

TLC2272AM-MIL 高度なLinCMOSレール・ツー・レール・オペアンプ

1 特長

- 出カスイングに両方の電源レールを含む
- 低ノイズ: $f = 1\text{kHz}$ 時に $9\text{nV}/\sqrt{\text{Hz}}$ (標準値)
- 低い入力バイアス電流: 1pA (標準値)
- 単一電源と分割電源での動作を完全に規定
- 同相入力電圧範囲に負のレールを含む
- 高いゲイン帯域幅: 2.2MHz (標準値)
- 高いスルー・レート: $3.6\text{V}/\mu\text{s}$ (標準値)
- 低い入力オフセット電圧: $T_A = 25^\circ\text{C}$ 時に 2.5mV (最大値)
- マクロモデル内蔵
- TLC272およびTLC274の性能強化版
- Q-Temp車載用で利用可能

2 アプリケーション

- 白物家電(冷蔵庫、洗濯機)
- ハンドヘルド監視システム
- 構成制御と印刷のサポート
- トランスデューサ・インターフェイス
- バッテリ駆動のアプリケーション

3 概要

TLC2272AM-MILデバイスは、テキサス・インスツルメンツ製のデュアル・オペアンプです。このデバイスはレール・ツー・レールの出力性能があり、単一および分割電源アプリケーションでダイナミック・レンジが増大します。

TLC2272AM-MILデバイスは 2MHz の帯域幅と $3\text{V}/\mu\text{s}$ のスルー・レートを実現しており、高速アプリケーションに適しています。このデバイスは既存のCMOSオペアンプと同等のAC性能を備えながら、ノイズ、入力オフセット電圧、消費電力の点でCMOSオペアンプより優れています。

TLC2272AM-MILデバイスのノイズ電圧は $9\text{nV}/\sqrt{\text{Hz}}$ で、競合ソリューションの半分です。

TLC2272AM-MILデバイスは入力インピーダンスが高く、ノイズが低いため、圧電性トランスデューサなど高インピーダンスのソース用の小信号コンディショニングに最適です。Micropowerの消費電力レベルであるため、ハンドヘルドの監視機器やリモート・センシング・アプリケーションで適切に動作します。さらに、単一または分割電源でレール・ツー・レール出力が可能のため、このデバイスはA/Dコンバータ(ADC)と接続するための優れた選択肢です。高精度のアプリケーション向けには、最大入力オフセット電圧 $950\mu\text{V}$ のTLC2272AM-MILデバイスが利用可能です。このデバイスは 5V および $\pm 5\text{V}$ で完全に動作が規定されています。

TLC2272AM-MILデバイスは、標準設計におけるTLC272のアップグレードとしても優れており、出力ダイナミック・レンジの増大、ノイズ電圧の低下、入力オフセット電圧の低下を実現できます。これらの拡張機能セットから、広範なアプリケーションで使用可能です。高い出力駆動能力と、広い入力電圧範囲を必要とするアプリケーション向けには、TLV2432およびTLV2442デバイスを参照してください。

設計に必要なアンプが1つだけの場合は、TLV2211、TLV2221、TLV2231ファミリを参照してください。これらのデバイスは単一のレール・ツー・レール・オペアンプで、SOT-23パッケージで供給されます。サイズが小さく、消費電力が低いため、高密度のバッテリー駆動機器に最適です。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
TLC2272AM-MIL	SOIC (8)	3.91mm×4.90mm
	CDIP (8)	6.67mm×9.60mm
	LCCC (20)	8.89mm×8.89mm
	CFP (10)	6.35mm×6.35mm

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Supply voltage, V_{DD+} ⁽²⁾		8	V
V_{DD-} ⁽²⁾	-8		V
Differential input voltage, V_{ID} ⁽³⁾		±16	V
Input voltage, V_I (any input) ⁽²⁾	$V_{DD-} - 0.3$	V_{DD+}	V
Input current, I_I (any input)		±5	mA
Output current, I_O		±50	mA
Total current into V_{DD+}		±50	mA
Total current out of V_{DD-}		±50	mA
Duration of short-circuit current at (or below) 25°C ⁽⁴⁾		Unlimited	
Operating ambient temperature range, T_A	-55	125	
Storage temperature, T_{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values, except differential voltages, are with respect to the midpoint between V_{DD+} and V_{DD-} .
- (3) Differential voltages are at IN+ with respect to IN-. Excessive current will flow if input is brought below $V_{DD-} - 0.3$ V.
- (4) The output may be shorted to either supply. Temperature or supply voltages must be limited to ensure that the maximum dissipation rating is not exceeded.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	Devices in D packages	±2000	V
	Charged-device model (CDM), per AEC Q100-011	Devices in D packages	±1000	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

