

PCM1822-Q1 ステレオ・チャンネル、32 ビット、192kHz、Burr-Brown™ オーディオ ADC

1 特長

- ステレオ高性能 ADC:
 - 2 チャンネルのアナログ・マイクロフォンまたはライン入力
- ADC ラインおよびマイクロフォンの差動およびシングルエンド入力性能:
 - PCM1822-Q1 ダイナミック・レンジ:
 - ダイナミック・レンジ・エンハンサが有効な状態で 117dB
 - ダイナミック・レンジ・エンハンサが無効な状態で 111dB
 - THD+N: -95dB
- 1V_{RMS} フルスケール入力
- ADC サンプル・レート (f_S): 8kHz~192kHz
- ハードウェア・ピン制御構成
- 線形位相または低レイテンシ・フィルタを選択可能
- 柔軟なオーディオ・シリアル・データ・インターフェイス:
 - マスタまたはスレーブ・インターフェイスを選択可能
 - 32 ビット、2 チャンネル TDM
 - 32 ビット、2 チャンネル I²S
- オーディオ・クロック喪失時の自動パワーダウン
- 高性能オーディオ PLL を内蔵
- 単一電源動作: 3.3V
- I/O 電源動作: 3.3V または 1.8V
- 3.3V AVDD 電源での消費電力:
 - 16kHz サンプル・レートで 19.6mW/ch
 - 48kHz サンプル・レートで 21.3mW/ch

2 アプリケーション

- 車載用アクティブ・ノイズ・キャンセル
- 車載用ヘッド・ユニット
- 後部座席用エンターテインメント
- デジタル・コックピット処理装置
- テレマティクス制御ユニット

3 概要

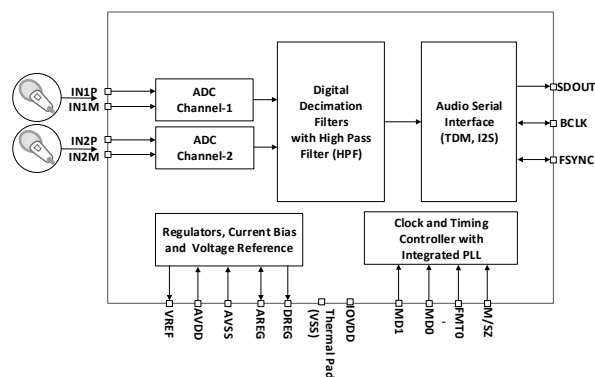

PCM1822-Q1 は、最大 2 つのアナログ・チャンネルの同時サンプリングをサポートする高性能 Burr-Brown™ オーディオ A/D コンバータ (ADC) です。本デバイスは、1V_{RMS} フルスケール信号のシングルエンドおよび差動のラインおよびマイクロフォン入力をサポートしています。フェーズ・ロック・ループ (PLL)、DC 除去ハイパス・フィルタ (HPF) を内蔵し、最高 192kHz のサンプル・レートに対応しています。TDM (時分割多重) または I²S オーディオ・フォーマットをサポートしており、これらのフォーマットはハードウェア・ピンの入力レベルで選択できます。また PCM1822-Q1 は、オーディオ・バス・インターフェイス動作をマスタ・モードまたはスレーブ・モードに選択できます。これらの高性能な機能を内蔵し、かつ 3.3V 単一電源で動作できることから、本デバイスは、低コストと省スペースが求められる遠距離マイクロフォン録音アプリケーションのオーディオ・システムに理想的な選択肢です。

PCM1822-Q1 は、-40°C~+125°Cで動作が規定されており、20 ピンの WQFN パッケージで供給されます。

製品情報

部品番号 ⁽¹⁾	パッケージ	本体サイズ (公称)
PCM1822-Q1	WQFN (20)	3.00mm × 3.00mm、0.5mm ピッチ

- (1) 利用可能なパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

Package	WQFN (RTE), 20-pin, 3.00 mm × 3.00 mm (0.5-mm pitch)					

6 Pin Configuration and Functions

图 6-1. RTW Package, 20-Pin WQFN With Exposed Thermal Pad, Top View

表 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	IN1P	Analog input	Analog input 1P pin.
2	IN1M	Analog input	Analog input 1M pin.
3	IN2P	Analog input	Analog input 2P pin.
4	IN2M	Analog input	Analog input 2M pin.
5	VSS	Analog Supply	Short this pin directly to the board ground plane.
6	SDOOUT	Digital output	Audio serial data interface bus output.
7	BCLK	Digital I/O	Audio serial data interface bus bit clock.
8	FSYNC	Digital I/O	Audio serial data interface bus frame synchronization signal.
9	IOVDD	Digital supply	Digital I/O power supply (1.8 V or 3.3 V, nominal).
10	VSS	Analog supply	Short this pin directly to the board ground plane.
11	MD1	Digital input	Device configuration mode select 1 pin.
12	MD0	Digital input	Device configuration mode select 0 pin.
13	MSZ	Digital input	Audio interface bus master or slave select pin.
14	DREG	Digital supply	Digital regulator output voltage for digital core supply (1.5 V, nominal).
15	VSS	Analog supply	Short this pin directly to the board ground plane.
16	AVDD	Analog supply	Analog power (3.3 V, nominal).
17	AREG	Analog supply	Analog on-chip regulator output voltage for analog supply (1.8 V, nominal).
18	VREF	Analog	Analog reference voltage filter output.
19	FMT0	Digital input	Audio interface format select pin referred to AVDD supply.
20	VSS	Analog supply	Short this pin directly to the board ground plane.
Thermal Pad (VSS)		Ground supply	Thermal pad shorted to internal device ground. Short thermal pad directly to board ground plane.

