set at a level away from the V_{OS} cross-over point. For small signals, this transition in V_{OS} shows up as a V_{CM} dependent spurious signal in series with the input signal and can effectively degrade small-signal parameters such as gain and common-mode rejection ratio. To resolve this problem, the small signal must be placed such that it avoids the V_{OS} crossover point. In addition to the rail-to-rail performance, the output stage can provide enough output current to drive 600- Ω loads. Because of the high-current capability, take care not to exceed the 150°C maximum junction temperature specification.

8.4.2 Shutdown Mode

The LMV98x-N family has a shutdown pin. To conserve battery life in portable applications, the LMV98x-N can be disabled when the shutdown pin voltage is pulled low. When in shutdown, the output stage is in a high-impedance state and the input bias current drops to less than 1 nA.

The shutdown pin cannot be left unconnected. In case shut-down operation is not required, the shutdown pin must be connected to $V+$ when the LMV98x-N are used. Leaving the shutdown pin floating results in an undefined operation mode, either shutdown or active, or even oscillating between the two modes.

Device Functional Modes (continued)

8.4.3 Input Bias Current Consideration

The LMV98x-N family has a complementary bipolar input stage. The typical input bias current (I_B) is 15 nA. The input bias current can develop a significant offset voltage. This offset is primarily due to I_B flowing through the negative feedback resistor, R_F . For example, if I_B is 50 nA and R_F is 100 k Ω , then an offset voltage of 5 mV develops ($V_{OS} = I_B \times R_F$). Using a compensation resistor (R_C), as shown in [Figure 29](#), cancels this effect. But the input offset current (I_{OS}) still contributes to an offset voltage in the same manner.

Figure 29. Canceling the Offset Voltage due to Input Bias Current

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The LMV98x-N devices bring performance, economy, and ease-of-use to low-voltage, low-power systems. They provide rail-to-rail input and rail-to-rail output swings into heavy loads.

9.2 Typical Applications

9.2.1 High-Side Current-Sensing Application

Copyright © 2016, Texas Instruments Incorporated

Figure 30. High-Side Current Sensing

9.2.1.1 Design Requirements

The high-side current-sensing circuit (Figure 30) is commonly used in a battery charger to monitor charging current to prevent overcharging. A sense resistor R_{SENSE} is connected to the battery directly. This system requires an op amp with rail-to-rail input. The LMV98x-N are ideal for this application because its common-mode input range extends up to the positive supply.

9.2.1.2 Detailed Design Procedure

As seen in Figure 30, the I_{CHARGE} current flowing through sense resistor R_{SENSE} develops a voltage drop equal to V_{SENSE} . The voltage at the negative sense point is now less than the positive sense point by an amount proportional to the V_{SENSE} voltage.

The low-bias currents of the LMV98x cause little voltage drop through R_2 , so the negative input of the LMV98x amplifier is at essentially the same potential as the negative sense input.

The LMV98x detects this voltage error between its inputs and servo the transistor base to conduct more current through Q1, increasing the voltage drop across R_1 until the LMV98x inverting input matches the noninverting input. At this point, the voltage drop across R_1 now matches V_{SENSE} .

I_G , a current proportional to I_{CHARGE} , flows according to Equation 2.

$$I_G = V_{SENSE} / R_1 = (R_{SENSE} \times I_{CHARGE}) / R_1 \quad (2)$$

Typical Applications (continued)

I_G also flows through the gain resistor R_3 developing a voltage drop equal to [Equation 3](#) and [Equation 4](#).

$$V_3 = I_G \times R_3 = (V_{RSENSE} / R_1) \times R_3 = ((R_{SENSE} \times I_{CHARGE}) / R_2) \times R_3 \quad (3)$$

$$V_{OUT} = (R_{SENSE} \times I_{CHARGE}) \times G$$

where

$$G = R_3 / R_1 \quad (4)$$

The other channel of the LMV98x may be used to buffer the voltage across R_3 to drive the following stages.

9.2.1.3 Application Curve

[Figure 31](#) shows the results of the example current sense circuit. After 4 V, there is an error where transistor Q1 runs out of headroom and saturates, limiting the upper output swing.

