OPAx170 36V、単一電源、SOT553、低消費電力オペアンプのバリュー・ライン・シリーズ

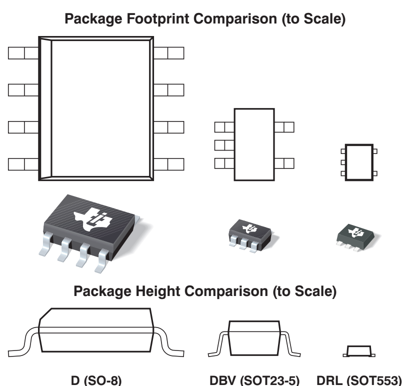
1 特長

- 電源電圧範囲: 2.7V～36V、±1.35V～±18V
- 低ノイズ: 19nV/√Hz
- RFI フィルタ付きの入力
- 入力範囲は負の電源電圧にも対応
- 入力範囲は正の電源電圧まで動作
- レール・ツー・レール出力
- ゲイン帯域幅: 1.2MHz
- 低い静止電流: アンプごとに110μA
- 高い同相除去: 120dB
- 低い入力バイアス電流: 15pA (最大)
- 業界標準のパッケージと*Micro*パッケージで供給
- WEBENCH® Power Designerにより、OPAx170を使用するカスタム設計を作成

2 アプリケーション

- 電源モジュールのトラッキング・アンプ
- 商業施設の電源
- トランスデューサ・アンプ
- ブリッジ・アンプ
- 温度計測
- ひずみゲージ・アンプ
- 高精度積分器
- バッテリ駆動計測器
- 試験用機器

36Vオペアンプの最小パッケージ



3 概要

OPA170、OPA2170、OPA4170デバイス(OPAx170)は36V、単一電源、低ノイズのオペアンプ・ファミリで、Microパッケージで供給され、2.7V (±1.35V)から36V (±18V)までの範囲の電源電圧で動作できます。低い静止電流で優れたオフセット、ドリフト、帯域幅を提供します。シングル、デュアル、クアッドの各製品で同一の仕様を備え、設計の柔軟性を高めています。

ほとんどのオペアンプでは1つの電源電圧でのみ動作が規定されているのに対して、OPAx170ファミリのオペアンプは2.7V～36Vで動作が規定されています。入力信号が電源レールを超えていても、位相反転は発生しません。OPAx170ファミリは、最大300pFの容量性負荷で安定です。通常の動作時に、入力は負のレールより100mV下、および正のレールから2V以内で動作できます。これらのデバイスは完全なレール・ツー・レール入力で、正のレールを100mV超えて動作しますが、正のレールから2V以内ではパフォーマンスが低下することに注意してください。OPAx170オペアンプは-40℃～+125℃で動作が規定されています。

製品情報(1)

型番	パッケージ	本体サイズ(公称)
OPA170	SOIC (8)	4.90mm×3.91mm
	SOT (5)	1.60mm×1.20mm
	SOT-23 (5)	2.90mm×1.60mm
OPA2170	SOIC (8)	4.90mm×3.91mm
	VSSOP (8)	3.00mm×3.00mm
	VSSOP (8)、*micro*サイズ	2.30mm×2.00mm
	WSON (8)	2.00mm×2.00mm
OPA4170	SOIC (14)	8.65mm×3.91mm
	TSSOP (14)	5.00mm×4.40mm

7 Specifications

7.1 Absolute Maximum Ratings

Over operating free-air temperature range, unless otherwise noted.[1]

	MIN	MAX	UNIT
Supply voltage	0	40	V
Single supply voltage		40	V
Signal input pin voltage	(V–) – 0.5	(V+) + 0.5	V
Signal input pin current	–10	10	mA
Output short-circuit current[2]	Continuous		
Operating ambient temperature, T_A	–55	150	°C
Junction temperature, T_J		150	°C
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Short-circuit to ground, one amplifier per package.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_S	Supply voltage (V+ – V–)	2.7	36	V
T_A	Operating temperature	–40	125	°C

