

TPA3128D2、TPA3129D2 2×30W、2×15W、アイドル時低消費電力 Class-Dアンプ

1 特長

- 複数の出力構成をサポート
 - 24Vで8Ω BTL負荷へ2×30W (TPA3128D2)
 - 15Vで8Ω BTL負荷へ2×15W (TPA3129D2)
- 広い電圧範囲: 4.5V~26V
- 効率的なClass-D動作
 - 非常に低いアイドル電流: 推奨LCフィルタ構成において23mA未満
 - 90%を超える電力効率と、低いアイドル損失により、ヒートシンクの必要性を大幅に低減
 - 出力電力に基づくアダプティブ(適応型)変調方式
 - スマート・アンプ・ドライバによりRCスナバの要件を低減
- 複数のスイッチング周波数
 - AM回避
 - マスタとスレーブとの同期
 - 300kHz~1.2MHzのスイッチング周波数
- 高PSRRのフィードバック電源段アーキテクチャによりPSUの要件を低減
- 電力制限をプログラム可能
- パラレルBTLモードとモノ・チャンネル・モードのサポート
- 単一と二重の電源モードをサポート
- 過電圧、低電圧、過熱、DC検出、短絡などの自己保護回路が内蔵され、エラー報告機能も搭載
- 放熱特性の優れたパッケージ
 - DAP (TPA3128D2およびTPA3129D2用の32ピンのHTSSOP下部パッド)

2 アプリケーション

- Bluetooth/ワイヤレス・スピーカ
- サウンドバー
- ミニ/マイクロ・コンポーネント、ドッキング・ステーション
- LCD/LED TV
- ホーム・シアター

3 概要

TPA3128D2およびTPA3129D2はアイドル電力損失が低く、Bluetooth/ワイヤレス・スピーカや、他のバッテリー駆動オーディオ・システムのバッテリー駆動時間を延ばすことができます。TPA3128D2デバイスは効率がいため、2層のPCBで外付けヒートシンクなしに2×30Wを出力できます。TPA3129D2デバイスは効率がいため、2層のPCBで外付けヒートシンクなしに2×15Wを出力できます。このデバイスは効率を向上させるモードを提案し、そのモードでは外部LCフィルタの電流リップルと、アイドル電流を動的に低減できます。

TPA31xxD2の高度な発振器/PLL回路は、複数のスイッチング周波数オプションを採用することでAM干渉を防止します。この機能はマスタまたはスレーブのオプションとともに使用できるため、複数のデバイスの同期が可能です。

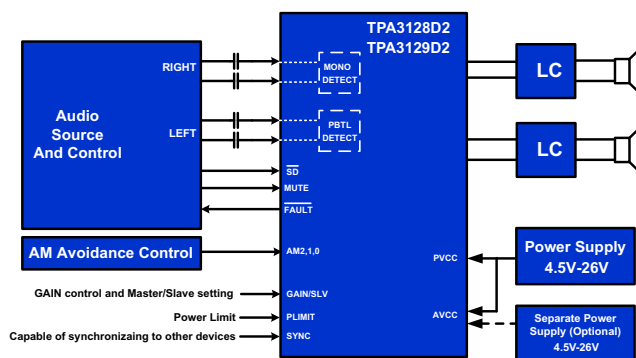

TPA31xxD2デバイスには、短絡保護、熱保護、および過電圧、低電圧、DC保護が搭載されており、フォルトから完全に保護されています。フォルトはプロセッサへ報告として返され、過負荷の状況においてデバイスが損傷を受けることを防ぎます。

5 Pin Configuration and Functions

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
1	MODSEL	I	Mode selection logic input (LOW = Ultra Low Idle Loss Mode, HIGH = BD Mode). TTL logic levels with compliance to AVCC.
2	SDZ	I	Shutdown logic input for audio amp (LOW = outputs Hi-Z, HIGH = outputs enabled). TTL logic levels with compliance to AVCC.
3	FAULTZ	DO	General fault reporting including Over-temp, DC Detect. Open drain. FAULTZ = High, normal operation FAULTZ = Low, fault condition
4	RINP	I	Positive audio input for right channel. Connect to GND for MONO mode.
5	RINN	I	Negative audio input for right channel. Connect to GND for MONO mode.
6	PLIMIT	I	Power limit level adjust. Connect a resistor divider from GVDD to GND to set power limit. Connect directly to GVDD for no power limit.
7	GVDD	PO	Internally generated gate voltage supply. Not to be used as a supply or connected to any component other than a 1 µF X7R ceramic decoupling capacitor and the PLIMIT and GAIN/SLV resistor dividers.
8	GAIN/SLV	I	Selects Gain and selects between Master and Slave mode depending on pin voltage divider.
9	GND	G	Ground
10	LINP	I	Positive audio input for left channel. Connect to GND for PBTL mode.
11	LINN	I	Negative audio input for left channel. Connect to GND for PBTL mode.
12	MUTE	I	Mute signal for fast disable/enable of outputs (HIGH = outputs Hi-Z, LOW = outputs enabled). TTL logic levels with compliance to AVCC.
13	AM2	I	AM Avoidance Frequency Selection
14	AM1	I	AM Avoidance Frequency Selection
15	AM0	I	AM Avoidance Frequency Selection
16	SYNC	DIO	Clock input/output for synchronizing multiple class-D devices. Direction determined by GAIN/SLV terminal.
17	AVCC	P	Analog Supply

(1) **TYPE:** DO = Digital Output, I = Analog Input, G = General Ground, PO = Power Output, BST = Boot Strap.

Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NO.	NAME		
18	PVCC	P	Power supply
19	PVCC	P	Power supply
20	BSNL	BST	Boot strap for negative left channel output, connect to 220 nF X5R, or better ceramic cap to OUTPL
21	OUTNL	PO	Negative left channel output
22	GND	G	Ground
23	OUTPL	PO	Positive left channel output
24	BSPL	BST	Boot strap for positive left channel output, connect to 220 nF X5R, or better ceramic cap to OUTNL
25	GND	G	Ground
26	BSNR	BST	Boot strap for negative right channel output, connect to 220 nF X5R, or better ceramic cap to OUTNR
27	OUTNR	PO	Negative right channel output
28	GND	G	Ground
29	OUTPR	PO	Positive right channel output
30	BSPR	BST	Boot strap for positive right channel output, connect to 220 nF X5R or better ceramic cap to OUTPR
31	PVCC	P	Power supply
32	PVCC	P	Power supply
33	PowerPAD	G	Connect to GND for best system performance. If not connected to GND, leave floating.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, V_{CC}	PV_{CC}, AV_{CC}	-0.3	30	V
Input voltage, V_I	INPL, INNL, INPR, INNRR	-0.3	6.3	V
	PLIMIT, GAIN / SLV, SYNC	-0.3	GVDD+0.3	V
	AM0, AM1, AM2, MUTE, SDZ, MODSEL	-0.3	PVCC+0.3	V
Slew rate, maximum ⁽²⁾	AM0, AM1, AM2, MUTE, SDZ, MODSEL		10	V/ms
Operating free-air temperature, T_A		-40	85	°C
Operating junction temperature, T_J		-40	150	°C
Storage temperature, T_{stg}		-40	125	°C