7 Specifications

7.1 Absolute Maximum Ratings

over the operating ambient temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage	AVDD to AVSS	-0.3	3.9	V
	AREG to AVSS	-0.3	2.0	
	IOVDD to VSS (thermal pad)	-0.3	3.9	
Ground voltage differences	AVSS to VSS (thermal pad)	-0.3	0.3	V
Analog input voltage	Analog input pins voltage to AVSS	-0.3	AVDD + 0.3	V
Digital input voltage	Digital input pins voltage to VSS (thermal pad)	-0.3	IOVDD + 0.3	V
Temperature	Operating ambient, T _A	-40	125	°C
	Junction, T _J	-40	150	
	Storage, T _{stg}	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
POWER					
AVDD, AREG ⁽¹⁾	Analog supply voltage AVDD to AVSS (AREG is generated using onchip regulator) - AVDD 3.3-V operation	3.0	3.3	3.6	V
IOVDD	IO supply voltage to VSS (thermal pad) - IOVDD 3.3-V operation	3.0	3.3	3.6	V
	IO supply voltage to VSS (thermal pad) - IOVDD 1.8-V operation	1.65	1.8	1.95	
INPUTS					
	Analog input pins and FMT0 voltage to VSS	0		AVDD	V
	Digital input pins voltage(except FMT0) to VSS (thermal pad)	0		IOVDD	V
TEMPERATURE					
T _A	Operating ambient temperature	-40		125	°C
OTHERS					
	Digital input pin used as MCLK input clock frequency			36.864	MHz
C _L	Digital output load capacitance		20	50	pF

- (1) AVSS and VSS (thermal pad): all ground pins must be tied together and must not differ in voltage by more than 0.2 V.

Thermal Information

THERMAL METRIC ⁽¹⁾		PCM1822-Q1	UNIT
		RTE (WQFN)	
		20 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	55.9	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	33.1	°C/W
R _{θJB}	Junction-to-board thermal resistance	23.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.6	°C/W

THERMAL METRIC ⁽¹⁾		PCM1822-Q1	UNIT
		RTE (WQFN)	
		20 PINS	
Ψ_{JB}	Junction-to-board characterization parameter	23.3	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	16.7	°C/W

(1) For more information about traditional and new thermal metrics, see the [spra953](#) application report.

7.4 Electrical Characteristics

at $T_A = 25^\circ\text{C}$, $AVDD = 3.3\text{ V}$, $IOVDD = 3.3\text{ V}$, $f_{IN} = 1\text{-kHz}$ sinusoidal signal, $f_S = 48\text{ kHz}$, 32-bit audio data, $BCLK = 256 \times f_S$, TDM slave mode (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	
ADC CONFIGURATION						
	AC input impedance	Input pins INxP or INxM		2.5	k Ω	
ADC PERFORMANCE FOR LINE, MICROPHONE INPUT RECORDING : AVDD 3.3-V OPERATION						
	Full-scale AC signal voltage Differential/Single Ended	AC-coupled input		1	V_{RMS}	
SNR	Signal-to-noise ratio, A-weighted ^{(1) (2)}	IN1 differential/single-ended input selected and AC signal shorted to ground, DRE enabled (DRE_LVL = -36 dB, DRE_MAXGAIN = 18 dB)		110	117	dB
		IN1 differential/single-ended input selected and AC signal shorted to ground, DRE disabled		105	111	
DR	Dynamic range, A-weighted ⁽²⁾	IN1 differential/single-ended input selected and -60-dB full-scale AC signal input, DRE enabled (DRE_LVL = -36 dB, DRE_MAXGAIN = 18 dB)		117		dB
		IN1 differential/single-ended input selected and -60-dB full-scale AC signal input, DRE disabled		111		
THD+N	Total harmonic distortion ^{(2) (3)}	IN1 differential/single-ended input selected and -1-dB full-scale AC signal input, DRE enabled (DRE_LVL = -36 dB, DRE_MAXGAIN = 18 dB)		-95	-80	dB
		IN1 differential/single-ended input selected and -1-dB full-scale AC signal input, DRE disabled		-95		
ADC OTHER PARAMETERS						
	Output data sample rate			7.35	192	kHz
	Output data sample word length				32	Bits

C_{IN}	Input capacitance for digital inputs	All digital pins			5		pF
R_{PD}	Pull-down resistance for digital I/O pins when asserted on				20		k Ω

TYPICAL SUPPLY CURRENT CONSUMPTION

I_{AVDD}		AVDD = 3.3 V, internal AREG		0.5	mA
I_{IOVDD}	Current consumption with all Clocks disabled	All external clocks stopped, IOVDD = 3.3 V		0.5	μA
I_{IOVDD}		All external clocks stopped, IOVDD = 1.8 V		0.3	
I_{AVDD}	Current consumption with ADC 2-channel operating at f_S 16-kHz, BCLK = $256 \times f_S$ and DRE disabled	AVDD = 3.3 V, internal AREG		11.9	mA
I_{IOVDD}		IOVDD = 3.3 V		0.05	
I_{IOVDD}		IOVDD = 1.8 V		0.02	
I_{AVDD}	Current consumption with ADC 2-channel operating at f_S 48-kHz, BCLK = $256 \times f_S$ and DRE disabled	AVDD = 3.3 V, internal AREG		12.9	mA
I_{IOVDD}		IOVDD = 3.3 V		0.1	
I_{IOVDD}		IOVDD = 1.8 V		0.05	
I_{AVDD}	Current consumption with ADC 2-channel operating at f_S 48-kHz, BCLK = $256 \times f_S$ and DRE enabled	AVDD = 3.3 V, internal AREG		14	mA
I_{IOVDD}		IOVDD = 3.3 V		0.1	
I_{IOVDD}		IOVDD = 1.8 V		0.05	

- Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the AC signal input shorted to ground, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
- All performance measurements done with a 20-kHz, low-pass filter and, where noted, an A-weighted filter. Failure to use such a filter may result in higher THD and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.
- For best distortion performance, use input AC-coupling capacitors with a low-voltage-coefficient.
- Gain drift = $\text{gain_variation}(\text{in temperature range}) / \text{typical gain value}(\text{gain at room temperature}) / \text{temperature range} \times 10^6$ measured with gain in linear scale.
- Phase drift = $\text{phase_deviation}(\text{in temperature range}) / (\text{temperature range})$.

