

TPS7A02 高速過渡応答、ナノパワー $I_Q = 25\text{nA}$ 、200mA、低ドロップアウト電圧レギュレータ

1 特長

- きわめて低い I_Q : 25ドロップアウト時でも nA (標準値)
- シャットダウン時 I_Q : 3nA (標準値)
- 非常に優れた過渡応答 (1mA~50mA)
 - セトリング時間: 10 μs 未満
 - アンダーシュート: 100mV
- パッケージ
 - 1.0mm × 1.0mm の X2SON
 - SOT23-5
 - 0.64mm × 0.64mm の DSBGA
- 入力電圧範囲: 1.5V~6.0V
- 出力電圧範囲 0.8V~5.0V (固定)
- 出力精度: 温度範囲全体で 1.5%
- スマート・イネーブルのプルダウン
- 非常に低いドロップアウト
 - 270mV 以下 (200mA、 $V_{\text{OUT}} = 3.3\text{V}$ の場合)
- 1 μF 以上のコンデンサで安定

2 アプリケーション

- ウェアラブル電子機器
- サーモスタット、煙感知器、熱感知器
- ガス、暖房、水道メーター
- 血糖値測定器およびパルス・オキシメータ (血中酸素飽和度計)
- 住宅用サーキット・ブレーカーおよび故障表示器
- ビル・セキュリティおよびビデオ監視デバイス
- EPOS (POS システム) カード・リーダー

3 概要

TPS7A02 は、非常に優れた過渡性能で 200mA を供給できる超小型超低静止電流の低ドロップアウト・レギュレータ (LDO) です。

I_Q が 25nA と非常に小さい TPS7A02 は、超低静止電流が重要な条件であるアプリケーション向けに設計されています。このデバイスはドロップアウト・モードでも小さな I_Q 消費を維持するため、バッテリー動作時間をさらに延長できます。シャットダウンまたはディセーブル・モードでは、わずか 3nA の I_Q しか消費しないため、バッテリーの保存寿命を延ばすのに役立ちます。

TPS7A02 は、最新のマイクロコントローラ (MCU) の低いコア電圧に対応するため、0.8V~5.0V (50mV 刻み) の出力範囲の製品を提供しています。

TPS7A02 は、スマート・イネーブル回路を備え、内部で制御されるプルダウン抵抗により、EN ピンをフローティング状態のままにしても LDO をディセーブル状態に維持します。これにより、EN ピンのプルダウンに使用する外付け部品を最小限に抑えることができます。この回路は、本デバイスがイネーブル状態のときに外付けプルダウン回路を流れる電流を最小化するのにも役立ちます。

TPS7A02 は、 $T_J = -40^\circ\text{C} \sim +125^\circ\text{C}$ の範囲で動作が完全に規定されています。

パッケージ情報⁽¹⁾

部品番号	パッケージ	本体サイズ (公称)
TPS7A02	DQN (X2SON, 4)	1.00mm × 1.00mm
	YCH (DSBGA, 4)	0.64mm × 0.64mm
	DBV (SOT-23, 5)	2.90mm × 1.60mm

- (1) 利用可能なパッケージについては、データシートの末尾にあるパッケージ・オプションについての付録を参照してください。

負荷過渡応答 ($V_{\text{IN}} = V_{\text{OUT}} + 1\text{V}$ 、 $C_{\text{OUT}} = 1\mu\text{F}$ 、 $I_{\text{OUT}} = 1\mu\text{s}$ で 1mA から 50mA に変化)

5 Pin Configuration and Functions

图 5-1. DQN Package, 1-mm × 1-mm, 4-Pin X2SON (Top View)

图 5-2. DBV Package, 5-Pin SOT-23 (Top View)