- (1) Stresses beyond those listed under absolute maximum ratings can cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods can affect device reliability.
- (2) 100-k Ω series resistor is required if maximum slew rate is exceeded.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	PV_{CC}, AV_{CC}	4.5		26	V
V_{IH}	High-level input voltage	AM0, AM1, AM2, MUTE, SDZ, SYNC, MODSEL	2			V
V_{IL}	Low-level input voltage	AM0, AM1, AM2, MUTE, SDZ, SYNC, MODSEL			0.8	V
V_{OL}	Low-level output voltage	FAULTZ, $R_{PULL-UP} = 100\text{ k}\Omega$, $PV_{CC} = 26\text{ V}$			0.8	V
I_{IH}	High-level input current	AM0, AM1, AM2, MUTE, SDZ, MODSEL ($V_I = 2\text{ V}$, $V_{CC} = 18\text{ V}$)			50	μA
$R_L(\text{BTL})$	Minimum load Impedance	Output filter: $L = 10\text{ }\mu\text{H}$, $C = 680\text{ nF}$	TPA3128D2	3.2	4	Ω
			TPA3129D2	5.6	8	
$R_L(\text{PBTL})$		Output filter: $L = 10\text{ }\mu\text{H}$, $C = 1\text{ }\mu\text{F}$	TPA3128D2	1.6	2	
			TPA3129D2	3.2	4	
L_o	Output-filter Inductance	Minimum output filter inductance under short-circuit condition	1			μH

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPA3128D2, TPA3129D2		UNIT
		DAP ⁽²⁾		
		32 PINS		
R _{θJA}	Junction-to-ambient thermal resistance	22		°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.3		°C/W
ψ _{JB}	Junction-to-board characterization parameter	4.8		°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) For the PCB layout, see the TPS3128D2EVM user guide.

6.5 DC Electrical Characteristics

T_A = 25°C, AV_{CC} = PV_{CC} = 12 V to 24 V, R_L = 4 Ω, f_s = 400 kHz, low idle-loss mode (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{OS}	Class-D output offset voltage (measured differentially)	V _I = 0 V		1.5	5	mV
I _{CC}	Quiescent supply current	SDZ = 2 V, With load and filter, PV _{CC} = 12 V		17		mA
		SDZ = 2 V, With load and filter, PV _{CC} = 24 V		23		mA
I _{CC(SD)}	Quiescent supply current in shutdown mode	SDZ = 0.8 V, With load and filter, PV _{CC} = 12 V		20		μA
		SDZ = 0.8 V, With load and filter, PV _{CC} = 24 V		30		μA
r _{DS(on)}	Drain-source on-state resistance, measured pin to pin	PV _{CC} = 21 V, I _{out} = 500 mA, T _J = 25°C		90		mΩ
G	Gain (BTL)	R1 = 5.6 kΩ, R2 = Open	19	20	21	dB
		R1 = 20 kΩ, R2 = 100 kΩ	25	26	27	
		R1 = 39 kΩ, R2 = 100 kΩ	31	32	33	dB
		R1 = 47 kΩ, R2 = 75 kΩ	35	36	37	
G	Gain (SLV)	R1 = 51 kΩ, R2 = 51 kΩ	19	20	21	dB
		R1 = 75 kΩ, R2 = 47 kΩ	25	26	27	
		R1 = 100 kΩ, R2 = 39 kΩ	31	32	33	dB
		R1 = 100 kΩ, R2 = 16 kΩ	35	36	37	
t _{on}	Turn-on time	SDZ = 2 V		40		ms
t _{OFF}	Turn-off time	SDZ = 0.8 V		2		μs
GVDD	Gate drive supply	IGVDD < 200 μA	5.1	5.6	6.3	V
V _O	Output voltage maximum under PLIMIT control	V(PLIMIT) = 2 V; V _I = 1 V _{rms}	6.75	8.2	8.75	V

6.6 AC Electrical Characteristics

T_A = 25°C, AV_{CC} = PV_{CC} = 12 V to 24 V, R_L = 4 Ω (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
KSVR	Power supply ripple rejection	200 mV _{PP} ripple at 1 kHz, Gain = 20 dB, Inputs AC-coupled to GND		-70		dB
P _O	Continuous output power	THD+N = 10%, f = 1 kHz, PV _{CC} = 14.4 V		25		W
		THD+N = 10%, f = 1 kHz, PV _{CC} = 21 V		30		
THD+N	Total harmonic distortion + noise	V _{CC} = 21 V, f = 1 kHz, P _O = 15 W (half-power)		0.1%		
Vn	Output integrated noise	20 Hz to 22 kHz, A-weighted filter, Gain = 20 dB		65		μV
				-80		dBV
	Crosstalk	V _O = 1 V _{rms} , Gain = 20 dB, f = 1 kHz		-100		dB
SNR	Signal-to-noise ratio	Maximum output at THD+N < 1%, f = 1 kHz, Gain = 20 dB, A-weighted		102		dB

AC Electrical Characteristics (continued)
 $T_A = 25^\circ\text{C}$, $A_{V_{CC}} = P_{V_{CC}} = 12\text{ V to }24\text{ V}$, $R_L = 4\ \Omega$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
f_{OSC}	Oscillator frequency	AM2=0, AM1=0, AM0=0	376	400	424	kHz
		AM2=0, AM1=0, AM0=1	470	500	530	
		AM2=0, AM1=1, AM0=0	564	600	636	
		AM2=0, AM1=1, AM0=1	940	1000	1060	
		AM2=1, AM1=0, AM0=0	1128	1200	1278	
		AM2=1, AM1=0, AM0=1	282	300	318	
		AM2=1, AM1=1, AM0=0	Reserved			
		AM2=1, AM1=1, AM0=1				
Thermal trip point			≥ 150			$^\circ\text{C}$
Thermal hysteresis			15			$^\circ\text{C}$
Over current trip point		TPA3128D2	7.5			A
		TPA3129D2	5.5			

6.7 Typical Characteristics

$f_s = 400$ kHz, Ultra Low Idle Loss Mode, TPA3128D2EVM Tested With AP2722. (unless otherwise noted)

Typical Characteristics (continued)

$f_s = 400$ kHz, Ultra Low Idle Loss Mode, TPA3128D2EVM Tested With AP2722. (unless otherwise noted)

Typical Characteristics (continued)

$f_s = 400$ kHz, Ultra Low Idle Loss Mode, TPA3128D2EVM Tested With AP2722. (unless otherwise noted)

Typical Characteristics (continued)

$f_s = 400$ kHz, Ultra Low Idle Loss Mode, TPA3128D2EVM Tested With AP2722. (unless otherwise noted)