7.5 Timing Requirements: TDM, I²S or LJ Interface

at $T_A = 25^\circ\text{C}$, IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see figure for timing diagram

		MIN	NOM	MAX	UNIT
$t_{(BCLK)}$	BCLK period	40			ns
$t_{H(BCLK)}$	BCLK high pulse duration ⁽¹⁾	25			ns
$t_{L(BCLK)}$	BCLK low pulse duration ⁽¹⁾	25			ns
$t_{SU(FSYNC)}$	FSYNC setup time	8			ns
$t_{HLD(FSYNC)}$	FSYNC hold time	8			ns
$t_{r(BCLK)}$	BCLK rise time	10% - 90% rise time ⁽²⁾		10	ns
$t_{f(BCLK)}$	BCLK fall time	90% - 10% fall time ⁽²⁾		10	ns

- The BCLK minimum high or low pulse duration must be higher than 25 ns (to meet the timing specifications), if the SDOOUT data line is latched on the opposite BCLK edge polarity than the edge used by the device to transmit SDOOUT data.

- (2) BCLK maximum rise and fall time can be relaxed to 13ns if BCLK frequency used in the system is below 20MHz. This can cause noise increase due to higher clock jitter.

7.6 Switching Characteristics: TDM, I²S or LJ Interface

at T_A = 25°C, IOVDD = 3.3 V or 1.8 V and 20-pF load on all outputs (unless otherwise noted); see figure for timing diagram

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
t _d (SDOUT-BCLK)	BCLK to SDOUT delay	50% of BCLK to 50% of SDOUT	3	18	ns
t _d (SDOUT-FSYNC)	FSYNC to SDOUT delay in TDM or LJ mode (for MSB data with TX_OFFSET = 0)	50% of FSYNC to 50% of SDOUT		18	ns
f _(BCLK)	BCLK output clock frequency: master mode (1)			24.576	MHz
t _H (BCLK)	BCLK high pulse duration: master mode		14		ns
t _L (BCLK)	BCLK low pulse duration: master mode		14		ns
t _d (FSYNC)	BCLK to FSYNC delay: master mode	50% of BCLK to 50% of FSYNC	3	18	ns
t _r (BCLK)	BCLK rise time: master mode	10% - 90% rise time		8	ns
t _f (BCLK)	BCLK fall time: master mode	90% - 10% fall time		8	ns

- (1) The BCLK output clock frequency must be lower than 18.5 MHz (to meet the timing specifications), if the SDOUT data line is latched on the opposite BCLK edge polarity than the edge used by the device to transmit SDOUT data.

7.7 Typical Characteristics

at $T_A = 25^\circ\text{C}$, $AVDD = 3.3\text{ V}$, $IOVDD = 3.3\text{ V}$, $f_{IN} = 1\text{-kHz}$ sinusoidal signal, $f_S = 48\text{ kHz}$, 32-bit audio data, $BCLK = 256 \times f_S$, TDM slave mode, PLL on, $DRE_LVL = -36\text{ dB}$, channel gain = 0 dB, and linear phase decimation filter (unless otherwise noted); all performance measurements are done with a 20-kHz, low-pass filter, and an A-weighted filter