表 5-1. Pin Functions: DQN, DBV

NAME	PIN		I/O ⁽¹⁾	DESCRIPTION
	DQN	DBV		
EN	3	3	Input	Enable pin. Driving this pin to logic high enables the device; driving this pin to logic low or floating this pin disables the device. This pin features an internal pulldown resistor, which is disconnected when EN is driven high externally and the device has started up.
GND	2	2	—	Ground pin. This pin must be connected to ground on the board.
IN	4	1	Input	Input pin. For best transient response and to minimize input impedance, use the recommended value or larger ceramic capacitor from IN to ground; see the Recommended Operating Conditions table. Place the input capacitor as close to the input of the device as possible.
NC	—	4	—	No connect pin. This pin is not internally connected. Connect to ground or leave floating.
OUT	1	5	Output	Regulated output pin. A 0.5- μ F or greater effective capacitance is required from OUT to ground for stability. For best transient response, use a 1- μ F or larger ceramic capacitor from OUT to ground. Place the output capacitor as close to output of the device as possible; see the Recommended Operating Conditions table.
Thermal pad	—	—	—	Connect the thermal pad to a large-area ground plane. The thermal pad is internally connect to ground.

(1) NC = No internal connection.

图 5-4. YCH Package, 4-Pin DSBGA, 0.35-mm Pitch (Bottom View)

表 5-2. Pin Functions: YCH

PIN		I/O	DESCRIPTION
YCH	NAME		
A1	IN	Input	Input pin. For best transient response and to minimize input impedance, use the recommended value or larger ceramic capacitor from IN to ground; see the Recommended Operating Conditions table. Place the input capacitor as close to input of the device as possible.
A2	OUT	Output	Regulated output pin. A 0.5- μ F or greater effective capacitance is required from OUT to ground for stability. For best transient response, use a 1- μ F or larger ceramic capacitor from OUT to ground. Place the output capacitor as close to output of the device as possible; see the Recommended Operating Conditions table.
B1	EN	Input	Enable pin. Driving this pin to logic high enables the device; driving this pin to logic low or floating this pin disables the device. This pin features an internal pulldown resistor, which is disconnected when EN is driven high externally and the device has started up.
B2	GND	—	Ground pin. This pin must be connected to ground and the thermal pad.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	V_{IN}	-0.3	6.5	V
	V_{EN}	-0.3	6.5	
	V_{OUT}	-0.3	$V_{IN} + 0.3$ or 5.5 ⁽²⁾	
Current	Maximum output	Internally limited		A
Temperature	Operating junction, T_J	-40	150	°C
	Storage, T_{stg}	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Maximum is $V_{IN} + 0.3$ V or 5.5 V, whichever is smaller.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safemanufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safemanufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	1.5		6.0	V
V _{EN}	Enable voltage	0		6.0	V
V _{OUT}	Output voltage	0.8		5.0	V
I _{OUT}	Output current	0		200	mA
C _{IN}	Input capacitor		1		μF
C _{OUT}	Output capacitor ^{(1) (2)}	1	1	22	μF
F _{EN}	EN toggle frequency			10	kHz
T _J	Operating junction temperature	-40		125	°C

- (1) Effective output capacitance of 0.5 μF minimum required for stability.
 (2) 22 μF is the maximum derated capacitance that can be used for stability.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS7A02			UNIT
		DQN (X2SON)	DBV (SOT-23-5)	YCH (DSBGA)	
		4 PINS	5 PINS	4 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	179.1	181.9	201.1	°C/W
R _{θJC(top)}	Junction-to-case(top) thermal resistance	137.6	53.0	2.3	°C/W
R _{θJB}	Junction-to-board thermal resistance	116.3	88.1	67.3	°C/W
ψ _{JT}	Junction-to-top characterization parameter	6.1	27.1	1.1	°C/W
ψ _{JB}	Junction-to-board characterization parameter	116.3	52.7	67.2	°C/W
R _{θJC(bot)}	Junction-to-case(bottom) thermal resistance	112.3	N/A	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