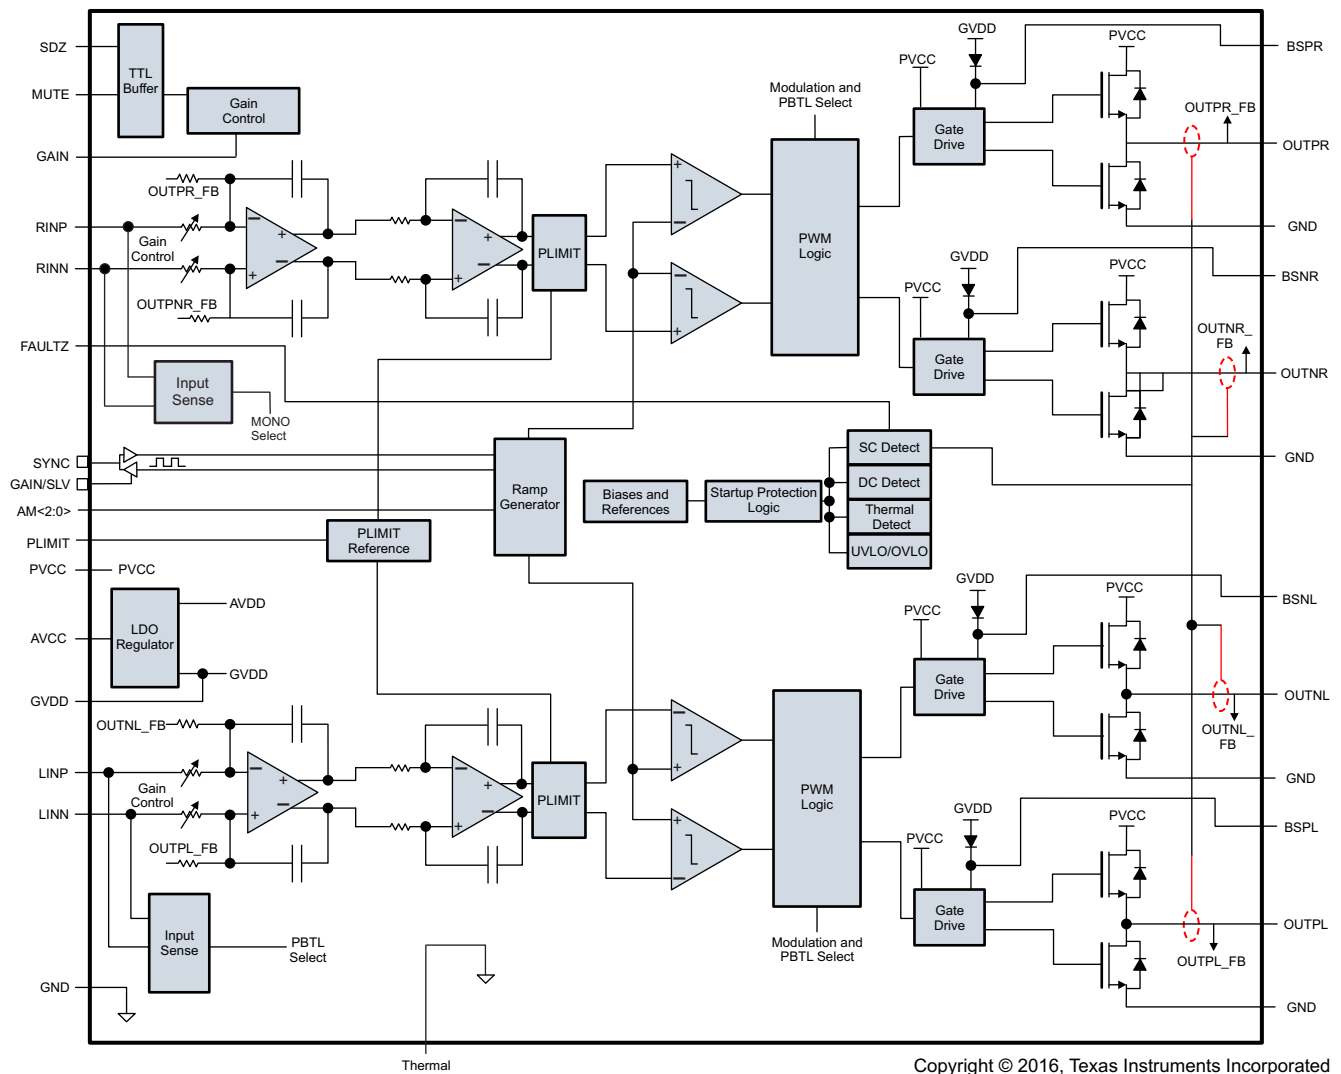

7 Detailed Description

7.1 Overview

The TPA3128D2 and TPA3129D2 devices are a highly efficient Class D audio amplifier with extreme low idle power dissipation. It can support as low as 23-mA idle loss current using standard LC filter configurations. It is integrated with 90-mΩ MOSFET that allows output currents up to 7.5 A for TPA3128D2 and 5.5 A for TPA3129D2. The high efficiency allows the amplifier to provide an excellent audio performance without the requirement for a bulky heat sink.

The device can be configured for either master or slave operation by using the SYNC pin. Configuring using the SYNC pin helps to prevent audible beats noise.

7.3 Feature Description

7.3.1 Gain Setting and Master and Slave

The gain of the TPA312xD2 is set by the voltage divider connected to the GAIN/SLV control pin. Master or Slave mode is also controlled by the same pin. An internal ADC is used to detect the 8 input states. The first four stages sets the GAIN in Master mode in gains of 20, 26, 32, 36 dB respectively, while the next four stages sets the GAIN in Slave mode in gains of 20, 26, 32, 36 dB respectively. The gain setting is latched during power-up and cannot be changed while device is powered. 表 1 lists the recommended resistor values and the state and gain:

表 1. Gain and Master/Slave

MASTER / SLAVE MODE	GAIN	R1 (to GND) ⁽¹⁾	R2 (to GVDD) ⁽¹⁾	INPUT IMPEDANCE
Master	20 dB	5.6 kΩ	OPEN	60 kΩ
Master	26 dB	20 kΩ	100 kΩ	30 kΩ
Master	32 dB	39 kΩ	100 kΩ	15 kΩ
Master	36 dB	47 kΩ	75 kΩ	9 kΩ
Slave	20 dB	51 kΩ	51 kΩ	60 kΩ
Slave	26 dB	75 kΩ	47 kΩ	30 kΩ
Slave	32 dB	100 kΩ	39 kΩ	15 kΩ
Slave	36 dB	100 kΩ	16 kΩ	9 kΩ

(1) Resistor tolerance should be 5% or better.

图 25. Gain, Master/Slave

In Master mode, SYNC terminal is an output, in Slave mode, SYNC terminal is an input for a clock input. TTL logic levels with compliance to GVDD.

