

TLV733P コンデンサ不要、300mA、低ドロップアウト・レギュレータ 1mm × 1mm X2SON パッケージ

1 特長

- 入力電圧範囲：1.4V～5.5V
- コンデンサありなしのどちらでも安定した動作
- フォールドバック過電流保護
- パッケージ:
 - 1.0mm×1.0mm X2SON (4)
 - SOT-23 (5)
- 非常に低いドロップアウト: 300mAで125mV (3.3V_{OUT})
- 精度: 標準値 1%、最大値 1.4%
- 低いI_Q: 34μA
- 固定出力電圧で利用可能: 1.0V～3.3V
- 高いPSRR: 1kHzにおいて50dB
- アクティブ出力放電

2 アプリケーション

- タブレット
- スマートフォン
- ノートPCおよびデスクトップPC
- 携帯型産業用および民生用製品
- WLANおよび他のPCアドオン・カード
- カメラ・モジュール

3 概要

TLV733 シリーズ低ドロップアウト・リニア・レギュレータ (LDO) は、優れたラインおよび負荷過渡性能で 300mA の電流を供給できる超小型低静止電流の LDO です。これらのデバイスの精度は 1% (標準値) です。

TLV733 シリーズは、入出力コンデンサがなくても安定性を確保できるように最新のコンデンサ不要アーキテクチャで設計されています。出力コンデンサが不要になるため、非常に小型のソリューションを作成でき、起動時の突入電流をなくすことができます。しかし、出力コンデンサが必要な場合でも、TLV733 シリーズはセラミック出力コンデンサで安定して動作します。TLV733 は、出力コンデンサを使用する場合、デバイスの電源オンおよびイネーブル時にフォールドバック電流制御も行います。この機能は、バッテリで動作するデバイスでは特に重要です。

TLV733 はアクティブ・プルダウン回路を備えており、ディセーブル時に出力負荷を迅速に放電します。

TLV733 シリーズは、標準の DBV (SOT-23) および DQN (X2SON) パッケージで供給されます。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ (公称)
TLV733P	SOT-23 (5)	2.90mm×1.60mm
	X2SON (4)	1.00mm×1.00mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にあるパッケージ・オプションについての付録を参照してください。

4 改訂履歴

Revision B (November 2015) から Revision C に変更

Page

•	Changed description of EN pin from 0.9 V to $V_{EN(HI)}$ and from 0.35 V to $V_{EN(LO)}$	4
•	Deleted typical specifications from $V_{EN(HI)}$ and $V_{EN(LO)}$ parameters	6
•	Added maximum specification to I_{LIM} parameter	6
•	Changed <i>Shutdown and Output Enable</i> title from <i>Shutdown</i> and changed first paragraph.....	14
•	Added DBV package to last paragraph of <i>Power Dissipation</i> section.....	17
•	追加「デバイスの項目表記」表に (3) を.....	21

Revision A (December 2014) から Revision B に変更

Page

•	「特長」で、低ドロップアウトについての箇条書き項目の値を、「電気的特性」の値に合わせて 122mV から 125mV に変更	1
•	最初のページのプロットで、 V_{OUT} のラベルを変更.....	1
•	Changed min junction temperature value from –55 to –40 in <i>Absolute Maximum Ratings</i> table	5
•	Changed max junction temperature value from 160 to 150 in <i>Absolute Maximum Ratings</i> table	5
•	Changed max storage temperature value from 150 to 160 in <i>Absolute Maximum Ratings</i> table.....	5
•	Added test condition to line regulation parameter in <i>Electrical Characteristics</i> table.....	6
•	Changed unit for line regulation parameter from mV/V to mV	6
•	Added test condition to load regulation parameter in <i>Electrical Characteristics</i> table	6

