| Bit | Field | Type | Reset | Description |
|-------|------------|------|-------|---|
| 31-16 | FIFO_FILL | R/W | 0h | Set the FIFO_FILL_LEVEL which is used to hold data in the FIFO until this level is reached before allow data to be pulled. This setting is only used when fifo_mode is set for Large Buffer operation |
| 15 | RESERVED | R/W | X | |
| 14-12 | BPP_BYPASS | R/W | 0h | Force unpacking of any Data type as selected RAW type. 0 - No bypass 1 - unpack as RAW6 2 - unpack as RAW7 3 - unpack as RAW8 4 - unpack as RAW10 5 - unpack as RAW12 6 - unpack as RAW14 7 - unpack as RAW16 |
| 11-10 | RESERVED | R/W | X | |

Table 9-139. CSI_RX_IF_VBUS2APB_STREAM2_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-------|--|
| 9-8 | FIFO_MODE | R/W | 0h | Stream FIFO configuration, which must be set in accordance to FIFO sizing, flow control and the relationship between the link and pixel interface data rates. Refer to Use Case descriptions for further guidance on FIFO sizing and valid stream configuration options. 00: Full Line Buffer. Hold data in FIFO until CRC check completes. 01: Large Buffer [Fill Level Controlled]. Hold data in FIFO until FIFO_FILL_LEVEL is reached. 1x: Short Buffer. When pixel output data rate can match link data rate, a small buffer can be used to accommodate CDC, pixel data packing, and data rate matching |
| 7-6 | RESERVED | R/W | X | |
| 5-4 | NUM_PIXELS | R/W | 0h | Number of pixels to output from the stream. Valid values are 1, 2, 4 and 8. The width of the pixel interface and the bits per pixel for the selected datatype will determine how many pixels can be output in a single cycle. Default will be 1 pixel per clock. 00 -> 1 pixel per clock 01 -> 2 pixels per clock 10 -> 4 pixels per clock 11 -> 8 pixels per clock [Reserved] |
| 3-2 | RESERVED | R/W | X | |
| 1 | LS_LE_MODE | R/W | 0h | Enable LS/LE control of HYSNC_VALID output. By default, LS and LE short packets are not required and HYSC_VALID will be generated from the start and end of payload data. |
| 0 | INTERFACE_MODE | R/W | 0h | Select the output configuration. Pixel = 0 [default] Packed = 1 |

9.70 CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_CTRL Register (Offset = 310h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_CTRL is shown in [Figure 9-67](#) and described in [Table 9-141](#).

Return to [Summary Table](#).

Stream Monitor configuration.

This register is used to configure the CSI2RX Monitors:

Programmable Frame monitor to trigger an event if a truncated frame is detected,

Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end,

Programmable line/byte counters to trigger an event at a specific byte in a line.

This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event.

This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled.

In these cases, the behaviour is unpredictable.

Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0.

| Bit | Field | Type | Reset | Description |
|-------|--------------|------|-------|---|
| 31-16 | FRAME_LENGTH | R/W | 0h | Indicates the frame length in lines to detect truncated frames. This value must not change while monitor is enabled, i.e. it must only be changed when the frame_mon_en bit is low. 0x0000 means truncated frame detection feature disabled |
| 15 | FRAME_MON_EN | R/W | 0h | Enables monitor. This bit must only be set high after the frame_mon_vc and frame_length have been set. |

Table 9-141. CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|--------------|------|-------|--|
| 14-11 | FRAME_MON_VC | R/W | 0h | Indicates virtual channel for monitor. This value must not change while monitor is enabled, i.e. it must only be changed when the frame_mon_en bit is low. |
| 10 | TIMER_EOF | R/W | 0h | Select the starting point of the timer: 0x 0: Start of Frame event on selected virtual channel 0x 1: End of Frame event on selected virtual channel. This value must not change while timer_en is enabled |
| 9 | TIMER_EN | R/W | 0h | Enables timer based interrupt. This bit must only be set high after the timer_eof and timer_vc have been set. |
| 8-5 | TIMER_VC | R/W | 0h | Indicates which VC should be used to generate timer based interrupt. This value must not change while timer_en is enabled. |
| 4 | LB_EN | R/W | 0h | Enables line/byte counter. This bit must only be set high after the lb_vc, line_count and byte_count have been set. |
| 3-0 | LB_VC | R/W | 0h | Indicates which VC should be used to generate line/byte counter interrupt. This value must not change while lb_en is enabled |

9.71 CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_FRAME Register (Offset = 314h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_FRAME is shown in [Figure 9-68](#) and described in [Table 9-143](#).

