7 Detailed Description

7.1 Overview

The TMP300 is a thermal sensor designed for overtemperature protection circuits in electronic systems. The TMP300 uses a set resistor to program the trip temperature of the digital output. An additional high-impedance (210 kΩ) analog voltage output provides the temperature reading.

7.2 Feature Description

7.2.1 Calculating R_{SET}

The set resistor (R_{SET}) provides a threshold voltage for the comparator input. The TMP300 trips when the V_{TEMP} pin exceeds the T_{SET} voltage. The value of the set resistor is determined by the analog output function and the 3-μA internal bias current.

To set the TMP300 to trip at a preset value, calculate the R_{SET} resistor value according to 式 1 or 式 2:

$$R_{SET} = \frac{(T_{SET} \times 0.01 + 0.5)}{3e^{-6}} \quad (1)$$

where

- T_{SET} is in °C; or

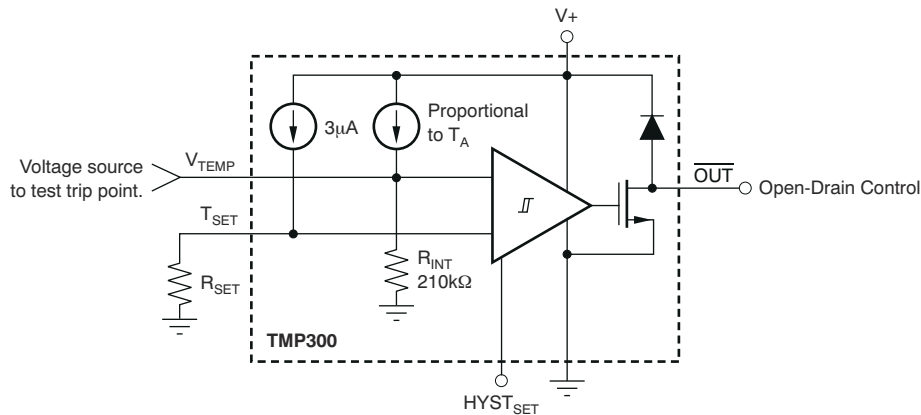

$$R_{SET} \text{ in } k\Omega = \frac{10(50 + T_{SET})}{3} \quad (2)$$

where

- T_{SET} is in °C.

7.2.2 Using V_{TEMP} to Trip the Digital Output

The analog voltage output can also serve as a voltage input that forces a trip of the digital output to simulate a thermal event. This simulation facilitates easy system design and test of thermal safety circuits, as shown in  7-1.

 7-1. Applying Voltage to Trip Digital Output

7.2.3 Analog Temperature Output

The analog out or V_{TEMP} pin is high-impedance (210 k Ω). Avoid loading this pin to prevent degrading the analog out value or trip point. Buffer the output of this pin when used for direct thermal measurement. [Fig 7-2](#) shows buffering of the analog output signal.

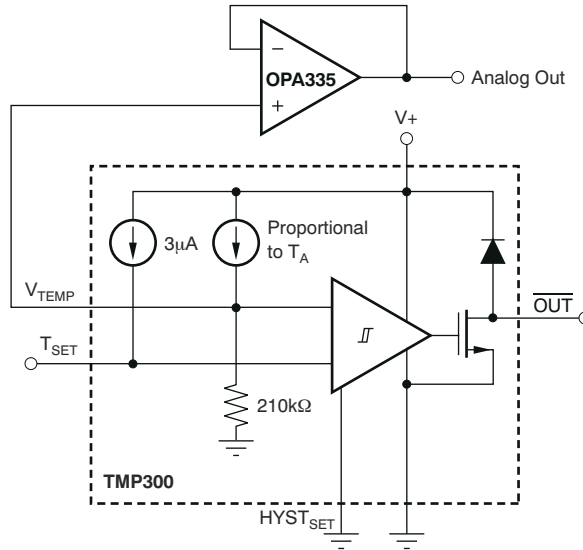

Fig 7-2. Buffering the Analog Output Signal

7.2.4 Using a DAC to Set the Trip Point

The trip point is easily converted by changing the digital-to-analog converter (DAC) code. This technique can be useful for control loops where a large thermal mass is being brought up to the set temperature and the \overline{OUT} pin is used to control the heating element. The analog output can be monitored in a control algorithm that adjusts the set temperature to prevent overshoot. [Fig 7-3](#) shows the trip set voltage error versus temperature, which shows error in $^{\circ}\text{C}$ of the comparator input over temperature. [Fig 7-4](#) shows an alternative method of setting the trip point by using a DAC.