2014年10月発行のものから更新

Page

•	データシートのページ上端にあるヘッダーの情報を、個別のデバイスではなくデバイス・ファミリを反映するよう変更.....	1
•	「特長」の入力電圧範囲についての箇条書き項目を、一覧の先頭に移動	1
•	最初のページの「代表的なアプリケーション回路」で、オプションのコンデンサの識別に関するエラーを正しく 変更	1
•	Changed format of I/O column contents and order of packages in <i>Pin Functions</i> table	4
•	Moved storage temperature range specification to <i>Absolute Maximum Ratings</i> table	5
•	Changed <i>Handling Ratings</i> table title to <i>ESD Ratings</i> , updated table format.....	5
•	Added new first row to the V_{DO} parameter in the <i>Electrical Characteristics</i> table.....	6

- Changed condition text for [Figure 34](#) 17
- 追加「評価基板」サブセクション 21
- 削除「関連リンク」セクション 21

5 Pin Configuration and Functions

Pin Functions

PIN		NO.	I/O	DESCRIPTION
NAME	DQN			
EN	3	3	I	Enable pin. Drive EN greater than $V_{EN(HI)}$ to turn on the regulator. Drive EN less than $V_{EN(LO)}$ to put the LDO into shutdown mode.
GND	2	2	—	Ground pin
IN	4	1	I	Input pin. A small capacitor is recommended from this pin to ground. See the Input and Output Capacitor Selection section for more details.
NC	N/A	4	—	No internal connection
OUT	1	5	O	Regulated output voltage pin. For best transient response, use a small 1- μ F ceramic capacitor from this pin to ground. See the Input and Output Capacitor Selection section for more details.
Thermal pad		—	—	The thermal pad is electrically connected to the GND node. Connect to the GND plane for improved thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating junction temperature range (unless otherwise noted); all voltages are with respect to GND⁽¹⁾

		MIN	MAX	UNIT
Voltage	V _{IN}	-0.3	6.0	V
	V _{EN}	-0.3	V _{IN} + 0.3	
	V _{OUT}	-0.3	3.6	
Current	I _{OUT}	Internally limited		A
Output short-circuit duration		Indefinite		
Temperature	Operating junction, T _J	-40	150	°C
	Storage, T _{stg}	-65	160	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Input range, V _{IN}	1.4		5.5	V
Output range, V _{OUT}	1.0		3.3	V
Output current, I _{OUT}	0		300	mA
Enable range, V _{EN}	0		V _{IN}	V
Junction temperature, T _J	-40		125	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TLV733P		UNIT
		DQN (X2SON)	DBV (SOT-23)	
		4 PINS	5 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	218.6	228.4	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	164.8	151.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	164.9	55.8	°C/W
ψ _{JT}	Junction-to-top characterization parameter	5.6	31.4	°C/W
ψ _{JB}	Junction-to-board characterization parameter	163.9	54.8	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	131.4	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application report](#).

6.5 Electrical Characteristics

At operating temperature range ($T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$), $V_{IN} = V_{OUT}(\text{nom}) + 0.5\text{ V}$ or 2.0 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, and $C_{IN} = C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted). All typical values at $T_J = 25^\circ\text{C}$.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
V_{IN}	Input voltage			1.4		5.5	V
	DC output accuracy	$T_J = 25^\circ\text{C}$		-1%		1%	
		$-40^\circ\text{C} \leq T_J \leq +125^\circ\text{C}$		-1.4%		1.4%	
UVLO	Undervoltage lockout	V_{IN} rising			1.3	1.4	V
		V_{IN} falling			1.25		
$\Delta V_{O(\Delta V)}$	Line regulation	$\Delta VI = V_{IN}(\text{nom})$ to $V_{IN}(\text{nom}) + 1$			1		mV
$\Delta V_{O(\Delta IO)}$	Load regulation	$\Delta IO = 1\text{ mA}$ to 300 mA	DQN package		16		mV
			DBV package		25		
V_{DO}	Dropout voltage ⁽¹⁾	$V_{OUT} = 0.98 \times V_{OUT}(\text{nom})$, $I_{OUT} = 300\text{ mA}$	$V_{OUT} = 1.1\text{ V}$, $-40^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$			460	mV
			$1.2\text{ V} \leq V_{OUT} < 1.5\text{ V}$, $-40^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$			420

7 Detailed Description

7.1 Overview

The TLV733 belongs to a new family of next-generation, low-dropout regulators (LDOs). These devices consume low quiescent current and deliver excellent line and load transient performance. These characteristics, combined with low noise, good PSRR with low dropout voltage, make this family of devices ideal for portable consumer applications.

