OPA2277-EP High-Precision, Low-Noise Operational Amplifier

1 Features

- Ultra-Low Offset Voltage: 10 µV
- High Open-Loop Gain: 134 dB
- High Common-Mode Rejection: 140 dB
- High Power Supply Rejection: 130 dB
- Low Bias Current: 1-nA Maximum
- Wide Supply Range: ±2 to ±18 V
- Low Quiescent Current: 800 µA/Amplifier
- Supports Defense, Aerospace, and Medical Applications
  - Controlled Baseline
  - One Assembly and Test Site
  - One Fabrication Site
  - Available in Military (–55°C to 125°C) Temperature Range (1)
  - Extended Product Life Cycle
  - Extended Product-Change Notification
  - Product Traceability

2 Applications

- Transducer Amplifier
- Bridge Amplifier
- Temperature Measurements
- Strain Gage Amplifier
- Precision Integrator
- Battery-Powered Instruments
- Test Equipment

(1) Additional temperature ranges available – contact factory

3 Description

The OPA2277 precision operational amplifier replaces the industry standard OP-177. It offers improved noise, wider output voltage swing, and is twice as fast with half the quiescent current. Features include ultra-low offset voltage and drift, low bias current, high common-mode rejection, and high power supply rejection.

OPA2277 operates from ±2-V to ±18-V supplies with excellent performance. Unlike most operational amplifiers, which are specified at only one supply voltage, the OPA2277 is specified for real-world applications; a single limit applies over the ±5-V to ±15-V supply range. High performance is maintained as the amplifiers swing to their specified limit. Because the initial offset voltage (±20 µV max) is so low, user adjustment is usually not required.

OPA2277 is easy to use and free from phase inversion and overload problems found in some operational amplifiers. It is stable in unity gain and provides excellent dynamic behavior over a wide range of load conditions. OPA2277 features completely independent circuitry for lowest crosstalk and freedom from interaction, even when overdriven or overloaded. Dual versions are available in DIP-8, SO-8. OPA2277 is fully specified and operates from –55°C to 125°C.

7 Specifications

7.1 Absolute Maximum Ratings(1)

over operating free-air temperature (unless otherwise noted)

		MIN	MAX	UNIT
	Supply voltage		36	V
	Input voltage	(V–) – 0.7	(V+) + 0.7	V
	Output short-circuit (to ground)(2)	Continuous		
	Operating temperature	–55	125	°C
	Junction temperature		150	°C
	Lead temperature (soldering, 10 s)		300	°C
T_{stg}	Storage temperature range	–55	125	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) One channel per package.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Machine model (MM)	±100	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_S	Specified voltage range	±5		±15	V
	Operating voltage range	±2		±18	V
T_J	Operating junction temperature	–55		125	°C

7.4 Thermal Information

THERMAL METRIC(1)		OPA2277 D 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	91.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	39.9	
$R_{\theta JB}$	Junction-to-board thermal resistance	40.6	
ψ_{JT}	Junction-to-top characterization parameter	3.9	
ψ_{JB}	Junction-to-board characterization parameter	39.6	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

7.5 Electrical Characteristics

At T_A = 25°C, V_S = ±5 V to ±15 V, R_L = 2 kΩ (unless otherwise noted).

