

# TLV1805 40V、レール・ツー・レール入力、プッシュプル出力、シャットダウン機能付きの高電圧コンパレータ

## 1 特長

- 電源電圧範囲：3.3V～40V
- 低い静止電流：135 $\mu$ A
- ピーク電流の大きいプッシュプル出力
- 位相反転保護機能付きのレール・ツー・レール入力
- 内蔵ヒステリシス：14mV
- 伝搬遅延時間：250ns
- 低い入力オフセット電圧：500 $\mu$ V
- ハイ・インピーダンス出力のシャットダウン
- パワーオン・リセット (POR)
- SOT-23-6 パッケージ

## 2 アプリケーション

- 逆電流保護のスマート・ダイオード・コントローラ
- 過電圧、低電圧、過電流の検出
- OR 接続 MOSFET コントローラ
- MOSFET ゲート・ドライバ
- 高電圧発振器
- システム監視
  - インフォテインメントおよびクラスタ
  - PLC
  - サーバー
  - モータ保護および制御

### P チャンネル MOSFET による過電圧保護

## 3 概要

TLV1805 高電圧コンパレータは、広い電源電圧範囲、プッシュプル出力、レール・ツー・レール入力、小さい静止電流、シャットダウン機能、高速な出力応答を持ち合わせた独自の製品です。これらすべての特長から、このコンパレータはスマート・ダイオード・コントローラの逆電流保護、過電流検出、およびプッシュプル出力段を使用して P チャンネルまたは N チャンネル MOSFET スイッチのゲートを駆動する過電圧保護回路など、正または負の電圧レールでの検出を必要とするアプリケーションに適しています。

### 製品情報<sup>(1)</sup>

型番	パッケージ	本体サイズ(公称)
TLV1805	SOT-23 (6)	1.60mm×2.90mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にあるパッケージ・オプションについての付録を参照してください。

## 4 改訂履歴

資料番号末尾の英字は改訂を表しています。その改訂履歴は英語版に準じています。

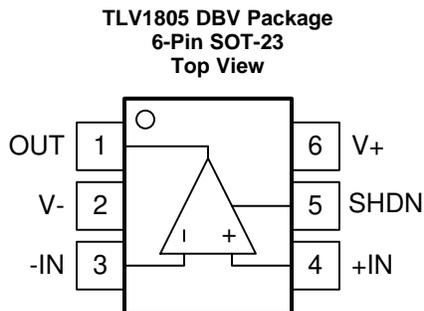

日付	リビジョン	注
2018年12月	*	初版 APL リリース。

## 5 概要 (続き)

高電圧コンパレータとしては珍しく、ピーク電流の大きいプッシュプル出力段には、どちらの電源レールへの負荷も高いエッジ速度でアクティブに駆動できるという利点があります。これは、予期しない高電圧電源へのホストの接続/切断を制御するために、MOSFET ゲートを迅速に HIGH または LOW に駆動する必要があるアプリケーションでは特に重要です。その他にも、低い入力オフセット電圧、低い入力バイアス電流、High-Z のシャットダウンなどの特長を備えているため、TLV1805 は広範なアプリケーションを柔軟に処理できます。パワー・オン・リセットにより、電源オン時の誤出力が防止されます。

TLV1805 は 6 ピン SOT-23 パッケージで、拡張産業用温度範囲の -40°C ~ +125°C で動作が規定されています。

## 6 Pin Configuration and Functions

Note the reversed positions of the input pins. This differs from a similar popular pinout.

### Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
IN+	4	I	Noninverting input
IN-	3	I	Inverting input
OUT	1	O	Output
SHDN	5	I	Shutdown (active high)
V+	6	P	Positive (highest) power supply
V-	2	P	Negative (lowest) power supply

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	MIN	MAX	UNIT
Supply voltage: $V_S = (V+) - (V-)$	-0.3	42	V
Input pins (IN+, IN-) <sup>(2)</sup>	(V-) - 0.3	(V+) + 0.3	V
Shutdown pin (SHDN) <sup>(3)</sup>	(V-) - 0.3	(V-) + 5.5	V
Current into Input pins (IN+, IN-, SHDN) <sup>(2)</sup>		±10	mA
Output (OUT)	(V-) - 0.3	(V+) + 0.3	V
Operating temperature	-55	150	°C
Junction temperature, $T_J$		150	°C
Storage temperature, $T_{stg}$	-65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.3 V beyond the supply rails must be current-limited to 10 mA or less.
- Shutdown pin is diode-clamped to (V-). Input to SHDN that can swing more than 0.3 V below (V-) must be current-limited to 10 mA or less.

