

## SN74LV165A-Q1 車載用パラレルロード 8 ビット・シフト・レジスタ

### 1 特長

- 車載アプリケーション用に AEC-Q100 認定済み:
  - デバイス温度グレード 1:
    - 40°C ~ 125°C,  $T_A$
  - デバイス HBM ESD 分類レベル 2
  - デバイス CDM ESD 分類レベル C6
- ウェットダブル・フラング QFN (WBQB) パッケージで供給
- 2V ~ 5.5V の  $V_{CC}$  で動作
- 最大  $t_{pd}$  10.5ns (5V 時)
- すべてのポートで混合モード電圧動作をサポート
- $I_{off}$  により部分的パワーダウン・モードでの動作をサポート
- JESD 17 準拠で 250mA 超のラッチアップ性能

### 2 アプリケーション

- マイクロコントローラの入力数拡張

### 3 概要

SN74LV165A-Q1 デバイスは、2V ~ 5.5V の  $V_{CC}$  で動作するように設計された、パラレルロード (並列読み込み) 8 ビット・シフト・レジスタです。

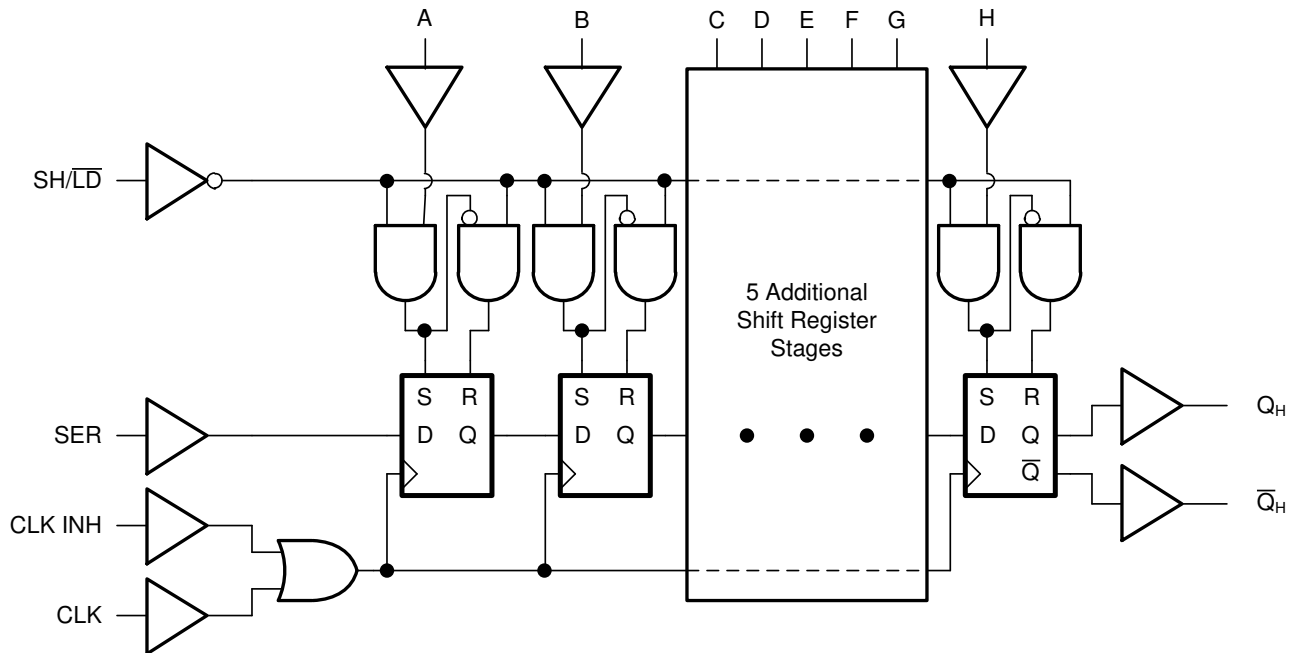

デバイスにクロックが供給されると、データはシリアル出力  $Q_H$  にシフトされます。各段のパラレル入力へのアクセスは、8 つの個別の直接データ入力によって提供されます。これらのデータ入力は、シフト / ロード ( $SH/\overline{LD}$ ) 入力が LOW レベルのときイネーブルになります。SN74LV165A-Q1 デバイスは、クロック禁止機能と、反転したシリアル出力  $\overline{Q}_H$  を備えています。