8 Detailed Description

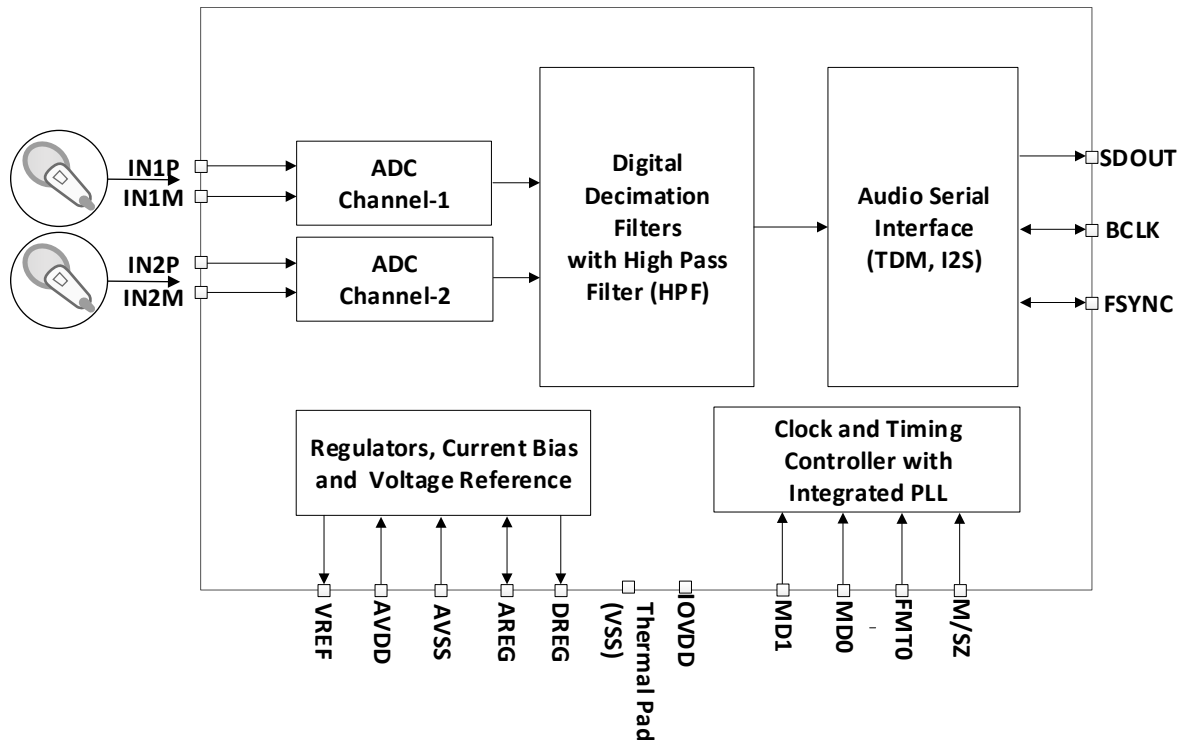

8.1 Overview

The PCM1822-Q1 is a high-performance, low-power, stereo-channel, audio analog-to-digital converter (ADC) with flexible audio interface control options. This device is intended for applications in automotive head units, display control unit, Active Noise Cancellation and Acoustic Echo Cancellation applications. The high dynamic range of the device enables far-field audio recording with high fidelity. This device integrates a host of features that reduces cost, board space, and power consumption in space-constrained applications. The device features are controlled through hardware by pulling pins high or low with resistors or a controller general-purpose input/output (GPIO). The PCM1822-Q1 also supports a power-down and reset function by means of halting the system clock.

The PCM1822-Q1 consists of the following blocks and features:

- Stereo-channel, multibit, high-performance delta-sigma ($\Delta\Sigma$) ADC
- Differential/Single-Ended audio inputs with a $1-V_{RMS}$ full-scale signal
- Hardware pin control operation to select the device features
- Audio bus serial interface master or slave select option
- Audio bus serial interface format select option
- Slave mode supports the audio bus serial interface up to 192 kHz sampling
- Slave mode supports a dynamic range enhancer (DRE) with 117-dB dynamic range for the PCM1822-Q1
- Slave mode supports decimation filters with linear-phase or low-latency filter selection
- Master mode operation supported using a system clock of $256 \times f_S$ or $512 \times f_S$
- Power-down function by means of halting the audio clocks
- Integrated high-pass filter (HPF) that removes the DC component of the input signal
- Integrated low-jitter phase-locked loop (PLL) supporting a wide range of system clocks
- Integrated digital and analog voltage regulators to support single-supply, 3.3-V operation

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Hardware Control

The device supports simple hardware-pin-controlled options to select a specific mode of operation and audio interface for a given system. The MSZ, MD0, MD1, and FMT0 pins allow the device to be controlled by either pullup or pulldown resistors.

8.3.2 Audio Serial Interfaces

Digital audio data flows between the host processor and the PCM1822-Q1 on the digital audio serial interface (ASI), or audio bus. This highly flexible ASI bus includes a TDM mode for multichannel operation, support for the I²S, and the pin-selectable master-slave configurability for bus clock lines.

The device supports an audio bus master or slave mode of operation using the hardware pin MSZ. In slave mode, FSYNC and BCLK work as input pins whereas in master mode, FSYNC and BCLK work as output pins generated by the device. 表 8-1 shows the master and slave mode selection using the MSZ pin.

表 8-1. Master and Slave Mode Selection

MSZ	MASTER AND SLAVE SELECTION
Low	Slave mode of operation
High	Master mode of operation

The bus protocol TDM or I²S format can be selected by using the FMT0 pin. As shown in 表 8-2, these modes are all most significant byte (MSB)-first, pulse code modulation (PCM) data format, with an output channel data word-length of 32 bits.

表 8-2. Audio Serial Interface Format

FMT0	AUDIO SERIAL INTERFACE FORMAT
Low	2-channel output with inter IC sound (I ² S) mode
High	2-channel output with time division multiplexing (TDM) mode

8.3.2.1 Time Division Multiplexed Audio (TDM) Interface

In TDM mode, also known as DSP mode, the rising edge of FSYNC starts the data transfer with the slot 0 data first. Immediately after the slot 0 data transmission, the remaining slot data are transmitted in order. FSYNC and each data bit (except the MSB of slot 0 when TX_OFFSET equals 0) is transmitted on the rising edge of BCLK. 图 8-1 to 图 8-4 illustrate the protocol timing for TDM operation with various configurations.

图 8-1. TDM Mode Protocol Timing (FMT0 = LOW) In Slave Mode

8-2. TDM Mode Protocol Timing (FMT0 = HIGH) In Slave Mode

8-3. TDM Mode Protocol Timing (FMT0 = LOW) In Master Mode

8-4. TDM Mode Protocol Timing (FMT0 = HIGH) In Master Mode

For proper operation of the audio bus in TDM mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels times the 32-bits word length of the output channel data. The device transmits a zero data value on SDOUT for the extra unused bit clock cycles. The device supports FSYNC as a pulse with a 1-cycle-wide bit clock, but also supports multiples as well.

8.3.2.2 Inter IC Sound (I²S) Interface

The standard I²S protocol is defined for only two channels: left and right. In I²S mode, the MSB of the left slot 0 is transmitted on the falling edge of BCLK in the second cycle after the *falling* edge of FSYNC. The MSB of the right slot 0 is transmitted on the falling edge of BCLK in the second cycle after the *rising* edge of FSYNC. Each subsequent data bit is transmitted on the falling edge of BCLK. In master mode, FSYNC is transmitted on the rising edge of BCLK. 8-5 and 8-6 show the protocol timing for I²S operation in slave and master mode of operation.