Specified at $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or 2.0 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, and $C_{IN} = C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted). Typical values are at $T_J = 25^\circ\text{C}$.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT	
	Nominal accuracy	$T_J = 25^\circ\text{C}$, $V_{OUT} \geq 1.5\text{ V}$, $1\text{ }\mu\text{A}^{(3)} \leq I_{OUT} \leq 1\text{ mA}$		-1		1	%	
		$T_J = 25^\circ\text{C}$; $V_{OUT} < 1.5\text{ V}$		-15		15	mV	
	Accuracy over temperature	$V_{OUT} \geq 1.5\text{ V}$	$T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$	-1.5		1.5	%	
		$V_{OUT} < 1.5\text{ V}$		-20		20	mV	
$\Delta V_{OUT}(\Delta V_{IN})$	Line regulation	$V_{OUT(nom)} + 0.5\text{ V} \leq V_{IN} \leq 6.0\text{ V}^{(1)}$				5	mV	
$\Delta V_{OUT}(\Delta I_{OUT})$	Load regulation ⁽²⁾	$1\text{ mA} \leq I_{OUT} \leq 200\text{ mA}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}^{(1)}$			20	38	mV	
						50		
I_{GND}	Ground current	$I_{OUT} = 0\text{ mA}$			25	46	nA	
						60		
I_{GND}/I_{OUT}	Ground current vs load current	$5\text{ }\mu\text{A} \leq I_{OUT} < 1\text{ mA}$			1		%	
		$1\text{ mA} \leq I_{OUT} < 100\text{ mA}$		$T_J = 25^\circ\text{C}$	0.25			
		$I_{OUT} \geq 100\text{ mA}$			0.15			
$I_{GND(DO)}$	Ground current in dropout ⁽³⁾	$I_{OUT} = 0\text{ mA}$, $V_{IN} = 95\% \times V_{OUT(NOM)}$			25		nA	
I_{SHDN}	Shutdown current	$V_{EN} = 0\text{ V}$, $1.5\text{ V} \leq V_{IN} \leq 5.0\text{ V}$, $T_J = 25^\circ\text{C}$			3	10	nA	
I_{CL}	Output current limit	$V_{OUT} = 90\% \times V_{OUT(nom)}$		$V_{OUT} < 2.5\text{ V}$, $V_{IN} = V_{OUT(nom)} + V_{DO(max)} + 1.0\text{ V}$	240	450	750	mA
				$V_{OUT} \geq 2.5\text{ V}$, $V_{IN} = V_{OUT(nom)} + V_{DO(max)} + 0.5\text{ V}$	240	450	750	mA
I_{SC}	Short-circuit current limit	$V_{OUT} = 0\text{ V}$			65		mA	
V_{DO}	Dropout voltage ⁽⁴⁾	$T_J = -40^\circ\text{C}$ to $+85^\circ\text{C}$		$0.8\text{ V} \leq V_{OUT} < 1.0\text{ V}$			1050	mV
				$1.0\text{ V} \leq V_{OUT} < 1.2\text{ V}$			790	
				$1.2\text{ V} \leq V_{OUT} < 1.5\text{ V}$			650	
				$1.5\text{ V} \leq V_{OUT} < 1.8\text{ V}$			490	
				$1.8\text{ V} \leq V_{OUT} < 2.5\text{ V}$			400	
				$2.5\text{ V} \leq V_{OUT} < 3.3\text{ V}$			310	
		$T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$		$3.3\text{ V} \leq V_{OUT} \leq 5.0\text{ V}$			270	
				$0.8\text{ V} \leq V_{OUT} < 1.0\text{ V}$			1100	
				$1.0\text{ V} \leq V_{OUT} < 1.2\text{ V}$			850	
				$1.2\text{ V} \leq V_{OUT} < 1.5\text{ V}$			700	
				$1.5\text{ V} \leq V_{OUT} < 1.8\text{ V}$			560	
				$1.8\text{ V} \leq V_{OUT} < 2.5\text{ V}$			450	
				$2.5\text{ V} \leq V_{OUT} < 3.3\text{ V}$			360	
				$3.3\text{ V} \leq V_{OUT} \leq 5.0\text{ V}$			310	
PSRR	Power-supply rejection ratio	$f = 1\text{ kHz}$, $I_{OUT} = 30\text{ mA}$			55		dB	
V_N	Output voltage noise	$BW = 10\text{ Hz}$ to 100 kHz , $V_{OUT} = 0.8\text{ V}$, $I_{OUT} = 30\text{ mA}$			130		μV_{RMS}	
V_{UVLO}	UVLO threshold	V_{IN} rising		1.23	1.3	1.47	V	
		V_{IN} falling		1.0	1.12	1.41		
$V_{UVLO(HYST)}$	UVLO hysteresis	V_{IN} hysteresis			180		mV	