このデバイスは、 $I_{off}$  を使った部分的パワーダウン・アプリケーション用の動作が完全に規定されています。 $I_{off}$  回路が出力をディセーブルにするので、電源切断時にデバイスに電流が逆流して損傷に至ることを回避できます。

#### 製品情報 (1)

| 部品番号          | パッケージ           | 本体サイズ (公称)    |
|---------------|-----------------|---------------|
| SN74LV165A-Q1 | WBQB (WQFN, 16) | 3.60 × 2.60mm |

(1) 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                  |   |                                       | MIN  | MAX                   | UNIT |
|------------------|---|---------------------------------------|------|-----------------------|------|
| V <sub>CC</sub>  | Supply voltage  |                                       | -0.5 | 7                     | V    |
| V <sub>I</sub>   | Input voltage <sup>(2)</sup>  |                                       | -0.5 | 7                     | V    |
| V <sub>O</sub>   | Voltage range applied to any output in the high-impedance or power-off state <sup>(2)</sup> |                                       | -0.5 | 7                     | V    |
| V <sub>O</sub>   | Output voltage <sup>(2) (3)</sup>   |                                       | -0.5 | V <sub>CC</sub> + 0.5 | V    |
| I <sub>IK</sub>  | Input clamp current   | V <sub>I</sub> < 0                    |      | -20                   | mA   |
| I <sub>OK</sub>  | Output clamp current  | V <sub>O</sub> < 0                    |      | -50                   | mA   |
| I <sub>O</sub>   | Continuous output current   | V <sub>O</sub> = 0 to V <sub>CC</sub> |      | ±25                   | mA   |
|                  | Continuous current through V <sub>CC</sub> or GND   |                                       |      | ±50                   | mA   |
| T <sub>stg</sub> | Storage temperature   |                                       | -65  | 150                   | °C   |

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) This value is limited to 5.5 V maximum.

### 6.2 ESD Ratings

|                    |                         |  | VALUE | UNIT |
|--------------------|-------------------------|--|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human body model (HBM), per AEC Q100-002 HBM ESD Classification Level 2 <sup>(1)</sup> | ±4000 | V    |
|                    |                         | Charged device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4B          | ±2000 |      |

- (1) AEC Q100-002 indicate that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

|                 |                                    |                                  | MIN                   | MAX                   | UNIT |
|-----------------|------------------------------------|----------------------------------|-----------------------|-----------------------|------|
| V <sub>CC</sub> | Supply voltage                     |                                  | 2                     | 5.5                   | V    |
| V <sub>IH</sub> | High-level input voltage           | V <sub>CC</sub> = 2 V            | 1.5                   |                       | V    |
|                 |                                    | V <sub>CC</sub> = 2.3 V to 5.5 V | V <sub>CC</sub> × 0.7 |                       |      |
| V <sub>IL</sub> | Low-level input voltage            | V <sub>CC</sub> = 2 V            |                       | 0.5                   | V    |
|                 |                                    | V <sub>CC</sub> = 2.3 V to 5.5 V |                       | V <sub>CC</sub> × 0.3 |      |
| V <sub>I</sub>  | Input voltage                      |                                  | 0                     | 5.5                   | V    |
| V <sub>O</sub>  | Output voltage                     |                                  | 0                     | V <sub>CC</sub>       | V    |
| I <sub>OH</sub> | High-level output current          | V <sub>CC</sub> = 2 V            |                       | –50                   | μA   |
|                 |                                    | V <sub>CC</sub> = 2.3 V to 2.7 V |                       | –2                    |      |
|                 |                                    | V <sub>CC</sub> = 3 V to 3.6 V   |                       | –6                    |      |
|                 |                                    | V <sub>CC</sub> = 4.5 V to 5.5 V |                       | –12                   |      |
| I <sub>OL</sub> | Low-level output current           | V <sub>CC</sub> = 2 V            |                       | 50                    | μA   |
|                 |                                    | V <sub>CC</sub> = 2.3 V to 2.7 V |                       | 2                     |      |
|                 |                                    | V <sub>CC</sub> = 3 V to 3.6 V   |                       | 6                     |      |
|                 |                                    | V <sub>CC</sub> = 4.5 V to 5.5 V |                       | 12                    |      |
| Δt/Δv           | Input transition rise or fall rate | V <sub>CC</sub> = 2.3 V to 2.7 V |                       | 200                   | ns/V |
|                 |                                    | V <sub>CC</sub> = 3 V to 3.6 V   |                       | 100                   |      |
|                 |                                    | V <sub>CC</sub> = 4.5 V to 5.5 V |                       | 20                    |      |
| T <sub>A</sub>  | Operating free-air temperature     |                                  | –40                   | 125                   | °C   |

