

SN74AXCH4T245 構成可能な電圧変換、Tri-State 出力、バス・ホールド入力を搭載した 4 ビット・バス・トランシーバ

1 特長

- 完全に構成可能なデュアル・レール設計により、各ポートは 0.65V~3.6V の範囲の電源電圧で動作可能
- データ入力時のバス・ホールドにより、外付けのプルアップまたはプルダウン抵抗が不要
- 動作温度範囲：-40°C~+125°C
- 複数の方向制御ピンにより、昇圧と降圧の変換を同時に実行
- グリッチの発生しない電源シーケンシング
- 最高 380Mbps をサポート (1.8V から 3.3V への変換時)
- V_{CC} 絶縁機能
- I_{off} により部分的パワーダウン・モード動作をサポート
- AVC ファミリのレベル・シフトと互換
- JESD 78, Class II 準拠で 100mA 超のラッチアップ性能
- JESD 22 を超える ESD 保護
 - 人体モデルで 8000V
 - 荷電デバイス・モデルで 1000V

2 アプリケーション

- エンタープライズおよび通信
- 産業用
- パーソナル・エレクトロニクス
- ワイヤレス・インフラ
- ビルディング・オートメーション

3 概要

SN74AXCH4T245 は、別々に構成可能な 2 つの電源レールを使用した、4 ビットの非反転バス・トランシーバです。このデバイスは、V_{CCA} 電源と V_{CCB} 電源の両方が最低 0.65V で動作します。A ポートは V_{CCA} (0.65V~3.6V の任意の電源電圧に対応) に追従するよう設計されています。同様に、B ポートは V_{CCB} (0.65V~3.6V の任意の電源電圧に対応) に追従するよう設計されています。SN74AXCH4T245 は単一電源システムにも対応しています。

SN74AXCH4T245 デバイスは、データ・バス間の非同期通信用に設計されており、方向制御入力 (1DIR および 2DIR) の論理レベルに応じて、A バスから B バスへ、または B バスから A バスへデータを送信します。出力イネーブル入力 (1OE および 2OE) を使用すると、出力をディセーブルにして、バスを実質的に絶縁できます。すべての制御ピン (xDIR および xOE) は V_{CCA} を基準としています。

アクティブなバス・ホールド回路により、使用されていない、または駆動されていない入力を有効なロジック状態に保持します。プルアップまたはプルダウン抵抗とバス・ホールド回路との併用は推奨しません。V_{CCA} または V_{CCB} に電源が存在する場合、方向制御または出力イネーブル・ピンの状態とは関係なく、バス・ホールド回路はそれぞれ A または B 入力でアクティブ状態を維持します。

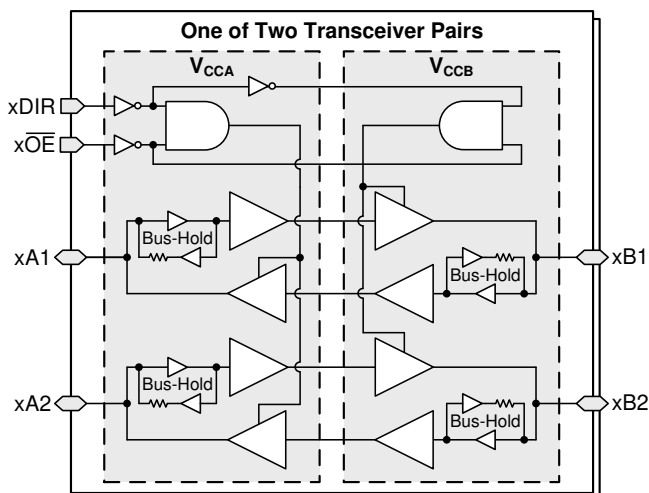

電源オンまたは電源オフ時にレベル・シフト I/O が確実に高インピーダンス状態になるように、プルアップ抵抗を経由して xOE ピンを V_{CCA} に接続する必要があります。

5 概要 (続き)

このデバイスは、 I_{off} 電流を使用する部分的パワーダウン・アプリケーション用に完全に動作が規定されています。 I_{off} 保護回路により、電源オフ時に入力、出力、複合 I/O は指定の電圧にバイアスされ、それらとの間に過剰な電流が流れることはありません。

V_{CC} 絶縁機能により、 V_{CCA} と V_{CCB} のどちらかが $100mV$ を下回ると、すべての I/O ポートは出力を無効にして高インピーダンス状態になります。

グリッチの発生しない電源シーケンシングにより、堅牢な電源シーケンシング性能が得られると同時に、どちらの電源レールも任意の順序で電源オン/オフできます。

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input voltage and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The output positive-voltage rating may be exceeded up to 4.2 V maximum if the output current rating is observed.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±8000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

(1) V_{CCI} is the V_{CC} associated with the input port.