7.7 Electrical Characteristics

at T_A = 25°C, V_{CM} = V_{OUT} = V_S / 2, and R_L = 10 kΩ connected to V_S / 2 (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE						
V_{OS}	Input offset voltage	T_A = 25°C		0.25	±1.8	mV
		T_A = –40°C to +125°C			±2	mV
dV_{OS}/dT	Input offset voltage drift	T_A = –40°C to +125°C		±0.3	±2	μV/°C
PSRR	Input offset voltage vs power supply	V_S = 4 V to 36 V, T_A = –40°C to +125°C		1	±5	μV/V
	Channel separation, dc			5		μV/V
INPUT BIAS CURRENT						
I_B	Input bias current	T_A = 25°C		±8	±15	pA
		T_A = –40°C to +125°C			±3.5	nA
I_{OS}	Input offset current	T_A = 25°C		±4	±15	pA
		T_A = –40°C to +125°C			±3.5	nA
NOISE						
	Input voltage noise	f = 0.1 Hz to 10 Hz		2		$μV_{PP}$
e_n	Input voltage noise density	f = 100 Hz		22		nV/√Hz
		f = 1 kHz		19		nV/√Hz
INPUT VOLTAGE						
V_{CM}	Common-mode voltage range[(1)]		(V–) – 0.1		(V+) – 2	V
CMRR	Common-mode rejection ratio	V_S = ±2 V, (V–) - 0.1 V < V_{CM} < (V+) - 2 V, T_A = –40°C to +125°C	90	104		dB
		V_S = ±18 V, (V–) - 0.1 V < V_{CM} < (V+) - 2 V, T_A = –40°C to +125°C	104	120		dB
INPUT IMPEDANCE						
	Differential			100 || 3		MΩ || pF
	Common-mode			6 || 3		10^{12} Ω || pF
OPEN-LOOP GAIN						
A_{OL}	Open-loop voltage gain	V_S = 4 V to 36 V, (V–) + 0.35 V < V_O < (V+) - 0.35 V, T_A = –40°C to +125°C	110	130		dB
FREQUENCY RESPONSE						
GBP	Gain bandwidth product			1.2		MHz
SR	Slew rate	G = +1		0.4		V/μs
t_S	Settling time	To 0.1%, V_S = ±18 V, G = +1, 10-V step		20		μs
		To 0.01% (12-bit), V_S = ±18 V, G = +1, 10-V step		28		μs
	Overload recovery time	V_{IN} × Gain > V_S		2		μs
THD+N	Total harmonic distortion + noise	G = +1, f = 1 kHz, V_O = 3 V_{RMS}		0.0002%		

(1) The input range can be extended beyond (V+) – 2 V up to V+. See the Typical Characteristics and Application and Implementation sections for additional information.

Electrical Characteristics (continued)

at T_A = 25°C, V_{CM} = V_{OUT} = V_S / 2, and R_L = 10 kΩ connected to V_S / 2 (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT						
V_O	Voltage output swing from positive rail	I_L = 0 mA, V_S = 4 V to 36 V		10		mV
		I_L sourcing 1 mA, V_S = 4 V to 36 V		115		mV
V_O	Voltage output swing from negative rail	I_L = 0 mA, V_S = 4 V to 36 V			8	mV
		I_L sinking 1 mA, V_S = 4 V to 36 V			70	mV
V_O	Voltage output swing from rail	V_S = 5 V, R_L = 10 kΩ; T_A = –40°C to +125°C	(V–) + 0.03		(V+) – 0.05	V
		R_L = 10 kΩ, A_{OL} ≥ 110 dB, T_A = –40°C to +125°C	(V–) + 0.35		(V+) – 0.35	V