(1) All unused inputs of the device must be held at V<sub>CC</sub> or GND to ensure proper device operation. See [Implications of Slow or Floating CMOS Inputs](#).

### 6.4 Thermal Information

| THERMAL METRIC <sup>(1)</sup> |  | SN74LV165A-Q1 | UNIT |
|-------------------------------|--|---------------|------|
|                               |  | WBQB (WQFN)   |      |
|                               |  | 16 PINS       |      |
| R <sub>θJA</sub>              | Junction-to-ambient thermal resistance       | 86            | °C/W |

## 7 Parameter Measurement Information

LOAD CIRCUIT FOR TOTEM-POLE OUTPUTS

LOAD CIRCUIT FOR 3-STATE AND OPEN-DRAIN OUTPUTS

- A.  $C_L$  includes probe and jig capacitance.
- B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics:  $PRR \leq 1 \text{ MHz}$ ,  $Z_O = 50 \Omega$ ,  $t_r \leq 3 \text{ ns}$ , and  $t_f \leq 3 \text{ ns}$ .
- D. The outputs are measured one at a time, with one input transition per measurement.
- E.  $t_{PZL}$  and  $t_{PHZ}$  are the same as  $t_{dis}$ .
- F.  $t_{PZL}$  and  $t_{PZH}$  are the same as  $t_{en}$ .
- G.  $t_{PHL}$  and  $t_{PLH}$  are the same as  $t_{pd}$ .
- H. All parameters and waveforms are not applicable to all devices.

