

TLV3801/TLV3802/TLV3811(C) LVDS 出力、225ps の高速コンパレータ

1 特長

- 小さい伝搬遅延時間: 225ps
- 小さいオーバードライブ分散: 5ps
- 静止電流: 17 mA
- 高いトグル周波数: 3GHz/6Gbps
- 狭パルス幅検出性能: 240ps
- LVDS 出力
- 入力と出力のグランド基準電圧を分離
- 単一電源電圧: 2.7V~5.25V
- 低い入力オフセット電圧: $\pm 0.5\text{mV}$
- 内部 2mV ヒステリシス: TLV380x
- 内部 1.1mV ヒステリシス: TLV3811
- 内部 0mV ヒステリシス: TLV3811C
- パッケージ: TLV3801 (8ピン WSON)、TLV3811(C) (6ピン DSBGA)、TLV3802 (12ピン WSON)

2 アプリケーション

- LIDAR の距離センシング
- タイム・オブ・フライト (ToF) センサ
- オシロスコープとロジック・アナライザの高速トリガ機能
- 高速差動ライン・レシーバ
- ドローン・ビジョン

3 概要

TLV380x/TLV3811(C) は、広い電源電圧範囲と 3GHz の非常に高いトグル周波数に対応する 225ps 高速コンパレータです。動作電源電圧範囲が 2.7V~5.25V (単一電源の場合)、2.7V~5.25V (分割電源の場合) であることに加えて、これらの機能はすべて業界標準の小型パッケージで供給されるため、これらのデバイスは LIDAR、差動ラ

イン・レシーバ・アプリケーション、試験 / 測定システムに最適です。

TLV380x/TLV3811(C) は、5ps という非常に強力な入力オーバードライブ性能と、わずか 240ps の狭パルス幅性能を備えています。ばらつきの小さい伝搬遅延特性 (入力オーバードライブ起因) と、短いパルスを検出する能力を併せ持つこれらのデバイスは、ファクトリ・オートメーション、ドローン・ビジョンなどのタイム・オブ・フライト (ToF) アプリケーションに最適です。

TLV380x/TLV3811(C) の低電圧差動信号 (LVDS) 出力は、データ スループットの向上と消費電力の最適化にも役立ちます。同様に相補出力は、各出力の同相ノイズを抑制することで、EMI 低減に役立ちます。LVDS 出力は、アプリケーション内の下流の大半の FPGA や CPU など、標準 LVDS 入力を受け入れるその他のデバイスの直接駆動およびインターフェイスを可能にします。

TLV3801 および TLV3802 は 8 ピン WSON パッケージおよび 12 ピン WSON パッケージ、TLV3811(C) は超小型の 6 ピン WCSP パッケージで提供されているため、光学センサ モジュールなどスペースの制約が厳しいアプリケーションに適しています。

製品情報

部品番号	パッケージ (1)	本体サイズ (公称)
TLV3801	WSON (8)	2.00mm × 2.00mm
TLV3811(C)	DSBGA (6)	1.218mm × 0.818mm
TLV3802	WSON (12)	3.00mm × 2.00mm

1. 利用可能なすべてのパッケージについては、データシートの末尾にある注文情報を参照してください。

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Supply voltage: ($V_{CC} - V_{EE}$) and ($V_{CC} - GND$) ⁽²⁾	-0.3	5.5	V
Input pins (IN+, IN-) from V_{EE} (WSON) ⁽³⁾	$V_{EE} - 0.3$	$V_{CC} + 0.3$	V
Input pins (IN+, IN-) from GND (DSBGA) ⁽⁴⁾	GND - 0.3	$V_{CC} + 0.3$	V
Current into input pins (IN+, IN-)	-10	10	mA
Output (OUT+, OUT-)	GND	V_{CC}	V
Current into output pins (OUT+, OUT-)		10	mA
Junction temperature, T_J		150	°C
Storage temperature, T_{stg}	-65	150	°C

- Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- V_{EE} less than or equal to GND
- Input terminals are diode-clamped to V_{EE} and V_{CC}
- Input terminals are diode-clamped to GND and V_{CC}

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±1000	

- JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.
- JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

6.3 Thermal Information

THERMAL METRIC ⁽¹⁾		TLV3801	TLV3811(C)	TLV3802	UNIT
		DSG (WSON)	YBG (DSBGA)	DSS (WSON)	
		8 PINS	6 PINS	12 PINS	
R_{qJA}	Junction-to-ambient thermal resistance	69.4	132.1	63.2	°C/W
$R_{qJC(top)}$	Junction-to-case (top) thermal resistance	95.7	1.4	61.9	°C/W
R_{qJB}	Junction-to-board thermal resistance	36.2	41	30.7	°C/W
γ_{JT}	Junction-to-top characterization parameter	3.5	0.3	2.4	°C/W
γ_{JB}	Junction-to-board characterization parameter	36.0	41	30.7	°C/W
$R_{qJC(bot)}$	Junction-to-case (bottom) thermal resistance	9.4	n/a	8.7	°C/W

- For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) report.