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
OFFSET VOLTAGE							
V_{OS}	Input offset voltage				±20	±65	µV
	vs temperature, T_J = –55°C to 125°C					±150	µV
	vs temperature (dV_{OS}/dT), T_J = –55°C to 125°C				±0.15		µV/°C
	vs power supply (PSRR)		V_S = ±2 V to ±18 V		±0.3	±1	µV/V
	T_J = –55°C to 125°C		V_S = ±2 V to ±18 V			±1	µV/V
	vs time				0.2		µV/mo
	Channel separation (dual)		dc		0.1		µV/V
INPUT BIAS CURRENT							
I_B	Input bias current				±0.5	±2.8	nA
	T_J = –55°C to 125°C					±7	nA
I_{OS}	Input offset current				±0.5	±2.8	nA
	T_J = –55°C to 125°C					±7	nA
NOISE							
	Input voltage noise, f = 0.1 to 10 Hz				0.22		µVpp
					0.035		µVrms
e_n	Input voltage noise density	f = 10 Hz			12		nV/√Hz
		f = 100 Hz			8		nV/√Hz
		f = 1 Hz			8		nV/√Hz
		f = 10 Hz			8		nV/√Hz
i_n	Current noise density	f = 1 kHz			0.2		pA/√Hz
INPUT VOLTAGE RANGE							
V_{CM}	Common-mode voltage range			(V–) + 2		(V+) – 2	V
CMRR	Common-mode rejection		V_{CM} = (V–) + 2 V to (V+) – 2 V	115	140		dB
	T_J = –55°C to 125°C		V_{CM} = (V–) + 2 V to (V+) – 2 V	115			dB
INPUT IMPEDANCE							
	Differential				100 || 3		MΩ || pF
	Common-mode		V_{CM} = (V–) + 2 V to (V+) – 2 V		250 || 3		GΩ || pF
OPEN-LOOP GAIN							
A_{OL}	Open-loop voltage gain		V_O = (V–) + 0.5 V to (V+) – 1.2 V, R_L = 10 kΩ		140		dB
	T_J = –55°C to 125°C		V_O = (V–) + 1.5 V to (V+) – 1.5 V, R_L = 2 kΩ	126	134		dB
			V_O = (V–) + 1.5 V to (V+) – 1.5 V, R_L = 2 Ω	126			dB
FREQUENCY RESPONSE							
GBW	Gain bandwidth product				1		MHz
SR	Slew rate				0.8		V/µs
	Settling time	0.1%	V_S = ±15 V, G = 1, 10-V step		14		µs
		0.01%	V_S = ±15 V, G = 1, 10-V step		16		µs
	Overload recovery time		V_{IN} x G = V_S		3		µs
	Total harmonic distortion + noise (THD + N)		f = 1 kHz, G = 1, V_O = 3.5 Vrms		0.002%		

Electrical Characteristics (continued)

At T_A = 25°C, V_S = ±5 V to ±15 V, R_L = 2 kΩ (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
OUTPUT

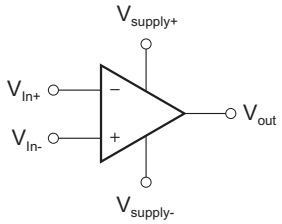
8 Detailed Description

8.1 Overview

The OPA2277 is a unity-gain stable, high-precision, and low-noise operational amplifier. OPA2277 operates from ±2- to ±18-V supplies with excellent performance. Unlike most operational amplifiers which are specified at only one supply voltage, the OPA2277 is specified for real-world applications; a single limit applies over the ±5- to ±15-V supply range. High performance is maintained as the amplifiers swing to their specified limit. Because the initial offset voltage (±50-μV max) is so low, user adjustment is usually not required.

8.2 Functional Block Diagram



8.3 Feature Description

The OPA2277 precision operational amplifier replaces the industry standard OP-177. It offers improved noise, wider output voltage swing, and is twice as fast with half the quiescent current. Features include ultra-low offset voltage and drift, low bias current, high common-mode rejection, and high power-supply rejection.

OPA2277 is easy to use and free from phase inversion and overload problems found in some operational amplifiers. It is stable in unity gain and provides excellent dynamic behavior over a wide range of load conditions. OPA2277 features completely independent circuitry for lowest crosstalk and freedom from interaction, even when overdriven or overloaded.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The OPA2277 is unity-gain stable and free from unexpected output phase reversal, making it easy to use in a wide range of applications. Applications with noisy or high-impedance power supplies may require decoupling capacitors close to the device pins. In most cases, 0.1-µF capacitors are adequate.