Return to [Summary Table](#).

Stream Monitor Frame.

Used to observe the current frame number and packet size on monitored virtual channels.

These values are extracted by the CSI2RX from the last frame start short packet data field.

Table 9-155. CSI_RX_IF_VBUS2APB_STREAM3_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|-------|-------|--|
| 31-5 | RESERVED | R/W | X | |
| 4 | SOFT_RST | R/W1C | 0h | Writing 1'b1 will apply a synchronous soft reset of this stream registers/FIFO |
| 3 | RESERVED | R/W | X | |
| 2 | ABORT | W | 0h | Writing 1 this register will cause the csi2rx to stop streaming on the corresponding output immediately. This may corrupt the output protocol. stream_abort_irq is generated on completion of the abort operation. |
| 1 | STOP | W | 0h | Writing 1 in this register will cause csi2rx to stop streaming on the corresponding output at the end of the current frame. If the command is issued during frame blanking, then the datapath will immediately stop streaming data on that output. stream_stop_irq is generated on completion of the stop operation. |

Table 9-155. CSI_RX_IF_VBUS2APB_STREAM3_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|--|
| 0 | START | W | 0h | Writing 1 in this register enables the corresponding datapath output. It will start streaming data at the start of the next frame that complies with the output configuration. stream_status[31] running indicates when data stream is enabled. |

9.78 CSI_RX_IF_VBUS2APB_STREAM3_STATUS Register (Offset = 404h) [reset = X]

| Bit | Field | Type | Reset | Description |
|-------|------------|------|-------|---|
| 31-16 | FIFO_FILL | R/W | 0h | Set the FIFO_FILL_LEVEL which is used to hold data in the FIFO until this level is reached before allow data to be pulled. This setting is only used when fifo_mode is set for Large Buffer operation |
| 15 | RESERVED | R/W | X | |
| 14-12 | BPP_BYPASS | R/W | 0h | Force unpacking of any Data type as selected RAW type. 0 - No bypass 1 - unpack as RAW6 2 - unpack as RAW7 3 - unpack as RAW8 4 - unpack as RAW10 5 - unpack as RAW12 6 - unpack as RAW14 7 - unpack as RAW16 |
| 11-10 | RESERVED | R/W | X | |

Table 9-161. CSI_RX_IF_VBUS2APB_STREAM3_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-------|--|
| 9-8 | FIFO_MODE | R/W | 0h | Stream FIFO configuration, which must be set in accordance to FIFO sizing, flow control and the relationship between the link and pixel interface data rates. Refer to Use Case descriptions for further guidance on FIFO sizing and valid stream configuration options. 00: Full Line Buffer. Hold data in FIFO until CRC check completes. 01: Large Buffer [Fill Level Controlled]. Hold data in FIFO until FIFO_FILL_LEVEL is reached. 1x: Short Buffer. When pixel output data rate can match link data rate, a small buffer can be used to accommodate CDC, pixel data packing, and data rate matching |
| 7-6 | RESERVED | R/W | X | |
| 5-4 | NUM_PIXELS | R/W | 0h | Number of pixels to output from the stream. Valid values are 1, 2, 4 and 8. The width of the pixel interface and the bits per pixel for the selected datatype will determine how many pixels can be output in a single cycle. Default will be 1 pixel per clock. 00 -> 1 pixel per clock 01 -> 2 pixels per clock 10 -> 4 pixels per clock 11 -> 8 pixels per clock [Reserved] |
| 3-2 | RESERVED | R/W | X | |
| 1 | LS_LE_MODE | R/W | 0h | Enable LS/LE control of HYSNC_VALID output. By default, LS and LE short packets are not required and HYSC_VALID will be generated from the start and end of payload data. |
| 0 | INTERFACE_MODE | R/W | 0h | Select the output configuration. Pixel = 0 [default] Packed = 1 |

9.81 CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_CTRL Register (Offset = 410h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_CTRL is shown in [Figure 9-78](#) and described in [Table 9-163](#).

