SN65HVS883 24V、8チャネル・デジタル入力シリアライザ

1 特長

- 8つのセンサ入力
  - 最大34Vの高い入力電圧
  - 0ms～3msのデバウンス・フィルタを選択可能
  - 0.2mA～5.2mAまで可変の電流制限
  - フィールド入力および電源ラインに対する15kV HBMまでの保護
- 外部のステータスLED用の出力ドライバ
- カスケード接続により、入力を8個単位で増やすことが可能
- SPI互換のインターフェイス
- 外部デジタル・アイソレータへの、レギュレートされた5V出力
- 低電源電圧インジケータ

2 アプリケーション

- 産業自動化およびプロセス制御用のセンサ入力
  - IEC61131-2タイプ1、2、3スイッチ
  - EN60947-5-2近接スイッチ
- PCおよびPLCシステム用の、チャネル数の多いデジタル入力モジュール
- 非集中化I/Oモジュール

3 概要

SN65HVS883は24V、8チャネルのデジタル入力シリアライザで、産業自動化において、PCおよびPLCベースのシステム用の、チャネル密度の高いデジタル入力モジュールとして使用されます。ガルバニー絶縁体と組み合わせることで、デバイスはフィールド側の24Vセンサ出力と、制御側の低電圧コントローラ入力との間で、完全なインターフェイスになります。

EN60947-5-2準拠の2線および3線の近接スイッチから供給される入力信号は、電流制限されてから、内部のデバウンス・フィルタにより検証されます。入力のスイッチング特性は、IEC61131-2のタイプ1、2、3センサ・スイッチに準拠しています。

負荷およびクロック信号を印加すると、入力データが並列にラッチされてシフト・レジスタに送られ、後段のアイソレータによりクロックに合わせて直列に、シリアルPLC入力へ送られます。

前段のデバイスのシリアル出力を後段のデバイスのシリアル入力へ接続することによって、複数のSN65HVS883をカスケード接続すると、チャネル数の多い入力モジュールの設計が可能になります。入力の状態は、3mAの定電流LED出力により示されます。内部の基準電流を設定するため、高精度の外付け抵抗が必要です。内蔵の電圧レギュレータにより、低消費電力アイソレータへ5Vの電源が供給されます。内部の電源電圧モニタにより、チップOK (CHOK)信号が出力されます。

SN65HVS883は28ピンのPWP PowerPAD™パッケージで供給され、効率的な放熱が可能です。このデバイスは、-40℃～85℃の温度範囲で動作が規定されています。

PIN		DESCRIPTION
PIN NO.	NAME	
1, 2	DB0, DB1	Debounce select inputs
3, 5, 7, 9, 11, 18, 20, 22	IPx	Input channel x
4, 6, 8, 10, 12, 17, 19, 21	REx	Return path x (LED drive)
13	RLIM	Current limiting resistor
14	V24	24 VDC field supply
15	5VOP	5 V output to supply low-power isolators
16	CHOK	Chip okay indicator output
23	SOP	Serial data output
24	$\overline{CE}$	Clock enable input
25	CLK	Serial clock input
26	$\overline{LD}$	Load pulse input
27	SIP	Serial data input
28	FGND	Field ground

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V24	Field power input	V24	–0.3	36	V
V_{IPx}	Field digital inputs	IPx	–0.3	36	V
V_{ID}	Voltage at any logic input	DB0, DB1, CLK, SIP, $\overline{CE}$, $\overline{LD}$	–0.5	6	V
I_O	Output current	CHOK, SOP		±8	mA
P_{TOT}	Continuous total power dissipation		See *Thermal Information* table		
T_J	Junction temperature			170	°C

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 (1)	All pins	±4000	V
			IPx,V24	±15000	
		Charged-device model (CDM), per JEDEC specification JESD22-C101 (2)	All pins	±1000	
		Machine Mode (3)	All pins	±100	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
(3) JEDEC Standard 22, Method A115-A.

6.3 Recommended Operating Conditions

		MIN	TYP	MAX	UNIT
V_{24}	Field supply voltage	10	24	34	V
V_{IPL}	Field input low-state input voltage (1)	0		4	V
V_{IPH}	Field input high-state input voltage (1)	10		34	V
V_{IL}	Logic low-state input voltage	0		0.8	V
V_{IH}	Logic high-state input voltage	2		5.5	V
R_{LIM}	Current limiter resistor	17	25	500	kΩ
f_{IP}	Input data rate (2)	0		1	Mbps
T_J				150	°C
T_A		–40		85	°C

(1) Field input voltages correspond to an input resistor of R_{IN} = 1.2 kΩ
(2) Maximum data rate corresponds to 0 ms debounce time, (DB0 = open, DB1 = FGND), and R_{IN} = 0 Ω

