

TPS62840 1.8V~6.5V、750mA、 I_Q 60nA の降圧型コンバータ

1 特長

- 静止電流：60nA
- I_Q 120nA の 100% デューティ・サイクル・モード
- 入力電圧範囲 V_{IN} ：1.8V~6.5V
- 出力電流：最大 750mA
- RF 対応 DCS-Control™
- 1 μ A の I_{OUT} で 80% の効率 (3.6V $_{IN}$ から 1.8V $_{OUT}$ へ)
- VSET ピンで選択可能な 16 の出力電圧
- PFM/PWM 自動遷移モードまたは強制 PWM モード
- 選択可能な強制 PWM モードと STOP モード
- 出力放電機能
- 25nA のシャットダウン電流
- SON-8、WCSP-6、熱特性強化型 HVSSOP-8 パッケージ

2 アプリケーション

- スマート・メーター、スマート・サーモスタット
- アセット・トラッキング・デバイス
- ウェアラブル電子機器
- 医療用センサ・パッチおよび患者モニター
- 産業用 IoT (スマート・センサ) / NB-IoT
- 試験/測定機器
- ATEX / 本質安全防爆

3 概要

TPS62840 は、静止電流が標準 60nA と極めて小さい、高効率の降圧型コンバータです。本デバイスは、バッテリー持続時間をさらに延長するため、100% モードで I_Q をわずかに 120nA に低減するための専用回路を備えています。

本デバイスは、無線に効率よく電力を供給するため DCS-Control を使用しており、1.8MHz (標準値) のスイッチング周波数で動作します。パワーセーブ・モードでは、1 μ A 以下の負荷電流範囲まで軽負荷時効率を維持できます。

VSET ピンに抵抗を接続することで定義済みの 16 種類の出力電圧を選択できるため、最小限の外付け部品数で各種用途に柔軟に対応できます。

試験および測定システムでノイズ・フリー測定を行うために、本デバイスの STOP ピンはすべてのスイッチング・ノイズを直ちに除去します。

TPS62840 は最大 750mA の出力電流を供給します。1.8V~6.5V の入力電圧に対応する本デバイスは、2S~4S アルカリ、1S~2S Li-MnO₂ または 1S リチウムイオン / Li-SoCl₂ など複数の電源をサポートしています。

製品情報⁽¹⁾

型番	パッケージ	本体サイズ(公称)
TPS6284x	8ピン DLC (SON)	1.5 mm x 2 mm
	6ピン YBG (WCSP)	0.97 mm x 1.47 mm
	8ピン DGR (HVSSOP)	3 mm x 5 mm

(1) 利用可能なすべてのパッケージについては、このデータシートの末尾にある注文情報を参照してください。

6 Pin Configuration and Functions

Pin Functions

NAME	PIN			I/O	DESCRIPTION
	DLC (SON-8)	DGR (HVSSOP-8)	YBG (WCSP-6)		
VIN	2	6	B1	PWR	V _{IN} power supply pin. Connect the input capacitor close to this pin for best noise and voltage spike suppression. A 4.7-μF ceramic capacitor is required.
SW	7	2	B2	PWR	The switch pin is connected to the internal MOSFET switches. Connect the inductor to this terminal.
GND	1	8	A1	PWR	GND supply pin. Connect this pin close to the GND terminal of the input and output capacitors.
VSET	5	4	C2	IN	Connecting a resistor to GND sets the output voltage when the converter is enabled. For the TPS62849, connect this pin to GND.
VOS	8	1	A2	IN	Output voltage sense pin for the internal feedback divider network and regulation loop. When the converter is disabled, this pin discharges V _{OUT} by an internal MOSFET. Connect this pin directly to the output capacitor with a short trace.
EN	4	5	C1	IN	Enable pin. A high level enables the device and a low level turns the device off. The pin features an internal pulldown resistor, which is disabled once the device has started up and the output voltage is regulated. The pulldown resistor is activated again, once a low level has been detected.
STOP	6	n/a	n/a	IN	STOP Switching pin. When this pin is logic high, the converter stops switching in order to provide a quiet supply rail. The output is powered from the charge available in the output capacitor. When this pin is logic low, the device immediately resumes operation. The pin features an internal pulldown resistor, which is disabled once a high level is detected at the input. The pulldown resistor is activated again, once a low level has been detected.
MODE	3	3	n/a	IN	MODE pin. A low level enables Power-Save Mode operation with an automatic transition between PFM and PWM modes. A high level forces the converter to operated in PWM mode. This pin can be toggled during operation. It must be terminated.
NC	n/a	7	n/a		This pin is not connected internally. Do not connect this pin.
EP	n/a	9	n/a	PWR	Exposed thermal pad ⁽¹⁾ . The PowerPAD must be connected to GND.