Return to [Summary Table](#).

Stream Monitor configuration.

This register is used to configure the CSI2RX Monitors:

Programmable Frame monitor to trigger an event if a truncated frame is detected,

Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end,

Programmable line/byte counters to trigger an event at a specific byte in a line.

This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event.

This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled.

In these cases, the behaviour is unpredictable.

Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0.

Table 9-163. CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|--------------|------|-------|---|
| 31-16 | FRAME_LENGTH | R/W | 0h | Indicates the frame length in lines to detect truncated frames. This value must not change while monitor is enabled, i.e. it must only be changed when the frame_mon_en bit is low. 0x0000 means truncated frame detection feature disabled |
| 15 | FRAME_MON_EN | R/W | 0h | Enables monitor. This bit must only be set high after the frame_mon_vc and frame_length have been set. |

Table 9-163. CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|--------------|------|-------|--|
| 14-11 | FRAME_MON_VC | R/W | 0h | Indicates virtual channel for monitor. This value must not change while monitor is enabled, i.e. it must only be changed when the frame_mon_en bit is low. |
| 10 | TIMER_EOF | R/W | 0h | Select the starting point of the timer: 0x 0: Start of Frame event on selected virtual channel 0x 1: End of Frame event on selected virtual channel. This value must not change while timer_en is enabled |
| 9 | TIMER_EN | R/W | 0h | Enables timer based interrupt. This bit must only be set high after the timer_eof and timer_vc have been set. |
| 8-5 | TIMER_VC | R/W | 0h | Indicates which VC should be used to generate timer based interrupt. This value must not change while timer_en is enabled. |
| 4 | LB_EN | R/W | 0h | Enables line/byte counter. This bit must only be set high after the lb_vc, line_count and byte_count have been set. |
| 3-0 | LB_VC | R/W | 0h | Indicates which VC should be used to generate line/byte counter interrupt. This value must not change while lb_en is enabled |

9.82 CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_FRAME Register (Offset = 414h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_FRAME is shown in [Figure 9-79](#) and described in [Table 9-165](#).

Return to [Summary Table](#).

Stream Monitor Frame.

Used to observe the current frame number and packet size on monitored virtual channels.

These values are extracted by the CSI2RX from the last frame start short packet data field.

| 15-0 | FRAME_COUNT_START | R/W | 0h | Indicates the frame number on which the interrupt should be generated and the stream will start outputting data on the pixel interface. [0x0000 will be the current frame.] |

9.86 CSI_RX_IF_VBUS2APB_STREAM3_FCC_CTRL Register (Offset = 424h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM3_FCC_CTRL is shown in [Figure 9-83](#) and described in [Table 9-173](#).

Return to [Summary Table](#).

Stream Frame Capture Counter control.

Used to enable / disable the FCC and specify which virtual channel it should operate on.

9.87 CSI_RX_IF_VBUS2APB_STREAM3_FIFO_FILL_LVL Register (Offset = 428h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM3_FIFO_FILL_LVL is shown in [Figure 9-84](#) and described in [Table 9-175](#).

Return to [Summary Table](#).

Stream FIFO fill level monitor. This can operate in 2 modes:

- 1 - Monitor peak fill level until the stream is stopped.
- 2 - Monitor peak fill level when the first FIFO read is made during a frame.

9.88 CSI_RX_IF_VBUS2APB_ASF_INT_STATUS Register (Offset = 900h) [reset = 0h]

CSI_RX_IF_VBUS2APB_ASF_INT_STATUS is shown in [Figure 9-85](#) and described in [Table 9-177](#).

Return to [Summary Table](#).

ASF Interrupt Status Register. This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_int_fatal or asf_int_nonfatal signal will be asserted. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register.