6.5 Electrical Characteristics (continued)

Specified at $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or 2.0 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, and $C_{IN} = C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted). Typical values are at $T_J = 25^\circ\text{C}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{EN(HI)}$	EN pin logic high voltage		1.1			V
$V_{EN(LOW)}$	EN pin logic low voltage				0.3	V
I_{EN}	EN pin leakage current	$V_{EN} = V_{IN} = 6.0\text{ V}$		10		nA
$R_{EN(PULLDOWN)}$	Smart enable pulldown resistor	$V_{EN} = 0.3\text{ V}$		500		K Ω
$R_{PULLDOWN}$	Pulldown resistor	$V_{IN} = 3.3\text{ V}$, device disabled		60		Ω
$T_{SD(shutdown)}$	Thermal shutdown temperature	Shutdown, temperature increasing		170		°C
$T_{SD(reset)}$	Thermal shutdown reset temperature	Reset, temperature decreasing		145		

- (1) $V_{IN} = 2.0\text{ V}$ for $V_{OUT} \leq 1.5\text{ V}$.
- (2) Load Regulation is normalized to the output voltage at $I_{OUT} = 1\text{ mA}$.
- (3) Specified by design
- (4) Dropout is measured by ramping V_{IN} down until $V_{OUT} = V_{OUT(nom)} \times 95\%$, with $I_{OUT} = 200\text{ mA}$.

6.6 Switching Characteristics

Specified at $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or 2.0 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, and $C_{IN} = C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted). Typical values are at $T_J = 25^\circ\text{C}$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{STR}	Start-up time	From EN assertion to $V_{OUT} = 90\% \times V_{OUT(nom)}$	$0.8\text{ V} \leq V_{OUT} \leq 1.5\text{ V}$	500	800	μs
			$1.5\text{ V} < V_{OUT} \leq 3.0\text{ V}$	750	1200	
			$3.0\text{ V} < V_{OUT} \leq 5.0\text{ V}$	1200	1600	

6.7 Typical Characteristics

at operating temperature range ($T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$), $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or 2.0 V (whichever is greater), $I_{OUT} = 1\text{ mA}$, $V_{EN} = V_{IN}$, and $C_{IN} = C_{OUT} = 1\text{ }\mu\text{F}$ (unless otherwise noted)

7 Detailed Description

7.1 Overview

The TPS7A02 is an ultra-low I_Q linear voltage regulator that is optimized for excellent transient performance. These characteristics make the device ideal for most battery-powered applications.

This low-dropout linear regulator (LDO) offers active discharge, foldback current limit, shutdown, and thermal protection capability.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Excellent Transient Response

The TPS7A02 includes several innovative circuits to ensure excellent transient response. Dynamic biasing increases the I_Q for a short duration during transients to extend the closed-loop bandwidth and improve the output response time to transients.

Adaptive biasing increases the I_Q as the DC load current increases, extending the bandwidth of the loop. The response time across the output voltage range is constant because a buffered reference topology is used, which keeps the control loop in unity gain at any output voltage.

These features give the device a wide loop bandwidth during transients that ensures excellent transient response while maintaining low I_Q in steady-state conditions.

7.3.2 Active Discharge (P-Version Only)

The device has an internal pulldown MOSFET that connects a $R_{PULLDOWN}$ resistor to ground when the device is disabled to actively discharge the output voltage. The active discharge circuit is activated by the enable pin or by the undervoltage lockout (UVLO).

Do not rely on the active discharge circuit for discharging a large amount of output capacitance after the input supply has collapsed because reverse current can possibly flow from the output to the input. This reverse current flow can cause damage to the device. Limit reverse current to no more than 5% of the device rated current for a short period of time.