(1) For more information about the PowerPAD, see the [PowerPAD™ Thermally Enhanced Package](#) application report.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Pin voltage ⁽²⁾	V _{IN}	-0.3	7	V
	SW (DC)	-0.3	V _{IN} + 0.3	V
	SW (AC), less than 10ns ⁽³⁾	-2.0	8.5	V
	EN, MODE, STOP	-0.3	6.5	V
	VSET	-0.3	V _{IN} + 0.3 < 3.6	V
	VOS	-0.3	3.7	V
Operating junction temperature, T _J		-40	150	°C
Storage temperature, T _{stg}		-65	150	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal GND.
- (3) While switching.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each pin.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{IN}	Supply voltage V _{IN}	1.8		6.5	V
L	Effective inductance	1.51	2.2	2.9	μH
C _{OUT}	Effective output capacitance	3	10	40	μF
C _{IN}	Effective input capacitance	1	4.7		μF
C _{VSET}	External parasitic capacitance at VSET pin			100	pF
R _{SET}	Nominal resistance range for external voltage selection resistor (E96 resistor series)	0.909		267	kΩ
	External voltage selection resistor tolerance			1%	
	External voltage selection resistor temperature coefficient			±200	ppm/°C
T _J	Operating junction temperature range	-40		125	°C

8 Detailed Description

8.1 Overview

The TPS6284x is a synchronous step-down converter with ultra-low quiescent current consumption. Using TI's DCS-Control topology, the device extends the high efficiency operation area down to micro amperes of load current during Power-Save Mode Operation. Depending on the output voltage, the device consumes quiescent current from both the input and output to reduce the overall input current consumption to 60 nA typical.

DCS-Control™ (Direct Control with Seamless Transition into Power-Save Mode) is an advanced regulation topology that combines the advantages of hysteretic and voltage mode controls. Characteristics of DCS-Control are excellent AC load regulation and transient response, low output ripple voltage, and a seamless transition between PFM and PWM modes. It includes a AC loop which senses the output voltage (VOS pin) and directly feeds this information into a fast comparator stage.

The device operates with a nominal switching frequency of 1.8 MHz. An additional voltage feedback loop is used to achieve accurate DC load regulation. The internally compensated regulation network achieves fast and stable operation with small external components and low ESR capacitors.

In Power-Save Mode, the switching frequency varies linearly with the load current. Since DCS-Control supports both operating modes, the transition from PWM to PFM is seamless with minimum output voltage ripple. The TPS6284x offers both, excellent DC voltage and superior load transient regulation, combined with low output voltage ripple thereby minimizing interferences with Radio Frequency circuits.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Smart Enable and Shutdown

To avoid a floating input, an internal 450-k Ω resistor pulls the EN pin to GND. This prevents an uncontrolled start-up of the device in case the EN pin cannot be driven low safely. The device is in shutdown mode when the EN input is logic low.

The device turns on with a logic high EN signal. An internal control circuit disconnects the EN pin pulldown resistor once the device has finished soft start and the output voltage is in regulation. With the EN pin set low, the device enters shutdown mode and the pulldown resistor is activated again.