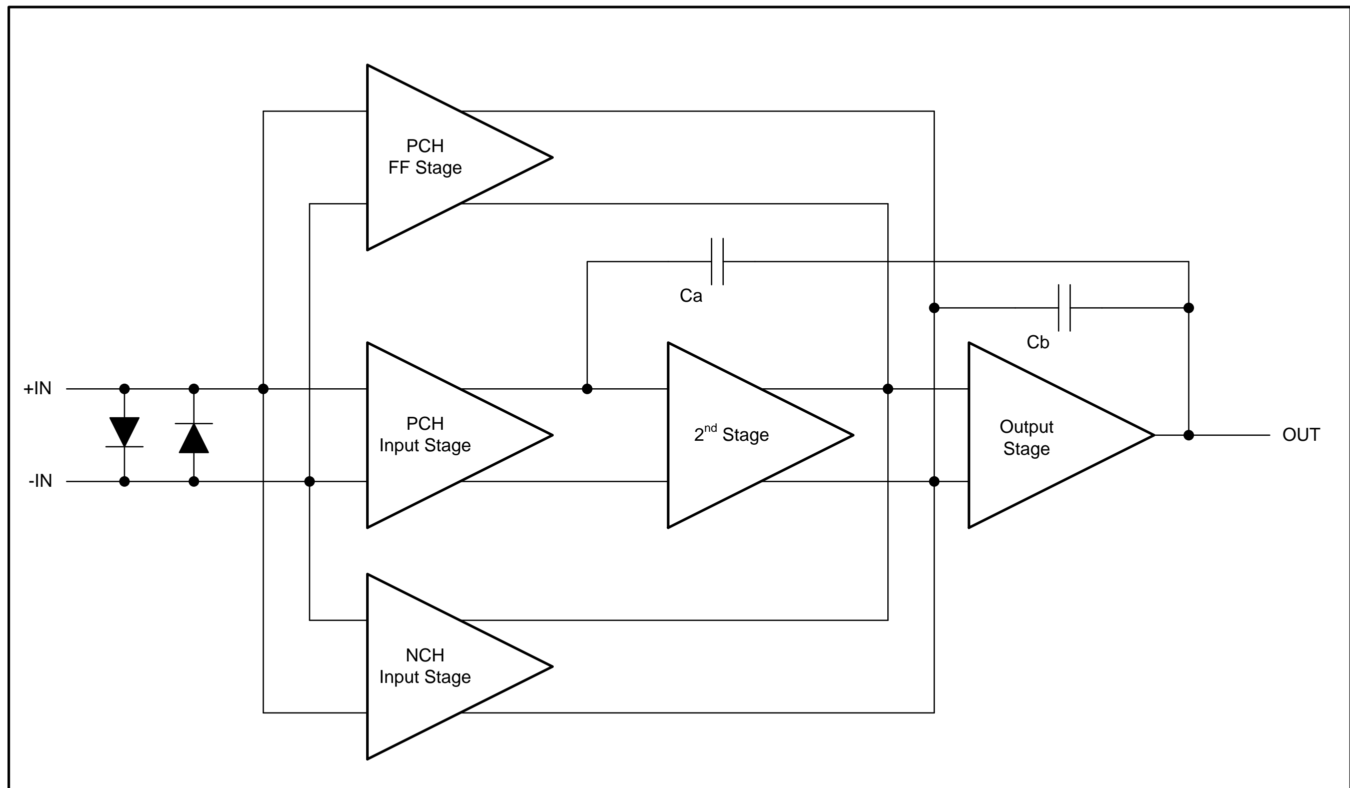
8 Detailed Description

8.1 Overview

The OPAx170 family of operational amplifiers provides high overall performance, making them ideal for many general-purpose applications. The excellent offset drift of only 2 μV/°C provides excellent stability over the entire temperature range. In addition, the device offers very good overall performance with high CMRR, PSRR, and A_{OL}.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Operating Characteristics

The OPAx170 family of amplifiers is specified for operation from 2.7 V to 36 V (±1.35 V to ±18 V). Many of the specifications apply from –40°C to +125°C. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the *Typical Characteristics*.

Copyright © 2011–2018, Texas Instruments Incorporated

Feature Description (continued)

8.3.2 Phase-Reversal Protection

The OPAx170 family has an internal phase-reversal protection. Many operational amplifiers exhibit a phase reversal when the input is driven beyond its linear common-mode range. This condition is most often encountered in noninverting circuits when the input is driven beyond the specified common-mode voltage range, causing the output to reverse into the opposite rail. The input of the OPAx170 prevents phase reversal with excessive common-mode voltage. Instead, the output limits into the appropriate rail. This performance is shown in 図 37.

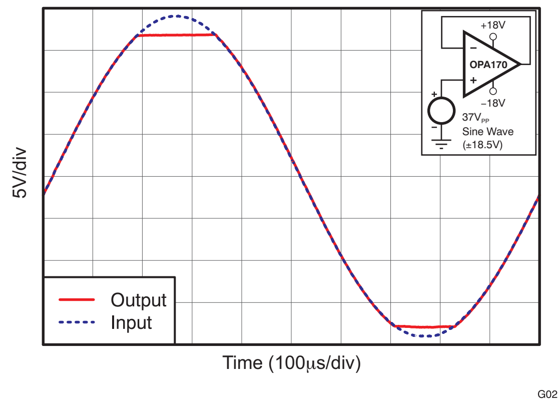


図 37. No Phase Reversal

8.3.3 Electrical Overstress

Designers often ask questions about the capability of an operational amplifier to withstand electrical overstress. These questions tend to focus on the device inputs, but can involve the supply voltage pins or even the output pin. Each of these different pin functions have electrical stress limits determined by the voltage breakdown characteristics of the particular semiconductor fabrication process and specific circuits connected to the pin. Additionally, internal electrostatic discharge (ESD) protection is built into these circuits to protect them from accidental ESD events both before and during product assembly.