9.92 CSI_RX_IF_VBUS2APB_ASF_FATAL_NONFATAL_SELECT Register (Offset = 910h) [reset = 7Fh]

CSI_RX_IF_VBUS2APB_ASF_FATAL_NONFATAL_SELECT is shown in [Figure 9-89](#) and described in [Table 9-185](#).

Return to [Summary Table](#).

The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered.

CSI_RX_IF_CP_INTD_EOI_REG is shown in [Figure 9-100](#) and described in [Table 9-209](#).

Return to [Summary Table](#).

End of Interrupt Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

**Table 9-208. CSI_RX_IF_CP_INTD_EOI_REG

10.6 CSI_TX_IF_ECC_AGGR_SEC_EOI_REG Register (Offset = 3Ch) [reset = X]

CSI_TX_IF_ECC_AGGR_SEC_EOI_REG is shown in [Figure 10-5](#) and described in [Table 10-13](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

CSI_TX_IF_ECC_AGGR_DED_EOI_REG is shown in [Figure 10-9](#) and described in [Table 10-21](#).

[Return to Summary Table.](#)

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

| 110h | CSI_TX_IF_DEBUG_CFG | CSI2 Transmitter Debug Enable Register | 0440 4110h |
| 114h | CSI_TX_IF_DEBUG_LN_FSM | Debug Register for Lane FSM. | 0440 4114h |
| 118h | CSI_TX_IF_DEBUG_CLK_LN_FSM | Debug Register for Clock Lane FSM | 0440 4118h |
| 11Ch | CSI_TX_IF_DEBUG_DATA_LN_FSM | Debug Register for Data Lane FSM. | 0440 411Ch |
| 120h | CSI_TX_IF_DEBUG_PROT0_FSM | Debug Register for Pixel IF0 Protocol FSM. | 0440 4120h |
| 124h | CSI_TX_IF_DEBUG_PROT1_FSM | Debug Register for Pixel IF1 Protocol FSM. (Optional: Available when PIXEL_IF2 or 4) | 0440 4124h |
| 128h | CSI_TX_IF_DEBUG_PROT2_FSM | Debug Register for Pixel IF2 Protocol FSM. (Optional: Available when PIXEL_IF4) | 0440 4128h |
| 12Ch | CSI_TX_IF_DEBUG_PROT3_FSM | Debug Register for Pixel IF3 Protocol FSM. (Optional: Available when PIXEL_IF4) | 0440 412Ch |
| 130h | CSI_TX_IF_DPHY_STATUS | DPHY Transmitter Status. | 0440 4130h |
| 134h | CSI_TX_IF_DPHY_CFG1 | DPHY Transmitter Configuration. | 0440 4134h |
| 13Ch | CSI_TX_IF_GENERIC | CSI2 Transmitter Test Register. | 0440 413Ch |
| 200h | CSI_TX_IF_ASF_INT_STATUS | ASF Interrupt Status Register. This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_int_fatal or asf_int_nonfatal signal will be asserted. Writing to either raw or masked CSI_TX_IF_STATUS registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt CSI_TX_IF_STATUS test register. | 0440 4200h |

Table 10-95. CSI_TX_IF0_VBUS2APB_WRAP_VBUSP_APB_CSI2TX Registers (continued)