### 7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1500	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±750	

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply voltage: $V_S = (V+) - (V-)$	3.3	40	V
Ambient temperature, $T_A$	-40	125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TLV1805	UNIT
		DBV (SOT23)	
		6 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	166.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	104.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	46.8	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	31.3	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	46.6	°C/W

- For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 7.5 Electrical Characteristics

$V_S = 3.3\text{ V to }40\text{ V}$ ,  $V_{CM} = V_S / 2$ ;  $T_A = 25^\circ\text{C}$  (unless otherwise noted). Typical values are at  $V_S = 12\text{ V}$  and  $T_A = 25^\circ\text{C}$ ,  $V_{CM} = V_S / 2$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>IO</sub>	Input offset voltage	$V_S = 3.3\text{V}, 12\text{V and }40\text{V}$	-4.5	±0.5	4.5	mV
		$V_S = 3.3\text{V}, 12\text{V and }40\text{V}, T_A = -40^\circ\text{C to }+125^\circ\text{C}$	-6.5		6.5	
dV <sub>IO</sub> /dT	Input offset voltage drift	$T_A = -40^\circ\text{C to }+125^\circ\text{C}$		±2.5		µV/°C
V <sub>HYS</sub>	Input hysteresis voltage			14		mV
V <sub>CM</sub>	Common-mode voltage range	$T_A = -40^\circ\text{C to }+125^\circ\text{C}$	(V-) - 0.2		(V+) + 0.2	V
I <sub>B</sub>	Input bias current			0.05		pA
I <sub>OS</sub>	Input offset current			0.05		pA
PSRR	Power-supply rejection ratio	$V_{CM} = V_-$		95		dB
CMRR	Common-mode rejection ratio	$(V_-) < V_{CM} < (V_+)$		80		dB
V <sub>OL</sub>	Voltage output swing from (V-)	$I_{SINK} \leq 5\text{mA}$ , input overdrive = -100 mV, $V_S = 5\text{V}, T_A = -40^\circ\text{C to }+125^\circ\text{C}$			300	mV
V <sub>OH</sub>	Voltage output swing from (V+)	$I_{SOURCE} \leq 5\text{mA}$ , input overdrive = +100 mV, $V_S = 5\text{V}, T_A = -40^\circ\text{C to }+125^\circ\text{C}$			300	mV
I <sub>sc_source</sub>	Peak charging current (sourcing) with output shorted to V- <sup>(1)</sup>	$V_S = 5\text{ V to }40\text{ V}$		100		mA
I <sub>sc_sink</sub>	Peak dis-charging current (sinking) with output shorted to V+ <sup>(1)</sup>	$V_S = 5\text{ V to }40\text{ V}$		100		mA
I <sub>Q</sub>	Quiescent current	$V_S = 12\text{ V}$ , no load, $V_{ID} = -0.1\text{ V}$ (output low), $T_A = 25^\circ\text{C}$		135	200	µA
		$V_S = 12\text{V to }40\text{V}$ no load, $V_{ID} = -0.1\text{ V}$ (output low), $T_A = -40^\circ\text{C to }+125^\circ\text{C}$			400	µA
t <sub>OFF</sub>	Time to enter shutdown	$C_L = 15\text{ pF}$		1.0		µs
t <sub>ON</sub>	Time to exit shutdown	$C_L = 15\text{ pF}$		2.3		µs
V <sub>SD</sub>	Shutdown input: voltage range <sup>(2)</sup>	$V_S = 3.3\text{ to }40\text{V}, T_A = -40\text{ to }125^\circ\text{C}$	0		5.5	V
V <sub>SD_VIH</sub>	SHDN pin input high level	$V_S = 3.3\text{ V and }40\text{V}, T_A = -40\text{ to }125^\circ\text{C}$	2	1.35		V
V <sub>SD_VIL</sub>	SHDN pin input low level	$V_S = 3.3\text{ V and }40\text{V}, T_A = -40\text{ to }125^\circ\text{C}$		0.65	0.4	V
I <sub>B-SDH</sub>	SHDN bias current	$V_S = V_{SD} = 5.5\text{ V}$		0.015		nA
		$V_S = 5\text{ V}, V_{SD} = 0\text{ V}$		0.001		nA
I <sub>Q-SD</sub>	Quiescent current (Shutdown)	$V_S = 12\text{V}; T_S = 25^\circ\text{C}; V_{SD} > V_{SD\_VIH\ Min}$		9.5	13	µA