8-5. I²S Mode Protocol Timing in Slave Mode

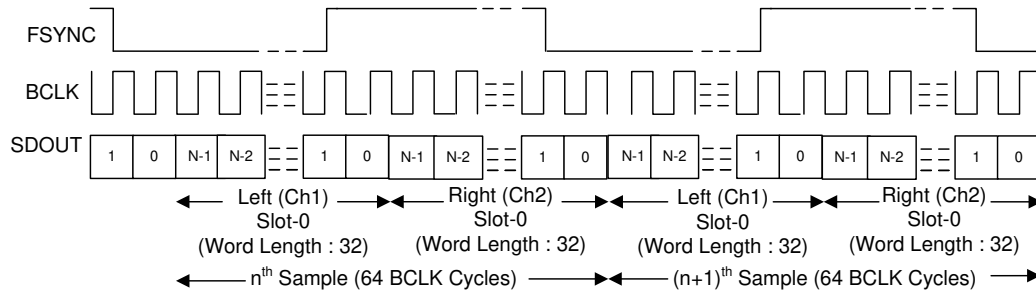

图 8-6. I²S Protocol Timing In Master Mode

For proper operation of the audio bus in I²S mode, the number of bit clocks per frame must be greater than or equal to the number of active output channels (including left and right slots) times the 32-bits word length of the output channel data. The device FSYNC low pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active left slots times the 32-bits data word length. Similarly, the FSYNC high pulse must be a number of BCLK cycles wide that is greater than or equal to the number of active right slots times the 32-bits data word length. The device transmit zero data value on SDOUT for the extra unused bit clock cycles.

8.3.3 Phase-Locked Loop (PLL) and Clock Generation

The device uses an integrated, low-jitter, phase-locked loop (PLL) to generate internal clocks required for the ADC modulator and digital filter engine, as well as other control blocks.

In slave mode of operation, the device supports the various output data sample rates (of the FSYNC signal frequency) and the BCLK to FSYNC ratio to configure all clock dividers, including the PLL configuration, internally without host programming. 表 8-3 and 表 8-4 list the supported FSYNC and BCLK frequencies.

表 8-3. Supported FSYNC (Multiples or Submultiples of 48 kHz) and BCLK Frequencies

BCLK TO FSYNC RATIO	BCLK (MHz)						
	FSYNC (8 kHz)	FSYNC (16 kHz)	FSYNC (24 kHz)	FSYNC (32 kHz)	FSYNC (48 kHz)	FSYNC (96 kHz)	FSYNC (192 kHz)
16	Reserved	0.256	0.384	0.512	0.768	1.536	3.072

384	2.8224	5.6448	8.4672	11.2896	16.9344	Reserved	Reserved
512	3.7632	7.5264	11.2896	15.0528	22.5792	Reserved	Reserved

In the master mode of operation, the device uses the MD1 pin (as the system clock, MCLK) as the reference input clock source with a supported system clock frequency option of either $256 \times f_s$ or $512 \times f_s$ as configured using the MD0 pin. Master mode supports f_s rates of 44.1 kHz and 48 kHz. 表 8-5 shows the system clock selection for the master mode using the MD0 pin.

表 8-5. System Clock Selection for the Master Mode

MD0	SYSTEM CLOCK SELECTION (Valid for Master Mode Only)
LOW	System clock with frequency $256 \times f_s$ connected to the MD1 pin as MCLK
HIGH	System clock with frequency $512 \times f_s$ connected to the MD1 pin as MCLK

See 表 8-7 and 表 8-20 for the MD0 and MD1 pin function in the slave mode of operation.

8.3.4 Input Channel Configurations

The device consists of two pairs of analog input pins (INxP and INxM) as differential inputs for the recording channel. The device supports simultaneous recording of up to two channels using the high-performance stereo ADC. The input source for the analog pins can be from electret condenser analog microphones, micro electrical-mechanical system (MEMS) analog microphones, or line-in (auxiliary) inputs from the system board.

The voice or audio signal inputs must be capacitively coupled (AC-coupled) to the device and, for best distortion performance, use the low-voltage coefficient capacitors for AC coupling. The typical input impedance for the PCM1822-Q1 is 2.5 k Ω for the INxP or INxM pins. The value of the coupling capacitor in AC-coupled mode must be chosen so that the high-pass filter formed by the coupling capacitor and the input impedance do not affect the signal content. Before proper recording can begin, this coupling capacitor must be charged up to the common-mode voltage at power-up. To enable quick charging, the device has a quick charge scheme to speed up the charging of the coupling capacitor at power-up. The default value of the quick-charge timing is set for a coupling capacitor up to 1 μ F.

8.3.5 Reference Voltage

All audio data converters require a DC reference voltage. The PCM1822-Q1 achieves low-noise performance by internally generating a low-noise reference voltage. This reference voltage is generated using a band-gap circuit with high PSRR performance. This audio converter reference voltage must be filtered externally using a minimum 1- μ F capacitor connected from the VREF pin to analog ground (AVSS). The value of this reference voltage, VREF, is set to 2.75 V, which in turn supports a $2 \times V_{RMS}$ differential full-scale input to the device. The required minimum AVDD voltage for this VREF voltage is 3 V. Do not connect any external load to a VREF pin.

8.3.6 Signal-Chain Processing

The PCM1822-Q1 signal chain is comprised of very-low-noise, high-performance, and low-power analog blocks and highly flexible and programmable digital processing blocks. The high performance and flexibility combined with a compact package makes the PCM1822-Q1 optimized for a variety of end-equipments and applications that require multichannel audio capture. 图 8-7 shows a conceptual block diagram for the PCM1822-Q1 that highlights the various building blocks used in the signal chain, and how the blocks interact in the signal chain. The PCM1822-Q1 does not support DRE.