A good understanding of this basic ESD circuitry and its relevance to an electrical overstress event is helpful. 図 38 illustrates the ESD circuits contained in the OPAx170 (indicated by the dashed line area). The ESD protection circuitry involves several current-steering diodes connected from the input and output pins and routed back to the internal power-supply lines, where the diodes meet at an absorption device internal to the operational amplifier. This protection circuitry is intended to remain inactive during normal circuit operation.

Feature Description (continued)

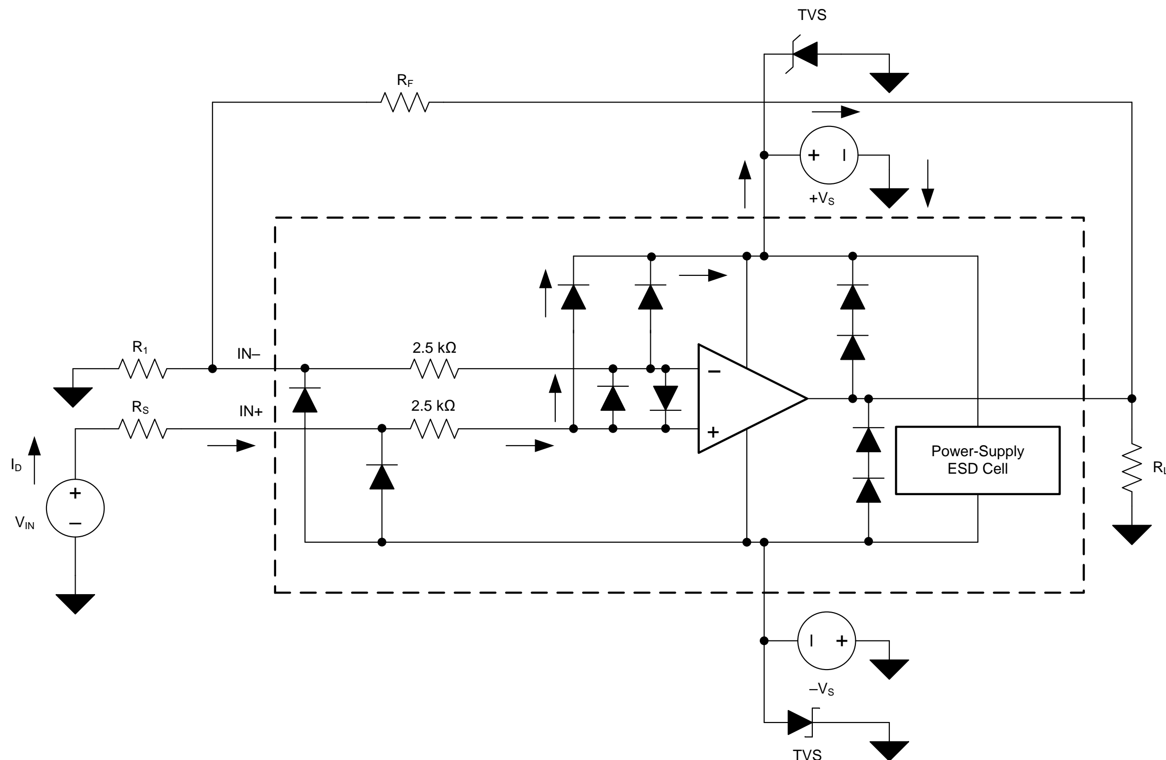

図 38. Equivalent Internal ESD Circuitry Relative to a Typical Circuit Application

An ESD event produces a short-duration, high-voltage pulse that is transformed into a short-duration, high-current pulse when discharging through a semiconductor device. The ESD protection circuits are designed to provide a current path around the operational amplifier core to prevent damage. The energy absorbed by the protection circuitry is then dissipated as heat.

When an ESD voltage develops across two or more amplifier device pins, current flows through one or more steering diodes. Depending on the path that the current takes, the absorption device can activate. The absorption device has a trigger, or threshold voltage, that is above the normal operating voltage of the OPAx170 but below the device breakdown voltage level. When this threshold is exceeded, the absorption device quickly activates and clamps the voltage across the supply rails to a safe level.