9.2 Typical Application

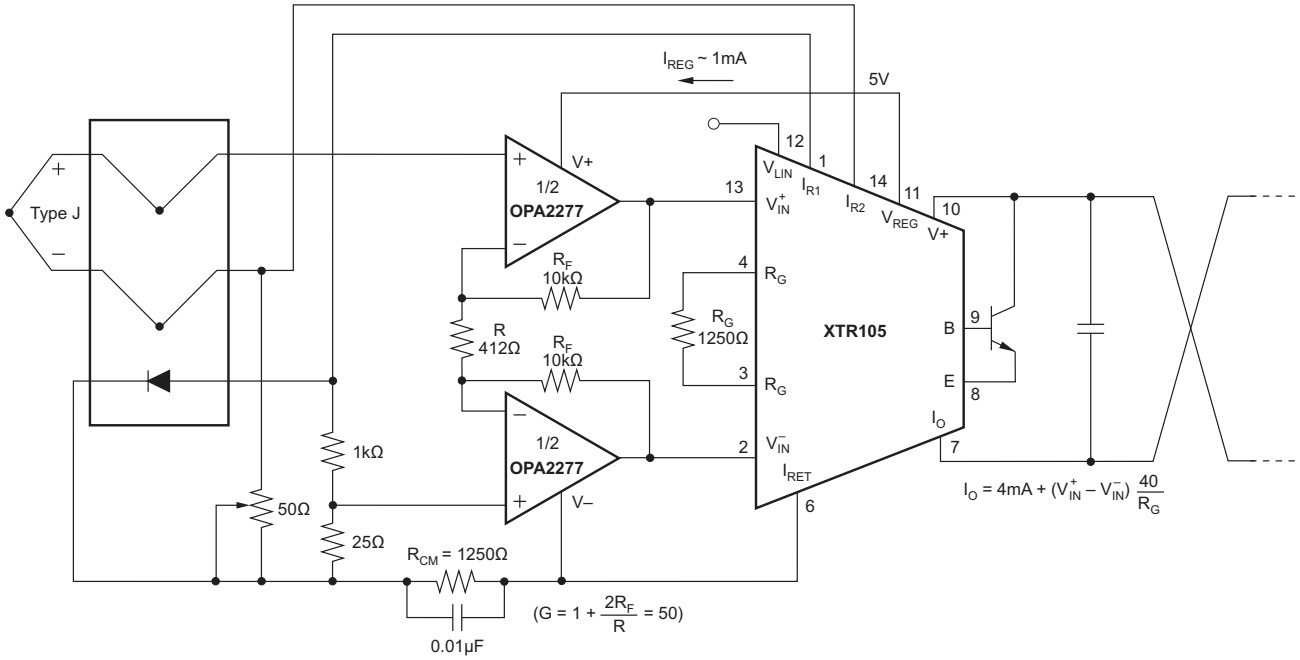


Figure 21. Thermocouple Low-Offset, Low-Drift Loop Measurement With Diode Cold Junction Compensation

9.2.1 Design Requirements

For the thermocouple low-offset, low-drift loop measurement with diode cold junction compensation (see Figure 21), Table 1 lists the design parameters needed with gain = 50.

$$G = 1 + \frac{2R_F}{R} = 50 \quad (1)$$

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
R_F	10 kΩ
R	412 Ω

9.2.2 Detailed Design Procedure

9.2.2.1 Offset Voltage Adjustment

The OPA2277 is laser-trimmed for very-low offset voltage and drift so most circuits do not require external adjustment. However, offset voltage trim connections are provided on pins 1 and 8. Offset voltage can be adjusted by connecting a potentiometer as shown in Figure 22. Only use this adjustment to null the offset of the operational amplifier. Do not use this adjustment to compensate for offsets created elsewhere in a system because this can introduce additional temperature drift.

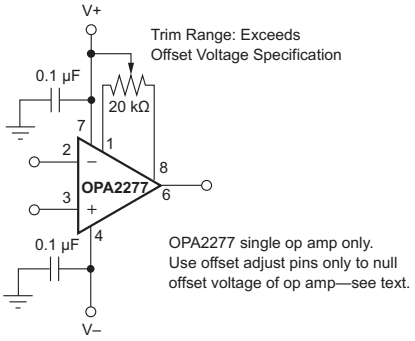

Figure 22. OPA2277 Offset Voltage Trim Circuit

9.2.2.2 Input Protection

The inputs of the OPA2277 are protected with 1-kΩ series input resistors and diode clamps. The inputs can withstand ±30-V differential inputs without damage. The protection diodes conduct current when the inputs are overdriven. This may disturb the slewing behavior of unity-gain follower applications, but does not damage the operational amplifier.

9.2.2.3 Input Bias Current Cancellation

The input stage base current of the OPA2277 is internally compensated with an equal and opposite cancellation circuit. The resulting input bias current is the difference between the input stage base current and the cancellation current. This residual input bias current can be positive or negative.

When the bias current is canceled in this manner, the input bias current and input offset current are approximately the same magnitude. As a result, it is not necessary to use a bias current cancellation resistor as is often done with other operational amplifiers (see Figure 23). A resistor added to cancel input bias current errors may actually increase offset voltage and noise.