8.3.2 Soft Start

To protect the battery and system from excessive inrush current, the device features a soft start of the output voltage.

Once the device has been enabled, it initializes and powers up its internal circuits. This occurs during the regulator start-up delay time ($t_{\text{STARTUP_DELAY}}$). Once this delay expires, the device enters soft start, starts switching, and ramps up the output voltage.

The device operates with a reduced switch current limit ($I_{\text{LIMF_SS}}$) throughout the entire soft-start phase (t_{SS}). The switch current limit is increased to its nominal value (I_{LIMF}) once the output voltage has reached its nominal value or the reduced current limit soft-start time ($t_{\text{SS_ILIMF}}$) has expired, whichever occurs first. The soft-start phase (t_{SS}) can last up to approximately 700 μs . [Figure 12](#) shows the start-up procedure.

Figure 12. Device Start-up

8.3.3 Mode Selection: Power-Save Mode (PFM/PWM) or Forced PWM Operation (FPWM)

Connecting the MODE input to GND enables the automatic PWM and power-save mode operation. The converter operates in PWM mode at moderate to heavy loads and in the PFM mode during light loads, which maintains high efficiency over a wide load current range.

Pulling the MODE pin high forces the converter to operate in PWM mode even at light load currents, allowing lower ripple compared to PFM mode switching. In this mode, the efficiency is lower compared to the power-save mode during light loads. For additional flexibility, it is possible to switch from power-save mode to forced PWM mode during operation. This allows efficient power management by adjusting the operation of the converter to the specific system requirements. The MODE pin must be terminated.

This pin is not available in the YBG package, where the device automatically transitions between power-save and PWM modes.

8.3.4 Output Voltage Selection (VSET)

The output voltage is set with a single external resistor connected between the VSET pin and GND. Once the device has been enabled and the control logic as well as the reference system are powered up, an R2D (resistor to digital) conversion is started to detect the value of the external R_{SET} resistor. A pre-defined fixed output voltage is set based on the R_{SET} value. The output voltage is set once during the start-up delay phase of the device.

Feature Description (continued)

Once the output voltage is set, the R2D converter is turned off to avoid current flowing through R_{SET} . Care must be taken that no parasitic current, capacitance, or both greater than 100 pF is present between the VSET and GND pins. This can cause false R_{SET} readings and a faulty output voltage to be set. The R2D converter is designed to operate with resistor values out of E96 series. 表 1 shows the allowed R_{SET} values.

表 1. Output Voltage Setting, R_{SET} Resistor

OUTPUT VOLTAGE SETTING V_{OUT} [V]			VSET RESISTANCE TO GND - E96 VALUES [Ω]

1.55	3.3	3.6	256.32 k	267 k	277.68 k

The output voltage of the TPS62849 is internally set to 3.4 V. Connect VSET directly to GND for this device.

8.3.5 Undervoltage Lockout UVLO

To avoid mis-operation of the device at low input voltages, an undervoltage lockout (UVLO) comparator monitors the supply voltage. The UVLO comparator shuts down the device at an input below the threshold V_{TH_UVLO-} with falling V_{IN} . The device starts at an input voltage higher than the threshold V_{TH_UVLO+} with rising V_{IN} .

When the device resumes operation from an undervoltage lockout condition, it behaves like being enabled. This means the internal control logic is powered up, the external R_{SET} resistor is read out and a soft-start sequence is initiated.

8.3.6 Switch Current Limit / Short Circuit Protection

The TPS6284x integrates a current limit on the high-side as well as on the low-side MOSFETs to protect the device against overload or short circuit conditions. The current in the switches is monitored cycle-by-cycle. If the high-side MOSFET current limit (I_{LIMF}) trips, the high-side MOSFET is turned off and the low-side MOSFET is turned on to ramp the inductor current down. Once the inductor current decreases below the low-side current limit (I_{LIMF}), the low-side MOSFET turns off and the high-side MOSFET turns on again.