| Offset | Acronym | Register Name | CSI_TX_IF0_VBUS2APB_WRAP_VBUSP_APB_CSI2TX Physical Address |
|--------|--|--|--|
| 204h | CSI_TX_IF_ASF_INT_RAW_STATUS | ASF Interrupt Raw Status Register. A bit set in this raw register indicates a source of ASF fault in the corresponding feature. Writing to either raw or masked CSI_TX_IF_STATUS registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt CSI_TX_IF_STATUS test register. | 0440 4204h |
| 208h | CSI_TX_IF_ASF_INT_MASK | The ASF interrupt mask register indicating which interrupt bits in the ASF interrupt CSI_TX_IF_STATUS register are masked. All bits are set at reset. Clear the individual bit to enable the corresponding interrupt. | 0440 4208h |
| 20Ch | CSI_TX_IF_ASF_INT_TEST | The ASF interrupt test register emulate hardware even. Write one to individual bit to trigger single event in (masked and raw) CSI_TX_IF_STATUS registers according to mask and will generate interrupt accordingly. | 0440 420Ch |
| 210h | CSI_TX_IF_ASF_FATAL_NONFATAL_SELECT | The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered. | 0440 4210h |
| 220h | CSI_TX_IF_ASF_SRAM_CORR_FAULT_STATUS | Status register for SRAM correctable fault. These fields are updated whenever asf_sram_corr_fault input is active. | 0440 4220h |
| 224h | CSI_TX_IF_ASF_SRAM_UNCORR_FAULT_STATUS | Status register for SRAM uncorrectable fault. These fields are updated whenever asf_sram_uncorr_fault input is active. | 0440 4224h |
| 228h | CSI_TX_IF_ASF_SRAM_FAULT_STATS | Statistics register for SRAM faults. Note that this register clears when software writes to any field. | 0440 4228h |
| 230h | CSI_TX_IF_ASF_TRANS_TO_CTRL | Control register to configure the ASF transaction timeout monitors. | 0440 4230h |
| 234h | CSI_TX_IF_ASF_TRANS_TO_FAULT_MASK | Control register to mask out ASF transaction timeout faults from triggering interrupts. On reset, all bits are set to mask out all sources. Clear the corresponding bit to enable the interrupt source. The width of this field is parameterisable and the bit definitions are implementation specific. | 0440 4234h |
| 238h | CSI_TX_IF_ASF_TRANS_TO_FAULT_STATUS | Status register for transaction timeouts fault. If a fault occurs the relevant CSI_TX_IF_STATUS bit will be set to 1. Each bit can be cleared by software writing 1 to each bit. | 0440 4238h |
| 240h | CSI_TX_IF_ASF_PROTOCOL_FAULT_MASK | Control register to mask out ASF Protocol faults from triggering interrupts. On reset, all bits are set to mask out all sources. Clear the corresponding bit to enable the interrupt source. The width of this field is parameterisable and the bit definitions are implementation specific. | 0440 4240h |
| 244h | CSI_TX_IF_ASF_PROTOCOL_FAULT_STATUS | Status register for protocol faults. If a fault occurs the relevant CSI_TX_IF_STATUS bit will be set to 1. Each bit can be cleared by software writing 1 to each bit | 0440 4244h |

Table 10-95. CSI_TX_IF0_VBUS2APB_WRAP_VBUSP_APB_CSI2TX Registers (continued)

10.106 CSI_TX_IF_ASF_INT_STATUS Register (Offset = 200h) [reset = 0h]

CSI_TX_IF_ASF_INT_STATUS is shown in [Figure 10-102](#) and described in [Table 10-213](#).

Return to [Summary Table](#).

ASF Interrupt Status Register. This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_int_fatal or asf_int_nonfatal signal will be asserted. Writing to either raw or masked CSI_TX_IF_STATUS registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt CSI_TX_IF_STATUS test register.

10.107 CSI_TX_IF_ASF_INT_RAW_STATUS Register (Offset = 204h) [reset = 0h]

CSI_TX_IF_ASF_INT_RAW_STATUS is shown in [Figure 10-103](#) and described in [Table 10-215](#).

Return to [Summary Table](#).

ASF Interrupt Raw Status Register. A bit set in this raw register indicates a source of ASF fault in the corresponding feature. Writing to either raw or masked CSI_TX_IF_STATUS registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt CSI_TX_IF_STATUS test register.

Table 10-214. CSI_TX_IF_ASF_INT_RAW_STATUS Instances

| Instance | Physical Address |
|---|------------------|
| CSI_TX_IF0_VBUS2APB_WRAP_VBU SP_APB_CSI2TX | 0440 4204h |

10.110 CSI_TX_IF_ASF_FATAL_NONFATAL_SELECT Register (Offset = 210h) [reset = 7Fh]

CSI_TX_IF_ASF_FATAL_NONFATAL_SELECT is shown in [Figure 10-106](#) and described in [Table 10-221](#).

Return to [Summary Table](#).

The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered.