图 8-7. Signal-Chain Processing Flowchart

The front-end dynamic range enhancer (DRE) gain amplifier in the PCM1822-Q1 is very low noise, with a 117-dB dynamic range performance. Along with a low-noise and low-distortion, multibit, delta-sigma ADC, the front-end DRE gain amplifier enables the PCM1822-Q1 to record a far-field audio signal with very high fidelity, both in quiet and loud environments. Moreover, the ADC architecture has inherent antialias filtering with a high rejection of out-of-band frequency noise around multiple modulator frequency components. Therefore, the device prevents noise from aliasing into the audio band during ADC sampling. Further on in the signal chain, an integrated, high-performance multistage digital decimation filter sharply cuts off any out-of-band frequency noise with high stop-band attenuation.

The device supports an input signal bandwidth up to 80 kHz, which allows the high-frequency non-audio signal to be recorded by using a 176.4-kHz (or higher) sample rate.

8.3.6.1 Digital High-Pass Filter

To remove the DC offset component and attenuate the undesired low-frequency noise content in the record data, the device supports a fixed high-pass filter (HPF) with -3-dB cut-off frequency of $0.00025 \times f_s$. The HPF is not a channel-independent filter but is globally applicable for all the ADC channels. This HPF is constructed using the first-order infinite impulse response (IIR) filter, and is efficient enough to filter out possible DC components of the signal. 表 8-6 shows the fixed -3-dB cutoff frequency value. 图 8-8 shows a frequency response plot for the HPF filter.

表 8-6. HPF Cutoff Frequency Value

-3-dB CUTOFF FREQUENCY VALUE	-3-dB CUTOFF FREQUENCY AT 16 kHz SAMPLE RATE	-3-dB CUTOFF FREQUENCY AT 48 kHz SAMPLE RATE
$0.00025 \times f_s$	4 Hz	12 Hz

图 8-8. HPF Filter Frequency Response Plot

8.3.6.2 Configurable Digital Decimation Filters

The device record channel includes a high dynamic range, built-in digital decimation filter to process the oversampled data from the multibit delta-sigma ($\Delta\Sigma$) modulator to generate digital data at the same Nyquist sampling rate as the FSYNC rate. The decimation filter can be chosen from two different types only in slave mode, depending on the required frequency response, group delay, and phase linearity requirements for the target application. The selection of the decimation filter option can be done by the MD0 pin. 表 8-7 shows the decimation filter mode selection for the record channel.

表 8-7. Decimation Filter Mode Selection for the Record Channel

MD0	DECIMATION FILTER MODE SELECTION (Supported Only in Slave Mode)
LOW	Linear phase filters are used for the decimation in slave mode. For master mode, the device always use linear phase filters for the decimation.
HIGH	Low latency filters are used for the decimation in slave mode. For master mode, the device always use linear phase filters for the decimation.

8.3.6.2.1 Linear Phase Filters

The linear phase decimation filters are the default filters set by the device and can be used for all applications that require a perfect linear phase with zero-phase deviation within the pass-band specification of the filter. The filter performance specifications and various plots for all supported output sampling rates are listed in this section.

8.3.6.2.1.1 Sampling Rate: 8 kHz or 7.35 kHz

图 8-9 and 图 8-10 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 8 kHz or 7.35 kHz. 表 8-8 lists the specifications for a decimation filter with an 8-kHz or 7.35-kHz sampling rate.

表 8-8. Linear Phase Decimation Filter Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	72.7			dB
	Frequency range is $4 \times f_s$ onwards	81.2			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		17.1		$1/f_s$

8.3.6.2.1.2 Sampling Rate: 16 kHz or 14.7 kHz

☒ 8-11 and ☒ 8-12 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. 表 8-9 lists the specifications for a decimation filter with an 16-kHz or 14.7-kHz sampling rate.

表 8-9. Linear Phase Decimation Filter Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.3			dB
	Frequency range is $4 \times f_s$ onwards	95.0			
Group delay or latency	Frequency range is 0 to $0.454 \times f_s$		15.7		$1/f_s$

8.3.6.2.1.3 Sampling Rate: 24 kHz or 22.05 kHz

☒ 8-13 and ☒ 8-14 respectively show the magnitude response and the pass-band ripple for a decimation filter with a sampling rate of 24 kHz or 22.05 kHz. 表 8-10 lists the specifications for a decimation filter with an 24-kHz or 22.05-kHz sampling rate.

表 8-10. Linear Phase Decimation Filter Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.454 \times f_s$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.58 \times f_s$ to $4 \times f_s$	73.0			dB
	Frequency range is $4 \times f_s$ onwards	96.4

Stop-band attenuation	Frequency range is $0.473 \times f_s$ to $4 \times f_s$	70.0			
	Frequency range is $4 \times f_s$ onwards	111.0			
Group delay or latency	Frequency range is 0 to $0.3 \times f_s$		11.9		$1/f_s$

8.3.6.2.2 Low-Latency Filters

For applications where low latency with minimal phase deviation (within the audio band) is critical, the low-latency decimation filters on the PCM1822-Q1 can be used. The device supports these filters with a group delay of approximately seven samples with an almost linear phase response within the $0.365 \times f_S$ frequency band. This section provides the filter performance specifications and various plots for all supported output sampling rates for the low-latency filters.

8.3.6.2.2.1 Sampling Rate: 16 kHz or 14.7 kHz

 8-23 shows the magnitude response and  8-24 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 16 kHz or 14.7 kHz. 表 8-15 lists the specifications for a decimation filter with a 16-kHz or 14.7-kHz sampling rate.