When the operational amplifier connects into a circuit (refer to 図 38), the ESD protection components are intended to remain inactive and do not become involved in the application circuit operation. However, circumstances may arise where an applied voltage exceeds the operating voltage range of a given pin. If this condition occurs, there is a risk that some internal ESD protection circuits can turn on and conduct current. Any such current flow occurs through steering-diode paths and rarely involves the absorption device.

図 38 shows a specific example where the input voltage (V_{IN}) exceeds the positive supply voltage (V+) by 500 mV or more. Much of what happens in the circuit depends on the supply characteristics. If V+ can sink the current, one of the upper input steering diodes conducts and directs current to V+. Excessively high current levels can flow with increasingly higher V_{IN}. As a result, the data sheet specifications recommend that applications limit the input current to 10 mA.

If the supply is not capable of sinking the current, V_{IN} can begin sourcing current to the operational amplifier and then take over as the source of positive supply voltage. The danger in this case is that the voltage can rise to levels that exceed the operational amplifier absolute maximum ratings.

Copyright © 2011–2018, Texas Instruments Incorporated

Feature Description (continued)

Another common question involves what happens to the amplifier if an input signal is applied to the input when the power supplies (V+ or V–) are at 0 V. Again, this question depends on the supply characteristic when at 0 V, or at a level below the input signal amplitude. If the supplies appear as high impedance, then the input source supplies the operational amplifier current through the current-steering diodes. This state is not a normal bias condition; most likely, the amplifier does not operate normally. If the supplies are low impedance, then the current through the steering diodes can become quite high. The current level depends on the ability of the input source to deliver current, and any resistance in the input path.

If there is any uncertainty about the ability of the supply to absorb this current, add external Zener diodes to the supply pins; see 図 38. Select the Zener voltage so that the diode does not turn on during normal operation. However, the Zener voltage must be low enough so that the Zener diode conducts if the supply pin begins to rise above the safe-operating, supply-voltage level.

The OPAx170 input pins are protected from excessive differential voltage with back-to-back diodes; see 図 38. In most circuit applications, the input protection circuitry has no effect. However, in low-gain or G = 1 circuits, fast-ramping input signals can forward-bias these diodes because the output of the amplifier cannot respond rapidly enough to the input ramp. If the input signal is fast enough to create this forward-bias condition, limit the input signal current to 10 mA or less. If the input signal current is not inherently limited, an input series resistor can be used to limit the input signal current. This input series resistor degrades the low-noise performance of the OPAx170. 図 38 illustrates an example configuration that implements a current-limiting feedback resistor.

8.3.4 Capacitive Load and Stability

The dynamic characteristics of the OPAx170 have been optimized for common operating conditions. The combination of low closed-loop gain and high capacitive loads decreases the phase margin of the amplifier and can lead to gain peaking or oscillations. As a result, heavier capacitive loads must be isolated from the output. The simplest way to achieve this isolation is to add a small resistor (for example, R_{OUT} equal to 50 Ω) in series with the output. Refer to 図 39 and 図 40 illustrate graphs of small-signal overshoot versus capacitive load for several values of R_{OUT}. Also, refer to applications bulletin AB-028, *Feedback Plots Define Op Amp AC Performance*, for details of analysis techniques and application circuits.

8.4 Device Functional Modes

8.4.1 Common-Mode Voltage Range

The input common-mode voltage range of the OPAx170 series extends 100 mV below the negative rail and within 2 V of the top rail for normal operation.

This device can operate with full rail-to-rail input 100 mV beyond the top rail, but with reduced performance within 2 V of the top rail. The typical performance in this range is summarized in 表 2.

表 2. Typical Performance for Common-Mode Voltages Within 2 V of the Positive Supply

PARAMETER		MIN	TYP	MAX	UNIT
Input common-mode voltage		(V+) – 2		(V+) + 0.1	V
Offset voltage			7		mV
	vs temperature		12		µV/°C
Common-mode rejection			65		dB
Open-loop gain			60		dB
Gain-bandwidth product			0.3		MHz
Slew rate			0.3		V/µs