7.3.3 Low I_Q in Dropout

In most LDOs the I_Q significantly increases when the device is placed into dropout, which is especially true for low I_Q LDOs. The TPS7A02 helps to reduce the battery discharge by detecting when the device is operating in dropout conditions and maintaining a low I_Q .

7.3.4 Smart Enable

The enable (EN) input polarity is active high. The output voltage is enabled when the voltage of the enable input is greater than $V_{EN(HI)}$ and disabled when the enable input voltage is less than $V_{EN(LOW)}$. If independent control of the output voltage is not needed, connect EN to IN.

This device has a smart enable circuit to reduce quiescent current. When the voltage on the enable pin is driven above $V_{EN(HI)}$, as listed in the *Electrical Characteristics* table, the device is enabled and the smart enable internal pulldown resistor ($R_{EN(PULLDOWN)}$) is disconnected. When the enable pin is floating, the $R_{EN(PULLDOWN)}$ is connected and pulls the enable pin low to disable the device. The $R_{EN(PULLDOWN)}$ value is listed in the *Electrical Characteristics* table.

This device has an internal pulldown circuit that activates when the device is disabled to actively discharge the output voltage.

7.3.5 Dropout Voltage

Dropout voltage (V_{DO}) is defined as the input voltage minus the output voltage ($V_{IN} - V_{OUT}$) at the rated output current (I_{RATED}), where the pass transistor is fully on. I_{RATED} is the maximum I_{OUT} listed in the *Recommended Operating Conditions* table. The pass transistor is in the ohmic or triode region of operation, and acts as a switch. The dropout voltage indirectly specifies a minimum input voltage greater than the nominal programmed output voltage at which the output voltage is expected to stay in regulation. If the input voltage falls to less than the nominal output regulation, then the output voltage falls as well.

For a CMOS regulator, the dropout voltage is determined by the drain-source on-state resistance ($R_{DS(ON)}$) of the pass transistor. Therefore, if the linear regulator operates at less than the rated current, the dropout voltage for that current scales accordingly. The following equation calculates the $R_{DS(ON)}$ of the device.

$$R_{DS(ON)} = \frac{V_{DO}}{I_{RATED}} \quad (1)$$

7.3.6 Foldback Current Limit

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a hybrid brick-wall-foldback scheme. The current limit transitions from a brick-wall scheme to a foldback scheme at the foldback voltage ($V_{FOLDBACK}$). In a high-load current fault with the output voltage above $V_{FOLDBACK}$, the brick-wall scheme limits the output current to the current limit (I_{CL}). When the voltage drops below $V_{FOLDBACK}$, a foldback current limit activates that scales back the current as the output voltage approaches GND. When the output is shorted, the device supplies a typical current called the short-circuit current limit (I_{SC}). I_{CL} and I_{SC} are listed in the *Electrical Characteristics* table.

For this device, $V_{FOLDBACK} = 0.5\text{ V}$.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brick-wall current limit, the pass transistor dissipates power $[(V_{IN} - V_{OUT}) \times I_{CL}]$. When the device output is shorted and the output is below $V_{FOLDBACK}$, the pass transistor dissipates power $[(V_{IN} - V_{OUT}) \times I_{SC}]$. If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application report](#).

Figure 7-1 shows a diagram of the foldback current limit.

Figure 7-1. Foldback Current Limit

7.3.7 Undervoltage Lockout (UVLO)

The device has an independent undervoltage lockout (UVLO) circuit that monitors the input voltage, allowing a controlled and consistent turn on and off of the output voltage. To prevent the device from turning off if the input drops during turn on, the UVLO has hysteresis as specified in the *Electrical Characteristics* table.

7.3.8 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature (T_J) of the pass transistor rises to $T_{SD(\text{shutdown})}$ (typical). Thermal shutdown hysteresis assures that the device resets (turns on) when the temperature falls to $T_{SD(\text{reset})}$ (typical).

The thermal time-constant of the semiconductor die is fairly short, thus the device may cycle on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during start up can be high from large $V_{IN} - V_{OUT}$ voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start up completes.