6.4 Thermal Information

THERMAL METRIC (1)			SN65HVS883 PWP (HTSSOP) 28 PINS	UNIT

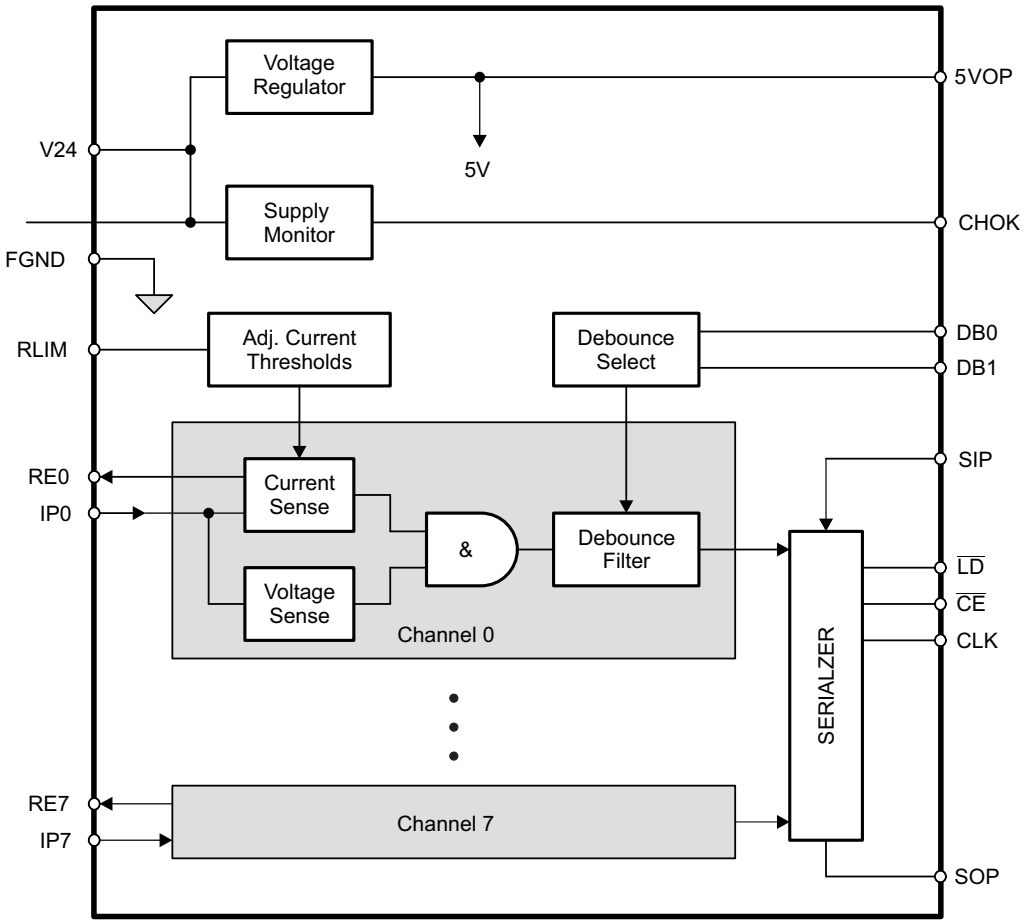
8 Detailed Description

8.1 Overview

The SN65HVS883 is an 8 channel, digital input serializer which operates from a 24 V supply and accepts digital inputs of up to 34 V on the 8 channels (IP0-IP7). The device provides a serially shifted digital output with reduced voltage ranges of 0-5 V for applications in industrial and building automation systems. The SN65HVS883 meets JEDEC standards for ESD protection (refer to *ESD Ratings*), and is SPI compatible for interfacing with standard microcontrollers. The serializer operates in 2 fundamental modes: Load Mode and Shift mode. In Load mode, information from the field inputs is allowed to latch into the shift register. In Shift mode, the information stored in the parallel shift register can be serially shifted to the serial output (SOP). A detailed description of the functional modes is available in the *Device Functional Modes* section.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Digital Inputs

Each digital input operates as a controlled current sink limiting the input current to a maximum value of I_{LIM}. The current limit is derived from the reference current via $I_{LIM} = n \times I_{REF}$, and I_{REF} is determined by $I_{REF} = V_{REF}/R_{LIM}$. Thus, changing the current limit requires the change of R_{LIM} to a different value via: $R_{LIM} = n \times V_{REF}/I_{LIM}$.

Inserting the actual values for n and V_{REF} gives: $R_{LIM} = 90\ V / I_{LIM}$.

While the device is specified for a current limit of **3.6 mA**, (via R_{LIM} = 25 kΩ), it is easy to lower the current limit to further reduce the power consumption. For example, for a current limit of **2.5 mA** simply calculate:

$$R_{LIM} = \frac{90\ V}{I_{LIM}} = \frac{90\ V}{2.5\ mA} = 36\ k\Omega \quad (1)$$

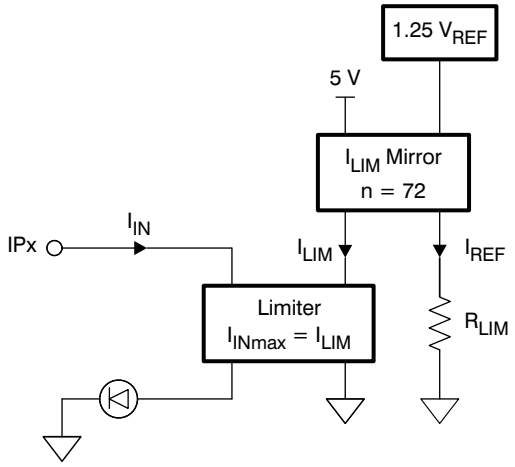


Figure 13. Digital Input Stage

8.3.2 Debounce Filter

The HVS883 applies a simple analog/digital filtering technique to remove unintended signal transitions due to contact bounce or other mechanical effects. Any new input (either low or high) must be present for the duration of the selected debounce time to be latched into the shift register as a valid state.

The logic signal levels at the control inputs, DB0 and DB1 of the internal Debounce-Select logic determine the different debounce times listed in the following truth table.

Table 1. Debounce Times

DB1	DB0	FUNCTION
Open	Open	3 ms delay
Open	FGND	1 ms delay
FGND	Open	0 ms delay (Filter bypassed)
FGND	FGND	Reserved