During soft start, the current limit is reduced to I_{LIMF_SS} . After soft start has finished, the current limit value increases to the normal value I_{LIMF} .

Due to internal propagation delay, the actual inductor current can exceed the static current limit during that time. The dynamic current limit can be calculated as follows:

$$I_{peak(typ)} = I_{LIMF} + \frac{V_L}{L} \cdot t_{LIM_DELAY}$$

where

- I_{LIMF} is the static current limit, specified in [Electrical Characteristics](#)
- L is the inductance
- V_L is the voltage across the inductor ($V_{IN} - V_{OUT}$)
- t_{LIM_DELAY} is the internal propagation delay (1)

In forced PWM mode, a negative current limit (I_{LIMN}) is enabled to prevent excessive current flowing backwards to the input. When the inductor current reaches I_{LIMN} , the low-side MOSFET turns off and the high-side MOSFET turns on and kept on until TON time expires.

8.3.7 Output Voltage Discharge

The purpose of the output discharge function is to ensure a defined ramp-down of the output voltage when the device is disabled.

The internal discharge resistor is connected to the VOS pin. The discharge function is enabled as soon as the device is disabled or if UVLO is entered. It is not active during Thermal Shutdown. The discharge circuit remains active as long as the input voltage is above 0.7 V.

8.3.8 Thermal Shutdown

The junction temperature (T_J) of the device is monitored by an internal temperature sensor. The device enters thermal shutdown when the junction temperature exceeds the thermal shutdown threshold (T_{SD}) of 160°C (typ.). Both the high-side and low-side MOSFETs are turned off. The device resumes its operation when the junction temperature falls below typically 155°C again and begins with a soft-start cycle without reading R_{SET} again. In Power-Save Mode, the thermal shutdown feature is disabled.

8.3.9 STOP Mode

The TPS6284x includes the STOP input pin, allowing the user to temporarily stop the switching of the regulator. The STOP pin function does not depend on the setting of the MODE pin. The STOP pin is only present on the DLC package.

When a logic high level is applied to the STOP pin, the regulator is forced to stop switching after the current switching cycle. The application is powered by the charge available in the output capacitor. No switching noise is generated, which can be beneficial in noise-sensitive sampled applications.

An MCU controlling this pin needs to take care to turn the device back on before the output voltage reaches a system critical level. Should this not happen, the output voltage is clamped to about 0.5 V below the set output voltage. In STOP mode, the device consumes typically 70 μ A operating quiescent current from the input supply.

When a logic low level is applied to the STOP pin, the regulator immediately resumes switching operation without a start-up delay or soft start. To avoid a floating input, an internal 450-k Ω resistor pulls the STOP pin to GND. A control circuit disconnects the pull-down resistor at the STOP pin once a high level has been detected (similar to the EN pin).

8.4 Device Functional Modes

8.4.1 Power-Save Mode Operation

The DCS-Control topology supports Power-Save Mode operation. At light loads, the device operates in PFM (Pulse Frequency Modulation) mode that generates a single switching pulse to ramp up the inductor current and recharge the output capacitor, followed by a sleep period where most of the internal circuits are shutdown to achieve lowest operating quiescent current. During this time, the load current is supported by the output capacitor. The duration of the sleep period depends on the load current and the inductor peak current. During the sleep periods, the current consumption is reduced to typically 60 nA. This low quiescent current consumption is achieved by an ultra-low power reference, an integrated high-impedance feedback divider network, and an optimized Power-Save Mode operation. To achieve a stable switching frequency in steady state operation, the on-time is calculated as in 式 2.

$$T_{ON} = \frac{V_{OUT}}{V_{IN}} \cdot 556\text{ns} \quad (2)$$

In PFM Mode, the switching frequency varies linearly with the load current and is calculated in 式 3. At medium and high load conditions, the device enters automatically PWM (Pulse Width Modulation) mode and operates in continuous conduction mode with a nominal switching frequency (f_{sw}). The switching frequency in PWM mode is controlled and depends on V_{IN} and V_{OUT} . The boundary between PWM and PFM mode is when the inductor current becomes discontinuous.

$$f_{PFM} = \frac{2 \cdot I_{OUT}}{T_{ON}^2 \cdot \frac{V_{IN}}{V_{OUT}} \left[\frac{V_{IN} - V_{OUT}}{L} \right]} \quad (3)$$

If the load current decreases, the converter seamlessly enters PFM mode to maintain high efficiency down to ultra-light loads. Since DCS-Control supports both operation modes within one single building block, the transition from PWM to PFM modes is seamless with minimum output voltage ripple.