(2) V_{CCO} is the V_{CC} associated with the output port.

(3) All typical data is taken at 25°C.

(4) The bus-hold circuit can sink at least the minimum low sustaining current at V_{IL} max. I_{BHL} should be measured after lowering V_{IN} to GND and then raising it to V_{IL} max.

(5) The bus-hold circuit can source at least the minimum high sustaining current at V_{IH} min. I_{BHH} should be measured after raising V_{IN} to VCC and then lowering it to V_{IH} min.

9 Detailed Description

9.1 Overview

The SN74AXCH4T245 is a 4-bit, dual-supply noninverting bidirectional voltage level translation device with bus-hold inputs. xAx pins and control pins (1DIR, 2DIR, 1OE, and 2OE) are reference to V_{CCA} logic levels, and xBx pins are referenced to V_{CCB} logic levels. The A port is able to accept I/O voltages ranging from 0.65 V to 3.6 V, while the B port can accept I/O voltages from 0.65 V to 3.6 V. A high on DIR allows data transmission from A to B and a low on DIR allows data transmission from B to A when OE is set to low. When OE is set to high, both xAx and xBx pins are in the high-impedance state. See [Device Functional Modes](#) for a summary of the operation of the control logic.

9.2 Functional Block Diagram

Note: Bus-hold circuits are only present for data inputs, not control inputs

9.3 Feature Description

9.3.1 Standard CMOS Inputs

Standard CMOS inputs are high impedance and are typically modeled as a resistor in parallel with the input capacitance given in the [Electrical Characteristics](#). The worst case resistance is calculated with the maximum input voltage, given in the [Absolute Maximum Ratings](#), and the maximum input leakage current, given in the [Electrical Characteristics](#), using Ohm's law ($R = V \div I$).

Signals applied to the inputs need to have fast edge rates, as defined by $\Delta t/\Delta v$ in [Recommended Operating Conditions](#) to avoid excessive current consumption and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be used to condition the input signal prior to the standard CMOS input.

9.3.2 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. The electrical and thermal limits defined in the [Absolute Maximum Ratings](#) must be followed at all times.

Feature Description (continued)

9.3.3 Partial Power Down (I_{off})

The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by I_{off} in the [Electrical Characteristics](#).

9.3.4 V_{CC} Isolation

The inputs and outputs for this device enter a high-impedance state when either supply is $<100\text{mV}$.

9.3.5 Over-voltage Tolerant Inputs

Input signals to this device can be driven above the supply voltage so long as they remain below the maximum input voltage value specified in the [Recommended Operating Conditions](#).

9.3.6 Glitch-free Power Supply Sequencing

Either supply rail may be powered on or off in any order without producing a glitch on the I/Os (that is, where the output erroneously transitions to VCC when it should be held low). Glitches of this nature can be misinterpreted by a peripheral as a valid data bit, which could trigger a false device reset of the peripheral, a false device configuration of the peripheral, or even a false data initialization by the peripheral. For more information regarding the power up glitch performance of the AXC family of level translators, see the [Glitch Free Power Sequencing With AXC Level Translators](#) application report

9.3.7 Negative Clamping Diodes

The inputs and outputs to this device have negative clamping diodes as depicted in [Figure 9](#).

注意

Voltages beyond the values specified in the [Absolute Maximum Ratings](#) table can cause damage to the device. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

Figure 9. Electrical Placement of Clamping Diodes for Each Input and Output

9.3.8 Fully Configurable Dual-Rail Design

Both the V_{CCA} and V_{CCB} pins can be supplied at any voltage from 0.65 V to 3.6 V, making the device suitable for translating between any of the voltage nodes (0.7 V, 0.8 V, 0.9 V, 1.2 V, 1.8 V, 2.5 V and 3.3 V).

9.3.9 Supports High-Speed Translation

The SN74AXCH4T245 device can support high data-rate applications. The translated signal data rate can be up to 380 Mbps when the signal is translated from 1.8 V to 3.3 V.