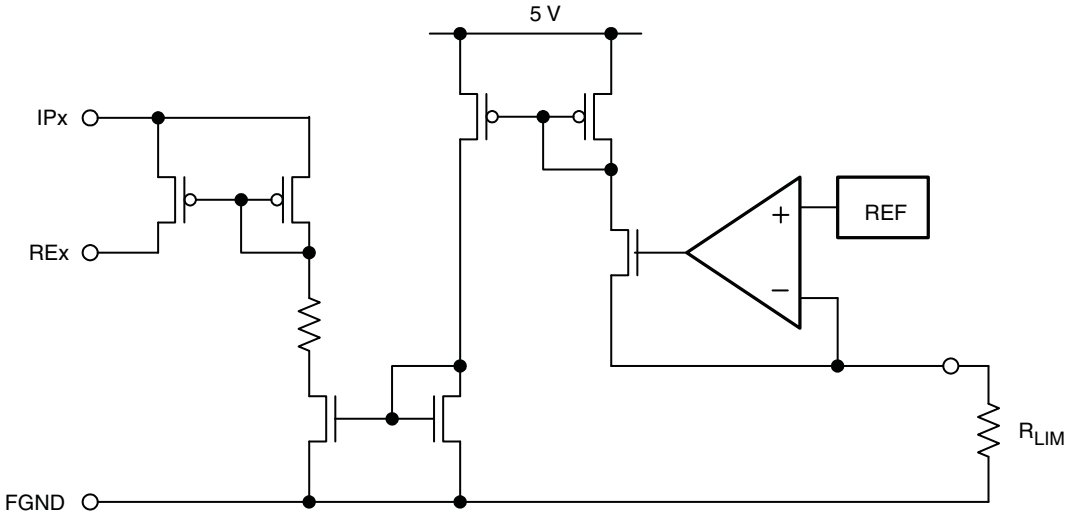

Figure 14. Equivalent Input Diagram

8.3.3 Shift Register

The conversion from parallel input to serial output data is performed by an eight-channel, parallel-in serial-out shift register. Parallel-in access is provided by the internal inputs, PIP0–PIP7, that are enabled by a low level at the load input ($\overline{LD}$). When clocked, the latched input data shift towards the serial output (SOP). The shift register also provides a clock-enable function.

Clocking is accomplished by a low-to-high transition of the clock (CLK) input while $\overline{LD}$ is held high and the clock enable ($\overline{CE}$) input is held low for all registers in the shift register except the last register which is latched by a high-to-low transition. Parallel loading is inhibited when LD is held high. The parallel inputs to the register are enabled while $\overline{LD}$ is low independently of the levels of the CLK, $\overline{CE}$, or serial (SIP) inputs.

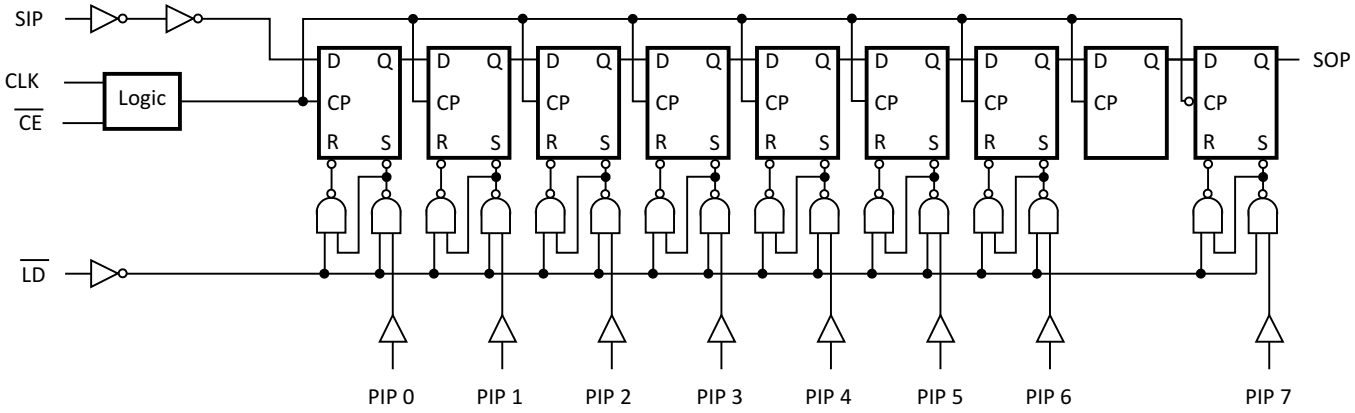

Figure 15. Shift Register Logic Structure

Table 2. Function Table

INPUTS			FUNCTION
$\overline{LD}$	CLK	$\overline{CE}$	
L	X	X	Parallel load
H	X	H	No change
H	↑	L	Shift(1)
H	↓	L	Shift(2)

(1) Shift = content of each internal register, except the last register, shifts towards serial output.
(2) Shift = content of the last register shifts towards serial output.

8.3.4 Voltage Regulator

The on-chip linear voltage regulator provides a 5 V supply to the internal- and external circuitry, such as digital isolators, with an output drive capability of 50 mA and a typical current limit of 115 mA. The regulator accepts input voltages from 34 V down to 10 V. Because the regulator output is intended to supply external digital isolator circuits proper output voltage decoupling is required. For best results connect a 1 μF and a 0.1 μF ceramic capacitor as close as possible to the 5VOP-output. For longer traces between the SN65HVS883 and isolators of the ISO72xx family use additional 0.1 μF and 10 pF capacitors next to the isolator supply pins. Make sure, however, that the total load capacitance does not exceed 4.7 μF.

For good stability the voltage regulator requires a minimum load current, $I_{L\text{-}MIN}$. Ensure that under any operating condition the ratio of the minimum load current in mA to the total load capacitance in μF is larger than 1:

$$\frac{I_{L\text{-}MIN}}{C_L} > \frac{1\ mA}{1\ \mu F} \quad (2)$$

8.3.5 Supply Voltage Monitor

The integrated supply voltage monitor senses the supply voltage of the SN65HVS883 at the V24-pin. If this voltage drops below 15 V but stays within the regulator's operating range, i.e., 15 V > V24 > 10 V, the output CHOK goes low 1 ms later. When the supply voltage returns to 24 V, the CHOK output turns logic high after 6 ms. Should the supply voltage drop below 10 V, the device ceases operation. Upon the supply returning to above 18 V, the CHOK output turns high again after 6 ms.