8.4.2 Forced PWM Mode Operation

With a high level on the MODE input, the device enters forced PWM Mode and operates with a high switching frequency over the entire load range, even at very light loads. This reduces or eliminates interference with RF and noise-sensitive circuits, but reduces efficiency at light loads. The MODE pin can be changed during operation and must be terminated.

8.4.3 100% Mode Operation

In PWM mode, the duty-cycle of a buck converter is given as $D = V_{OUT}/V_{IN}$. The duty-cycle increases as the input voltage comes closer to the output voltage. Once the input voltage decreases to near 100% duty cycle, the output voltage set point is increased by +30 mV. As the input voltage decreases further, the device enters 100% duty-cycle mode and keeps the high-side MOSFET on continuously. The output (V_{OUT}) is connected to the input (V_{IN}) through the inductor and the internal high-side MOSFET. The minimum input voltage to maintain a given output voltage depends on the load current and is calculated as:

$$V_{INmin} = V_{OUT} + I_{OUT} \times (R_{DS(on)max} + R_L)$$

where

- I_{OUT} = output current
- $R_{DS(on)max}$ = maximum P-channel switch $R_{DS(on)}$
- R_L = DC resistance of the inductor

The TPS6284x contains special circuitry to keep an ultra-low I_Q of 120 nA during 100% mode operation.

9 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

9.2 Typical Application

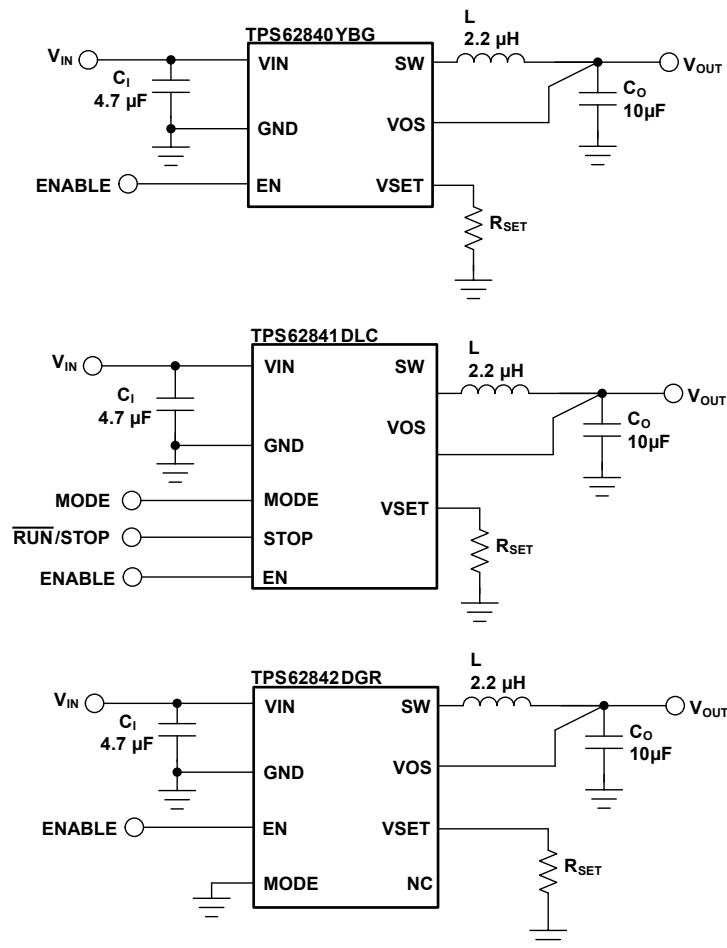

图 13. TPS6284x Application Circuit

Additional circuits are shown in the [System Examples](#).