(1) Continuous short circuit can result in excessive heating and exceeding the maximum allowed junction temperature of 150°C. Please refer to the Maximum Output Current Derating curve in the Typical Operation Plots.

(2) The recommended voltage range if  $V_{SD}$  is independent of  $V_S$ .

## 7.6 Switching Characteristics

Typical values are at  $T_A = 25^\circ\text{C}$ ,  $V_S = 12\text{ V}$ ,  $V_{CM} = V_S / 2$ ; Input overdrive = 100 mV (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>PHL</sub>	Propagation delay time, high-to-low <sup>(1)</sup>	$C_L = 15\text{ pF}$		250		ns
		$C_L = 4\text{ nF}$		450		ns
t <sub>PLH</sub>	Propagation delay time, low-to-high <sup>(1)</sup>	$C_L = 15\text{ pF}$		250		ns
		$C_L = 4\text{ nF}$		500		ns
t <sub>R</sub>	Rise time	20% to 80%, $C_L = 15\text{ pF}$		18		ns
		20% to 80%, $C_L = 4\text{ nF}$		0.3		µs
t <sub>F</sub>	Fall time	20% to 80%, $C_L = 15\text{ pF}$		10		ns
		20% to 80%, $C_L = 4\text{ nF}$		0.26		µs

(1) High-to-low and low-to-high refers to the transition at the input.

### Switching Characteristics (continued)

Typical values are at  $T_A = 25^\circ\text{C}$ ,  $V_S = 12\text{ V}$ ,  $V_{CM} = V_S / 2$ ; Input overdrive = 100 mV (unless otherwise noted).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{START}$	Power-up time <sup>(2)</sup>		45		$\mu\text{s}$

(2) During power on,  $V_S$  must exceed 3.3 V for  $t_{ON}$  before the output is in a correct state.

## 8 Detailed Description

### 8.1 Overview

The TLV1805 comparator features a rail-to-rail inputs with a push-pull output stage that operates at supply voltages as high as 40 V or  $\pm 20$  V. The rail-to-rail input stage enables detection of signals close to the supply and ground while the push-pull output stage creates fast transition edges to either supply rail. A low supply current of 135  $\mu$ A per channel with small, space-saving packages, makes these comparators versatile for use in a wide range of applications, from portable to industrial.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Rail to Rail Inputs

The TLV1805 comparator features a CMOS input with a common-mode range that includes both supply rails. The TLV1805-Q1 is designed to prevent phase inversion when the input pins exceed the supply voltage.

#### 8.3.2 Power On Reset

The TLV1805 incorporates a power-on reset that holds the output in a High-Z state until the minimum operating supply voltage has been reached for at least 20 $\mu$ s. After this time the output will start responding to the inputs. This feature prevents false outputs during power-up and power-down.

#### 8.3.3 High Power Push-Pull Output

The push-pull output stage, which is unique for high-voltage comparators, offers the advantage of allowing the output to actively drive the load to either supply rail with a fast edge rate. A high output sink and source peak current of over 100mA allows quickly charging and discharging capacitive loads such as cables and power MOSFET gates. Caution must be taken to ensure that the package power dissipation is not exceeded when switching at these high supply voltages. See [Figure 22](#) for the output current derating curve.

