

Synchronous Buck Converter Reference Design for Infotainment Applications

Description

This reference design is a Synchronous Buck Converter circuit using the LM63625-Q1 controller integrated circuit (IC). The design accepts an input voltage of $9.8 V_{IN}$ to $16 V_{IN}$ and provides a regulated output voltage of $9.3 V_{OUT}$ capable of delivering up to 2.1 A of current. The design is built on a 4-layer FR-4 PCB, with 1 oz copper for each of the four layers.

The board is $29.2 \text{ mm} \times 12.5 \text{ mm}$. See [LM636xx-Q1 Functional Safety FIT Rate, FMD, and Pin FMA](#) for any safety concerns.

Features

- Very small design size with single-sided component assembly
- Regulator includes integrated FETs
- High efficiency
- Optimized for automotive applications
- Regulator features spread-spectrum switching (dithering) for improved EMI performance

Applications

- [Aftermarket head unit](#)
- [Automotive head unit](#)

Note

Waveforms gathered for [Section 3.4 \(Start-up and Shutdown\)](#) were performed with $6 \times 22\text{-}\mu\text{F}$ output capacitors installed and with a $100\text{-k}\Omega$ top feedback divider resistor and $12.1\text{-k}\Omega$ bottom feedback divider resistor. All other tests were performed using the $2 \times 22\text{-}\mu\text{F}$ output capacitors and $24.9\text{-k}\Omega$ top feedback divider resistor and $3.01\text{-k}\Omega$ bottom feedback divider resistor.

No significant change is anticipated during start-up, except for a lower input current during the soft-start period when using $2 \times 22\text{-}\mu\text{F}$ output capacitors.

No significant change is anticipated during shutdown, except for a faster output voltage decay when using $2 \times 22\text{-}\mu\text{F}$ output capacitors.

1 Test Prerequisites

1.1 Voltage and Current Requirements

Table 1-1. Voltage and Current Requirements

Parameter	Specifications
V_{IN}	9.8 VDC to 16 VDC, 13.2 VDC nominal
V_{OUT}	9.3 VDC
I_{OUT}	1.8 A nominal, 2.1 A maximum
Switching Frequency	About 500 kHz

2 Testing and Results

2.1 Voltage Regulation

Figure 2-1. FPWM Line and Load Regulation, $V_{OUT} = 9.32$ V, $T_a = 25^\circ\text{C}$

Figure 2-2. PFM Line and Load Regulation, $V_{OUT} = 9.36\text{ V}$, $T_a = 25^\circ\text{C}$

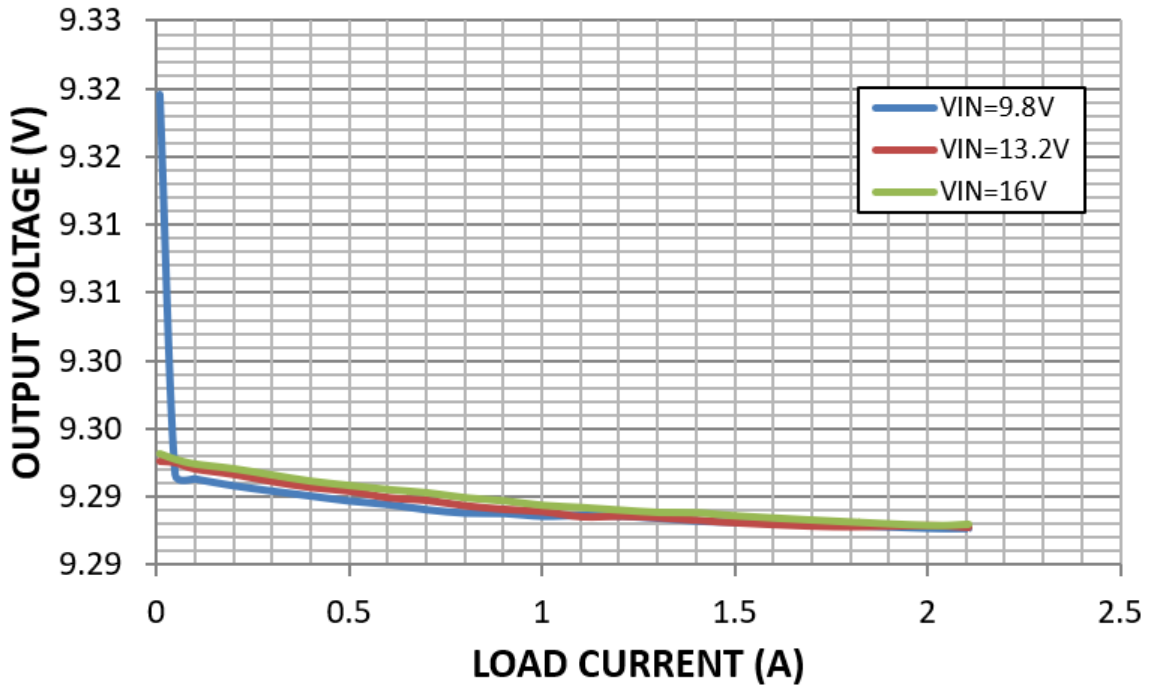

Figure 2-3. FPWM Line and Load Regulation, $V_{OUT} = 9.32\text{ V}$, $T_a = -30^\circ\text{C}$

Figure 2-4. PFM Line and Load Regulation, $V_{OUT} = 9.37\text{ V}$, $T_a = -30^\circ\text{C}$

3.2 Current Limit

The following figures show a load step being applied from 2.1 A to 3.5 A. The current ramps up, hits current limit, and output drops followed by hiccup mode. Once the load step goes down to 2.1 A the output recovers with soft start.

Figure 3-37. Load Step, 13.2 V_{IN}, 25°C

Figure 3-38. Load Step, 13.2 V_{IN}, -30°C

Figure 3-39. Load Step, 13.2 V_{IN}, 85°C

In Figure 3-40 through Figure 3-42, the current limit trip point shifts as the load is increased to above the limit.