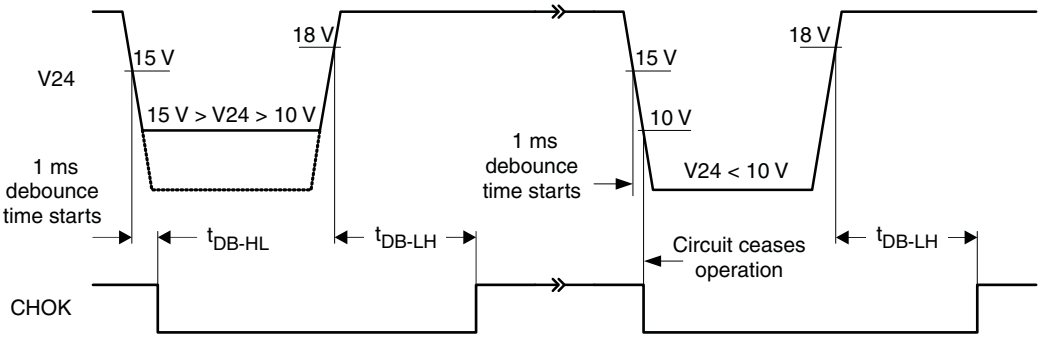

Figure 16. CHOK Output Timing as a Function of Supply Voltage Drop at V24

8.4 Device Functional Modes

The 2 functional modes of operation are Load mode and Shift mode.

Load mode enables information from the field inputs to latch into the shift register. To enter load mode, the $\overline{LD}$ pin must be held low, and the device remains in load mode regardless of the CLK, $\overline{CE}$, or serial (SIP) input levels. A high level at the $\overline{LD}$ pin switches the device into Shift mode.

When the device is in Shift mode, a low level at the $\overline{CE}$ pin causes the data stored in all registers of the parallel shift register except for the last register, to be serially shifted toward the serial output (SOP) on the rising edge of CLK. The final register in the shift register will be shifted toward the serial output (SOP) on the falling edge of CLK. A high level at the $\overline{CE}$ pin inhibits the serial shifting, which is demonstrated in Figure 21. After 8 consecutive CLK cycles, the serial output (SOP) remains at the level of the serial input (SIP) which is internally pulled to logic high. A logic high at the $\overline{CE}$ pin is required to signify the end of the serial data output. For of a daisy chained configuration, the serial output (SOP) of the SN65HVS883 can be connected to the serial input (SIP) of a following device, and additional clock cycles are required to shift the additional data out of the chain. The number of consecutive clock cycles will equal 8 times the number of devices in the chain. See Figure 22 for an example of a cascaded chain of 4x SN65HVS883.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

9.1.1 System-Level EMC

The SN65HVS883 must operate reliably in harsh industrial environments. At a system level, the device is tested according to several international electromagnetic compatibility (EMC) standards.

In addition to the device internal ESD structures, external protection circuitry, such as the one in Figure 17, can be used to absorb as much energy from burst- and surge-transients as possible.

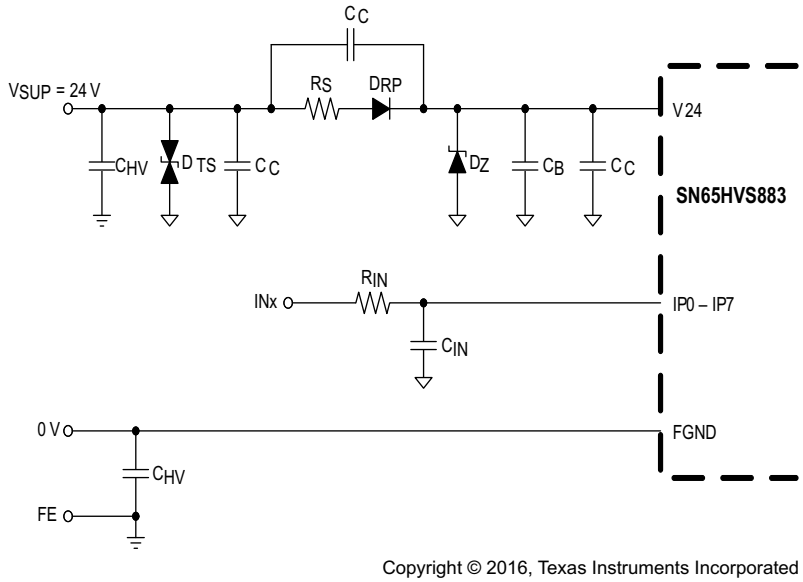

Figure 17. Typical EMC Protection Circuitry for Supply and Signal Inputs

Table 3. Components

DESIGNATOR	DESCRIPTION
D_{TS}	39 V Transient Voltage Suppressor: SM15T39CA
D_{RP}	Super Rectifier: BYM10-1000, or General Purpose rectifier: 1N4007
D_Z	33 V – 36 V fast Zener Diode, Z2SMB36
R_S	56 Ω, 1/3 W MELF Resistor
R_{IN}	1.2 kΩ, 1/4 W MELF Resistor
C_{IN}	22 nF, 60 V Ceramic Capacitor
C_{HV}	4.7 nF, 2 kV Ceramic Capacitor
C_C	n x 220 nF, 60 V Ceramic Capacitors
C_B	1 µF - 10 µF, 60 V Ceramic Capacitor

9.1.2 Input Channel Switching Characteristics

The input stage of the SN65HVS883 is so designed, that for an input resistor R_{IN} = 1.2 kΩ the trip point for signalling an ON-condition is at 9.4 V at 3.6 mA. This trip point satisfies the switching requirements of IEC61131-2 Type 1 and Type 3 switches.