7.3.2 Input Impedance

The TPA31xxD2 input stage is a fully differential input stage and the input impedance changes with the gain setting from 9 kΩ at 36 dB gain to 60 kΩ at 20 dB gain. 表 1 lists the values from min to max gain. The tolerance of the input resistor value is ±20% so the minimum value will be higher than 7.2 kΩ. The inputs must be AC-coupled to minimize the output dc-offset and ensure correct ramping of the output voltages during power-ON and power-OFF. The input ac-coupling capacitor together with the input impedance forms a high-pass filter with the following cut-off frequency:

$$f = \frac{1}{2\pi Z_i C_i} \quad (1)$$

If a flat bass response is required down to 20 Hz the recommended cut-off frequency is a tenth of that, 2 Hz. 表 2 lists the recommended ac-couplings capacitors for each gain step. If a –3-dB capacitor is accepted at 20 Hz 10 times lower capacitors can be used – for example, a 1-μF capacitor can be used.

表 2. Recommended Input AC-Coupling Capacitors

GAIN	INPUT IMPEDANCE	INPUT CAPACITANCE	HIGH-PASS FILTER
20 dB	60 k Ω	1.5 μ F	1.8 Hz
26 dB	30 k Ω	3.3 μ F	1.6 Hz
32 dB	15 k Ω	5.6 μ F	2.3 Hz
36 dB	9 k Ω	10 μ F	1.8 Hz

图 26. Input Impedance

The input capacitors used should be a type with low leakage, such as quality electrolytic, tantalum, or ceramic capacitors. If a polarized type is used the positive connection should face the input pins which are biased to 3 Vdc.

7.3.3 Startup and Shutdown Operation

The TPA31xxD2 employs a shutdown mode of operation designed to reduce supply current (I_{cc}) to the absolute minimum level during periods of nonuse for power conservation. The SDZ input terminal should be held high (see specification table for trip point) during normal operation when the amplifier is in use. Pulling SDZ low will put the outputs to mute and the amplifier to enter a low-current state. Do not leave SDZ unconnected, because amplifier operation would be unpredictable.

For the best power-off pop performance, place the amplifier in the shutdown mode prior to removing the power supply. The gain setting is selected at the end of the start-up cycle. At the end of the start-up cycle, the gain is selected and cannot be changed until the next power-up.

7.3.4 PLIMIT Operation

The TPA31xxD2 has a built-in voltage limiter that can be used to limit the output voltage level below the supply rail, the amplifier operates as if it was powered by a lower supply voltage, and thereby limits the output power. Add a resistor divider from GVDD to ground to set the voltage at the PLIMIT pin. An external reference may also be used if tighter tolerance is required. Add a 1- μ F capacitor from pin PLIMIT to ground to ensure stability.

图 27. Power Limit Example

The PLIMIT circuit sets a limit on the output peak-to-peak voltage. The limiting is done by limiting the duty cycle to a fixed maximum value. The limit can be thought of as a "virtual" voltage rail which is lower than the supply connected to PVCC. The "virtual" rail is approximately four times the voltage at the PLIMIT pin. The output voltage can be used to calculate the maximum output power for a given maximum input voltage and speaker impedance.

$$P_{OUT} = \frac{\left(\left(\frac{R_L}{R_L + 2 \times R_S} \right) \times V_P \right)^2}{2 \times R_L} \quad \text{for unclipped power}$$

where

- $P_{OUT} (10\%THD) = 1.25 \times P_{OUT} (\text{unclipped})$
- R_L is the load resistance.
- R_S is the total series resistance including $R_{DS(on)}$, and output filter resistance.
- V_P is the peak amplitude, which is limited by "virtual" voltage rail. (2)

表 3. Power Limit Example

PV _{CC} (V)	PLIMIT VOLTAGE (V) ⁽¹⁾	R to GND	R to GVDD	OUTPUT VOLTAGE (V _{rms})
24 V	GVDD	Open	Short	17.9
24 V	3.3	45 kΩ	51 kΩ	12.67
24 V	2.25	24 kΩ	51 kΩ	9
12 V	GVDD	Open	Short	10.33
12 V	2.25	24 kΩ	51 kΩ	9
12 V	1.5	18 kΩ	68 kΩ	6.3

(1) PLIMIT measurements taken with EVM gain set to 26 dB and input voltage set to 1 V_{rms}.

7.3.5 GVDD Supply

The GVDD Supply is used to power the gates of the output full bridge transistors. The GVDD Supply can also be used to supply the PLIMIT and GAIN/SLV voltage dividers. Decouple GVDD with a X5R ceramic 1-μF capacitor to GND. The GVDD supply is not intended to be used for external supply. The current consumption should be limited by using resistor voltage dividers for GAIN/SLV and PLIMIT of 100 kΩ or more.

7.3.6 BSPx AND BSNx Capacitors

The full H-bridge output stages use only NMOS transistors. Therefore, they require bootstrap capacitors for the high side of each output to turn on correctly. A 220-nF ceramic capacitor of quality X5R or better, rated for at least 16 V, must be connected from each output to the corresponding bootstrap input. (See the application circuit diagram in [Figure 36](#).) The bootstrap capacitors connected between the BSxx pins and corresponding output function as a floating power supply for the high-side N-channel power MOSFET gate drive circuitry. During each high-side switching cycle, the bootstrap capacitors hold the gate-to-source voltage high enough to keep the high-side MOSFETs turned on.

7.3.7 Differential Inputs

The differential input stage of the amplifier cancels any noise that appears on both input lines of the channel. To use the TPA31xxD2 with a differential source, connect the positive lead of the audio source to the RINP or LINP input and the negative lead from the audio source to the RINN or LINN input. To use the TPA31xxD2 with a single-ended source, ac ground the negative input through a capacitor equal in value to the input capacitor on positive and apply the audio source to either input. In a single-ended input application, the unused input should be ac grounded at the audio source instead of at the device input for best noise performance. For good transient performance, the impedance seen at each of the two differential inputs should be the same.

The impedance seen at the inputs should be limited to an RC time constant of 1 ms or less if possible to allow the input dc blocking capacitors to become completely charged during the 40-ms power-up time. If the input capacitors are not allowed to completely charge, there will be some additional sensitivity to component matching which can result in pop if the input components are not well matched.

7.3.8 Device Protection System

The TPA31xxD2 contains a complete set of protection circuits carefully designed to make system design efficient as well as to protect the device against any kind of permanent failures due to short circuits, overload, over temperature, and under-voltage. The FAULTZ pin will signal if an error is detected according to [表 4](#):

表 4. Fault Reporting

FAULT	TRIGGERING CONDITION (typical value)	FAULTZ	ACTION	LATCHED/SELF-CLEARING
Over Current	Output short or short to PVCC or GND	Low	Output high impedance	Latched
Over Temperature	$T_j > 150^\circ\text{C}$	Low	Output high impedance	Latched
Too High DC Offset	DC output voltage	Low	Output high impedance	Latched
Under Voltage on PVCC	$PVCC < 4.5\text{V}$	–	Output high impedance	Self-clearing
Over Voltage on PVCC	$PVCC > 27\text{V}$	–	Output high impedance	Self-clearing

7.3.9 DC Detect Protection

The TPA31xxD2 has circuitry which will protect the speakers from DC current which might occur due to defective capacitors on the input or shorts on the printed circuit board at the inputs. A DC detect fault will be reported on the FAULT pin as a low state. The DC Detect fault will also cause the amplifier to shutdown by changing the state of the outputs to Hi-Z.