This family of regulators offers foldback current limit, shutdown, and thermal protection. The operating junction temperature for this family of devices is -40°C to 125°C .

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Undervoltage Lockout (UVLO)

The TLV733 uses an undervoltage lockout (UVLO) circuit that disables the output until the input voltage is greater than the rising UVLO voltage, $UVLO_{RISE}$. This circuit ensures that the device does not exhibit any unpredictable behavior when the supply voltage is lower than the operational range of the internal circuitry. During UVLO disable, the output is connected to ground with a 120- Ω pulldown resistor.

7.3.2 Shutdown and Output Enable

The enable pin (EN) is active high. Enable the device by forcing the EN pin to exceed $V_{EN(HI)}$. Turn off the device by forcing the EN pin to drop below $V_{EN(LO)}$. If shutdown capability is not required, connect EN to IN. There is no internal pulldown resistor connected to the EN pin.

The TLV733 has an internal pulldown MOSFET that connects a 120- Ω resistor to ground when the device is disabled. The discharge time after disabling depends on the output capacitance (C_{OUT}) and the load resistance (R_L) in parallel with the 120- Ω pulldown resistor. The time constant is calculated in [Equation 1](#):

$$\tau = \frac{120 \cdot R_L}{120 + R_L} \cdot C_{OUT} \quad (1)$$

7.3.3 Internal Foldback Current Limit

The TLV733 has an internal foldback current limit that protects the regulator during fault conditions. The current allowed through the device is reduced as the output voltage falls. When the output is shorted, the LDO supplies a typical current of 150 mA. The output voltage is not regulated when the device is in current limit. In this condition, the output voltage is the product of the regulated current and the load resistance. When the device output is shorted, the PMOS pass transistor dissipates power $[(V_{IN} - V_{OUT}) \times I_{OS}]$ until thermal shutdown is triggered and the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the fault condition continues, the device cycles between current limit and thermal shutdown. See the [Thermal Information](#) table for more details.

The foldback current-limit circuit limits the current allowed through the device to current levels lower than the minimum current limit at nominal V_{OUT} current limit (I_{LIM}) during startup. See [Figure 18](#) to [Figure 20](#) for typical foldback current limit values. If the output is loaded by a constant-current load during startup, or if the output voltage is negative when the device is enabled, then the load current demanded by the load may exceed the foldback current limit and the device may not rise to the full output voltage. For constant-current loads, disable the output load until the TLV733 has fully risen to its nominal output voltage.

The TLV733 PMOS pass element has an intrinsic body diode that conducts current when the voltage at the OUT pin exceeds the voltage at the IN pin. Do not force the output voltage to exceed the input voltage because excessively high current may flow through the body diode.

7.3.4 Thermal Shutdown

Thermal shutdown protection disables the output when the junction temperature rises to approximately 160°C. Disabling the device eliminates the power dissipated by the device, allowing the device to cool. When the junction temperature cools to approximately 140°C, the output circuitry is again enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits regulator dissipation, protecting it from damage as a result of overheating.

Activating the thermal shutdown feature usually indicates excessive power dissipation as a result of the product of the $(V_{IN} - V_{OUT})$ voltage and the load current. For reliable operation, limit junction temperature to 125°C maximum. To estimate the margin of safety in a complete design, increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions.