表 8-15. Low-Latency Decimation Filter Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.451 \times f_S$	-0.05		0.05	dB
Stop-band attenuation	Frequency range is $0.61 \times f_S$ onwards	87.3			dB
Group delay or latency	Frequency range is 0 to $0.363 \times f_S$		7.6		$1/f_S$
Group delay deviation	Frequency range is 0 to $0.363 \times f_S$	-0.022		0.022	$1/f_S$
Phase deviation	Frequency range is 0 to $0.363 \times f_S$	-0.21		0.25	Degrees

8.3.6.2.2.2 Sampling Rate: 24 kHz or 22.05 kHz

Figure 8-25 shows the magnitude response and Figure 8-26 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 24 kHz or 22.05 kHz. Table 8-16 lists the specifications for a decimation filter with a 24-kHz or 22.05-kHz sampling rate.

表 8-16. Low-Latency Decimation Filter Specifications

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Pass-band ripple	Frequency range is 0 to $0.459 \times f_s$	-0.01		0.01	dB
Stop-band attenuation	Frequency range is $0.6 \times f_s$ onwards	87.2			dB
Group delay or latency	Frequency range is 0 to $0.365 \times f_s$		7.5		$1/f_s$
Group delay deviation	Frequency range is 0 to $0.365 \times f_s$	-0.026		0.026	$1/f_s$
Phase deviation	Frequency range is 0 to $0.365 \times f_s$	-0.26		0.30	Degrees

8.3.6.2.2.3 Sampling Rate: 32 kHz or 29.4 kHz

Figure 8-27 shows the magnitude response and Figure 8-28 shows the pass-band ripple and phase deviation for a decimation filter with a sampling rate of 32 kHz or 29.4 kHz. Table 8-17 lists the specifications for a decimation filter with a 32-kHz or 29.4-kHz sampling rate.

表 8-17. Low-Latency Decimation Filter Specifications

8.3.7 Dynamic Range Enhancer (DRE)

The device integrates an ultra-low noise front-end DRE gain amplifier with 123-dB dynamic range performance with a low-noise, low-distortion, multibit delta-sigma ($\Delta\Sigma$) ADC with a 113-dB dynamic range. The dynamic range enhancer (DRE) is a digitally assisted algorithm to boost the overall channel performance. The DRE monitors the incoming signal amplitude and accordingly adjusts the internal DRE amplifier gain automatically. The DRE achieves a complete-channel dynamic range as high as 123 dB. At a system level, the DRE scheme enables far-field, high-fidelity recording of audio signals in very quiet environments and low-distortion recording in loud environments.

The DRE can be enabled only in slave mode by driving the MD1 pin high. 表 8-20 shows the DRE selection for the record channel.

表 8-20. DRE Selection for the Record Channel

MD1	DRE SELECTION (Supported Only in Slave Mode)
Low	The DRE is disabled in slave mode. For master mode, the DRE is always disabled.
High	The DRE is enabled with DRE_LVL = -36 dB and DRE_MAXGAIN = 18 dB in slave mode. For master mode, the DRE is always disabled.

This algorithm is implemented with very low latency and all signal chain blocks are designed to minimize any audible artifacts that may occur resulting from dynamic gain modulation. The target signal threshold level (DRE_LVL), at which the DRE is triggered, is fixed to the -36-dB input signal level. The DRE gain range can be dynamically modulated by using DRE_MAXGAIN, which is fixed to 18 dB to maximize the benefit of the DRE in real-world applications and to minimize any audible artifacts.

Enabling the DRE for processing increases the power consumption of the device because of increased signal processing. Therefore, disable the DRE for low-power critical applications. Furthermore, the DRE is not supported for output sample rates greater than 48 kHz.

8.4 Device Functional Modes

8.4.1 Active Mode

The device wakes up in active mode when AVDD and IOVDD are available. Configure all hardware control pins (MSZ, MD0, MD1, and FMT0) for the device desired mode of operation before enabling clocks for the device.

In active mode, when the audio clocks are available, the device automatically powers up all ADC channels and starts transmitting data over the audio serial interface. If the clocks are stopped, then the device auto powers down the ADC channels.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The PCM1822-Q1 is a multichannel, high-performance audio analog-to-digital converter (ADC) that supports output sample rates of up to 192 kHz. The device supports up to two analog microphones for simultaneous recording applications.

The PCM1822-Q1 configuration is supported using various hardware pin control options. The device supports a highly flexible, audio serial interface (TDM and I²S) to transmit audio data seamlessly in the system across devices.

9.2 Typical Application

Figure 9-1 shows a typical configuration of the PCM1822-Q1 for an application using stereo analog microelectrical-mechanical system (MEMS) microphones for simultaneous recording operation with a time-division multiplexing (TDM) audio data slave interface. For best distortion performance, use input AC-coupling capacitors with a low-voltage coefficient.