For reliable operation, limit the junction temperature to the maximum listed in the *Recommended Operating Conditions* table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

7.4 Device Functional Modes

7.4.1 Device Functional Mode Comparison

表 7-1 shows the conditions that lead to the different modes of operation. See the *Electrical Characteristics* table for parameter values.

表 7-1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal operation	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Dropout operation	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Disabled (any true condition disables the device)	$V_{IN} < V_{UVLO}$	$V_{EN} < V_{EN(LOW)}$	Not applicable	$T_J > T_{SD(shutdown)}$

7.4.2 Normal Operation

The device regulates to the nominal output voltage when the following conditions are met:

- The input voltage is greater than the nominal output voltage plus the dropout voltage ($V_{OUT(nom)} + V_{DO}$)
- The output current is less than the current limit ($I_{OUT} < I_{CL}$)
- The device junction temperature is less than the thermal shutdown temperature ($T_J < T_{SD}$)
- The enable voltage has previously exceeded the enable rising threshold voltage and has not yet decreased to less than the enable falling threshold

7.4.3 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and acts as a switch. Line or load transients in dropout can result in large output-voltage deviations.

When the device is in a steady dropout state (defined as when the device is in dropout, $V_{IN} < V_{OUT(NOM)} + V_{DO}$, directly after being in a normal regulation state, but *not* during start-up), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value greater than or equal to the nominal output voltage plus the dropout voltage ($V_{OUT(NOM)} + V_{DO}$), the output voltage can overshoot for a short period of time while the device pulls the pass transistor back into the linear region.

7.4.4 Disabled

The output of the device can be shutdown by forcing the voltage of the enable pin to less than the maximum EN pin low-level input voltage (see the *Electrical Characteristics* table). When disabled, the pass transistor is turned off, internal circuits are shutdown, and the output voltage is actively discharged to ground by an internal discharge circuit from the output to ground.

8 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくこととなります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

8.1.1 Recommended Capacitor Types

The device is designed to be stable using low equivalent series resistance (ESR) ceramic capacitors at the input and output. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and C0G-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance.

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. As a rule of thumb, expect the effective capacitance to decrease by as much as 50%. The input and output capacitors recommended in the *Recommended Operating Conditions* table account for an effective capacitance of approximately 50% of the nominal value.

8.1.2 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. An input capacitor is recommended if the source impedance is more than 0.5 Ω . A higher value capacitor may be necessary if large, fast rise-time load or line transients are anticipated or if the device is located several inches from the input power source.

Dynamic performance of the device is improved with the use of an output capacitor. Use an output capacitor within the range specified in the *Recommended Operating Conditions* table for stability.

8.1.3 Load Transient Response

The load-step transient response is the output voltage response by the LDO to a step in load current, whereby output voltage regulation is maintained. There are two key transitions during a load transient response: the transition from a light to a heavy load and the transition from a heavy to a light load. The regions shown in [Figure 8-1](#) are broken down as follows. Regions A, E, and H are where the output voltage is in steady-state.

Figure 8-1. Load Transient Waveform

During transitions from a light load to a heavy load, the:

- Initial voltage dip is a result of the depletion of the output capacitor charge and parasitic impedance to the output capacitor (region B)
- Recovery from the dip results from the LDO increasing the sourcing current, and leads to output voltage regulation (region C)

During transitions from a heavy load to a light load, the:

- Initial voltage rise results from the LDO sourcing a large current, and leads to the output capacitor charge to increase (region F)
- Recovery from the rise results from the LDO decreasing the sourcing current in combination with the load discharging the output capacitor (region G)

A larger output capacitance reduces the peaks during a load transient but slows down the response time of the device. A larger DC load also reduces the peaks because the amplitude of the transition is lowered and a higher current discharge path is provided for the output capacitor.