## 8 Detailed Description

### 8.1 Overview

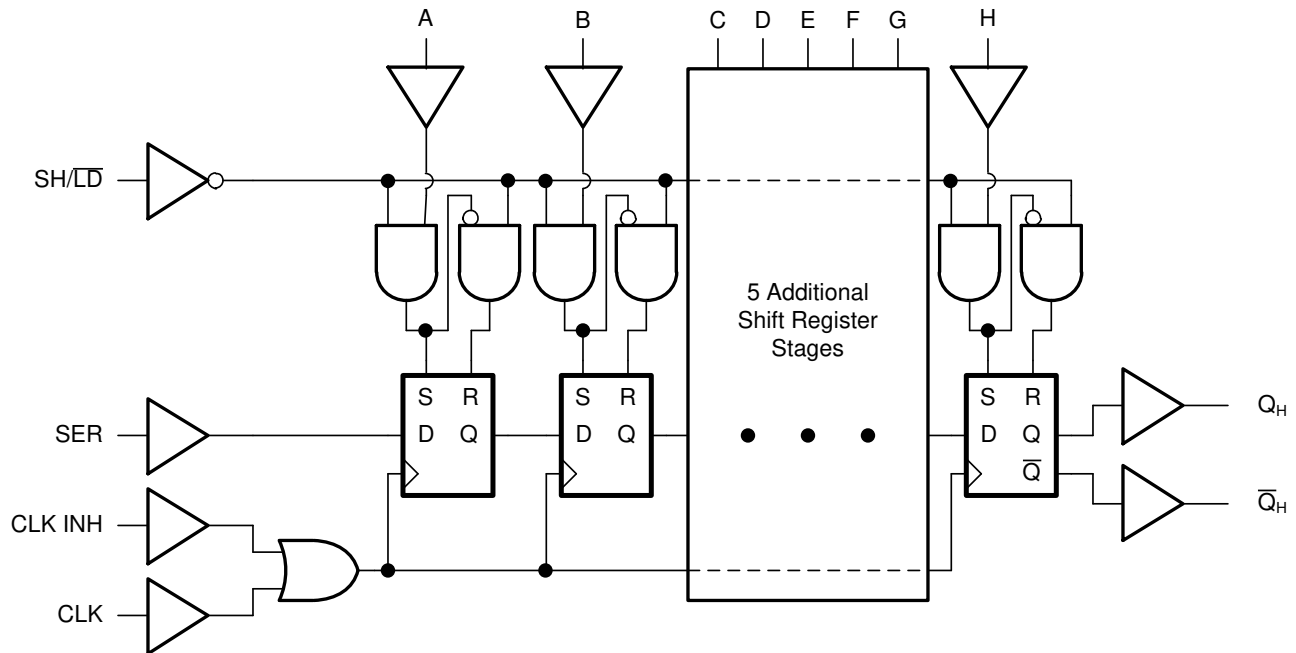

The SN74LV165A-Q1 device is a parallel-load, 8-bit shift registers designed for 2 V to 5.5 V  $V_{CC}$  operation.

When the device is clocked, data is shifted toward the serial output  $Q_H$ . Parallel-in access to each stage is provided by eight individual direct data inputs that are enabled by a low level at the shift/load ( $SH/\overline{LD}$ ) input. The SN74LV165A-Q1 features a clock-inhibit function and a complemented serial output,  $\overline{Q}_H$ .

Clocking is accomplished by a low-to-high transition of the clock (CLK) input while  $SH/\overline{LD}$  is held high and clock inhibit (CLK INH) is held low. The functions of CLK and CLK INH are interchangeable. Since a low CLK and a low-to-high transition of CLK INH accomplishes clocking, CLK INH must be changed to the high level only while CLK is high. Parallel loading is inhibited when  $SH/\overline{LD}$  is held high. The parallel inputs to the register are enabled while  $SH/\overline{LD}$  is held low, independently of the levels of CLK, CLK INH, or SER.

The SN74LV165A-Q1 is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the devices when they are powered down.

### 8.2 Functional Block Diagram

8-1. Logic Diagram (Positive Logic)

### 8.3 Feature Description

#### 8.3.1 Balanced CMOS Push-Pull Outputs

This device includes balanced CMOS push-pull outputs. The term *balanced* indicates that the device can sink and source similar currents. The drive capability of this device may create fast edges into light loads, so routing and load conditions should be considered to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. It is important for the output power of the device to be limited to avoid damage due to overcurrent. The electrical and thermal limits defined in the *Absolute Maximum Ratings* must be followed at all times.

Unused push-pull CMOS outputs should be left disconnected.

### 8.3.2 Latching Logic

This device includes latching logic circuitry. Latching circuits commonly include D-type latches and D-type flip-flops, but include all logic circuits that act as volatile memory.

When the device is powered on, the state of each latch is unknown. There is no default state for each latch at start-up.

The output state of each latching logic circuit only remains stable as long as power is applied to the device within the supply voltage range specified in the *Recommended Operating Conditions* table.

### 8.3.3 Partial Power Down ( $I_{off}$ )

This device includes circuitry to disable all outputs when the supply pin is held at 0 V. When disabled, the outputs will neither source nor sink current, regardless of the input voltages applied. The amount of leakage current at each output is defined by the  $I_{off}$  specification in the *Electrical Characteristics* table.

### 8.3.4 Wettable Flanks

This device includes wettable flanks for at least one package. See the *Features* section on the front page of the data sheet for which packages include this feature.

**8-2. Simplified Cutaway View of Wettable-Flank QFN Package and Standard QFN Package After Soldering**

Wettable flanks help improve side wetting after soldering, which makes QFN packages easier to inspect with automatic optical inspection (AOI). As shown in 8-2, a wettable flank can be dimpled or step-cut to provide additional surface area for solder adhesion which assists in reliably creating a side fillet. See the mechanical drawing for additional details.

### 8.3.5 Clamp Diode Structure

Figure 8-3 shows the inputs and outputs to this device have negative clamping diodes only.