9.2.1 Design Requirements

表 2 shows the list of components for the application circuit and the characteristic application curves.

Typical Application (continued)

9.2.2 Detailed Design Procedure

The inductor and output capacitor together provide a low-pass filter. To simplify this process, 表 3 outlines possible inductor and capacitor value combinations.

表 3. Recommended LC Output Filter Combinations

INDUCTOR VALUE [μH] ⁽¹⁾	OUTPUT CAPACITOR VALUE [μF] ⁽²⁾	
	10 μF	22 μF
2.2	√ ⁽³⁾	√

(1) Inductor tolerance and current de-rating is anticipated. The effective inductance can vary by 20% and -20%.

(2) Capacitance tolerance and bias voltage de-rating is anticipated. The effective capacitance varies by +20% and -50%.

(3) Typical application configuration. Other check marks indicate alternative filter combinations.

9.2.2.1 Inductor Selection

The inductor value affects the peak-to-peak ripple current, PWM-to-PFM transition point, output voltage ripple, and efficiency. The selected inductor has to be rated for its DC resistance and saturation current. The inductor ripple current (ΔI_L) decreases with higher inductance and increases with higher V_{IN} or V_{OUT} and can be estimated according to 式 4.

式 5 calculates the maximum inductor current under static load conditions. The saturation current of the inductor must be rated higher than the maximum inductor current, as calculated with 式 5. This is recommended because during a heavy load transient the inductor current rises above the calculated value. A more conservative way is to select the inductor saturation current according to the high-side MOSFET switch current limit, I_{LIMF} .

$$\Delta I_L = V_{out} \times \frac{1 - \frac{V_{out}}{V_{in}}}{L \times f} \quad (4)$$

$$I_{Lmax} = I_{outmax} + \frac{\Delta I_L}{2}$$

where

- f is the switching frequency
- L is the inductance
- ΔI_L is the peak-to-peak inductor ripple current
- I_{Lmax} is the maximum inductor current

(5)

表 4 shows a list of possible inductors.

表 4. List of Possible Inductors⁽¹⁾

INDUCTANCE [μH]	INDUCTOR TYPE	SIZE [L x W x T]	SUPPLIER

2.2	DFE201210S	[2.0 mm x 1.2 mm x 1.0 mm max.]	muRata

(1) See the [Third-party Products Disclaimer](#).

9.2.2.2 Output Capacitor Selection

The DCS-Control scheme of the TPS62840 allows the use of tiny ceramic capacitors. Ceramic capacitors with low-ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric.

At light load currents, the converter operates in Power-Save Mode and the output voltage ripple is dependent on the output capacitor value. Larger output capacitors reduce the output voltage ripple. The leakage current of the output capacitor adds to the overall quiescent current.

表 5. List of Possible Capacitors⁽¹⁾

CAPACITOR VALUE [μF]	CAPACITOR TYPE	SIZE IMPERIAL (METRIC)	SIZE [L x W x T]	SUPPLIER
10	GRM155R60G106ME44D	0402 (1005)	[1mm x 0.5mm x 0.65mm max.]	muRata

(1) See the [Third-party Products Disclaimer](#).

9.2.2.3 Input Capacitor Selection

Because the buck converter has a pulsating input current, a low-ESR input capacitor is required for best input voltage filtering to minimize input voltage spikes. For most applications, a 4.7-μF input capacitor is sufficient.

When operating from a high impedance source, a larger input buffer capacitor is recommended to avoid voltage drops during start-up and load transients.

The input capacitor can be increased without any limit for better input voltage filtering. The leakage current of the input capacitor adds to the overall quiescent current. 表 6 shows a selection of input and output capacitors.