10.117 CSI_TX_IF_ASF_PROTOCOL_FAULT_MASK Register (Offset = 240h) [reset = X]

CSI_TX_IF_ASF_PROTOCOL_FAULT_MASK is shown in [Figure 10-113](#) and described in [Table 10-235](#).

Return to [Summary Table](#).

Control register to mask out ASF Protocol faults from triggering interrupts. On reset, all bits are set to mask out all sources. Clear the corresponding bit to enable the interrupt source. The width of this field is parameterisable and the bit definitions are implementation specific.

CSI_TX_IF_EOI_REG is shown in [Figure 10-117](#) and described in [Table 10-245](#).

Return to [Summary Table](#).

End of Interrupt Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 11-623. DPHY_RX_MMR_SLV_LANE Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|------------------|------|-------|---|
| 31 | RXCLKACTIVEHSCLK | R | 0h | Receiver high speed clock active: Driven active when the receiver high speed clock is active. 1'b 0: Receiver high speed clock not active, 1'b 1: Receiver high speed clock active |
| 30 | CMN_READY | R | 0h | Common ready indication: Indicates the completion of the startup process of the common module. Once this signal is driven active, the PMA lanes may be released from reset. 1'b 0 : Indicates that the startup process for the common components is not complete. This will be the case for both the power on reset sequence, and when the common is transitioning into and out of the low power modes. 1'b 1: Indicates that the startup process for the common components is complete and the common is ready. Note that this is a function of the PLL being enabled and locked. |

Table 11-623. DPHY_RX_MMR_SLV_LANE Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|----------------|------|-------|--|
| 29-27 | RESERVED | R/W | X | |
| 26 | PSO_DISABLE | R/W | 0h | <p>Disable power shut off: Disables the ability to switch off the analog switched power islands in the DPHY_RX_MMR_SLV_LANE when in the ultra low power state.</p> <p>1'b</p> <p>0: Power islands are switched off and on under the normal control of the escape mode process.</p> <p>1'b</p> <p>1: Power island shutoff functions disabled, and switched power islands forced to the enabled state.</p> |
| 25 | RESERVED | R/W | X | |
| 24 | PSO_CMN | R/W | 0h | <p>Disable power shut off: Power Shutoff signal for CMN</p> <p>1 : CMN is power OFF</p> <p>0 : CMN is power ON</p> |
| 23 | LANE_RSTB_CMN | R/W | 0h | <p>[Only on SR1.1+] SW reset for CMN.</p> <p>0: asserted</p> <p>1: released</p> |
| 22-16 | PSM_CLOCK_FREQ | R/W | 0h | <p>PMA state machine clock frequency divider control: This signal specifies a divider value used to create an internal divided clock that is a function of the psm_clock clock.</p> <p>This signal must be driven with a value such that the frequency of the divided clock is 1 MHz.</p> <p>In the case where it is not possible for the divided clock to be exactly 1 MHz, a value should be selected that results in the clock frequency being the closest to 1 MHz.</p> <p>The following specifies the divider settings that the values of this signal correspond to.</p> <p># 8'h</p> <p>00 : Reserved # 8'h</p> <p>01 : Div 1 # 8'h</p> <p>02 : Div 2 # 8'h</p> <p>03 : Div 3 # 8'h</p> <p>04 : Div 4 ...</p> <p># 8'hFF : Div 255 Note: PSM clock has a maximum frequency of 100 MHz.</p> <p>values beyond 100 should not be programmed</p> |
| 15-12 | RESERVED | R/W | X | |
| 11-9 | IPCONFIG_CMN | R/W | 0h | <p>This signal decides which clock DPHY_RX_MMR_SLV_LANE acts as master clock DPHY_RX_MMR_SLV_LANE to all data lanes.</p> <p>Needed only for RX IP.</p> <p>Bit[2]: Reserved CASE {Bit[1],Bit[0]}:</p> <p>00: Left RX clk DPHY_RX_MMR_SLV_LANE provides clock to all left and right data lanes.</p> <p>01: Left RX clk DPHY_RX_MMR_SLV_LANE provides clock to all right data lanes, Right RX clk DPHY_RX_MMR_SLV_LANE provides clock to all left data lanes.</p> <p>10: Right RX clk DPHY_RX_MMR_SLV_LANE provides clock to all right data lanes, Left RX clk DPHY_RX_MMR_SLV_LANE provides clock to all left data lanes.</p> <p>11: Right RX clk DPHY_RX_MMR_SLV_LANE provides clock to all left and right data lanes.</p> |