#### 8.3.4 Shutdown Function

The TLV1805 has a logic level SHDN input. When the shutdown SHDN input is 1.4V above V-, the TLV1805 is disabled. When disabled, the output becomes high impedance (Hi-Z), and the supply current drops to below 10 $\mu$ A. The input bias current remains unchanged. Voltages may still be applied to the comparator inputs as long as V+ power is still applied and the applied input voltages are still within the specified input voltage range.

## Feature Description (continued)

### 注意

The maximum voltage on the shutdown pin is +5.5V referred to V-, regardless of supply voltage. Connect the SHDN pin to V- if shutdown is not used. Do not float the SHDN pin.

A high value pull-up or pull-down resistor on the output may be required if a specific logic level is required during shutdown (when the output is High-Z). This prevents logic inputs from floating to illegal states when the comparator output is in High-Z mode.

Since the Shutdown threshold voltage is a tested parameter, the shutdown pin can also be used as a second comparison input to provide a secondary measurement, such as overvoltage monitoring, as shown in the [P-Channel Reverse Current Protection With Overvoltage Protection](#) circuit.

### 8.3.5 Internal Hysteresis

The TLV1805 contains 14mV of internal hysteresis.

The hysteresis transfer curve is shown in [Figure 63](#). This curve is a function of three components:  $V_{TH}$ ,  $V_{OS}$ , and  $V_{HYST}$ :

- $V_{TH}$  is the actual set voltage or threshold trip voltage.
- $V_{OS}$  is the internal offset voltage between  $V_{IN+}$  and  $V_{IN-}$ . This voltage is added to  $V_{TH}$  to form the actual trip point at which the comparator must respond to change output states.
- $V_{HYST}$  is the internal hysteresis (or trip window) that is designed to reduce comparator sensitivity to noise (14 mV for the TLV1805).

**Figure 63. Hysteresis Transfer Curve**

## 8.4 Device Functional Modes

### 8.4.1 External Hysteresis

External Hysteresis may be added to further improve response to noisy or slow-moving input signals.