The TLV733 internal protection circuitry protects against overload conditions but is not intended to be activated in normal operation. Continuously running the TLV733 into thermal shutdown degrades device reliability.

7.4 Device Functional Modes

7.4.1 Normal Operation

The device regulates to the nominal output voltage under the following conditions:

- The input voltage has previously exceeded the UVLO rising voltage and has not decreased below the UVLO falling threshold.
- The input voltage is greater than the nominal output voltage added to the dropout voltage.
- The enable voltage has previously exceeded the enable rising threshold voltage and not decreased below the enable falling threshold.
- The output current is less than the current limit.
- The device junction temperature is less than the thermal shutdown temperature.

7.4.2 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this condition, the output voltage is the same the input voltage minus the dropout voltage. The transient performance of the device is significantly degraded because the pass device is in a triode state and no longer controls the current through the LDO. Line or load transients in dropout may result in large output voltage deviations.

7.4.3 Disabled

The device is disabled under the following conditions:

- The input voltage is less than the UVLO falling voltage, or has not yet exceeded the UVLO rising threshold.
- The enable voltage is less than the enable falling threshold voltage or has not yet exceeded the enable rising threshold.
- The device junction temperature is greater than the thermal shutdown temperature.

When the device is disabled, the active pulldown resistor discharges the output.

Table 1 shows the conditions that lead to the different modes of operation.

Table 1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal mode	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > UVLO_{RISE}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{LIM}$	$T_J < 160^{\circ}C$
Dropout mode	$UVLO_{RISE} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{LIM}$	$T_J < 160^{\circ}C$
Disabled mode (any true condition disables the device)	$V_{IN} < UVLO_{FALL}$	$V_{EN} < V_{EN(LO)}$	—	$T_J > 160^{\circ}C$

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Input and Output Capacitor Selection

The TLV733 uses an advanced internal control loop to obtain stable operation both with and without the use of input or output capacitors. Dynamic performance is improved with the use of an output capacitor, and may be improved with an input capacitor. An output capacitance of 0.1 μF or larger generally provides good dynamic response. Use X5R- and X7R-type ceramic capacitors because these capacitors have minimal variation in value and equivalent series resistance (ESR) over temperature.

Although an input capacitor is not required for stability, increased output impedance from the input supply may compromise the performance of the TLV733. Good analog design practice is to connect a 0.1- μF to 1- μF capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. Use an input capacitor if the source impedance is greater than 0.5 Ω . Use a higher-value capacitor if large, fast, rise-time load transients are anticipated, or if the device is located several inches from the input power source.

Figure 33 shows the transient performance improvements with an external 1- μF capacitor on the output versus no output capacitor. The data in this figure are taken with an increasing load step from 50 mA to 300 mA, and the peak output voltage deviation (load transient response) is measured. For low output current slew rates, ($< 0.1 \text{ A}/\mu\text{s}$), the transient performance of the device is similar with or without an output capacitor. As the current slew rate is increased, the peak voltage deviation is significantly increased. For loads that exhibit fast current slew rates above 0.1 $\text{A}/\mu\text{s}$, use an output capacitor. For best performance, the maximum recommended output capacitance is 100 μF .

TLV73333PDBV, output current stepped from 50 mA to 300 mA, output voltage change measured at positive dI/dt

Figure 33. Output Voltage Deviation vs Load Step Slew Rate

Some applications benefit from the removal of the output capacitor. In addition to space and cost savings, the removal of the output capacitor lowers inrush current as a result of eliminating the required current flow into the output capacitor upon startup. In these cases, take care to ensure that the load is tolerant of the additional output voltage deviations.

Application Information (continued)

8.1.2 Dropout Voltage

The TLV733 uses a PMOS pass transistor to achieve low dropout. When $(V_{IN} - V_{OUT})$ is less than the dropout voltage (V_{DO}), the PMOS pass device is in the linear region of operation and the input-to-output resistance is the $R_{DS(ON)}$ of the PMOS pass element. V_{DO} scales approximately with output current because the PMOS device behaves like a resistor in dropout mode. As with any linear regulator, PSRR and transient response degrade as $(V_{IN} - V_{OUT})$ approaches dropout operation. See [Figure 7](#) to [Figure 12](#) for typical dropout values.