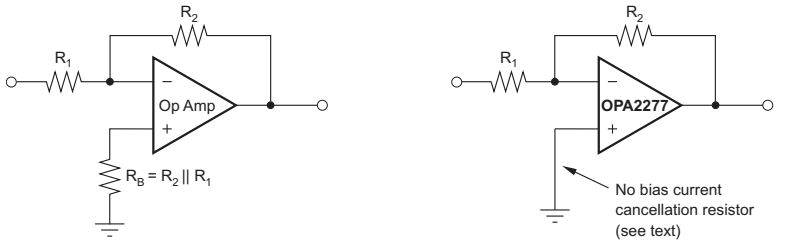

Figure 23. Input Bias Current Cancellation

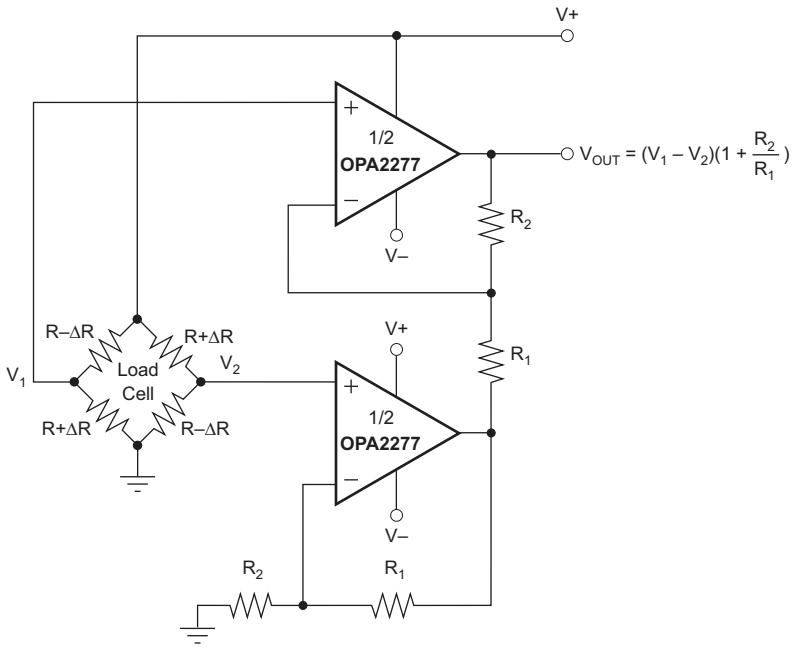

A. For integrated solution see: INA126, INA2126 (dual), INA125 (on-board reference), or INA122 (single-supply).

Figure 24. Load Cell Amplifier

9.2.3 Application Curves

At T_J = 25°C, V_S = ±15 V, and R_L = 2 kΩ. Figure 25 shows Change in input bias current versus power supply voltage. Curve shows normalized change in bias current with respect to V_S = ±10 V (+20 V). Typical IB may range from –0.5 to 0.5 nA at V_S = ±10 V. Figure 26 shows change in input bias current versus common-mode voltage. Curve shows normalized change in bias current with respect to V_{CM} = 0 V. Typical IB may range from –0.5 to 0.5 nA at V_{CM} = 0 V.