## Device Functional Modes (continued)

### 8.4.1.1 Inverting Comparator With Hysteresis

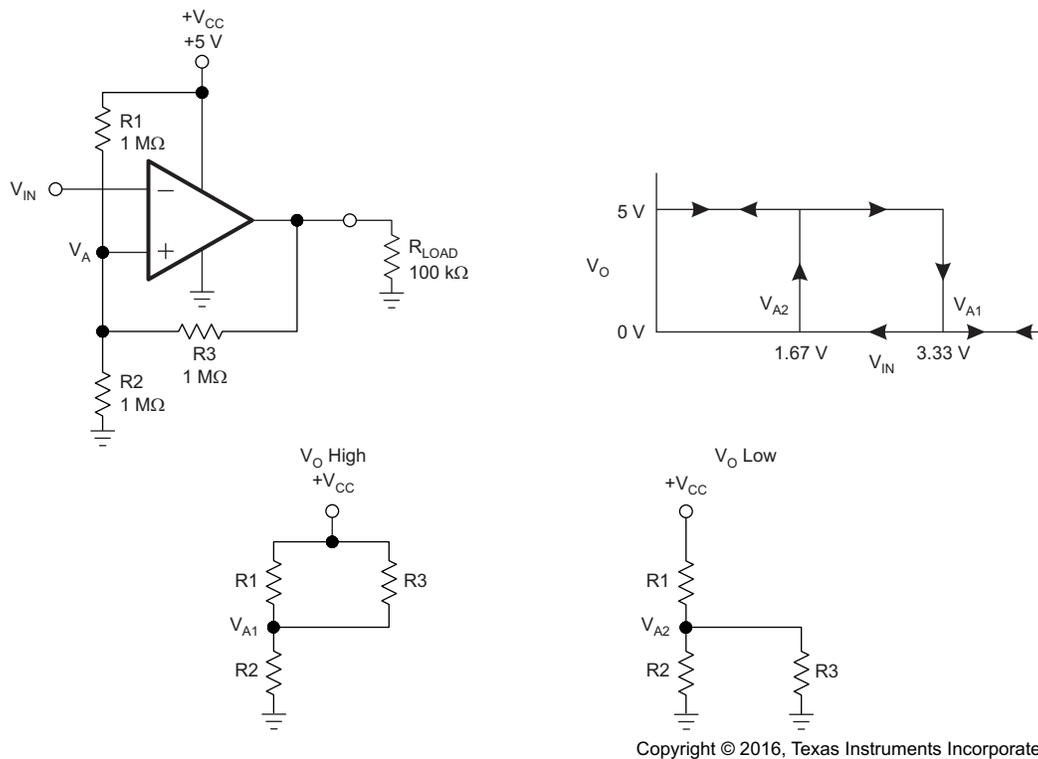

FIG 64. TLV1805 in an Inverting Configuration With Hysteresis

The inverting comparator with hysteresis requires a three-resistor network that is referenced to the comparator supply voltage ( $V_{CC}$ ), as shown in FIG 64. When  $V_{IN}$  at the inverting input is less than  $V_A$ , the output voltage is high (for simplicity, assume  $V_O$  switches as high as  $V_{CC}$ ). The three network resistors can be represented as  $R1 \parallel R3$  in series with  $R2$ . 式 1 defines the high-to-low trip voltage ( $V_{A1}$ ).

$$V_{A1} = V_{CC} \times \frac{R2}{(R1 \parallel R3) + R2} \quad (1)$$

When  $V_{IN}$  is greater than  $V_A$ , the output voltage is low, very close to ground. In this case, the three network resistors can be presented as  $R2 \parallel R3$  in series with  $R1$ . Use 式 2 to define the low to high trip voltage ( $V_{A2}$ ).

$$V_{A2} = V_{CC} \times \frac{R2 \parallel R3}{R1 + (R2 \parallel R3)} \quad (2)$$

式 3 defines the total hysteresis provided by the network.

$$\Delta V_A = V_{A1} - V_{A2} \quad (3)$$

**Device Functional Modes (continued)**
**8.4.1.2 Noninverting Comparator With Hysteresis**

Copyright © 2016, Texas Instruments Incorporated

**FIG 65. TLV1805-Q1 in a Noninverting Configuration With Hysteresis**

A noninverting comparator with hysteresis requires a two-resistor network, as shown in FIG 65, and a voltage reference ( $V_{REF}$ ) at the inverting input. When  $V_{IN}$  is low, the output is also low. For the output to switch from low to high,  $V_{IN}$  must rise to  $V_{IN1}$ . Use 式 4 to calculate  $V_{IN1}$ .

$$V_{IN1} = R1 \times \frac{V_{REF}}{R2} + V_{REF} \quad (4)$$

When  $V_{IN}$  is high, the output is also high. For the comparator to switch back to a low state,  $V_{IN}$  must drop to  $V_{IN2}$  such that  $V_A$  is equal to  $V_{REF}$ . Use 式 5 to calculate  $V_{IN2}$ .

$$V_{IN2} = \frac{V_{REF} (R1 + R2) - V_{CC} \times R1}{R2} \quad (5)$$

The hysteresis of this circuit is the difference between  $V_{IN1}$  and  $V_{IN2}$ , as shown in 式 6.

$$\Delta V_{IN} = V_{CC} \times \frac{R1}{R2} \quad (6)$$

## 9 Application and Implementation

### 注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TLV1805 family of devices can be used in a wide variety of applications, such as MOSFET gate drivers, zero crossing detectors, window comparators, over and undervoltage detectors, and high-side voltage sense circuits.

### 9.2 Typical Applications

Comparators are used to differentiate between two different signal levels. For example, a comparator differentiates between an over-temperature and normal-temperature condition. However, noise or signal variation at the comparison threshold causes multiple transitions. This application example sets upper and lower hysteresis thresholds to eliminate the multiple transitions caused by noise.

图 66. Comparator with Hysteresis

#### 9.2.1 Design Requirements

The design requirements are as follows:

- Supply voltage: 5 V
- Input: 0 V to 5 V
- Lower threshold ( $V_L$ ) = 2.3 V  $\pm$ 0.1 V
- Upper threshold ( $V_H$ ) = 2.7 V  $\pm$ 0.1 V
- $V_H - V_L = 2.4$  V  $\pm$ 0.1 V
- Low-power consumption

#### 9.2.2 Detailed Design Procedure

A small change to the comparator circuit can be made to add hysteresis. Hysteresis uses two different threshold voltages to avoid the multiple transitions introduced in the previous circuit. The input signal must exceed the upper threshold ( $V_H$ ) to transition low, or below the lower threshold ( $V_L$ ) to transition high.