Feature Description (continued)

9.3.10 Bus-Hold Data Inputs

Each data input on this device includes a weak latch that maintains a valid logic level on the input. The state of these latches is unknown at startup and remains unknown until the input has been forced to a valid high or low state. After data has been sent through a channel, the latch then maintains the previous state on the input if the line is left floating. It is not recommended to use pull-up or pull-down resistors together with a bus-hold input, as it may cause undefined inputs to occur which leads to excessive current consumption.

Bus-hold data inputs prevent floating inputs on this device. The [Implications of Slow or Floating CMOS Inputs](#) application report explains the problems associated with leaving CMOS inputs floating.

These latches remain active at all times, independent of all control signals such as direction control or output enable.

The [Bus-Hold Circuit](#) application report has additional details regarding bus-hold inputs.

(1) Input circuits of the data I/Os are always active.

(2) Bus-hold circuits of the data I/Os are always active, independent of the state of the control inputs.

10 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The SN74AXCH4T245 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The SN74AXCH4T245 device is ideal for use in applications where a push-pull driver is connected to the data I/Os. The max data rate can be up to 380 Mbps when device translates a signal from 1.8 V to 3.3 V.

One example application is shown in [Figure 11](#), where the SN74AXCH4T245 device is used to translate a low voltage UART signal from an SoC to a higher voltage signal which properly drive the inputs of the bluetooth module, and vice versa.

10.2 Typical Application

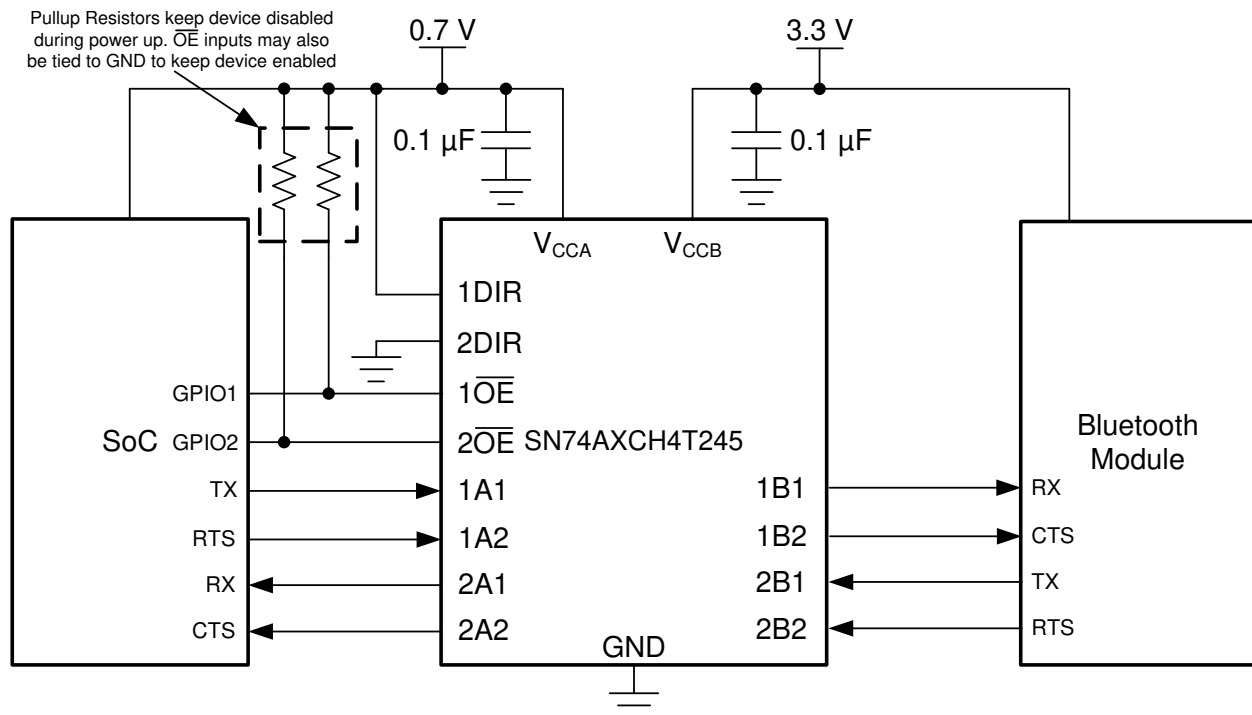

图 11. UART Interface Application

10.2.1 Design Requirements

For this design example, use the parameters listed in [Table 3](#).