If automatic recovery from the short circuit protection latch is desired, connect the FAULTZ pin directly to the SDZ pin. Connecting the FAULTZ and SDZ pins allows the FAULTZ pin function to automatically drive the SDZ pin low which clears the DC Detect protection latch.

A DC Detect Fault is issued when the output differential voltage of either channel exceeds DC protection threshold level for more than 640 ms at the same polarity. [表 5](#) below shows some examples of the typical DC Detect Protection threshold for several values of the supply voltage. The Detect Protection Threshold feature protects the speaker from large DC currents or AC currents less than 2 Hz. To avoid nuisance faults due to the DC detect circuit, hold the SD pin low at power-up until the signals at the inputs are stable. Also, take care to match the impedance seen at the positive and negative inputs to avoid nuisance DC detect faults.

[表 5](#) lists the minimum output offset voltages required to trigger the DC detect. The outputs must remain at or above the voltage listed in the table for more than 640 ms to trigger the DC detect.

表 5. DC Detect Threshold

18	5.4

7.3.10 Short-Circuit Protection and Automatic Recovery Feature

The TPA31xxD2 has protection from over current conditions caused by a short circuit on the output stage. The short circuit protection fault is reported on the FAULTZ pin as a low state. The amplifier outputs are switched to a high impedance state when the short circuit protection latch is engaged. The latch can be cleared by cycling the SDZ pin through the low state.

If automatic recovery from the short circuit protection latch is desired, connect the FAULTZ pin directly to the SDZ pin. Connecting the FAULTZ and SDZ pins allows the FAULTZ pin function to automatically drive the SDZ pin low which clears the short-circuit protection latch.

In systems where a possibility of a permanent short from the output to PVDD or to a high voltage battery like a car battery can occur, pull the MUTE pin low with the FAULTZ signal with a inverting transistor to ensure a high-Z restart, like shown in the [图 28](#) below:

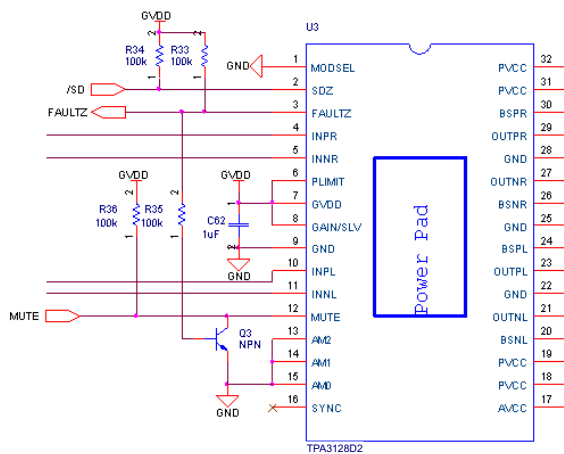

Figure 28. MUTE Driven by Inverted FAULTZ

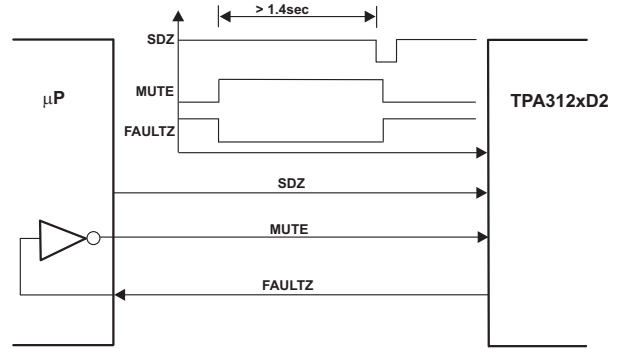

Figure 29. Timing Requirement for SDZ

7.3.11 Thermal Protection

Thermal protection on the TPA31xxD2 prevents damage to the device when the internal die temperature exceeds 150°C. This trip point has a ±15°C tolerance from device to device. Once the die temperature exceeds the thermal trip point, the device enters into the shutdown state and the outputs are disabled. This is a latched fault.

Thermal protection faults are reported on the FAULTZ terminal as a low state.