8.4.2 Overload Recovery

Overload recovery is defined as the time required for the operational amplifier output to recover from the saturated state to the linear state. The output devices of the operational amplifier enter the saturation region when the output voltage exceeds the rated operating voltage, either resulting from the high input voltage or the high gain. After the device enters the saturation region, the charge carriers in the output devices need time to return back to the normal state. After the charge carriers return back to the equilibrium state, the device begins to slew at the normal slew rate. Thus, the propagation delay in case of an overload condition is the sum of the overload recovery time and the slew time. The overload recovery time for the OPAx170 is approximately 2 µs.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The OPAx170 family of operational amplifiers provides high overall performance in a large number of general-purpose applications. As with all amplifiers, applications with noisy or high-impedance power supplies require decoupling capacitors placed close to the device pins. In most cases, 0.1-µF capacitors are adequate. Follow the additional recommendations in *Layout Guidelines* in order to achieve the maximum performance from this device. Many applications may introduce capacitive loading to the output of the amplifier (potentially causing instability). One method of stabilizing the amplifier in such applications is to add an isolation resistor between the amplifier output and the capacitive load. The design process for selecting this resistor is given in *Typical Application*.

9.2 Typical Application

This circuit can be used to drive capacitive loads such as cable shields, reference buffers, MOSFET gates, and diodes. The circuit uses an isolation resistor (Riso) to stabilize the output of an operational amplifier. Riso modifies the open-loop gain of the system to ensure the circuit has sufficient phase margin.

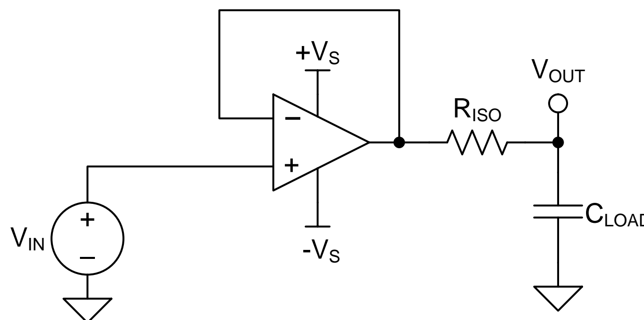

図 41. Unity-Gain Buffer With R_{ISO} Stability Compensation

9.2.1 Design Requirements

The design requirements are:

- Supply voltage: 30 V (±15 V)
- Capacitive loads: 100 pF, 1000 pF, 0.01 µF, 0.1 µF, and 1 µF
- Phase margin: 45° and 60°

9.2.2 Detailed Design Procedure

9.2.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the OPAx170 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance

Typical Application (continued)

- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2.2.2 Unity-Gain Buffer

図 41 shows a unity-gain buffer driving a capacitive load. 式 1 shows the transfer function for the circuit in 図 41. Not shown in 図 41 is the open-loop output resistance of the operational amplifier, R_o.

$$T(s) = \frac{1 + C_{LOAD} \times R_{ISO} \times s}{1 + \left(R_o + R_{ISO}\right) \times C_{LOAD} \times s} \quad (1)$$

The transfer function in 式 1 has a pole and a zero. The frequency of the pole (f_p) is determined by (R_o + R_{ISO}) and C_{LOAD}. Components R_{ISO} and C_{LOAD} determine the frequency of the zero (f_z). A stable system is obtained by selecting R_{ISO} such that the rate of closure (ROC) between the open-loop gain (A_{OL}) and 1/β is 20 dB/decade. 図 42 depicts the concept. The 1/β curve for a unity-gain buffer is 0 dB.