Fig 7-3. Trip Set Voltage Error vs Temperature

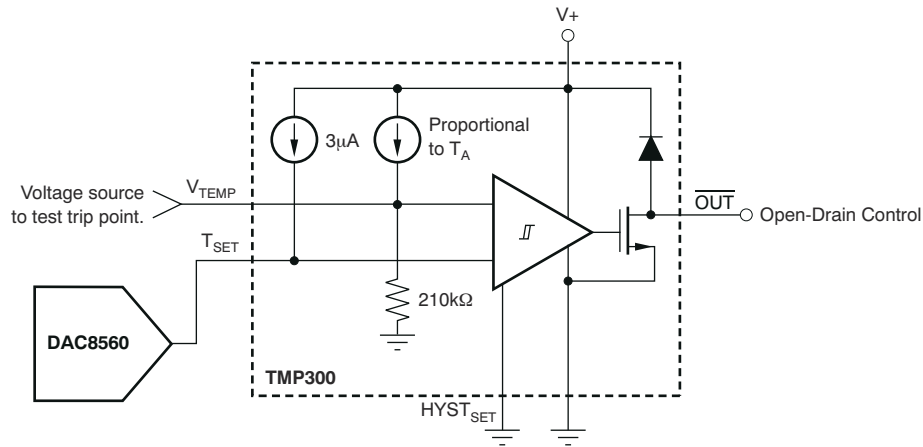

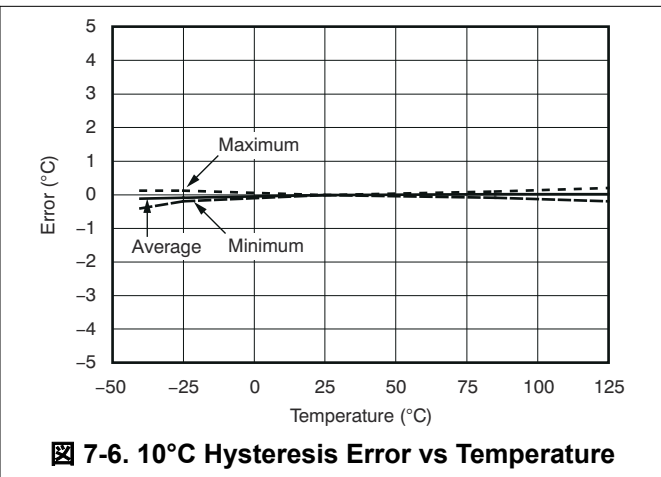

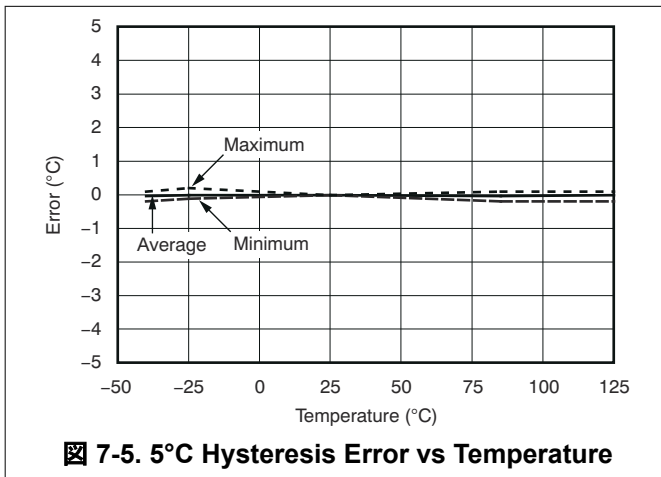

FIG 7-4. DAC Generates the Voltage-Driving T_{SET} Pin

7.2.5 Hysteresis

The hysteresis pin has two settings. Grounding HYST_{SET} results in 5°C of hysteresis. Connecting HYST_{SET} to V_S results in 10°C of hysteresis. FIG 7-5 and FIG 7-6 show the hysteresis error variation over temperature.

Use bypass capacitors on the supplies as well as on the R_{SET} and analog out (V_{TEMP}) pins when in noisy environments, as shown in [Figure 7-7](#). These capacitors reduce premature triggering of the comparator.