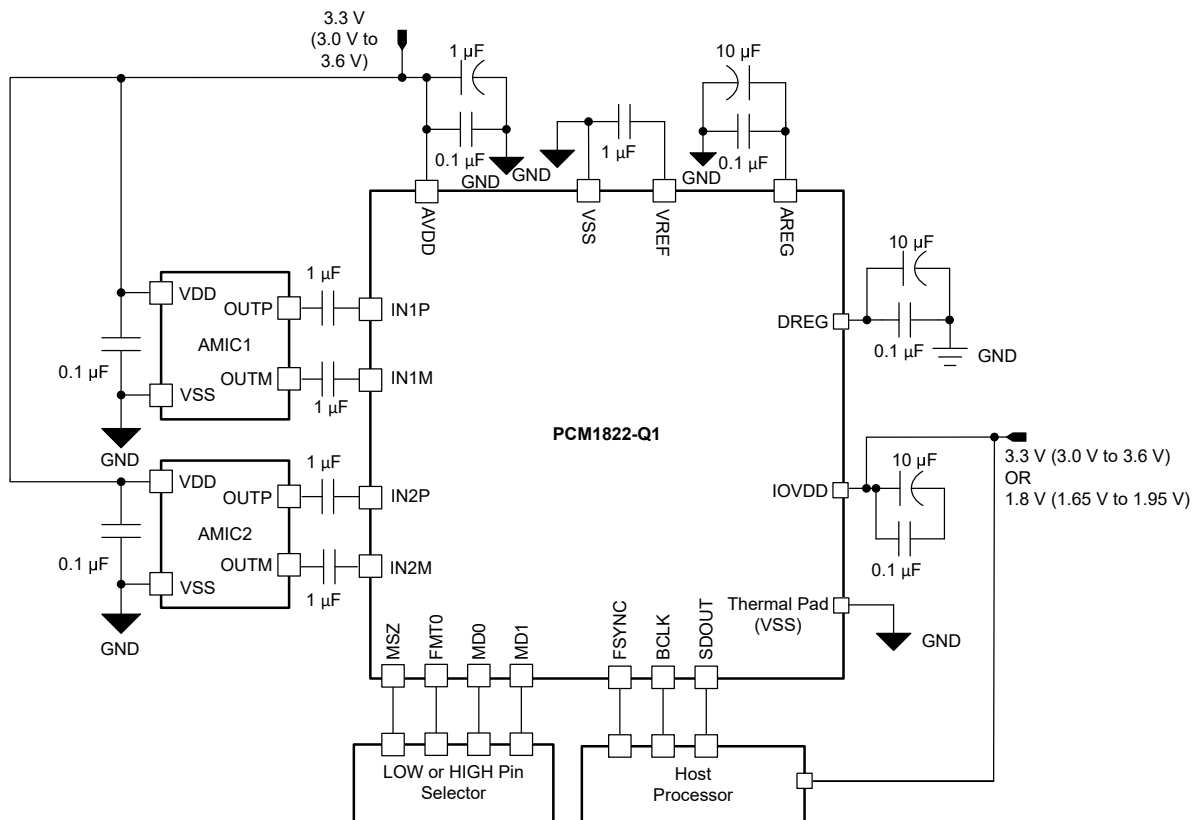

Figure 9-1. Two-Channel Analog Microphone Recording Diagram for 3.3-V AVDD Operation

9.2.1 Design Requirements

表 9-1 lists the design parameters for this application.

表 9-1. Design Parameters

KEY PARAMETER	SPECIFICATION: 3.3-V AVDD OPERATION
AVDD	3.3 V
AVDD supply current consumption	12.9 mA (two-channel recording, $f_s = 48$ kHz)
IOVDD	1.8 V or 3.3 V

9.2.2 Detailed Design Procedure

This section describes the necessary steps to configure the PCM1822-Q1 for this specific application. The following steps provide a sequence of steps that must be executed in the time between powering the device up and reading data from the device or transitioning from one mode to another mode of operation.

1. Apply power to the device:
 - a. Power-up the IOVDD and AVDD power supplies
 - b. The device now goes into low-power mode
2. Configure the pins for correct configuration:
 - a. Connect the MSZ, FMT0, MD0, and MD1 pin voltages for the desired configuration
 - b. Apply FSYNC and BCLK with the desired output sample rates and the BCLK to FSYNC ratio
 See the [Phase-Locked Loop \(PLL\) and Clock Generation](#) section for supported sample rates and the BCLK to FSYNC ratio
 - c. The device recording data are now sent to the host processor via the audio serial data bus
3. Stop the clocks to stop recording of data at any time

9.2.3 Application Curves

Measurements are done on the EVM by feeding the device analog input signal using audio precision and with a 3.3-V AVDD supply.

10 Power Supply Recommendations

The power-supply sequence between the IOVDD and AVDD rails can be applied in any order. However, do not provide any clocks until the IOVDD and AVDD supply voltage settles to a stable and supported operating voltage range. Provide the clocks (FSYNC and BCLK) only when all hardware control pins (MSZ, MD0, MD1, FMT0, and FMT1) are driven to the voltage level for the device desired mode of operation.

For the supply power-up requirement, t_1 and t_2 must be at least 100 μ s. For the supply power-down requirement, t_3 and t_4 must be at least 10 ms. This timing (as shown in [Figure 10-1](#)) allows the device to ramp down the volume on the record data, power down the analog and digital blocks, and put the device into hardware shutdown mode.

Figure 10-1. Power-Supply Sequencing Requirement Timing Diagram

Make sure that the supply ramp rate is slower than 1 V/ μ s and that the wait time between a power-down and a power-up event is at least 100 ms.

11 Layout

11.1 Layout Guidelines

Each system design and printed circuit board (PCB) layout is unique. The layout must be carefully reviewed in the context of a specific PCB design. However, the following guidelines can optimize the device performance:

- Connect the thermal pad to ground. Use a via pattern to connect the device thermal pad, which is the area directly under the device, to the ground planes. This connection helps dissipate heat from the device.
- The decoupling capacitors for the power supplies must be placed close to the device pins.
- Route the analog differential audio signals differentially on the PCB for better noise immunity. Avoid crossing digital and analog signals to prevent undesirable crosstalk.
- The device internal voltage references must be filtered using external capacitors. Place the filter capacitors near the VREF pin for optimal performance.
- Directly short the VREF external capacitor ground terminal to the AVSS pin without using any vias for this connection trace.
- Use ground planes to provide the lowest impedance for power and signal current between the device and the decoupling capacitors. Treat the area directly under the device as a central ground area for the device, and all device grounds must be connected directly to that area.

12.3 Trademarks

Burr-Brown™ and TI E2E™ are trademarks of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

RTE0020A

PACKAGE OUTLINE
WQFN - 0.8 mm max height

PLASTIC QUAD FLATPACK- NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

WQFN - 0.8 mm max height

RTE0020A

PLASTIC QUAD FLATPACK- NO LEAD

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
PCM1822QRTERQ1	ACTIVE	WQFN	RTE	20	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	1822Q	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
