LMR36506RREVM User's Guide

The Texas Instruments LMR36506RREVM evaluation module help designers evaluate the operation and performance of the LMR36506 wide-input buck converters. The LMR36506 is an easy-to-use synchronous step-down DC/DC converter capable of driving up to 0.6 A of load current from an input voltage of up to 65 V. The LMR36506RREVM features an output voltage of 3.3 V or 5 V and a switching frequency of 1 MHz. See the *LMR36506 3-V–65-V, 0.6-A Ultra-Small Synchronous Buck Converter with 4 µA I_Q* data sheet for additional features, detailed descriptions, and available options.

Table 1. Device and Package Configurations

EVM	U1	FREQUENCY	SPREAD SPECTRUM	CURRENT	PIN 1 TRIM
LMR36506RREVM	LMR36506RRPE	1000 kHz	Disabled	0.6 A	RT with PFM

1 Setup

This section describes the test points and connectors on the EVM and how to properly connect, set up, and use the LMR36506RREVM.

1.1 Test Points

The test points on the top of the board can be used for connecting to the input and output of the EVM. See Figure 2 for typical test setup. The functions of the test points connections are:

- **VIN_EMI —** Input supply to EVM including an EMI filter. Connect to a suitable input supply. Connect at this point for conducted EMI test.
- **GND —** Ground connection for the input supply as well as test points for ground connection
- **VIN —** Input supply to the IC. Can be connected to DMM to measure input voltage after EMI filter
- **VOUT —** Output voltage test point of EVM. Can be connected to a desired load
- **EN —** This test point is connected to the EN pin. By default, there is a pullup resistor R2 (RENT) to VIN to enable the IC.
- **PGOOD —** This test point is connected to the PGOOD pin from the IC. It is an open-drain output of the PGOOD pin. Can be tied to external supply through a pullup resistor or left open
- **SYNC —** In a **MODE/SYNC** trim part, this test point is connected to the SYNC pin of the IC. Can be connected to an external clock to synchronize the IC. Make sure R4 (RMODE) is installed and R5 (RT) is not installed. In a **RT** trim part, this test point is connected to the RT pin of the IC when the R4 (RMODE) is installed.
- **VCC —** This test point is connected to the VCC pin.
- **SW —** This test point is connected to the switch node.

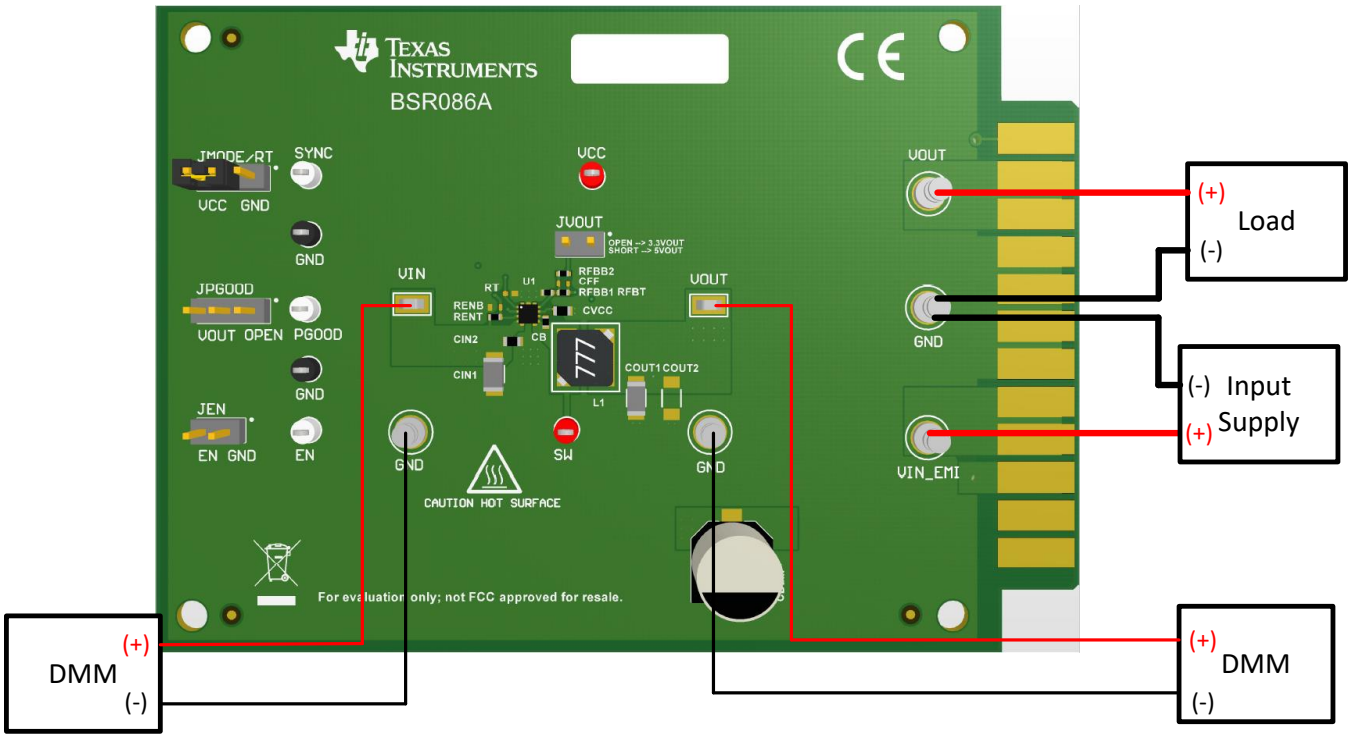

Figure 2. EVM Board Connections

1.2 Jumpers

See Figure 3 for jumper locations.