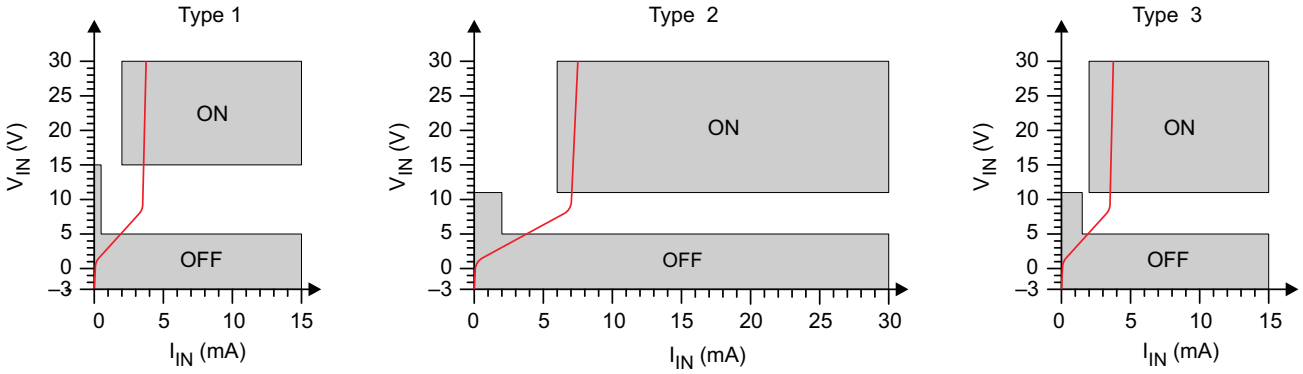

Figure 18. Switching Characteristics for IEC61131-2 Type 1, 2, and 3 Proximity Switches

For a Type 2 switch application, two inputs are connected in parallel. The current limiters then add to a total maximum current of 7.2 mA. While the return-path (RE-pin), of one input might be used to drive an indicator LED, the RE-pin of the other input channel should be connected to ground (FGND).

Paralleling input channels reduces the number of available input channels from an octal Type 1 or Type 3 input to a quad Type 2 input device. Note, that in this configuration output data of an input channel is represented by two shift register bits.

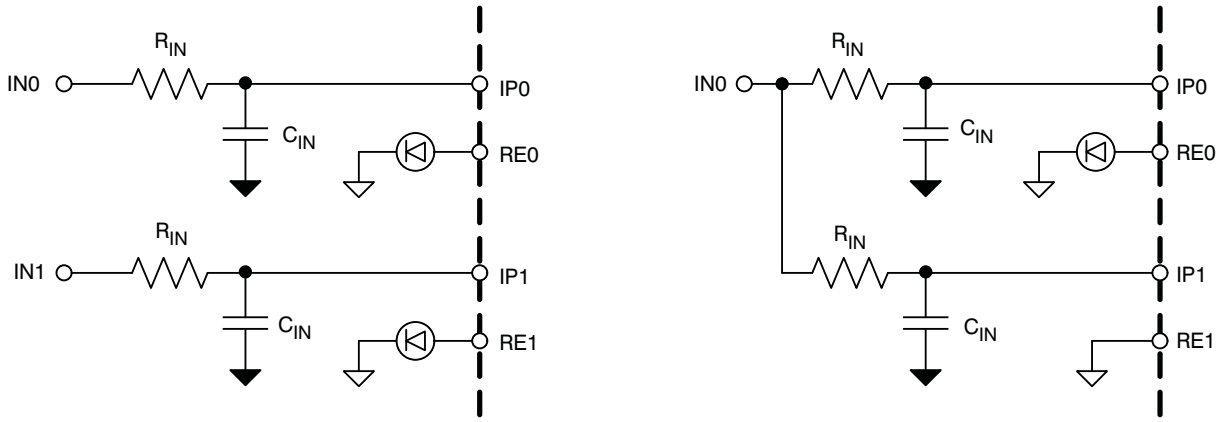

Figure 19. Paralleling Two Type 1 or Type 3 Inputs Into One Type 2 Input

9.1.3 Digital Interface Timing

The digital interface of the SN65HVS883 is SPI compatible and interfaces, isolated or non-isolated, to a wide variety of standard micro controllers.

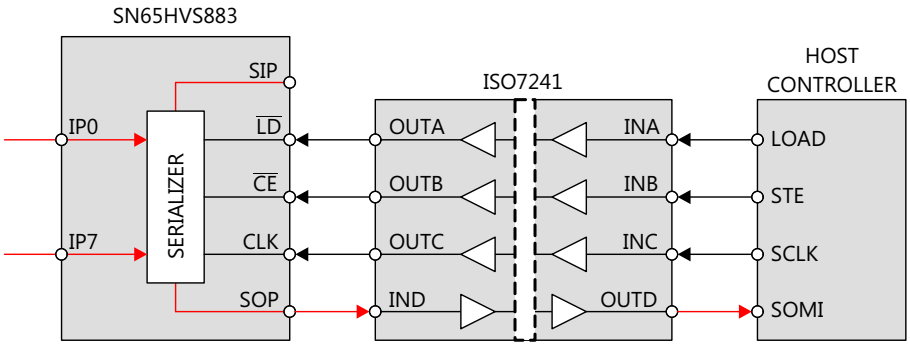

Figure 20. Simple Isolation of the Shift Register Interface

Upon a low-level at the load input, $\overline{LD}$, the information of the field inputs, IP0 to IP7 is latched into the shift register. Taking $\overline{LD}$ high again blocks the parallel inputs of the shift register from the field inputs. A low-level at the clock-enable input, $\overline{CE}$, enables the clock signal, CLK, to serially shift the data to the serial output, SOP. Data is clocked into the shift register at the rising edge of CLK and out of the shift register on the falling edge of CLK. Thus after eight consecutive clock cycles all field input data have been clocked out of the shift register and the information of the serial input, SIP, appears at the serial output, SOP.

The $\overline{CE}$ signal should only be transitioned low while the CLK signal is low which ensures that a rising edge of CLK occurs before a falling edge of CLK. This shifts the data into and through the shift register up until the final register before the first bit that was loaded into the final register is shifted out the serial output, SOP. If a falling edge of CLK is seen first following the transition of $\overline{CE}$ to low, the final register outputs the first bit, IP0, on the serial output, SOP, before shifting the rest of the bits through the shift register. The previous value of the second to last register prior to the $\overline{LD}$ event will then be shifted into the final register on the next rising CLK edge and output on the serial output, SOP, before the next valid bit, IP1, is output on the serial output, SOP. This appears as an erroneous bit in the serial data. Also, depending on how many falling CLK edges were seen before the $\overline{CE}$ signal is transitioned back high, the final bit, IP7, may not get shifted out of the shift register.