8.1.4 Undervoltage Lockout (UVLO) Operation

The UVLO circuit ensures that the device stays disabled before the input supply reaches the minimum operational voltage range, and ensures that the device shuts down when the input supply collapses. [Figure 8-2](#) shows the UVLO circuit response to various input voltage events. The diagram can be separated into the following parts:

- Region A: The device does not start until the input reaches the UVLO rising threshold.
- Region B: Normal operation, regulating device.
- Region C: Brownout event above the UVLO falling threshold (UVLO rising threshold – UVLO hysteresis). The output may fall out of regulation but the device remains enabled.
- Region D: Normal operation, regulating device.
- Region E: Brownout event below the UVLO falling threshold. The device is disabled in most cases and the output falls because of the load and active discharge circuit. The device is reenabled when the UVLO rising threshold is reached by the input voltage and a normal start-up follows.
- Region F: Normal operation followed by the input falling to the UVLO falling threshold.
- Region G: The device is disabled when the input voltage falls below the UVLO falling threshold to 0 V. The output falls because of the load and active discharge circuit.

Figure 8-2. Typical UVLO Operation

8.1.5 Power Dissipation (P_D)

Circuit reliability demands that proper consideration be given to device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must be as free as possible of other heat-generating devices that cause added thermal stresses.

As a first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. Use [Equation 2](#) to approximate P_D :

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (2)$$

Power dissipation can be minimized, and thus greater efficiency achieved, by proper selection of the system voltage rails. Proper selection allows the minimum input-to-output voltage differential to be obtained. The low dropout of the TPS7A02 allows for maximum efficiency across a wide range of output voltages.

The main heat conduction path for the device is through the thermal pad on the package. As such, the thermal pad must be soldered to a copper pad area under the device. This pad area contains an array of plated vias that conduct heat to any inner plane areas or to a bottom-side copper plane.

The maximum power dissipation determines the maximum allowable junction temperature (T_J) for the device. According to 式 3, power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A). 式 4 rearranges 式 3 for output current.

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (3)$$

$$I_{OUT} = (T_J - T_A) / [R_{\theta JA} \times (V_{IN} - V_{OUT})] \quad (4)$$

Unfortunately, this thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The $R_{\theta JA}$ recorded in the *Thermal Information* table is determined by the JEDEC standard, PCB, and copper-spreading area, and is only used as a relative measure of package thermal performance. For a well-designed thermal layout, $R_{\theta JA}$ is actually the sum of the X2SON package junction-to-case (bottom) thermal resistance ($R_{\theta JC(bot)}$) plus the thermal resistance contribution by the PCB copper.

8.1.5.1 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the LDO when in-circuit on a typical PCB board application. These metrics are not strictly speaking thermal resistances, but rather offer practical and relative means of estimating junction temperatures. These psi metrics are determined to be significantly independent of the copper-spreading area. The key thermal metrics (Ψ_{JT} and Ψ_{JB}) are used in accordance with 式 5 and are given in the *Thermal Information* table.

$$\Psi_{JT} : T_J = T_T + \Psi_{JT} \times P_D \text{ and } \Psi_{JB} : T_J = T_B + \Psi_{JB} \times P_D \quad (5)$$

where:

- P_D is the power dissipated as explained in 式 2
- T_T is the temperature at the center-top of the device package, and
- T_B is the PCB surface temperature measured 1 mm from the device package and centered on the package edge

8.1.5.2 Recommended Area for Continuous Operation

The operational area of an LDO is limited by the dropout voltage, output current, junction temperature, and input voltage. The recommended area for continuous operation for a linear regulator is given in 图 8-3 and can be separated into the following parts:

- Dropout voltage limits the minimum differential voltage between the input and the output ($V_{IN} - V_{OUT}$) at a given output current level. See the *Dropout Operation* section for more details.
- The rated output currents limits the maximum recommended output current level. Exceeding this rating causes the device to fall out of specification.
- The rated junction temperature limits the maximum junction temperature of the device. Exceeding this rating causes the device to fall out of specification and reduces long-term reliability.
 - The shape of the slope is given by 式 4. The slope is nonlinear because the maximum rated junction temperature of the LDO is controlled by the power dissipation across the LDO; thus when $V_{IN} - V_{OUT}$ increases the output current must decrease.
- The rated input voltage range governs both the minimum and maximum of $V_{IN} - V_{OUT}$.