**注意**

Voltages beyond the values specified in the *Absolute Maximum Ratings* table can cause damage to the device. The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

Figure 8-3. Electrical Placement of Clamping Diodes for Each Input and Output

### 8.4 Device Functional Modes

The [Operating Mode Table](#) and the [Output Function Table](#) list the functional modes of the SN74LV165A-Q1.

Table 8-1. Operating Mode Table

| INPUTS <sup>(1)</sup> |     |         | FUNCTION             |
|-----------------------|-----|---------|----------------------|
| SH/LD                 | CLK | CLK INH |                      |
| L                     | X   | X       | Parallel load        |
| H                     | H   | X       | No change            |
| H                     | X   | H       | No change            |
| H                     | L   | ↑       | Shift <sup>(2)</sup> |
| H                     | ↑   | L       | Shift <sup>(2)</sup> |

- (1) H = High Voltage Level, L = Low Voltage Level, X = Do Not Care, ↑ = Low to High transition  
 (2) Shift: content of each internal register shifts towards serial output Q<sub>H</sub>. Data at SER is shifted into the first register.

Table 8-2. Output Function Table

| INTERNAL REGISTERS <sup>(1) (2)</sup> |   | OUTPUTS <sup>(2)</sup> |    |
|---------------------------------------|---|------------------------|----|
| A – G                                 | H | Q                      | Q̄ |
| X                                     | L | L                      | H  |
| X                                     | H | H                      | L  |

- (1) Internal registers refer to the shift registers inside the device. These values are set by either loading data from the parallel inputs, or by clocking data in from the serial input.  
 (2) H = High Voltage Level, L = Low Voltage Level, X = Do Not Care

## 9 Application and Implementation

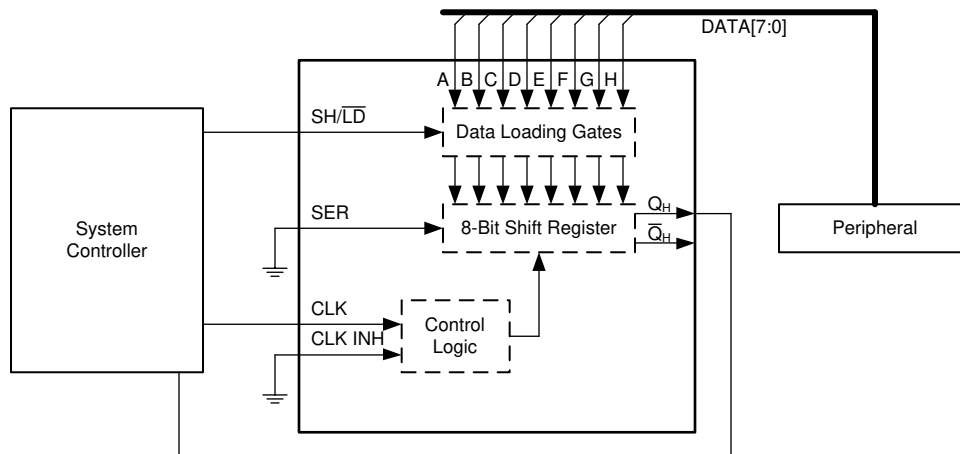

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The SN74LV165A-Q1 is a low drive CMOS device that can be used for a multitude of bus interface type applications where output ringing is a concern. The low-drive and slow-edge rates minimize overshoot and undershoot on the outputs.

### 9.2 Typical Application

☒ 9-1. Input Expansion with Shift Registers

### 9.2.1 Power Considerations

Ensure the desired supply voltage is within the range specified in the *Recommended Operating Conditions*. The supply voltage sets the device's electrical characteristics as described in the *Electrical Characteristics* section.

The positive voltage supply must be capable of sourcing current equal to the total current to be sourced by all outputs of the SN74LV165A-Q1 plus the maximum static supply current,  $I_{CC}$ , listed in the *Electrical Characteristics*, and any transient current required for switching. The logic device can only source as much current that is provided by the positive supply source. Be sure to not exceed the maximum total current through  $V_{CC}$  listed in the *Absolute Maximum Ratings*.