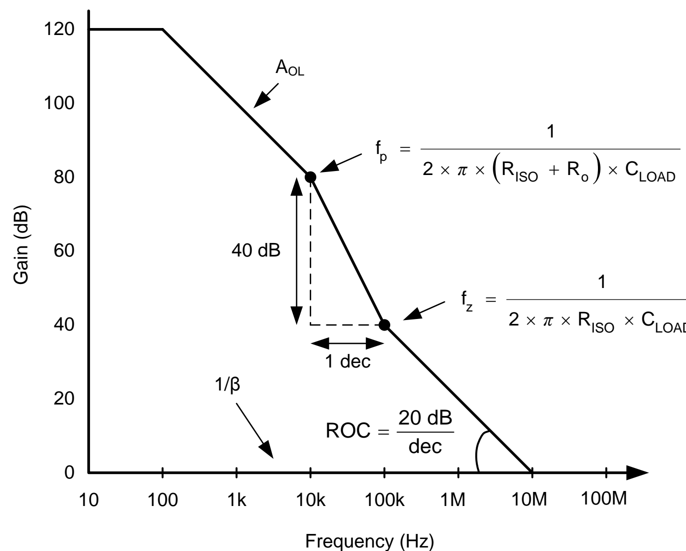

図 42. Unity-Gain Amplifier With R_{ISO} Compensation

ROC stability analysis is typically simulated. The validity of the analysis depends on multiple factors, especially the accurate modeling of R_o. In addition to simulating the ROC, a robust stability analysis includes a measurement of overshoot percentage and ac gain peaking of the circuit using a function generator, oscilloscope, and gain and phase analyzer. Phase margin is then calculated from these measurements. 表 3 shows the overshoot percentage and ac gain peaking that correspond to phase margins of 45° and 60°. For more details on this design and other alternative devices that can be used in place of the OPA170, see the Precision Design, *Capacitive Load Drive Solution Using an Isolation Resistor*.

表 3. Phase Margin versus Overshoot and AC Gain Peaking

PHASE MARGIN	OVERSHOOT	AC GAIN PEAKING
45°	23.3%	2.35 dB
60°	8.8%	0.28 dB

Copyright © 2011–2018, Texas Instruments Incorporated

9.2.3 Application Curve

Using the described methodology, the values of R_{ISO} that yield phase margins of 45º and 60º for various capacitive loads were determined. The results are shown in 図 43.

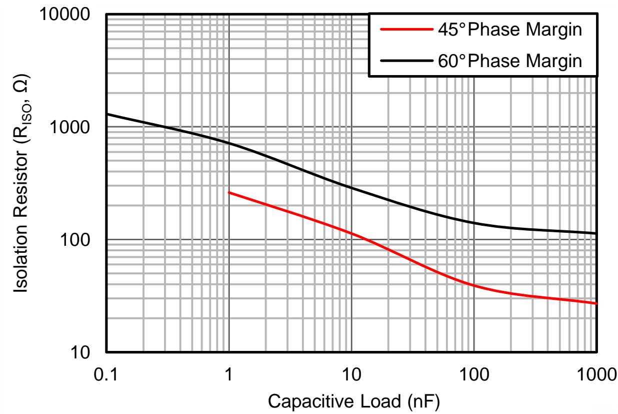

図 43. Isolation Resistor Required for Various Capacitive Loads to Achieve a Target Phase Margin

10 Power Supply Recommendations

The OPAx170 is specified for operation from 2.7 V to 36 V (±1.35 V to ±18 V); many specifications apply from –40°C to 85°C. Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the *Typical Characteristics*.

> **注意**
>
> Supply voltages larger than 40 V can permanently damage the device; see the *Absolute Maximum Ratings*.

Place 0.1-µF bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see the *Layout* section.

11 Layout

11.1 Layout Guidelines

For best operational performance of the device, use good printed-circuit board (PCB) layout practices, including:

- Noise can propagate into analog circuitry through the power pins of the circuit as a whole and the operational amplifier itself. Bypass capacitors are used to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1-µF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for single-supply applications.
- Separate grounding for analog and digital portions of circuitry is one of the simplest and most-effective methods of noise suppression. One or more layers on multilayer PCBs are usually devoted to ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Make sure to physically separate digital and analog grounds, paying attention to the flow of the ground current. For more detailed information, see application report SLOA089, *Circuit Board Layout Techniques*.
- In order to reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If these traces cannot be kept separate, crossing the sensitive trace perpendicularly is much better than in parallel with the noisy trace.
- Place the external components as close to the device as possible. As illustrated in 図 45, keeping R_F and R_G close to the inverting input minimizes parasitic capacitance.
- Keep the length of input traces as short as possible. Always remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring can significantly reduce leakage currents from nearby traces that are at different potentials.

12 デバイスおよびドキュメントのサポート

12.1 デバイス・サポート

12.1.1 デベロッパー・ネットワークの製品に関する免責事項

デベロッパー・ネットワークの製品またはサービスに関するTIの出版物は、単独またはTIの製品、サービスと一緒に提供される場合に関係なく、デベロッパー・ネットワークの製品またはサービスの適合性に関する是認、デベロッパー・ネットワークの製品またはサービスの是認の表明を意味するものではありません。

12.1.2 開発サポート

12.1.2.1 TINA-TI™ (無料のダウンロード・ソフトウェア)

TINA™は、SPICEエンジンをベースにした単純かつ強力な、使いやすい回路シミュレーション・プログラムです。また、TINA-TI™はTINAソフトウェアの無料バージョンで、完全な機能を持ち、パッシブとアクティブ両方のモデルに加えて、マクロ・モデルのライブラリがプリロードされています。TINA-TIには従来型のDC、過渡、および周波数ドメインのSPICEによる分析と、追加の設計機能が搭載されています。