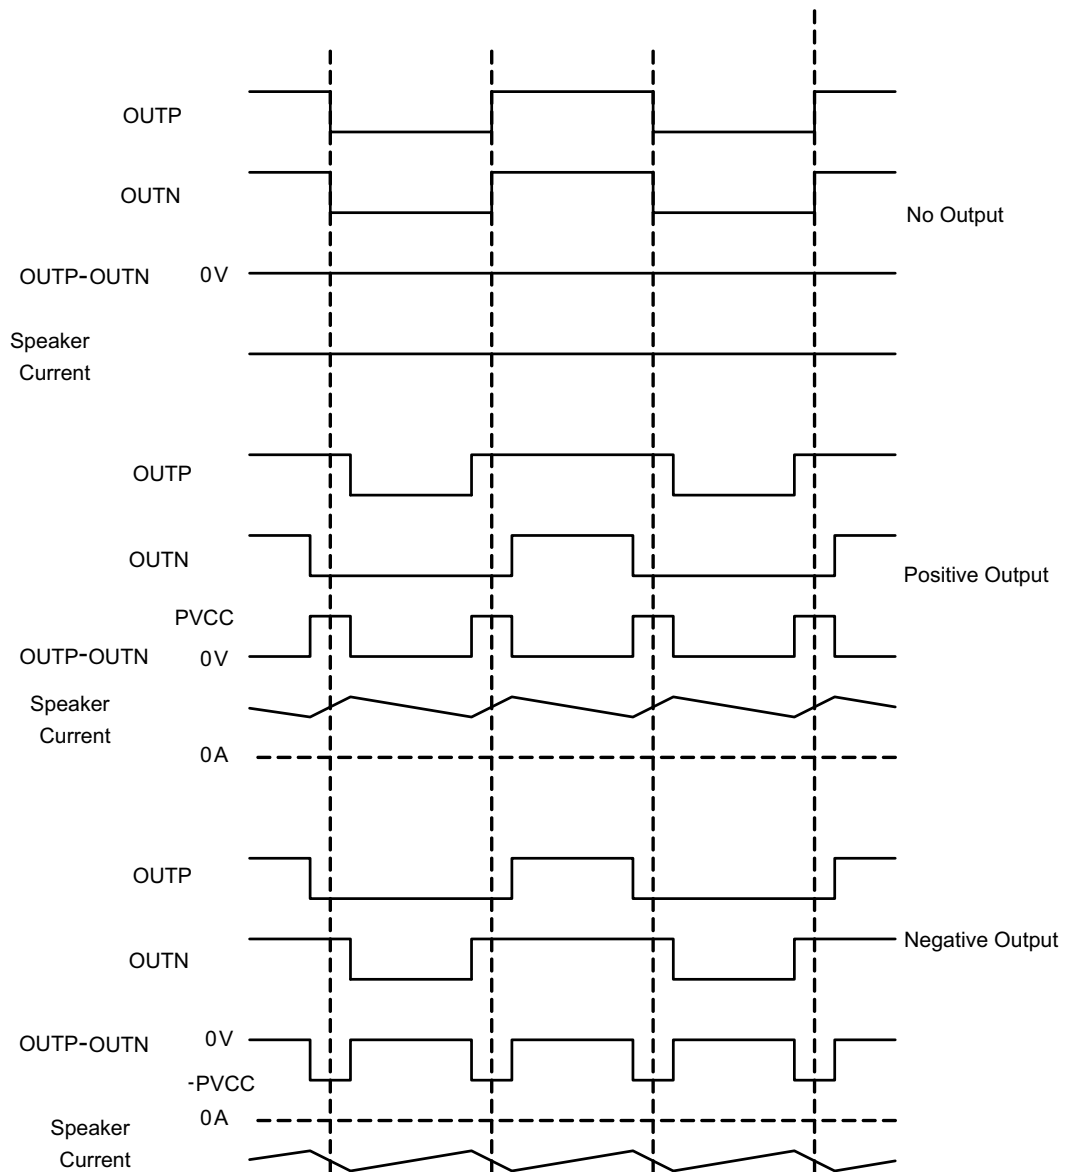

If automatic recovery from the thermal protection latch is desired, connect the FAULTZ pin directly to the SDZ pin. This allows the FAULTZ pin function to automatically drive the SDZ pin low which clears the thermal protection latch.

7.3.12 Device Modulation Scheme

The TPA3128D2 and TPA3129D2 have the option of running in either BD modulation or low idle-loss mode.

7.3.12.1 BD-Modulation

This is a modulation scheme that allows operation without the classic LC reconstruction filter when the amp is driving an inductive load with short speaker wires. Each output is switching from 0 volts to the supply voltage. The OUTPx and OUTNx are in phase with each other with no input so that there is little or no current in the speaker. The duty cycle of OUTPx is greater than 50% and OUTNx is less than 50% for positive output voltages. The duty cycle of OUTPx is less than 50% and OUTNx is greater than 50% for negative output voltages. The voltage across the load sits at 0V throughout most of the switching period, reducing the switching current, which reduces any I²R losses in the load.

30. BD Mode Modulation

7.3.13 Efficiency: LC Filter Required with the Traditional Class-D Modulation Scheme

The main reason that the traditional class-D amplifier based on AD modulation requires an output filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. The ripple current is large for the traditional modulation scheme, because the ripple current is proportional to voltage multiplied by the time at that voltage. The differential voltage swing is $2 \times V_{CC}$, and the time at each voltage is half the period for the traditional modulation scheme. An ideal LC filter is required to store the ripple current from each half cycle for the next half cycle, while any resistance causes power dissipation. The speaker is both resistive and reactive, whereas an LC filter is almost purely reactive.

The TPA3128D2 and TPA3129D2 modulation schemes have little loss in the load without a filter because the pulses are short and the change in voltage is V_{CC} instead of $2 \times V_{CC}$. As the output power increases, the pulses widen, making the ripple current larger. Ripple current could be filtered with an LC filter for increased efficiency, but for most applications the filter is not required.

An LC filter with a cutoff frequency less than the class-D switching frequency allows the switching current to flow through the filter instead of the load. The filter has less resistance but higher impedance at the switching frequency than the speaker, which results in less power dissipation, therefore increasing efficiency.

7.3.14 Ferrite Bead Filter Considerations

Using the Advanced Emissions Suppression Technology in the TPA3128D2 and TPA3129D2 amplifiers, a high efficiency class-D audio amplifier can be designed while minimizing interference to surrounding circuits. Designing the amplifier can also be accomplished with only a low-cost ferrite bead filter. In this case the user must carefully select the ferrite bead used in the filter. One important aspect of the ferrite bead selection is the type of material used in the ferrite bead. Not all ferrite material is alike, therefore the user must select a material that is effective in the 10-MHz to 100-MHz range which is key to the operation of the class-D amplifier. Many of the specifications regulating consumer electronics have emissions limits as low as 30 MHz. The ferrite bead filter should be used to block radiation in the 30-MHz and above range from appearing on the speaker wires and the power supply lines which are good antennas for these signals. The impedance of the ferrite bead can be used along with a small capacitor with a value in the range of 1000 pF to reduce the frequency spectrum of the signal to an acceptable level. For best performance, the resonant frequency of the ferrite bead/capacitor filter should be less than 10 MHz.

Also, the ferrite bead must be large enough to maintain its impedance at the peak currents expected for the amplifier. Some ferrite bead manufacturers specify the bead impedance at a variety of current levels. In this case the user can make sure the ferrite bead maintains an adequate amount of impedance at the peak current the amplifier will see. If these specifications are not available, the device can also estimate the bead current handling capability by measuring the resonant frequency of the filter output at low power and at maximum power. A change of resonant frequency of less than fifty percent under this condition is desirable. Examples of ferrite beads which have been tested and work well with the TPA3136D2 can be seen in the TPA3136D2EVM user guide [SLOU444](#).

A high quality ceramic capacitor is also required for the ferrite bead filter. A low ESR capacitor with good temperature and voltage characteristics will work best.

Additional EMC improvements may be obtained by adding snubber networks from each of the class-D outputs to ground. Suggested values for a simple RC series snubber network would be 18Ω in series with a 330 pF capacitor although design of the snubber network is specific to every application and must be designed taking into account the parasitic reactance of the printed circuit board as well as the audio amp. Take care to evaluate the stress on the component in the snubber network especially if the amp is running at high P_{VCC} . Also, make sure the layout of the snubber network is tight and returns directly to the GND pins on the IC.

☒ 31 and ☒ 32 are TPA3128D2 EN55022 Radiated Emissions results uses TPA3128D2EVM with 8- Ω speakers.

7.3.15 When to Use an Output Filter for EMI Suppression

A complete LC reconstruction filter should be added in some circuit instances. These circumstances might occur if there are nearby circuits which are sensitive to noise. In these cases a classic second order Butterworth filter similar to those shown in the figures below can be used.

Some systems have little power supply decoupling from the AC line but are also subject to line conducted interference (LCI) regulations. These include systems powered by "wall warts" and "power bricks." In these cases, LC reconstruction filters can be the lowest cost means to pass LCI tests. Common mode chokes using low frequency ferrite material can also be effective at preventing line conducted interference.

7.4 Device Functional Modes

7.4.1 PBTL Mode

The TPA3128D2 can be connected in PBTL mode enabling up to 60W output power. This is done by:

- Connect INPL and INNPL directly to Ground (without capacitors) this sets the device in Mono mode during power up.
- Connect OUTPR and OUTNR together for the positive speaker terminal and OUTNL and OUTPL together for the negative pin.
- Analog input signal is applied to INPR and INNR.