6.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Single supply operation: $V_{CC} - V_{EE}$ with $V_{EE} = GND$	2.7	5.25	V
Split supply operation: $V_{CC} - V_{EE}$ with $V_{EE} < GND$ (WSON)	2.7	5.25	V
Split supply operation: $V_{CC} - GND$ with $V_{EE} < GND$ (WSON)	2.4	5.25	V
Input voltage range (WSON)	$V_{EE} + 1.5$	$V_{CC} + 0.1$	V
Input voltage range (DSBGA)	GND + 1.5	$V_{CC} + 0.1$	V
Differential Input voltage range	-1.5	+1.5	V

6.4 Recommended Operating Conditions (続き)

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Ambient temperature, T_A	-40	125	°C

6.5 Electrical Characteristics

For $V_{CC} = 3.3\text{ V}$, $V_{EE} = \text{GND} = 0$, $V_{CM} = 2.5\text{ V}$ at $T_A = 25^\circ\text{C}$ (Unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

7 Detailed Description

7.1 Overview

The TLV380x/TLV3811(C) are high-speed comparators with LVDS output. The fast response time of these comparators make them well suited for applications that require narrow pulse width detection or high toggle frequencies. The TLV3801 is available in the 8-pin WSON package and the TLV3802 is available in the 12-pin WSON package while the TLV3811(C) is available in the 6-pin DSBGA package.

7.2 Functional Block Diagram

7.3 Feature Description

The TLV380x/TLV3811(C) are high-speed comparators with a typical propagation delay of 225 ps and LVDS output. The minimum pulse width detection capability is 240 ps and the typical toggle frequency is 3 GHz (6 Gbps). These comparators are well suited for distance sensing for LIDAR and time-of-flight applications as well as for high-speed test and measurement systems. The TLV380x has two separate power rails for the input and the output; this allows the input to be referenced from either single or split supply (VCC and VEE) while the output is referenced from ground (VCC and GND). On the other hand, the TLV3811(C) has one power rail for both inputs and outputs and can only be operated at a single supply.

7.4 Device Functional Modes

The TLV380x has a single functional mode and is operational on the condition that both the input supply voltage (VCC - VEE) is greater than or equal to 2.7 V and the output supply voltage (VCC - GND) is greater than or equal to 2.4 V.

The TLV3811(C) has a single functional mode and is operational when the power supply voltage (VCC - GND) is greater than or equal to 2.7 V.

7.4.1 Inputs

The TLV380x/TLV3811(C) feature an input stage, capable of operating between 1.5 V above VEE (GND for TLV3811(C)) and 0.1 V above VCC, with an internal ESD protection circuit that includes two pairs of front-to-back diodes between IN+ and IN- as well as two 50 Ω resistors, as shown in [Figure 7-1](#). This prevents damage to the input stage by limiting the differential input voltage to be no more than twice the diode's forward-voltage drop $2 \times V_F$ (2×0.7 V).

図 7-1. Input Stage Circuitry

When the differential input voltage exceeds $2 \times V_F$, the input bias current increases at the input pins IN+ and IN-, as shown in 式 1.

$$\text{Input Current} = [(V_{IN+} - V_{IN-}) - 2 \times V_F] / (2 \times 50) \quad (1)$$

To avoid damaging the inputs when exceeding the recommended input voltage range, an external resistor should be used to limit the current. The current should be limited to less than 10 mA.

7.4.2 LVDS Output

The TLV380x/TLV3811(C) outputs are LVDS compliant. When the input of the downstream device is terminated with a 100 Ω resistor, the comparators provide a ± 350 mV differential swing at an output common-mode voltage of 1.25 V above GND. Fully differential outputs enable fast digital toggling and reduce EMI compared to single-ended output standards.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Capacitive Loads

Under reasonable capacitive loads, the device maintains specified propagation delay. However, excessive capacitive loading under high switching frequencies may increase supply current, propagation delay, or induce decreased slew rate.