表 6. List of Possible Capacitors⁽¹⁾

⊠ 60. The Broad Range of Input Voltage Sources and Various Power Loads that TPS6284x Can Support

10 Power Supply Recommendations

The power supply must provide a current rating according to the supply voltage, output voltage, and output current of the TPS62840.

11 Layout

11.1 Layout Guidelines

The TPS62840 pinout has been optimized to enable a single layer PCB routing of the device and its critical passive components such as C_{IN} , C_{OUT} , and L .

- As for all switching power supplies, the layout is an important step in the design. Care must be taken in board layout to get the specified performance.
- It is critical to provide a low inductance, low impedance ground path. Therefore, use wide and short traces for the main current paths.
- The input capacitor must be placed as close as possible to the V_{IN} and GND pins of the device. This is the most critical component placement.
- The VOS line is a sensitive, high impedance line and must be connected to the output capacitor and routed away from noisy components and traces (for example, the SW line) or other noise sources.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
SCALE: 30X

4224310/A 05/2018

NOTES: (continued)

- 4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

YBG0006

PACKAGE OUTLINE

DSBGA - 0.5 mm max height

DIE SIZE BALL GRID ARRAY

4224328/A 05/2018

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

PowerPAD is a trademark of Texas Instruments.

NOTES:

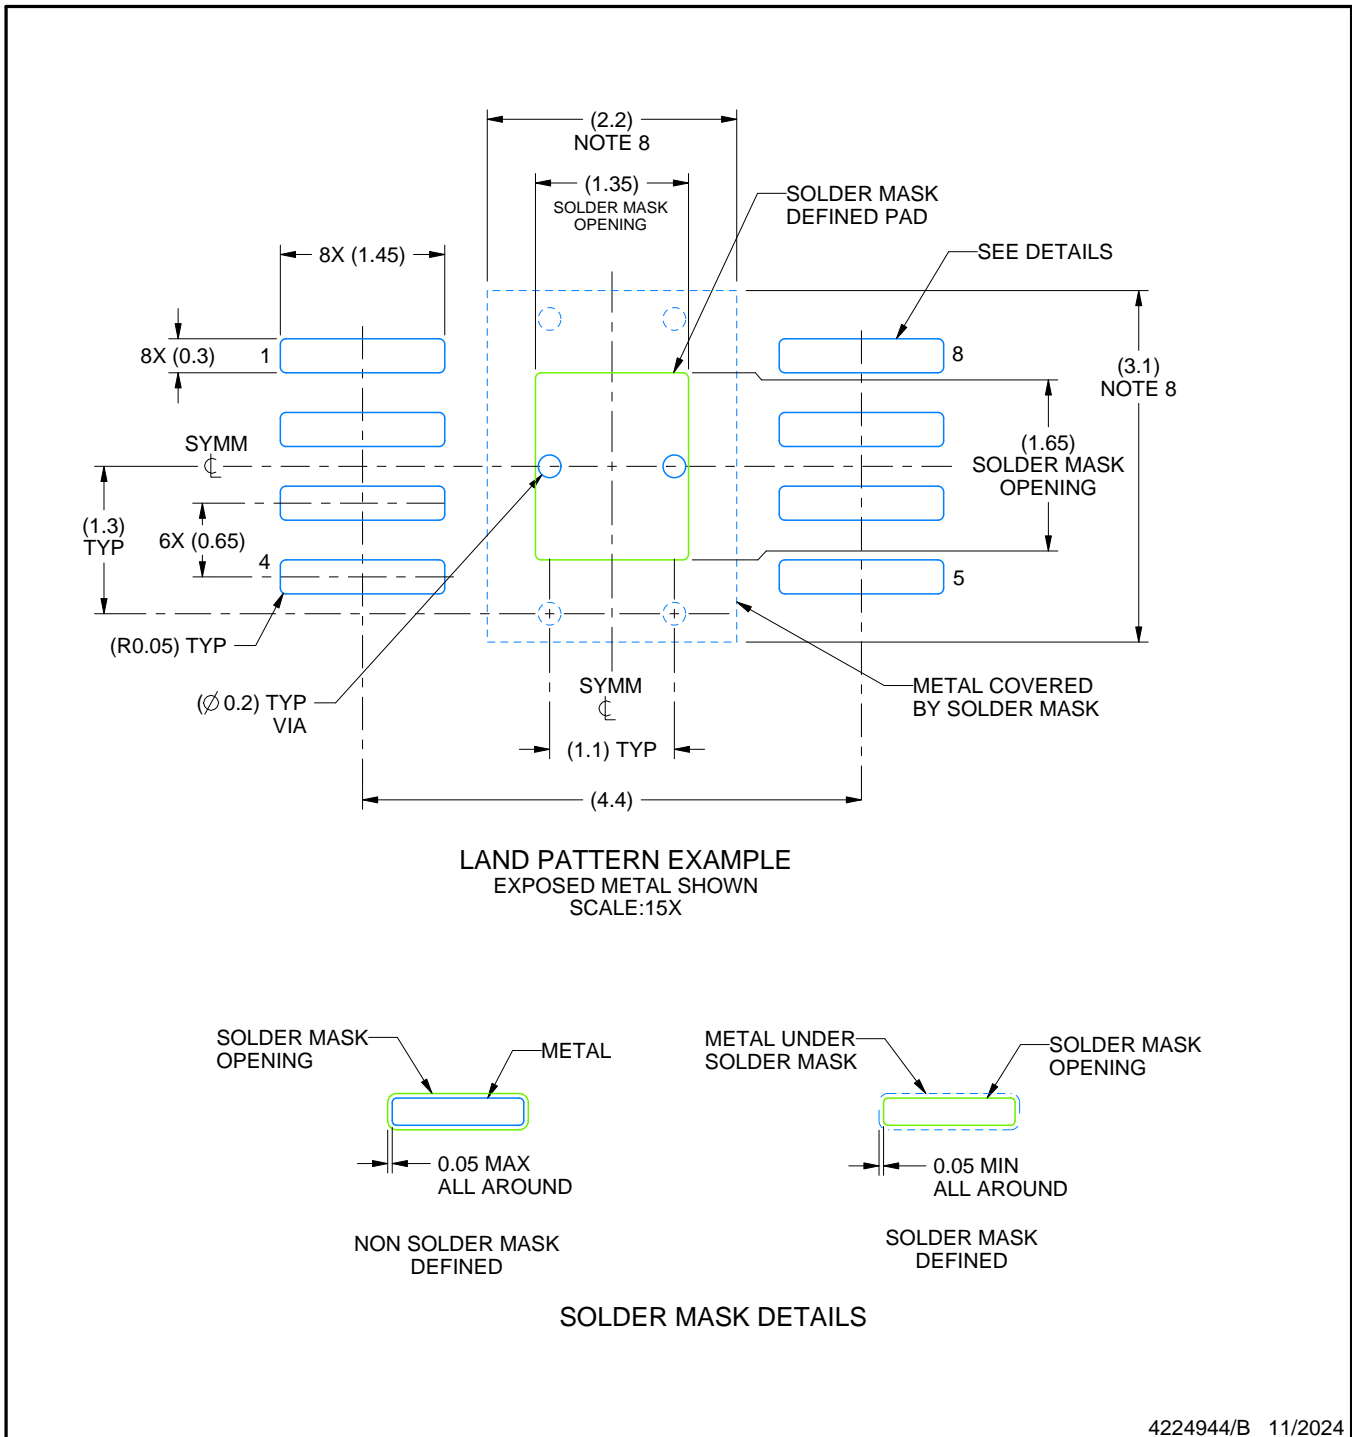

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.3 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.

PowerPAD™ HVSSOP - 1.1 mm max height

PLASTIC SMALL OUTLINE

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
7. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
8. Size of metal pad may vary due to creepage requirement.