表 3. Design Parameters

DESIGN PARAMETERS	EXAMPLE VALUES
Input voltage range	0.65 V to 3.6 V
Output voltage range	0.65 V to 3.6 V

10.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
 - Use the supply voltage of the device that is driving the SN74AXCH4T245 device to determine the input voltage range. For a valid logic-high, the value must exceed the high-level input voltage (V_{IH}) of the input port. For a valid logic low the value must be less than the low-level input voltage (V_{IL}) of the input port.
- Output voltage range
 - Use the supply voltage of the device that the SN74AXCH4T245 device is driving to determine the output voltage range.

10.2.3 Application Curve

⊠ 12. Up Translation at 2.5 MHz (0.7 V to 3.3 V)

11 Power Supply Recommendations

Always apply a ground reference to the GND pins first. This device is designed for glitch free power sequencing without any supply sequencing requirements such as ramp order or ramp rate.

This device was designed with various power supply sequencing methods in mind to help prevent unintended triggering of downstream devices. For more information regarding the power up glitch performance of the AXC family of level translators, see the [Glitch Free Power Sequencing With AXC Level Translators](#) application report

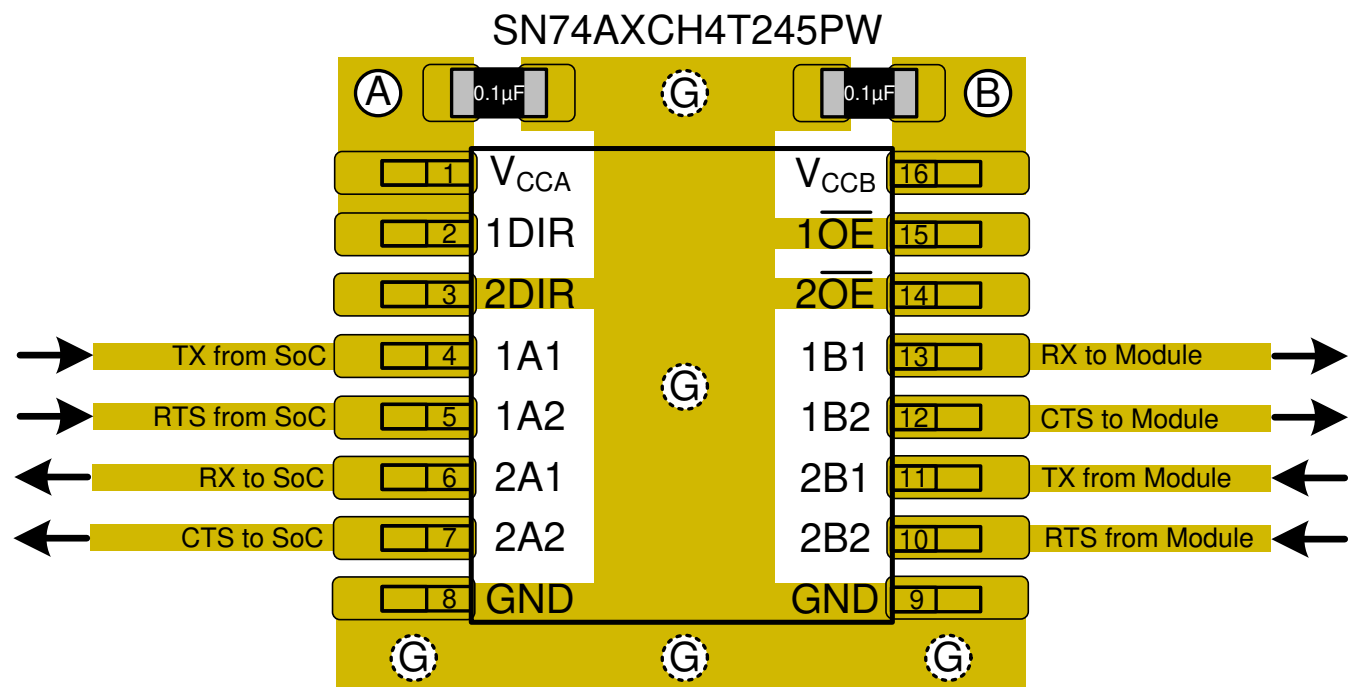

12 Layout

12.1 Layout Guidelines

To ensure reliability of the device, following common printed-circuit board layout guidelines are recommended:

- Use bypass capacitors on the power supply pins and place them as close to the device as possible.
- Use short trace lengths to avoid excessive loading.
- Do not use pullup or pulldown resistors on data inputs for devices with bus-hold circuits.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