		MIN	MAX	UNIT
$V_{DD±}$	Supply voltage	±2.2	±8	V
V_I	Input voltage	V_{DD-}	$V_{DD+} - 1.5$	V
V_{IC}	Common-mode input voltage	V_{DD-}	$V_{DD+} - 1.5$	V
T_A	Operating ambient temperature	-55	125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾	TLC2272AM-MIL				UNIT
	D (SOIC)	JG (CDIP)	FK (LCCC)	U (CFP)	
	8-PIN		20-PIN	10-PIN	
$R_{θJA}$	Junction-to-ambient thermal resistance ⁽²⁾⁽³⁾	115.6	—	—	°C/W
$R_{θJC(top)}$	Junction-to-case (top) thermal resistance ⁽²⁾⁽³⁾	61.8	18	121.3	°C/W
$R_{θJB}$	Junction-to-board thermal resistance	55.9	—	—	°C/W
$ψ_{JT}$	Junction-to-top characterization parameter	14.3	—	—	°C/W
$ψ_{JB}$	Junction-to-board characterization parameter	55.4	—	—	°C/W
$R_{θJC(bot)}$	Junction-to-case (bottom) thermal resistance	—	—	8.68	°C/W

- (1) For more information about traditional and new thermal metrics, see *Semiconductor and IC Package Thermal Metrics*.
- (2) Maximum power dissipation is a function of $T_{J(max)}$, $R_{θJA}$, and T_A . The maximum allowable power dissipation at any allowable ambient temperature is $P_D = (T_{J(max)} - T_A) / R_{θJA}$. Operating at the absolute maximum T_J of 150°C can affect reliability.
- (3) The package thermal impedance is calculated in accordance with JESD 51-7 (plastic) or MIL-STD-883 Method 1012 (ceramic).

6.5 TLC2272AM-MIL Electrical Characteristics $V_{DD} = 5\text{ V}$

at specified ambient temperature, $V_{DD} = 5\text{ V}$; $T_A = 25^\circ\text{C}$, unless otherwise noted.

7 Detailed Description

7.1 Overview

The TLC2272AM-MIL device is a rail-to-rail output operational amplifier. The device operates from a 4.4-V to 16-V single supply or ± 2.2 -V to ± 8 -V dual supply, is unity-gain stable, and is suitable for a wide range of general-purpose applications.

7.2 Functional Block Diagram

Table 2. Device Component Count⁽¹⁾

COMPONENT	COUNT
Transistors	38
Resistors	26
Diodes	9
Capacitors	3

(1) Includes both amplifiers and all ESD, bias, and trim circuitry.

7.3 Feature Description

The TLC2272AM-MIL device features 2-MHz bandwidth and voltage noise of $9 \text{ nV}/\sqrt{\text{Hz}}$ with performance rated from 4.4 V to 16 V across a temperature range of -40°C to 125°C . LinMOS suits a wide range of audio, automotive, industrial, and instrumentation applications.

7.4 Device Functional Modes

The TLC2272AM-MIL device is powered on when the supply is connected. The device may operate with single or dual supply, depending on the application. The device is in its full-performance mode once the supply is above the recommended value.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Macromodel Information

Macromodel information provided was derived using MicroSim Parts™, the model generation software used with MicroSim PSpice™. The Boyle macromodel ⁽¹⁾ and subcircuit in Figure 53 were generated using the TLC2272AM-MIL typical electrical and operating characteristics at $T_A = 25^\circ\text{C}$. Using this information, output simulations of the following key parameters can be generated to a tolerance of 20% (in most cases):

- Maximum positive output voltage swing
- Maximum negative output voltage swing
- Slew rate
- Quiescent power dissipation
- Input bias current
- Open-loop voltage amplification
- Unity-gain frequency
- Common-mode rejection ratio
- Phase margin
- DC output resistance
- AC output resistance
- Short-circuit output current limit

Figure 53. Boyle Macromodel and Subcircuit

8.2 Typical Application

8.2.1 High-Side Current Monitor

Figure 54. Equivalent Schematic (Each Amplifier)

8.2.1.1 Design Requirements

For this design example, use the parameters listed in [Table 3](#) as the input parameters.