8.1.3 Power Dissipation

The ability to remove heat from the die is different for each package type, presenting different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to ambient air. Performance data for JEDEC high-K boards are given in the [Thermal Information](#) table. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves heatsink effectiveness.

Power dissipation (P_D) depends on input voltage and load conditions. P_D is equal to the product of the output current and voltage drop across the output pass element, as shown in [Equation 2](#).

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (2)$$

[Figure 34](#) shows the maximum ambient temperature versus the power dissipation of the TLV733 in the DQN and DBV packages. This figure assumes the device is soldered on JEDEC standard high-K layout with no airflow over the board. Actual board thermal impedances vary widely. If the application requires high power dissipation, having a thorough understanding of the board temperature and thermal impedances is helpful to make sure the TLV733 does not operate continuously above a junction temperature of 125°C.

TLV733, high-K layout

Figure 34. Maximum Ambient Temperature vs Device Power Dissipation

8.2 Typical Applications

8.2.1 DC-DC Converter Post Regulation

Figure 35. DC-DC Converter Post Regulation

8.2.1.1 Design Requirements

Table 2. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	1.8 V, $\pm 5\%$
Output voltage	1.5 V, $\pm 1\%$
Output current	200-mA dc, 300-mA peak
Output voltage transient deviation	< 10%, 1-A/ μ s load step from 50 mA to 200 mA
Maximum ambient temperature	85°C

8.2.1.2 Design Considerations

Input and output capacitors are required to achieve the output voltage transient requirements. Capacitance values of 1 μ F are selected to give the maximum output capacitance in a small, low-cost package.

Figure 7 shows the 1.2-V option dropout voltage. Given that dropout voltages are higher for lower output-voltage options, and given that the 1.2-V option dropout voltage is typically less than 300 mV at 125°C, then the 1.5-V option dropout voltage is typically less than 300 mV at 125°C.

Verify that the maximum junction temperature is not exceeded by referring to Figure 34.

8.2.1.3 Application Curve

Figure 36. 1.8-V to 1.5-V Regulation at 300 mA

8.2.2 Capacitor-Free Operation from Battery Input Supply

Figure 37. Capacitor-Free Operation from Battery Input Supply

8.2.2.1 Design Requirements

Table 3. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	3.0 V to 1.8 V (two 1.5-V batteries)
Output voltage	1.0 V, ±1%
Input current	200 mA, maximum
Output load	100-mA dc
Maximum ambient temperature	70°C

8.2.2.2 Design Considerations

An input capacitor is not required for this design because of the low impedance connection directly to the battery. No output capacitor allows for the minimal possible inrush current during startup, ensuring the 200-mA maximum input current is not exceeded.

Verify that the maximum junction temperature is not exceeded by referring to [Figure 34](#).

8.2.2.3 Application Curve

Figure 38. No Inrush Startup, 3.0-V to 1.0-V Regulation

9 Power Supply Recommendations

Connect a low output impedance power supply directly to the IN pin of the TLV733. Inductive impedances between the input supply and the IN pin can create significant voltage excursions at the IN pin during startup or load transient events. If inductive impedances are unavoidable, use an input capacitor.

10 Layout

10.1 Layout Guidelines

- Place input and output capacitors as close to the device as possible.
- Use copper planes for device connections, in order to optimize thermal performance.
- Place thermal vias around the device to distribute the heat.
- Do not place a thermal via directly beneath the thermal pad of the DQN package. A via can wick solder or solder paste away from the thermal pad joint during the soldering process, leading to a compromised solder joint on the thermal pad.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

DBV0005A

PACKAGE OUTLINE

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
5. Support pin may differ or may not be present.

EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