图 66 illustrates hysteresis on a comparator. Resistor  $R_H$  sets the hysteresis level.

When the output is at a logic high (5 V),  $R_H$  is in parallel with  $R_X$ . This configuration drives more current into  $R_Y$ , and raises the threshold voltage ( $V_H$ ) to 2.7 V. The input signal must drive above  $V_H = 2.7$  V to cause the output to transition to logic low (0 V).

## Typical Applications (continued)

When the output is at logic low (0 V),  $R_h$  is in parallel with  $R_y$ . This configuration reduces the current into  $R_y$ , and reduces the threshold voltage to 2.3 V. The input signal must drive below  $V_L = 2.3$  V to cause the output to transition to logic high (5 V).

For more details on this design, refer to Precision Design [TIPD144](#), *Comparator with Hysteresis Reference Design*.

### 9.2.3 Application Curve

Figure 67 shows the upper and lower thresholds for hysteresis. The upper threshold is 2.76 V and the lower threshold is 2.34 V, both of which are close to the design target.

Figure 67. TLV1805 Upper and Lower Threshold with Hysteresis

## Typical Applications (continued)

### 9.2.4 Reverse Current Protection Using MOSFET and TLV1805

An N-Channel or P-Channel MOSFET may be used to protect against reverse current. Reverse current is defined as current flowing from the load ( $V_{LOAD}$ ) to the source ( $V_{BATT}$ ). Both the P-Channel and N-Channel circuits work on the same basic principle, where a comparator monitors the voltage across the MOSFET's Source and Drain terminals (monitoring  $V_{DS}$ ). The described circuits also protect against reverse voltage.

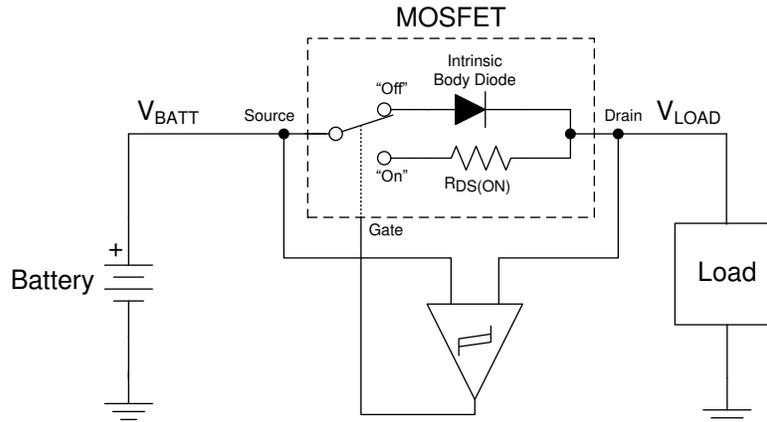

FIG 68. Simplified Operational Theory

When the current is flowing from the battery ( $V_{BATT}$ ) to the load ( $V_{LOAD}$ ), the battery voltage will be higher than the load voltage due to voltage drop across the MOSFET caused by the  $R_{DS(ON)}$  or the intrinsic body diode forward voltage drop. The comparator will detect this and turn "on" the MOSFET so that the load current is now flowing through the low loss  $R_{DS(ON)}$  path.

In a reverse current condition,  $V_{LOAD}$  will be higher than  $V_{BATT}$ . The comparator will detect this and drive the gate to set  $V_{GS} = 0$  to turn "off" the MOSFET (non-conducting). The body diode is reverse biased and will block current flow.

For a P-Channel MOSFET, the gate must be driven at least 4V or more *below* the battery voltage to turn "on" the MOSFET.

For a N-Channel MOSFET, the gate must be driven 4V or more *above* the battery voltage to turn "on" the MOSFET. If a higher voltage is not available in the system, a charge pump is usually required to generate a voltage higher than the battery voltage to provide the necessary positive gate drive voltage.