TINA-TIはAnalog eLab Design Centerから無料でダウンロードでき、ユーザーが結果をさまざまな方法でフォーマットできる、広範な後処理機能を備えています。仮想計測器により、入力波形を選択し、回路ノード、電圧、および波形をプローブして、動的なクイック・スタート・ツールを作成できます。

注

これらのファイルを使用するには、TINA ソフトウェア (DesignSoft™製) またはTINA-TIソフトウェアがインストールされている必要があります。TINA-TIフォルダから、無料のTINA-TIソフトウェアをダウンロードしてください。

12.1.2.2 DIPアダプタ評価モジュール

DIPアダプタ評価モジュール・ツールを使用すると、小さな表面実装ICのプロトタイプを簡単に、低コストで作成できます。この評価ツールは、DまたはU(SOIC-8)、PW(TSSOP-8)、DGK(MSOP-8)、DBV(SOT23-6、SOT23-5、およびSOT23-3)、DCK(SC70-6およびSC70-5)、およびDRL(SOT563-6)のTIパッケージに対応しています。DIPアダプタ評価モジュールは、ターミナル・ストリップとともに使用することも、既存の回路へ直接接続することもできます。

12.1.2.3 ユニバーサル・オペアンプ評価モジュール

ユニバーサル・オペアンプ評価モジュールは一連の汎用のブランクアウト回路基板で、各種のICパッケージ・タイプ向けの回路のプロトタイプ作成を容易にします。この評価モジュール基板は、多くの異なる回路を簡単かつ迅速に構築できるように設計されています。5つのモデルが提供されており、それぞれのモデルは特定のパッケージ・タイプを対象としています。PDIP、SOIC、MSOP、TSSOP、およびSOT23のパッケージがすべてサポートされています。

注

これらの基板には部品が搭載されていないため、ユーザーが独自のICを供給する必要があります。ユニバーサル・オペアンプ評価モジュールを注文するときに、オペアンプ・デバイスのサンプルをいくつか要求することをお勧めします。

12.1.2.4 TI Precision Designs

TI Precision Designsは、TIの高精度アナログ・アプリケーションの専門家により作成されたアナログ・ソリューションで、多くの有用な回路に関して、動作理論、コンポーネント選択、シミュレーション、完全なPCB回路図とレイアウト、部品表、性能測定結果を提供します。TI Precision Designsは、http://www.ti.com/ww/en/analog/precision-designs/からオンラインで入手できます。

デバイス・サポート (continued)

12.1.2.5 WEBENCH® Filter Designer

WEBENCH® Filter Designerは単純で強力な、使いやすいアクティブ・フィルタ設計プログラムです。WEBENCH Filter Designerを使用すると、TIのベンダ・パートナーからのTI製オペアンプやパッシブ・コンポーネントを使用して、最適なフィルタ設計を作成できます。

WEBENCH® Filter Designerは、WEBENCH® Design CenterからWebベースのツールとして利用でき、包括的な複数段アクティブ・フィルタ・ソリューションをわずか数分で設計、最適化、シミュレーションできます。

12.1.2.6 WEBENCH®ツールによるカスタム設計

ここをクリックすると、WEBENCH® Power Designerにより、OPAx170デバイスを使用するカスタム設計を作成できます。

1. 最初に、入力電圧(V_{IN})、出力電圧(V_{OUT})、出力電流(I_{OUT})の要件を入力します。
2. オプティマイザのダイヤルを使用して、効率、占有面積、コストなどの主要なパラメータについて設計を最適化します。
3. 生成された設計を、テキサス・インスツルメンツが提供する他の方式と比較します。

WEBENCH Power Designerでは、カスタマイズされた回路図と部品リストを、リアルタイムの価格と部品の在庫情報と併せて参照できます。

通常、次の操作を実行可能です。

- 電気的なシミュレーションを実行し、重要な波形と回路の性能を確認する。
- 熱シミュレーションを実行し、基板の熱特性を把握する。
- カスタマイズされた回路図やレイアウトを、一般的なCADフォーマットで出力する。
- 設計のレポートをPDFで印刷し、設計を共有する。

WEBENCHツールの詳細は、www.ti.com/WEBENCHでご覧になれます。

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.