Figure 8-3 shows the recommended area of operation for this device on a JEDEC-standard high-K board with a $R_{\theta JA}$ as given in the *Thermal Information* table.

Figure 8-3. Region Description of Continuous Operation Regime

8.2 Typical Application

Figure 8-4. Operation From a Battery Input Supply

8.2.1 Design Requirements

Table 8-1. Design Parameters

PARAMETER	DESIGN REQUIREMENT
Input voltage	1.8 V to 3.0 V (two 1.5-V batteries)
Output voltage	1.0 V, $\pm 1\%$
Input current	200 mA, maximum
Output load	10-mA DC
Maximum ambient temperature	70°C

8.2.2 Detailed Design Procedure

For this design example, the 1.0-V, fixed-version TPS7A0210 is selected. A dual AA Alkaline battery was used, thus a 1.0- μF input capacitor is recommended to minimize transient currents drawn from the battery. A 1.0- μF output capacitor is also recommended for excellent load transient response. The dropout voltage (V_{DO}) is kept within the TPS7A02 dropout voltage specification for the 1.0-V output voltage option to keep the device in regulation under all load and temperature conditions for this design. Use the recommended 1- μF input and output capacitor because the input source has a high equivalent series resistor (ESR) of 600 m Ω (typ). The very small ground current consumed by the regulator maintains a high current efficiency as compared to the load current consumed by the system, as shown in Figure 8-5 which allows for long battery life. Equation 6 can be used to calculate the current efficiency (I_{η}) of this system.

$$I_{\eta}(\%) = I_{OUT} / (I_{OUT} + I_Q) \times 100 \quad (6)$$

8.2.3 Application Curve

8-5. Current Efficiency vs I_{OUT} and Temperature

8.3 Power Supply Recommendations

This device is designed to operate from an input supply voltage range of 1.5 V to 6.0 V. The input supply must be well regulated and free of spurious noise. To ensure that the output voltage is well regulated and dynamic performance is optimum, the input supply must be at least $V_{OUT(nom)} + 0.5$ V. TI highly recommends using a 1- μ F or greater input capacitor to reduce the impedance of the input supply, especially during transients.

8.4 Layout

8.4.1 Layout Guidelines

- Place input and output capacitors as close to the device as possible.
- Use copper planes for device connections to optimize thermal performance.
- Place thermal vias around the device to distribute the heat.
- Do not place a thermal via directly beneath the thermal pad of the DQN package. A via can wick solder or solder paste away from the thermal pad joint during the soldering process, leading to a compromised solder joint on the thermal pad.

8.4.2 Layout Examples

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of ≤ 1000 ppm threshold. Antimony trioxide based flame retardants must also meet the ≤ 1000 ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

SCALE: 40X

SOLDER MASK DETAIL

4215302/E 12/2016

NOTES: (continued)

7. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sluea271).
8. If any vias are implemented, it is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE
 BASED ON 0.075 - 0.1mm THICK STENCIL
 EXPOSED PAD
 88% PRINTED SOLDER COVERAGE BY AREA
 SCALE: 60X

4215302/E 12/2016

NOTES: (continued)

9. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

YCH0004

PACKAGE OUTLINE

DSBGA - 0.4 mm max height

DIE SIZE BALL GRID ARRAY

4224061/A 12/2017

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.

EXAMPLE BOARD LAYOUT

YCH0004

DSBGA - 0.4 mm max height

DIE SIZE BALL GRID ARRAY

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE: 50X

SOLDER MASK DETAILS
NOT TO SCALE

4224061/A 12/2017

NOTES: (continued)

- Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints. See Texas Instruments Literature No. SNVA009 (www.ti.com/lit/snva009).

EXAMPLE STENCIL DESIGN

YCH0004

DSBGA - 0.4 mm max height

DIE SIZE BALL GRID ARRAY

SOLDER PASTE EXAMPLE
BASED ON 0.075 mm THICK STENCIL
SCALE: 50X

4224061/A 12/2017

NOTES: (continued)

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