Figure 31. Current Sense Amplifier Results

9.2.2 Half-Wave Rectifier Applications

Figure 32. Half-Wave Rectifier With Rail-To-Ground Output Swing Referenced to Ground

Figure 33. Half-Wave Rectifier With Negative-Going Output Referenced to V_{CC}

Typical Applications (continued)

9.2.2.1 Design Requirements

Because the LMV98x-N input common-mode range includes both positive and negative supply rails and the output can also swing to either supply, achieving half-wave rectifier functions in either direction is an easy task. All that is required are two external resistors; there is no requirement for diodes or matched resistors. The half-wave rectifier can have either positive or negative going outputs, depending on the way the circuit is arranged.

9.2.2.2 Detailed Design Procedure

In Figure 32 the circuit is referenced to ground, while in Figure 33 the circuit is biased to the positive supply. These configurations implement the half-wave rectifier because the LMV98x-N can not respond to one-half of the incoming waveform. It can not respond to one-half of the incoming because the amplifier cannot swing the output beyond either rail; therefore, the output disengages during this half cycle. During the other half cycle, however, the amplifier achieves a half wave that can have a peak equal to the total supply voltage. R_1 must be large enough not to load the LMV98x-N.

9.2.2.3 Application Curves

9.2.3 Instrumentation Amplifier With Rail-to-Rail Input and Output Application

Figure 36. Rail-to-Rail Instrumentation Amplifier

9.2.3.1 Design Requirements

Using three of the LMV98x-N amplifiers, an instrumentation amplifier with rail-to-rail inputs and outputs can be made as shown in Figure 36.

9.2.3.2 Detailed Design Procedure

In this example, amplifiers on the left side act as buffers to the differential stage. These buffers assure that the input impedance is high. They also assure that the difference amp is driven from a voltage source. This is necessary to maintain the CMRR set by the matching R_1 to R_2 with R_3 to R_4 . The gain is set by the ratio of R_2/R_1 and R_3 must equal R_1 and R_4 equal R_2 . With both rail-to-rail input and output ranges, the input and output are only limited by the supply voltages. Remember that even with rail-to-rail outputs, the output can not swing past the supplies so the combined common-mode voltages plus the signal must not be greater than the supplies or limiting occurs.

Typical Applications (continued)

9.2.3.3 Application Curve

Figure 37 shows the results of the instrumentation amplifier with R_1 and $R_3 = 1\text{ K}$, and R_2 and $R_4 = 100\text{ k}\Omega$, for a gain of 100, running on a single 5-V supply with a input of $V_{CM} = V_S/2$. The combined effects of the individual offset voltages can be seen as a shift in the offset of the curve.

Figure 37. Instrumentation Amplifier Output Results

9.3 Do's and Don'ts

Do properly bypass the power supplies.

Do add series resistance to the output when driving capacitive loads, particularly cables, Muxes and ADC inputs.

Do add series current limiting resistors and external schottky clamp diodes if input voltage is expected to exceed the supplies. Limit the current to 1 mA or less (1 k Ω per volt).

10 Power Supply Recommendations

The LMV98x-N is specified for operation from 1.8 V to 5 V; many specifications apply from -40°C to 125°C . Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in [Typical Characteristics](#).

CAUTION

Supply voltages larger than 5.5 V can permanently damage the device; see [Absolute Maximum Ratings](#).

For proper operation, the power supplies must be properly decoupled. For decoupling the supply lines, TI recommends that 10-nF capacitors be placed as close as possible to the op amp power supply pins. For single-supply, place a capacitor between V^+ and V^- supply leads. For dual supplies, place one capacitor between V^+ and ground, and one capacitor between V^- and ground.

11 Layout

11.1 Layout Guidelines

The V^+ pin must be bypassed to ground with a low-ESR capacitor.

The optimum placement is closest to the V^+ and ground pins.

Take care to minimize the loop area formed by the bypass capacitor connection between V^+ and ground.

The ground pin must be connected to the PCB ground plane at the pin of the device.

The feedback components must be placed as close to the device as possible minimizing strays.

11.2 Layout Example

Figure 38. SOT-23 Layout Example

12 デバイスおよびドキュメントのサポート

12.1 ドキュメントのサポート

12.1.1 関連資料

関連資料については、以下を参照してください。

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