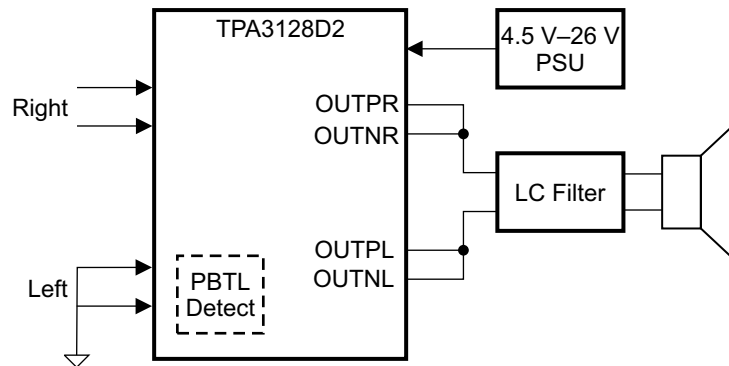

图 34. PBTL Mode

7.4.2 Mono Mode (Single Channel Mode)

The and TPA3129D2 can be connected in MONO mode to cut the idle power-loss nearly by half. This is done by:

- Connect INPR and INNR directly to Ground (without capacitors) this sets the device in Mono mode during power up.
- Connect OUTPL and OUTNL to speaker just like normal BTL mode.
- Analog input signal is applied to INPL and INNL.

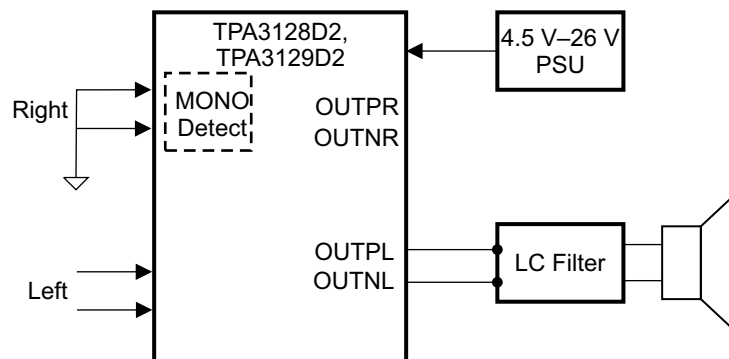

图 35. MONO Mode

8 Applications and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

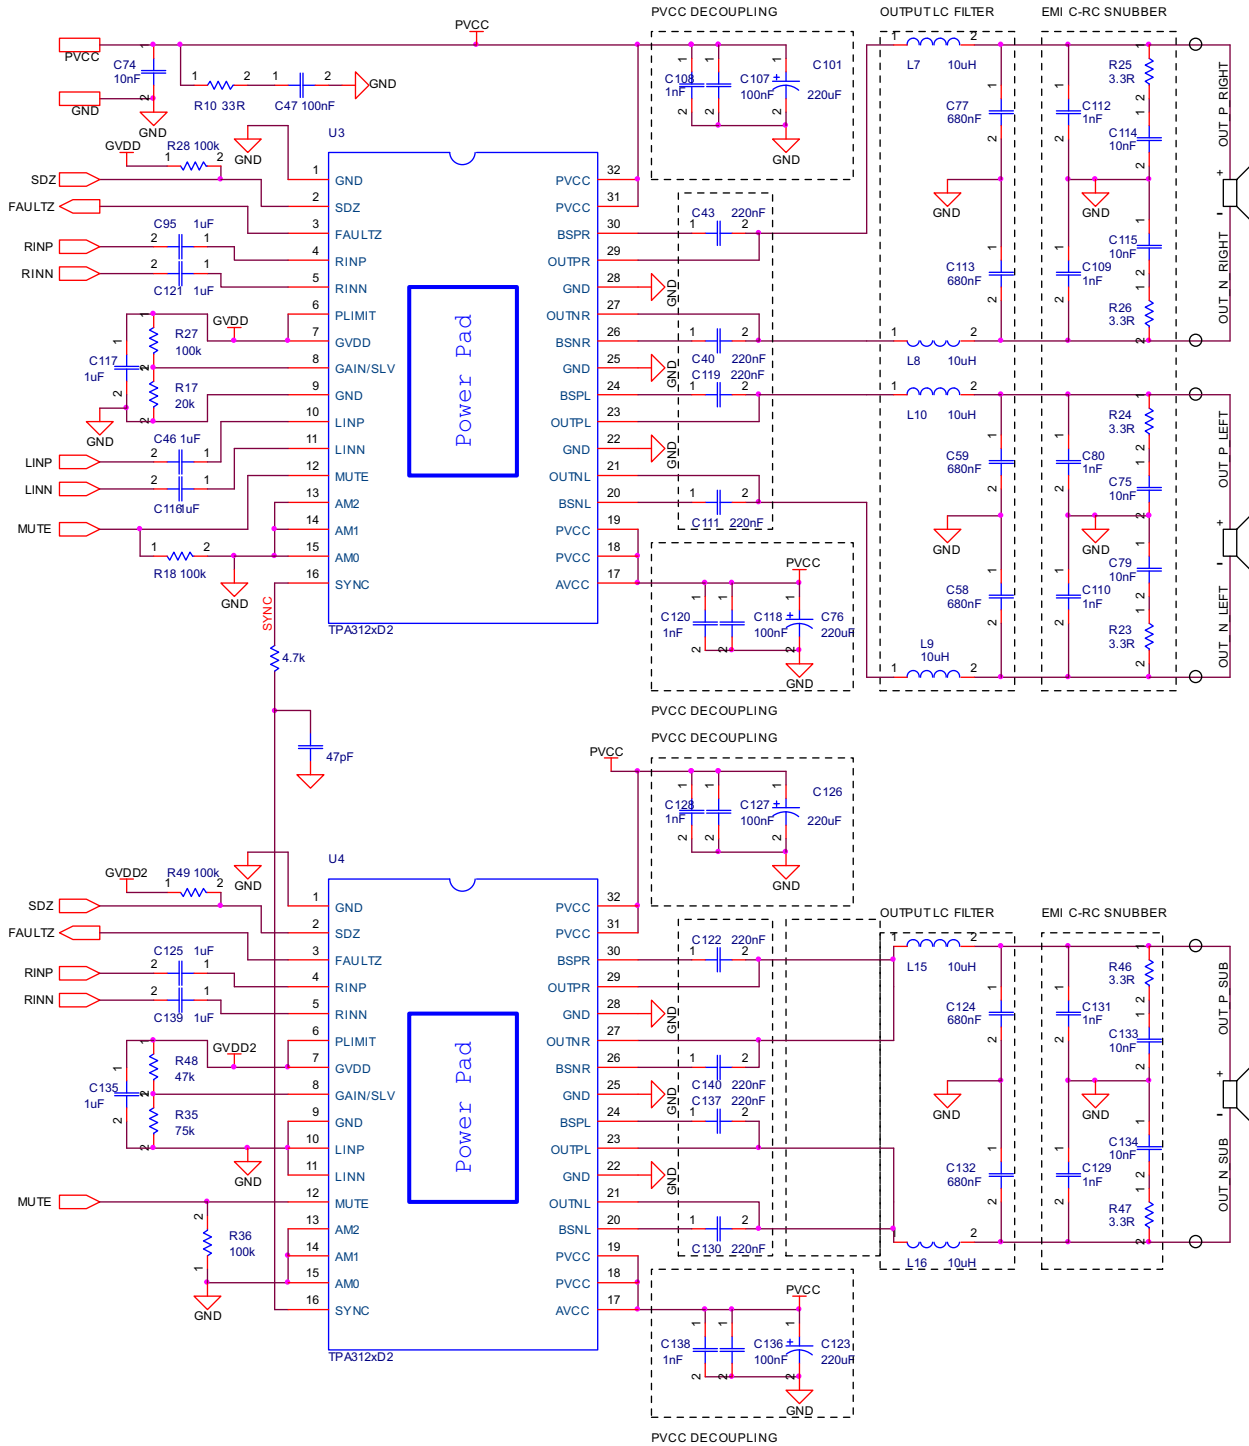

8.1 Application Information

This section describes a 2.1 Master and Slave application. The Master is configured as stereo outputs and the Slave is configured as mono PBTL output.