The ground must be capable of sinking current equal to the total current to be sunk by all outputs of the SN74LV165A-Q1 plus the maximum supply current,  $I_{CC}$ , listed in the *Electrical Characteristics*, and any transient current required for switching. The logic device can only sink as much current that can be sunk into its ground connection. Be sure to not exceed the maximum total current through GND listed in the *Absolute Maximum Ratings*.

The SN74LV165A-Q1 can drive a load with a total capacitance less than or equal to 50 pF while still meeting all of the data sheet specifications. Larger capacitive loads can be applied; however, it is not recommended to exceed 50 pF.

The SN74LV165A-Q1 can drive a load with total resistance described by  $R_L \geq V_O / I_O$ , with the output voltage and current defined in the *Electrical Characteristics* table with  $V_{OH}$  and  $V_{OL}$ . When outputting in the HIGH state, the output voltage in the equation is defined as the difference between the measured output voltage and the supply voltage at the  $V_{CC}$  pin.

Total power consumption can be calculated using the information provided in [CMOS Power Consumption and Cpd Calculation](#).

Thermal increase can be calculated using the information provided in [Thermal Characteristics of Standard Linear and Logic \(SLL\) Packages and Devices](#).

#### 注意

The maximum junction temperature,  $T_{J(max)}$  listed in the *Absolute Maximum Ratings*, is an additional limitation to prevent damage to the device. Do not violate any values listed in the *Absolute Maximum Ratings*. These limits are provided to prevent damage to the device.

### 9.2.2 Input Considerations

Input signals must cross  $V_{IL(max)}$  to be considered a logic LOW, and  $V_{IH(min)}$  to be considered a logic HIGH. Do not exceed the maximum input voltage range found in the *Absolute Maximum Ratings*.

Unused inputs must be terminated to either  $V_{CC}$  or ground. The unused inputs can be directly terminated if the input is completely unused, or they can be connected with a pull-up or pull-down resistor if the input will be used sometimes, but not always. A pull-up resistor is used for a default state of HIGH, and a pull-down resistor is used for a default state of LOW. The drive current of the controller, leakage current into the SN74LV165A-Q1 (as specified in the *Electrical Characteristics*), and the desired input transition rate limits the resistor size. A 10-k $\Omega$  resistor value is often used due to these factors.

The SN74LV165A-Q1 has CMOS inputs and thus requires fast input transitions to operate correctly, as defined in the *Recommended Operating Conditions* table. Slow input transitions can cause oscillations, additional power consumption, and reduction in device reliability.

Refer to the *Feature Description* section for additional information regarding the inputs for this device.

### 9.2.3 Output Considerations

The positive supply voltage is used to produce the output HIGH voltage. Drawing current from the output will decrease the output voltage as specified by the  $V_{OH}$  specification in the *Electrical Characteristics*. The ground voltage is used to produce the output LOW voltage. Sinking current into the output will increase the output voltage as specified by the  $V_{OL}$  specification in the *Electrical Characteristics*.

Push-pull outputs that could be in opposite states, even for a very short time period, should never be connected directly together. This can cause excessive current and damage to the device.

Two channels within the same device with the same input signals can be connected in parallel for additional output drive strength.

Unused outputs can be left floating. Do not connect outputs directly to  $V_{CC}$  or ground.

Refer to the *Feature Description* section for additional information regarding the outputs for this device.

### 9.2.4 Detailed Design Procedure

1. Add a decoupling capacitor from  $V_{CC}$  to GND. The capacitor needs to be placed physically close to the device and electrically close to both the  $V_{CC}$  and GND pins. An example layout is shown in the *Layout* section.
2. Ensure the capacitive load at the output is  $\leq 50$  pF. This is not a hard limit; it will, however, ensure optimal performance. This can be accomplished by providing short, appropriately sized traces from the SN74LV165A-Q1 to one or more of the receiving devices.
3. Ensure the resistive load at the output is larger than  $(V_{CC} / I_{O(max)}) \Omega$ . This will ensure that the maximum output current from the *Absolute Maximum Ratings* is not violated. Most CMOS inputs have a resistive load measured in  $M\Omega$ ; much larger than the minimum calculated previously.
4. Thermal issues are rarely a concern for logic gates; the power consumption and thermal increase, however, can be calculated using the steps provided in the application report, [CMOS Power Consumption and Cpd Calculation](#).