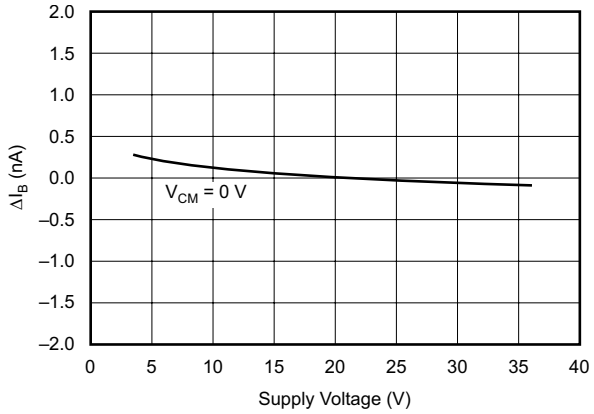

Figure 25. Change in Input Bias Current vs Power Supply Voltage

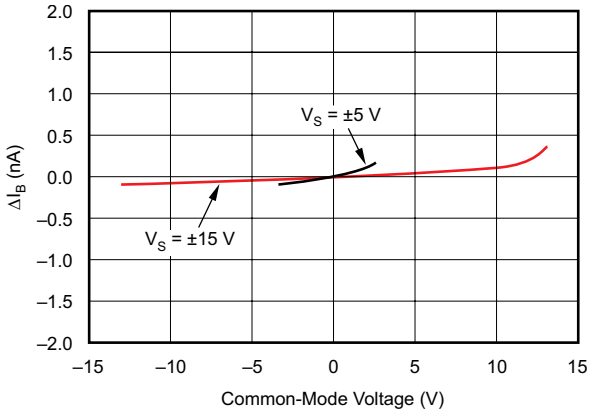

Figure 26. Change in Input Bias Current vs Common-Mode Voltage

10 Power Supply Recommendations

The OPA2277 operational amplifier operates from ±2.5- to ±18-V supplies with excellent performance. Unlike most operational amplifiers which are specified at only one supply voltage, the OPA2277 is specified for real-world applications. A single set of specifications applies over the ±5- to ±15-V supply range. Specifications are ensured for applications between ±5- and ±15-V power supplies. Some applications do not require equal positive and negative output voltage swing. Power supply voltages do not need to be equal. The OPA2277 can operate with as little as 5 V between the supplies and with up to 36 V between the supplies. For example, the positive supply could be set to 25 V with the negative supply at –5 V, or vice-versa. In addition, key parameters are ensured over the specified temperature range, –55°C to 125°C. The *Typical Characteristics* show parameters which vary significantly with operating voltage or temperature.

11 Layout

11.1 Layout Guidelines

Solder the lead-frame die pad to a thermal pad on the PCB. Mechanical drawings in *Mechanical, Packaging, and Orderable Information* show the physical dimensions for the package and pad.

Soldering the exposed pad significantly improves board-level reliability during temperature cycling, key push, package shear, and similar board-level tests. Even with applications that have low-power dissipation, the exposed pad must be soldered to the PCB to provide structural integrity and long-term reliability.

The OPA2277 has very-low offset voltage and drift. To achieve highest performance, optimize circuit layout and mechanical conditions. Offset voltage and drift can be degraded by small thermoelectric potentials at the operational amplifier inputs. Connections of dissimilar metals generate thermal potential which can degrade the ultimate performance of the OPA2277. These thermal potentials can be made to cancel by assuring that they are equal in both input terminals.

- Keep thermal mass of the connections made to the two input terminals similar.
- Locate heat sources as far as possible from the critical input circuitry.
- Shield operational amplifier and input circuitry from air currents such as cooling fans.

11.2 Layout Example

11.2.1 Board Layout

This demonstration fixture is a two-layer PCB. It uses a ground plane on the bottom, and signal and power traces on the top. The ground plane has been opened up around Op Amp pins sensitive to capacitive loading. Power-supply traces are laid out to keep current loop areas to a minimum. The SMA (or SMB) connectors may be mounted either vertically or horizontally.

The location and type of capacitors used for power-supply bypassing are crucial to high-frequency amplifiers. The tantalum capacitors, C_1 and C_2, do not need to be as close to pins 7 and 4 on your PCB, and may be shared with other amplifiers.

11.2.2 Measurement Tips

This demonstration fixture and the component values shown are designed to operate in a 50Ω environment. Most data sheet plots are obtained in this manner. Change the component values for different input and output impedance levels.

Do not use high-impedance probes; they represent a heavy capacitive load to the Op Amps, and will alter the amplifier response. Instead, use low impedance (≤ 500Ω) probes with adequate bandwidth. The probe input capacitance and resistance set an upper limit on the measurement bandwidth. If a high-impedance probe must be used, place a 100Ω resistor on the probe tip to isolate its capacitance from the circuit.

Layout Example (continued)

12 Device and Documentation Support

12.1 Trademarks

All trademarks are the property of their respective owners.

12.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.3 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
OPA2277MDTEP	Active	Production	SOIC (D) | 8	250 | SMALL T&R	Yes	NIPDAU	Level-3-260C-168 HR	-55 to 125	OPA 2277E
OPA2277MDTEP.A	Active	Production	SOIC (D) | 8	250 | SMALL T&R	Yes	NIPDAU	Level-3-260C-168 HR	-55 to 125	OPA 2277E

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