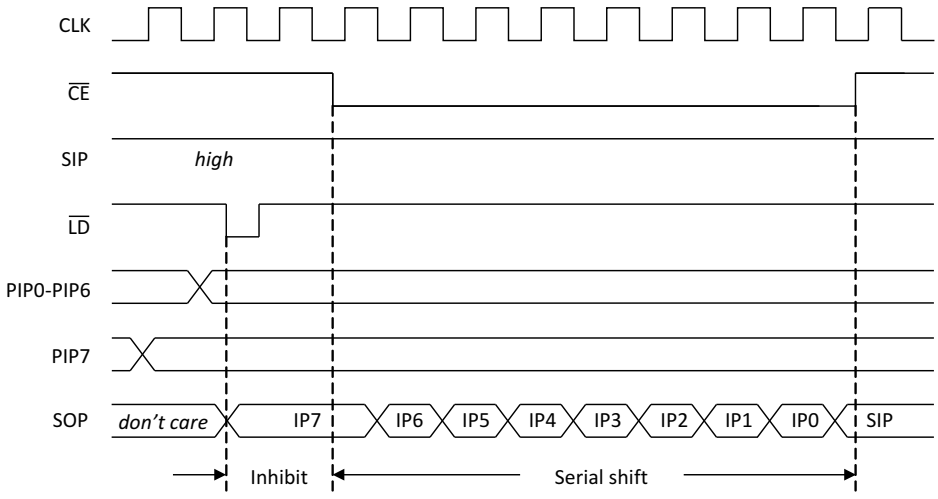

Figure 21. Interface Timing for Parallel-Load and Serial-Shift Operation of the Shift Register

9.1.4 Cascading for High Channel Count Input Modules

Designing high-channel count modules require cascading multiple SN65HVS883 devices. Simply connect the serial output (SOP) of a leading device with the serial input (SIP) of a following device without changing the processor interface.

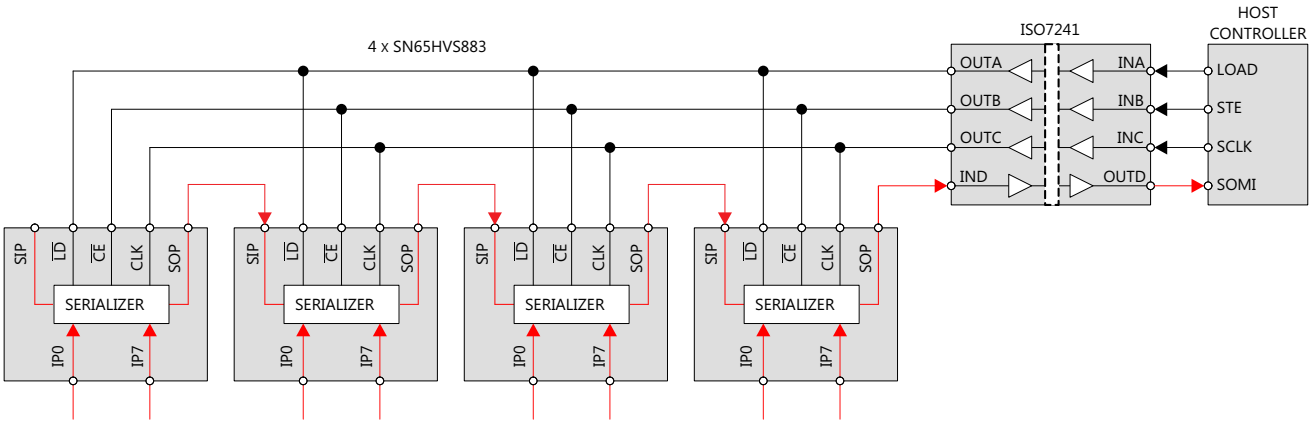

Figure 22. Cascading Four SN65HVS883 for a 32-Channel Input Module

NOTE

When daisy-chaining multiple devices, the maximum operating rate (CLK pulse width) may need to be restricted in order to maintain minimum set-up/hold timing relationships between the serial data (SIP/SOP) and the CLK line.