### 9.2.5 Application Curves

9-2. Application Timing Diagram

## 10 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the *Absolute Maximum Ratings* section. Each  $V_{CC}$  terminal must have a good bypass capacitor to prevent power disturbance. For devices with a single supply, TI recommends a 0.1- $\mu$ F capacitor; if there are multiple  $V_{CC}$  terminals, then TI recommends a 0.01- $\mu$ F or 0.022- $\mu$ F capacitor for each power terminal. Multiple bypass capacitors can be paralleled to reject different frequencies of noise. Frequencies of 0.1  $\mu$ F and 1  $\mu$ F are commonly used in parallel. The bypass capacitor must be installed as close as possible to the power terminal for best results.

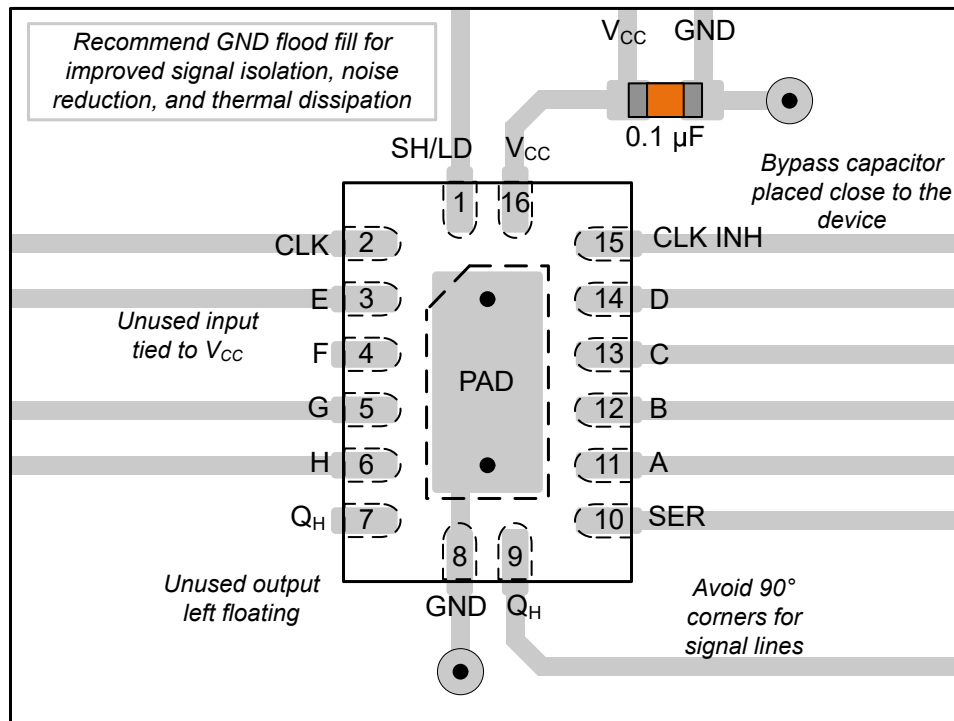

## 11 レイアウト

### 11.1 Layout Guidelines

When using multiple bit logic devices, inputs should not float. In many cases, functions or parts of functions of digital logic devices are unused. Some examples are when only two inputs of a triple-input AND gate are used, or when only 3 of the 4-buffer gates are used. Such unused input pins must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. All unused inputs of digital logic devices must be connected to a logic high or logic low voltage, as defined by the input voltage specifications, to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally, the inputs are tied to GND or  $V_{CC}$ , whichever makes more sense for the logic function or is more convenient.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

| Orderable Device   | Status<br>(1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan<br>(2) | Lead finish/<br>Ball material<br>(6) | MSL Peak Temp<br>(3) | Op Temp (°C) | Device Marking<br>(4/5) | Samples |
|--------------------|---------------|--------------|-----------------|------|-------------|-----------------|--------------------------------------|----------------------|--------------|-------------------------|---------|
| SN74LV165AQWBQBRQ1 | ACTIVE        | WQFN         | BQB             | 16   | 3000        | RoHS & Green    | NIPDAU                               | Level-1-260C-UNLIM   | -40 to 125   | LV165Q                  | Samples |

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