Table 3. Design Parameters

PARAMETER	VALUE
V_{BAT}	Battery voltage 12 V
R_{SENSE}	Sense resistor 0.1 Ω
I_{LOAD}	Load current 0 A to 10 A
Operational amplifier	Set in differential configuration with gain = 10

8.2.1.2 Detailed Design Procedure

This circuit is designed for measuring the high-side current in automotive body control modules with a 12-V battery or similar applications. The operational amplifier is set as differential with an external resistor network.

8.2.1.2.1 Differential Amplifier Equations

[Equation 1](#) and [Equation 2](#) are used to calculate V_{OUT} .

$$V_{OUT} = \frac{R_g}{R} \left(\frac{\frac{R}{R_g} - \frac{R_1}{R_2}}{1 + \frac{R_1}{R_2}} \times \frac{V_1 + V_2}{2} + \frac{1 + \frac{1}{2} \left(\frac{R_1}{R_2} + \frac{R}{R_g} \right)}{1 + \frac{R_1}{R_2}} (V_1 - V_2) \right) \quad (1)$$

$$V_{OUT} = \frac{R_g}{R} \left(\frac{\frac{R}{R_g} - \frac{R_1}{R_2}}{1 + \frac{R_1}{R_2}} \times V_{BAT} + \frac{1 + \frac{1}{2} \left(\frac{R_1}{R_2} + \frac{R}{R_g} \right)}{1 + \frac{R_1}{R_2}} \times R_S \times I_{LOAD} \right) \quad (2)$$

In an ideal case $R_1 = R$ and $R_2 = R_g$, and V_{OUT} can then be calculated using [Equation 3](#):

$$V_{OUT} = \frac{R_g}{R} \times R_S \times I_{LOAD} \quad (3)$$

However, as the resistors have tolerances, they cannot be perfectly matched.

$$R_1 = R \pm \Delta R_1$$

$$R_2 = R_2 \pm \Delta R_2$$

$$R = R \pm \Delta R$$

$$R_g = R_g \pm \Delta R_g$$

$$\text{Tol} = \frac{\Delta R}{R} \tag{4}$$

By developing the equations and neglecting the second order, the worst case is when the tolerances add up. This is shown by [Equation 5](#).

$$V_{\text{OUT}} = \pm (4 \text{ Tol}) \frac{R_g}{R + R_g} \times V_{\text{BAT}} + \left(1 \pm 2 \text{ Tol} \left(1 + \frac{2R}{R + R_g} \right) \right) \frac{R_g}{R} \times R_S \times I_{\text{LOAD}}$$

where

- Tol = 0.01 for 1%
 - Tol = 0.001 for 0.1%
- (5)

If the resistors are perfectly matched, then Tol = 0 and V_{OUT} is calculated using [Equation 6](#).

$$V_{\text{OUT}} = \frac{R_g}{R} \times R_S \times I_{\text{LOAD}} \tag{6}$$

The highest error is from the common mode, as shown in [Equation 7](#).

$$4 (\text{Tol}) \frac{R_g}{R + R_g} \times V_{\text{BAT}} \tag{7}$$

Gain of 10, $R_g / R = 10$, and Tol = 1%:

$$\text{Common mode error} = ((4 \times 0.01) / 1.1) \times 12 \text{ V} = 0.436 \text{ V}$$

Gain of 10 and Tol = 0.1%:

$$\text{Common mode error} = 43.6 \text{ mV}$$

The resistors were chosen from 2% batches.

$$R_1 \text{ and } R \text{ } 12 \text{ k}\Omega$$

$$R_2 \text{ and } R_g \text{ } 120 \text{ k}\Omega$$

$$\text{Ideal Gain} = 120 / 12 = 10$$

The measured value of the resistors:

$$R_1 = 11.835 \text{ k}\Omega$$

$$R = 11.85 \text{ k}\Omega$$

$$R_2 = 117.92 \text{ k}\Omega$$

$$R_g = 118.07 \text{ k}\Omega$$

8.2.1.3 Application Curves

9 Power Supply Recommendations

Supply voltage for a single supply is from 4.4 V to 16 V, and from ± 2.2 V to ± 8 V for a dual supply. In the high-side sensing application, the supply is connected to a 12-V battery.

10 Layout

10.1 Layout Guidelines

The TLC2272AM-MIL device is a wideband amplifier. To realize the full operational performance of the device, good high-frequency printed-circuit-board (PCB) layout practices are required. Low-loss 0.1- μ F bypass capacitors must be connected between each supply pin and ground as close to the device as possible. The bypass capacitor traces should be designed for minimum inductance.

10.2 Layout Example

Figure 57. Layout Example

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