9.2 Typical Application

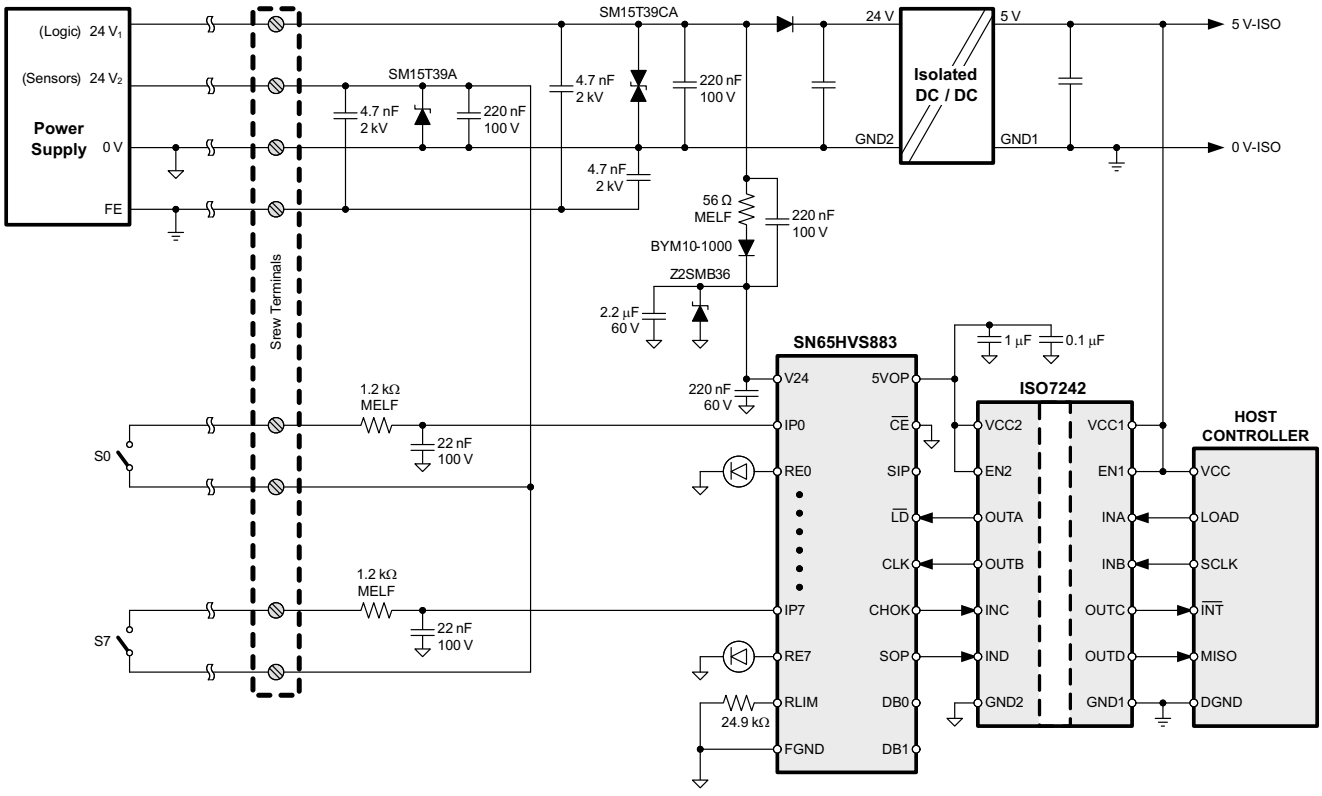

Figure 23. Typical Digital Input Module Application

Typical Application (continued)

9.2.1 Design Requirements

The simplified schematic in Figure 23 demonstrates a typical application of the SN65HVS883 for sensing the state of digital switches with 24-V high logic levels. In this application, a 5-V host controller must receive the state of 8 switches as a serial input, while remaining isolated from the high voltage power supply.

9.2.2 Detailed Design Procedure

9.2.2.1 Input Stage

Selection of the current limiting resistor R_{LIM} sets the input current limit I_{LIM} for the device. *Digital Inputs* includes necessary equations for choosing the limiting resistor.

The On/Off voltage thresholds at the device pin $V_{TH(IP+)}$ and $V_{TH(IP-)}$ are fixed to 5.2 V and 4.3 V respectively, however the On/Off voltage thresholds of the field input $V_{TH(IN+)}$ and $V_{TH(IN-)}$ are determined by the value of the series resistor RIN placed between the field input and the device. The threshold voltage $V_{TH(IN+)}$ is determined with the following equation:

$$V_{TH(IN+)} = I_{IN} \times R_{IN} + V_{TH(IP+)} \quad (3)$$

Substituting Equation 1 and solving for R_{IN} produces an equation for R_{IN} given a desired on-threshold.

$$R_{IN} = \frac{(V_{TH(IN+)} - 5.2V) \times R_{LIM}}{90V} \quad (4)$$

The following equation can be used to calculate the off-threshold voltage given a value for R_{IN}

$$V_{TH(IN-)} = \frac{90V \times R_{IN}}{R_{LIM}} + V_{TH(IP-)} \quad (5)$$

Figure 24 contains an example input characteristic:

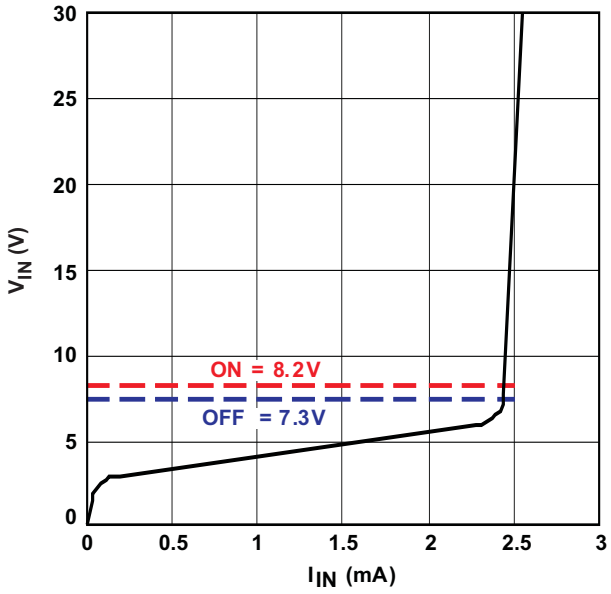

Figure 24. SN65HVS883 Example Input Characteristic

Typical Application (continued)

9.2.2.2 Setting Debounce Time

The logic signals at the DB0 and DB1 pins determine the denounce times for the device according to the table in section 6.5. The DB0 and DB1 pins are internally pulled high. Connecting the pins to GND in different configurations allows for selection of 0, 1, or 3 ms debounce times. In noisy environments, it is recommended that unused DB pins should be connected externally to a 5 V supply.

9.2.2.3 Example: High-Voltage Sensing Application

For the high-voltage sensing application in Figure 23, inputs from each switch (S0-S7) are connected to the 8 parallel inputs (IP0-IP7) of the SN65HVS883 through 1.2 kΩ MELF resistors. Small capacitors (22 nF) are tied to ground at each input to provide noise protection for the signals. A resistor is added between the R_{LIM} pin and GND to provide a device current limit according to the equation $I_{LIM} = 90\ V / R_{LIM}$. In this example, with a 24.9 kΩ resistor, the current limit for the device is set to 3.6 mA. LEDs are placed between pins RE0-RE7 to allow for external status observation of the parallel inputs. Finally the SN65HVS883 is connected through a digital isolation device to the host controller to provide galvanic isolation to the external interfaces and to allow for communication between the 5 V SN65HVS883 logic and the 5-V host controller. The host controller manages mode switching and clocking of the SN65HVS883 through the digital isolation device.