8.1.2 Hysteresis

A comparator's high, open-loop gain creates a small band of input differential voltage where the comparator may produce "chatter" which causes the output to toggle back and forth between a "logic high" and a "logic low". This can cause design challenges for inputs with slow rise and fall times or systems with excessive noise. These challenges can be prevented by adding hysteresis to the comparator. However, hysteresis must be added strategically when input signals are small since it can cause signals to go undetected. As a result, TLV3811C is optimized for detecting small, fast-switching inputs and has 0 mV of internal hysteresis. On the other hand, for detecting larger input signals in the presence of noise, the TLV3811 has 1.1 mV of internal hysteresis and TLV3801 and TLV3802 have 2 mV.

Since the TLV380x/TLV3811(C) only have a minimal amount of internal hysteresis, external hysteresis can be applied in the form of a positive feedback loop that adjusts the trip point of the comparator depending on its current output state. See the [Non-Inverting Comparator With Hysteresis](#) section for more details.

8.2 Typical Application

8.2.1 Optical Receiver

The TLV380x/TLV3811(C) can be used in conjunction with a high performance amplifier such as the OPA858 to create an optical receiver as shown in the [Figure 8-1](#). The photodiode operates in photoconductive mode: exposure to light will cause a reverse current through the photodiode. A bias voltage is applied to the op amp's non-inverting input to prevent saturation at the negative power supply. The OPA858 takes the current conducting through the diode and translates it into a voltage for a high speed comparator to detect. The TLV380x/TLV3811(C) will then output the proper LVDS signal according to the threshold set (V_{REF}).

図 8-1. Optical Receiver

8.2.1.1 Design Requirements

表 8-1. Design Parameters

PARAMETER	VALUE
V_{CC}	+5 V
V_{EE}	0 V
$V_{OUT, SWING}$	100 mV
I_{DIODE}	100 μ A
f_p	159 MHz

8.2.1.2 Detailed Design Procedure

Set V_{BIAS} to be in the recommended common-mode voltage range of the OPA858. This is also the minimum output voltage of the op amp $V_{OUT, MIN}$ as the op amp will attempt to settle at the voltage applied to the non-inverting input.

The maximum output voltage of the op amp $V_{OUT, MAX}$ can be calculated from the desired output voltage swing $V_{OUT, SWING}$ and $V_{OUT, MIN}$, as shown in 式 2.

$$V_{OUT, MAX} = V_{OUT, SWING} + V_{OUT, MIN} \quad (2)$$

The gain resistor R_F is determined by the desired $V_{OUT, MAX}$ and $V_{OUT, MIN}$ and the maximum current I_{DIODE} through the diode, as shown in 式 2.

$$R_F = (V_{OUT, MAX} - V_{OUT, MIN}) / I_{DIODE} \quad (3)$$

The feedback capacitor, in combination with the gain resistor, forms a pole in the frequency response of the amplifier. The feedback capacitor can be determined by the gain resistor and the desired pole frequency f_p , as shown in 式 2.

$$C_F = 1 / (2 \times \pi \times R_F \times f_p) \quad (4)$$

Set V_{REF} to be the switching threshold voltage between $V_{OUT, MAX}$ and $V_{OUT, MIN}$.

TLV3801, TLV3802, TLV3811

JAJSLB5C – DECEMBER 2021 – REVISED DECEMBER 2023

Select values for V_{BIAS} and V_{REF} . Plug in given values for $V_{OUT, MAX}$, I_{DIODE} , and f_p . For the given example, $V_{BIAS} = 1.5\text{ V}$, $V_{REF} = 1.55\text{ V}$, and R_F, C_F is solved as $1\text{ k}\Omega$ and 1 pF , respectively.

For more information, please refer to the op amp tutorials for stability analysis on the transimpedance amplifier [Spice Stability Analysis](#) and [Op Amp Stability](#). See application note SBOA268A [Transimpedance Amplifier Circuit](#) for more detailed procedures.

図 8-2. Optical Receiver Output Waveforms

8.2.2 Non-Inverting Comparator With Hysteresis

A way to implement external hysteresis is to add two resistors to the circuit: one in series between the reference voltage and the inverting pin, and another from the inverting pin to one of the differential output pins.