#### 9.2.4.1 Minimum Reverse Current

There is a minimum amount of reverse current that is needed to trip the comparator. To detect this reverse current, a voltage must be dropped across the MOSFET ( $V_{MEAS}$ ).

When the MOSFET is off,  $V_{GS}$  will be in the -600mV to -1V range due to the forward voltage drop ( $V_F$ ) of the MOSFET body diode. Response to this large voltage will be immediate.

However, with the MOSFET "on" (conducting), the current required to create the trip voltage will be much greater. The trip voltage drop required across the MOSFET  $R_{DS(ON)}$  will be the comparator offset voltage plus half of the hysteresis.

The maximum offset voltage of the TLV1805 is 5mV with a typical hysteresis of 14mV. The trip voltage can be calculated from:

$$V_{TRIP} = V_{OS(max)} + (V_{HYST} / 2) = 5 \text{ mV} + 7 \text{ mV} = 12 \text{ mV} \quad (7)$$

The actual current trip point will depend on the MOSFET  $R_{DS(ON)}$  and  $V_{GS}$  drive level. Assuming the MOSFET has a 22 m $\Omega$  on resistance, the trip current is found from:

$$I_{TRIP} = V_{TRIP} / R_{DS(ON)} = 12 \text{ mV} / 22 \text{ m}\Omega = 546\text{mA} \quad (8)$$

## Typical Applications (continued)

### 9.2.4.2 N-Channel Reverse Current Protection Circuit

In order to turn "on" the N-Channel MOSFET, the MOSFET gate must be brought "High" above  $V_{BATT}$ . If a higher voltage is not available, a charge pump circuit is required to provide the comparator with a supply voltage above  $V_{BATT}$ .

Fig 69. N-Channel Reverse Current Schematic with Oscillator

C1, D1, D2 & C2 form the charge pump. The AC drive signal is applied through C1 into the charge pump. The result is a voltage across C2 that is approximately equal to the peak-to-peak amplitude of the AC waveform, minus 700mV. If a 12Vpp waveform is applied to the C1 input, 11.3V will be generated across C2. This voltage is on top of the  $V_{BATT}$  voltage, so the voltage seen from the D2-C2 junction ground is 23.3V. This provides the needed higher voltage to drive the MOSFET and power the comparator.

An external oscillator source may be used, such as the gate drive output of a switcher, system clock or any available clock source in the 1kHz to 10MHz range. The charge pump should be fed by a 50 percent duty cycle square wave source of 5Vpp or more. Since the input capacitor of the charge-pump effectively AC-couples the input, the oscillator may be ground referenced.

R1 and D3 form the comparator supply clamp to limit the gate drive to prevent exceeding the  $V_{GS(MAX)}$  of the MOSFET during an overvoltage event. R1 must be sized to dissipate any expected overvoltage.

D4 and R2 clamp the input should  $V_{BATT}$  drop below  $V_{LOAD}$  (as in a supply reversal).

The output diode D6 is used to anchor the output during light or floating loads. At light or no loads, there is a possibility the MOSFET could turn on due to the comparator offset voltage. The diode provides enough of a negative leakage to turn the MOSFET off.

#### 9.2.4.2.1 N-Channel Oscillator Circuit

The oscillation frequency is determined by R5 and C5. The default configuration oscillates around 10kHz (depending on RC component tolerances). For further information on selecting these RC values, please see the Engineers Cookbook Circuit entitled [Oscillator Circuit \(SNOA990\)](#). Do note that R5 does present an AC load to the oscillator output, and should be sized appropriately to minimize the peak charging currents of C5 (use large resistors and small capacitors).

## Typical Applications (continued)

The output amplitude is roughly equivalent to the  $V_{LOAD}$  voltage minus the TLV1805 output saturation (approximately 300mV). With a maximum supply voltage of 40V for the TLV1805, the oscillator circuit is capable of generating up to 39Vpp!

The TLV1805 oscillator typically starts oscillating when  $V_{LOAD}$  reaches 2.8V, though full specified operation does not occur until 3.3V.