- **JEN -** This jumper allows the ENABLE input to be connected to GND in order to disable the IC. By default, this jumper is left open since there is a pullup resistor R2 (RENT) to VIN to enable the IC.
- **JPGOOD -** Use this jumper to select how the PGOOD pin can be connected. A jumper can be used to connect pin 2 and 3. In this configuration, the PGOOD pin will be pulled up to VOUT through R9 (RPGOOD) with a value of 100 kΩ. By default, this jumper is left open.
- **JMODE/RT -** Use this jumper to select the mode of operation in a **MODE/SYNC** trim part. Connecting a jumper between pin 1 and 2 cause the IC to operate in PFM (Pulse Frequency Modulation) mode for a higher efficiency at light load. A jumper between pin 2 and pin 3 causes the IC to operate in FPWM mode (Forced Pulse Width Modulation) mode. By default, the jumper is connected between pin 1 and 2.
  In an **RT** trim part, connecting this jumper from pin 1 and 2 sets the switching frequency to 2.2 MHz and connecting this jumper from pin 2 and 3 sets the switching frequency to 1 MHz. See the *LMR36506 3-V–65-V, 0.6-A Ultra-Small Synchronous Buck Converter with 4 µA I_Q* data sheet for more information on switching frequency configuration.
- **JVOUT** This jumper can be used to select the output voltage on the EVM. Leaving the jumper open sets the EVM output voltage to 3.3 V whereas adding a jumper sets the output voltage on the EVM to be 5 V.

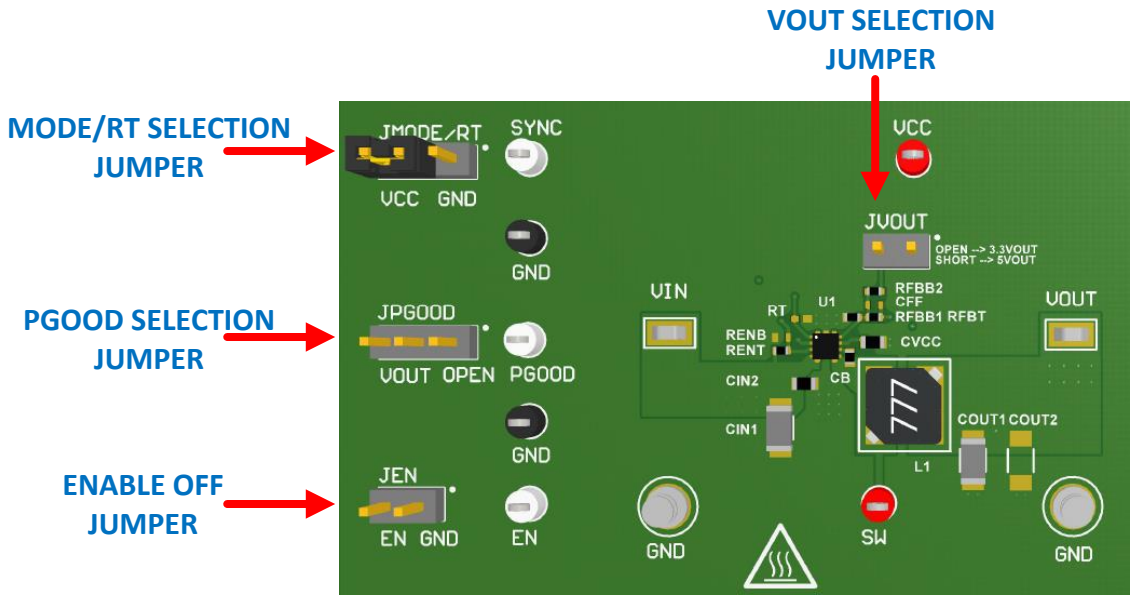

Figure 3. Jumper Locations

2 Operation

2.1 Quick Start

1. Connect the voltage supply between the VIN_EMI and GND test points.
2. Connect the load between the VOUT and GND test points.
3. Set the supply voltage at an appropriate level between 5.5 V to 65 V. Set the current limit of the supply to an appropriate level.
4. Turn on the power supply. With the default configuration, the EVM powers up and provides V_{OUT} = 3.3 V.
5. Monitor the output voltage. The maximum load current must be 0.6 A with the LMR36506 device.