図 8-3. Non-Inverting Comparator with Hysteresis Circuit

8.2.2.1 Design Requirements

表 8-2. Design Parameters

PARAMETER	VALUE
V_{HYS}	50 mV
V_{REF}	2.5 V

表 8-2. Design Parameters (続き)

PARAMETER	VALUE
V_{T1}	2.34 V
V_{T2}	2.29 V
Q	1.375 V
\bar{Q}	1.025 V

8.2.2.2 Detailed Design Procedure

First, create an equation for V_T that covers both output voltages when the output is high or low.

$$V_{T1} = \frac{V_{REF}R_2 + QR_1}{R_1 + R_2} \quad (5)$$

$$V_{T2} = \frac{V_{REF}R_2 + \bar{Q}R_1}{R_1 + R_2} \quad (6)$$

The hysteresis voltage in this network is equal to the difference in the two threshold voltage equations.

$$V_{HYS} = V_{T1} - V_{T2} \quad (7)$$

$$V_{HYS} = \frac{V_{REF}R_2 + QR_1}{R_1 + R_2} - \frac{V_{REF}R_2 + \bar{Q}R_1}{R_1 + R_2} \quad (8)$$

$$V_{HYS} = \frac{(Q - \bar{Q})R_1}{R_1 + R_2} \quad (9)$$

$$V_{HYS} = \frac{V_{OD}R_1}{R_1 + R_2} \quad (10)$$

Note that these equations do not take into account the effects of the internal hysteresis and offset voltage of the comparator. Design parameters will need to be adjusted accordingly.

Select a value for R_2 . Plug in given values for V_{REF} , V_{T1} , V_{T2} , Q , and \bar{Q} , and solve for R_1 . For the given example, $R_2 = 50 \text{ k}\Omega$, and R_1 is solved as $= 8.3 \text{ k}\Omega$.

8.2.2.3 Application Performance Plots

図 8-4. Hysteresis Curve for LVDS Comparator

8.2.3 Logic Clock Source to LVDS Transceiver

The 図 8-5 shows a logic clock source being terminated and driven with the TLV3802/TLV3811(C) across a CAT6 Cable to receive an equivalent LVDS clock signal at the receiver end.

図 8-5. LVDS Clock Transceiver

8.2.4 External Trigger Function for Oscilloscopes

図 8-6 is a typical configuration for creating an external trigger on oscilloscopes. The user adjusts the trigger level, and a DAC converts this trigger level to a voltage the TLV380x/TLV3811(C) can use as a reference. The input voltage from an oscilloscope channel is then compared to the trigger reference voltage, and the TLV380x/TLV3811(C) sends an LVDS signal to a downstream FPGA to begin a capture. It is common to see bipolar inputs in test and measurement systems such as oscilloscopes; therefore, the TLV380x can be configured in split supply so that the inputs are in the allowable input voltage range.

8-6. External Trigger Function

8.3 Power Supply Recommendations

The TLV380x has two separate power rails: VCC - VEE for the input stage and VCC - GND for the output stage. This allows for both single and split supply capabilities for the input stage with a separate ground reference for the LVDS output stage. Split supply operation allows users to apply both positive and negative (bipolar) voltages to the input pins.

When operating from a single supply, the supply voltage range for both the input and output stage is 2.7 V to 5.25 V. When operating from split supply rails, the supply voltage range for the input stage (VCC - VEE) is 2.7 V to 5.25 V, and the supply voltage range for the output stage (VCC - GND) is 2.4 V to 5.25 V. The output logic level is independent of the VCC and VEE levels. The TLV3811(C) is specified for operation from 2.4 V to 5.25 V and can only be operated from a single supply with both inputs and outputs referenced to GND.

Regardless of single supply or split supply operation, proper decoupling capacitors are required. It is recommended to use a scheme of multiple, low-ESR ceramic capacitors from the supply pins to the ground plane for optimum performance. A good combination would be 100 pF, 10 nF, and 1 uF with the lowest value capacitor closest to the comparator.

8.4 Layout

8.4.1 Layout Guidelines

Comparators are very sensitive to input noise. For best results, adhere to the following layout guidelines.

1. Use a printed-circuit-board (PCB) with a good, unbroken, low-inductance ground plane. Proper grounding (use of a ground plane) helps maintain specified device performance.
2. To minimize supply noise for single and split supply, place decoupling capacitor arrays as close as possible to V_{CC} .
3. On the inputs and the output, keep lead lengths as short as possible to avoid unwanted parasitic feedback around the comparator. Keep inputs away from the output.
4. Solder the device directly to the PCB rather than using a socket.
5. For slow-moving input signals, take care to prevent parasitic feedback. A small capacitor (1000 pF or less) placed between the inputs can help eliminate oscillations in the transition region. This capacitor causes some degradation to propagation delay when impedance is low. The topside ground plane runs between the output and inputs.
6. Use a 100 Ω termination resistor across the device's LVDS output.
7. Use higher performance substrate materials such as Rogers.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