For more information, please see the TLV1805-Q1 Evaluation Module Users Guide [TLV1805-Q1 Evaluation Module Users Guide \(SNOU158\)](#).

### 9.2.5 P-Channel Reverse Current Protection Circuit

Figure 70 shows the P-Channel circuit. In order to turn "on" the P-Channel MOSFET, the gate must be brought "Low" below  $V_{BATT}$ . To accomplish this, the comparators inverting input is tied to the battery side of the MOSFET to set the output low during forward current.

Figure 70. P-Channel Reverse Current Schematic

This design implements a "floating ground" topology, using D3, D4 and R12, to allow for clamping the comparator supply voltage as to not exceed the  $V_{GS(MAX)}$  of the MOSFET. During a reverse voltage or supply drop, D4 also prevents C1 from discharging to allow some standby time to keep the comparator powered during the event.

During "normal" forward current operation, the quiescent current of the comparator circuit flows through D4 and R4. D3 provides the clamping during an overvoltage event.

R4 is sized to allow for minimum voltage drop during "normal" operation, but also to allow for dissipation during overvoltage events. R4 will see the battery voltage minus the D3 Zener voltage during an overvoltage event. Since the comparator supply voltage is clamped by D3, the maximum battery voltage is determined by the power dissipated by R4 and the  $V_{DS(MAX)}$  of the MOSFET.

R2 limits the gate current should there be any transients and should be a low value to allow the peak currents needed to drive the MOSFET gate capacitance. R3 provides the pull-down needed when the comparator output goes high-Z during power-off to ensure the gate is pulled to zero volts to turn off the MOSFET.

R1 and D2 clamp the input voltage should the  $V_{BATT}$  input go below the floating ground Voltage (such as in a battery reversal). A bonus feature is that during a reverse battery voltage condition, D2 and R1 pull the floating ground down towards the negative potential, providing power to the comparator during reverse voltage.

The output clamp diode D5 is used to anchor the output during light or floating loads. At light or no loads, there is a possibility the MOSFET could turn on due to the comparator offset voltage. The diode provides enough of a negative leakage to turn the MOSFET off.

## Typical Applications (continued)

### 9.2.7 OR'ing MOSFET Controller

The previous reverse current circuits may be combined to create an OR'ing supply controller, utilizing either the P-Channel or N-Channel topologies.

For the previous P-Channel circuit, if no negative input voltages are possible, and the input voltage is below the MOSFET's  $V_{GS(MAX)}$ , then D3, D4 and R4 may be eliminated (the D2 anode, U1 pins 2 and 5, and C1 can be directly grounded).

For the N-Channel circuit, the oscillator drive can be shared between the channels, or eliminated if a higher system voltage is available to provide the higher voltage.

图 72. N-Channel OR'ing MOSFET Controller

## 10 Power Supply Recommendations

The TLV1805 family of devices is specified for operation from 3.3 V to 40 V ( $\pm 1.65$  to  $\pm 20$  V); many specifications apply from  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in the *Typical Characteristics* section.

### 注意

Supply voltages larger than 40 V can permanently damage the device; see the *Recommended Operating Conditions* section.

Place 0.1- $\mu\text{F}$  bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement; see the [Layout Guidelines](#) section.

The TLV1805 does not contain reverse battery protection, so applying negative voltage to the supply pins must be avoided. The TLV1805 cannot withstand ISO 16750 type waveforms alone and requires external protection circuitry.

## 11 Layout

### 11.1 Layout Guidelines

Comparators are very sensitive to input noise. For best results, maintain the following layout guidelines:

- Use a printed circuit board (PCB) with a good, unbroken low-inductance ground plane. Proper grounding (use of ground plane) helps maintain specified performance of the TLV1805 family of devices.
- To minimize supply noise, place a decoupling capacitor (0.1- $\mu\text{F}$  ceramic, surface-mount capacitor) as close as possible to  $V_S$  as shown in [Figure 73](#).
- On the inputs and the output, keep lead lengths as short as possible to avoid unwanted parasitic feedback around the comparator. Keep inputs away from the output.
- Solder the device directly to the PCB rather than using a socket.
- Run the ground pin ground trace under the device up to the bypass capacitor, shielding the inputs from the outputs.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