8.2 Typical Application

A 2.1 solution, U1 TPA312xD2 in Master mode 400 kHz, BTL, gain of 20 dB, power limit not implemented. U2 in Slave, PBTL mode gain of 20dB. Inputs are connected for differential inputs.

Typical Application (continued)

Copyright © 2016, Texas Instruments Incorporated

36. TPA312xD2 Schematic

Typical Application (continued)

8.2.1 Design Requiriements

DESIGN PARAMETERS	EXAMPLE VALUE
Input voltage range PVCC	4.5 V to 26 V
PWM output frequencies	300kHz, 400 kHz, 500 kHz, 600 kHz, 1 MHz or 1.2 MHz
Maximum output power	50 W

8.2.2 Detailed Design Procedure

The TPA31xxD2 devices are very flexible and easy to use Class D amplifier; therefore the design process is straightforward. Before beginning the design, gather the following information regarding the audio system.

- PVCC rail planned for the design
- Speaker or load impedance
- Maximum output power requirement
- Desired PWM frequency

8.2.2.1 Select the PWM Frequency

Set the PWM frequency by using AM0, AM1 and AM2 pins.

8.2.2.2 Select the Amplifier Gain and Master/Slave Mode

In order to select the amplifier gain setting, the designer must determine the maximum power target and the speaker impedance. Once these parameters have been determined, calculate the required output voltage swing which delivers the maximum output power.

Choose the lowest analog gain setting that corresponds to produce an output voltage swing greater than the required output swing for maximum power. The analog gain and master/slave mode can be set by selecting the voltage divider resistors (R1 and R2) on the Gain/SLV pin.

8.2.2.3 Select Input Capacitance

Select the bulk capacitors at the PVCC inputs for proper voltage margin and adequate capacitance to support the power requirements. In practice, with a well-designed power supply, two 100- μ F, 50-V capacitors should be sufficient. One capacitor should be placed near the PVCC inputs at each side of the device. PVCC capacitors should be a low ESR type because they are being used in a high-speed switching application.

8.2.2.4 Select Decoupling Capacitors

Good quality decoupling capacitors must be added at each of the PVCC inputs to provide good reliability, good audio performance, and to meet regulatory requirements. X5R or better ratings should be used in this application. Consider temperature, ripple current, and voltage overshoots when selecting decoupling capacitors. Also, these decoupling capacitors should be located near the PVCC and GND connections to the device in order to minimize series inductances.

8.2.2.5 Select Bootstrap Capacitors

Each of the outputs require bootstrap capacitors to provide gate drive for the high-side output FETs. For this design, use 0.22- μ F, 25-V capacitors of X5R quality or better.

8.2.3 Application Curves

9 Power Supply Recommendations

The power supply requirements for the TPA312xD2 consist of one higher-voltage supply to power the output stage of the speaker amplifier. Several on-chip regulators are included on the TPA312xD2 to generate the voltages necessary for the internal circuitry of the audio path. The voltage regulators which have been integrated are sized only to provide the current necessary to power the internal circuitry. The external pins are provided only as a connection point for off-chip bypass capacitors to filter the supply. Connecting external circuitry to these regulator outputs may result in reduced performance and damage to the device. The high voltage supply, between 4.5 V and 26 V, supplies the analog circuitry (AVCC) and the power stage (PVCC). The AVCC supply feeds internal LDO including GVDD. This LDO output are connected to external pins for filtering purposes, but should not be connected to external circuits. GVDD LDO output have been sized to provide current necessary for internal functions but not for external loading.

9.1 Power Supply Mode

The TPA3128D2 and TPA3129D2 devices support both single and dual power supply modes. Dual power supply mode is benefit for low PVCC power consumption. For dual power supply mode application, when AVCC is supplied with 4.5V power, PVCC is recommended to be lower than 20V. When PVCC is supplied with power greater than 20V, AVCC is recommended to be higher than 6V.

10 Layout

10.1 Layout Guidelines

The TPA312xD2 can be used with a small, inexpensive ferrite bead output filter for most applications. However, because the class-D switching edges are fast, the layout of the printed circuit board must be planned carefully. The following suggestions will help to meet EMC requirements.

- Decoupling capacitors — The high-frequency decoupling capacitors should be placed as close to the PVCC and AVCC terminals as possible. Large (100 μ F or greater) bulk power supply decoupling capacitors should be placed near the TPA312xD2 on the PVCC supplies. Local, high-frequency bypass capacitors should be placed as close to the PVCC pins as possible. These caps can be connected to the IC GND pad directly for an excellent ground connection. Consider adding a small, good quality low ESR ceramic capacitor between 220 pF and 1 nF and a larger mid-frequency cap of value between 100 nF and 1 μ F also of good quality to the PVCC connections at each end of the chip.
- Keep the current loop from each of the outputs through the ferrite bead and the small filter cap and back to GND as small and tight as possible. The size of this current loop determines its effectiveness as an antenna.
- Grounding — The PVCC decoupling capacitors should connect to GND. All ground should be connected at the IC GND, which should be used as a central ground connection or star ground for the TPA312xD2.
- Output filter — The ferrite EMI filter (see [Figure 33](#)) should be placed as close to the output terminals as possible for the best EMI performance. The LC filter should be placed close to the outputs. The capacitors used in both the ferrite and LC filters should be grounded.

Layout Guidelines (continued)

For an example layout, see the TPA3128D2 Evaluation Module (TPA3128D2EVM) User Guide (SLOU336). Both the EVM user manual and the thermal pad application reports, SLMA002 and SLMA004, are available on the TI Web site at <http://www.ti.com>.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

DAP (R-PDSO-G32)

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、[TI の総合的な品質ガイドライン](#)、[ti.com](#) または TI 製品などに関連して提供される他の適用条件に従い提供されます。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。TI がカスタム、またはカスタマー仕様として明示的に指定していない限り、TI の製品は標準的なカタログに掲載される汎用機器です。

お客様がいかなる追加条項または代替条項を提案する場合も、TI はそれらに異議を唱え、拒否します。