9.2.3 Application Curve

The application traces acquired in Figure 25 demonstrates the typical behavior of the SN65HVD883 when in shift mode (Load Pulse Input pulled high and Clock Enable Input pulled low). Channel 1 shows the SIP input, Channel 2 shows the CLK input, and Channel 3 shows the SOP output.

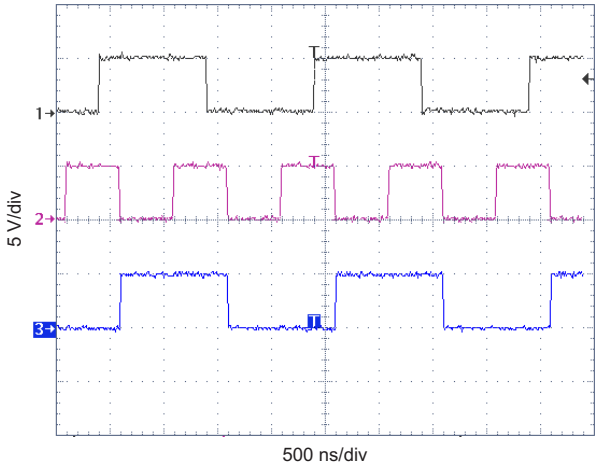

Figure 25. SN65HVS883 Serial Input and Output Timing

10 Power Supply Recommendations

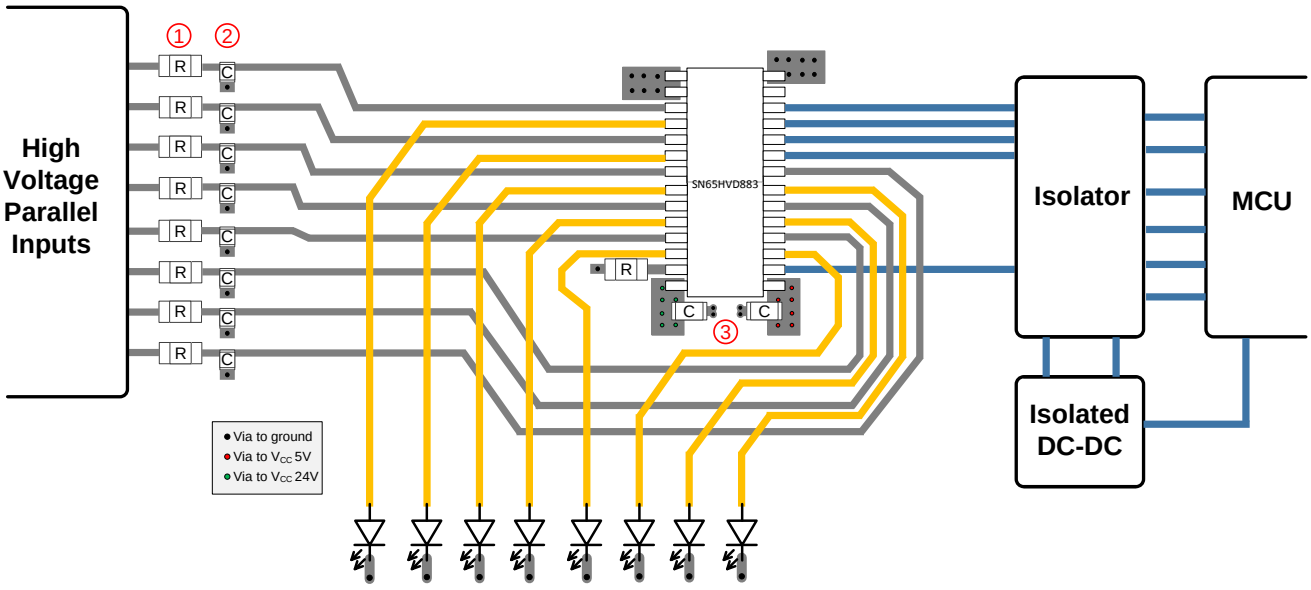
The SN65HVS883 operates within a recommended supply voltage range from 4.5 V to 5.5 V. A 0.1 µF or larger capacitor should be placed between V_{CC} and ground to improve power supply noise immunity. A current limiting resistor can be used to reduce overall power consumption as described in *Digital Inputs*. The high voltage parallel field inputs can accept voltages ranging from 0 V to 34 V, however all other inputs must remain between 0 V to 5 V. Refer to the *Recommended Operating Conditions* table for more detailed voltage suggestions. High voltage field inputs should be buffered as shown in Figure 23 to improve input noise immunity.

11 Layout

11.1 Layout Guidelines

1. Place series MELF resistors between the field inputs and the device input pins.
2. Place small ~22 nF capacitors close to the field input pins to reduce noise.
3. Place a supply buffering 0.1-µF capacitor around as close to the V_{CC} pin as possible.

11.2 Layout Example



12 デバイスおよびドキュメントのサポート

12.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

12.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、ti.comのデバイス製品フォルダを開いてください。右上の隅にある「*通知を受け取る*」をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取れます。変更の詳細については、修正されたドキュメントに含まれている改訂履歴をご覧ください。

12.3 コミュニティ・リソース

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support ***TI's Design Support*** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 商標

PowerPAD, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 静電気放電に関する注意事項

これらのデバイスは、限定的なESD（静電破壊）保護機能を内 蔵しています。保存時または取り扱い時は、MOSゲートに対す る静電破壊を防止するために、リード線同士をショートさせて おくか、デバイスを導電フォームに入れる必要があります。

12.6 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。これらの情報は、指定のデバイスに対して提供されている最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
SN65HVS883PWPR	ACTIVE	HTSSOP	PWP	28	2000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	HVS883	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