Table 11-623. DPHY_RX_MMR_SLV_LANE Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------------------|------|-------|---|
| 8 | CLK_SWAPDPDN_DL_L_3 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 7 | CLK_SWAPDPDN_DL_L_2 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 6 | DATA_SWAPDPDN_DL_L_3 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 5 | DATA_SWAPDPDN_DL_L_2 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 4 | CLK_SWAPDPDN_DL_L_1 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 3 | CLK_SWAPDPDN_DL_L_0 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 2 | DATA_SWAPDPDN_DL_L_1 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 1 | DATA_SWAPDPDN_DL_L_0 | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |
| 0 | CLK_SWAPDPDN_CL_L | R/W | 0h | Swap DP and DN: When enabled, the rx_p and rx_m differential pins will be swapped. 1'b 0: Not swapped 1'b 1: Swapped |

12 DPHY_TX Registers

Table 12-2 lists the memory-mapped registers for the DPHY_TX registers. All register offset addresses not listed in Table 12-2 should be considered as reserved locations and the register contents should not be modified.

This is the MMR register region for the DPHY_TX component

Table 12-1. DPHY_TX Instances

| Instance | Base Address |
|----------|--------------|
| DPHY_TX0 | 0448 0000h |

Table 12-2. DPHY_TX Registers

| Offset | Acronym | Register Name | DPHY_TX0 Physical Address |
|--------|-----------------------------|---------------|---------------------------------|
| 0h | DPHY_TX_CMN0_CMN_ANA_TBIT0 | | 0448 0000h |
| 4h | DPHY_TX_CMN0_CMN_ANA_TBIT1 | | 0448 0004h |
| 8h | DPHY_TX_CMN0_CMN_ANA_TBIT2 | | 0448 0008h |
| Ch | DPHY_TX_CMN0_CMN_ANA_TBIT3 | | 0448 000Ch |

13 VPFE Registers

This section describes VPFE Configuration registers and VPFE RAT module registers.

13.1 VPFE Configuration Registers

Table 13-2 lists the memory-mapped registers for the VPFE Configuration registers. All register offset addresses not listed in Table 13-2 should be considered as reserved locations and the register contents should not be modified.

VPFE Registers

Table 13-1. VPFE Instances

| Instance | Base Address |
|------------|--------------|
| VPFE0_VPFE | 02F0 8000h |

Table 13-2. VPFE Registers

| Offset | Acronym | Register Name | VPFE0_VPFE Physical Address |
|--------|-------------------------------------|---------------|-----------------------------|
| 0h | VPFE_REVISION | | 02F0 8000h |
| 4h | VPFE_PCR | | 02F0 8004h |

| R/W-0h | | | | | | | | | | | | | | | | R/W-0h | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 13-12. VPFE_PIX_LINES Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|-------|------|-------|--|
| 31-16 | PPLN | R/W | 0h | Pixels per line - number of pixel clock periods in one line HD period = PPLN+1 pixel clocks PPLN is not used when HD and VD are inputs, ie when VDHDOUT in SYN_MODE register is cleared to '0' *This bit field is latched by VD |
| 15-0 | HLPFR | R/W | 0h | Half lines per field or frame - sets number of half lines per frame or field VD period = [HLPFR+1]/2 lines HLPFR is not used when HD and VD are inputs, ie when VDHDOUT in SYN_MODE register is cleared to '0' This tells the internal timing generator to generate the sufficient number of HD pulses in between two VD pulses If the sensor is an interlaced sensor, say for example, with a total of 525 [or 526] lines, then this field should be set to 525 [or 526] This means that 525 [or 526] half lines are written for each field If the sensor is progressive, then this register should be set to be twice the number of lines to be written For example, if sensor outputs 1024 lines, this field should be set to 2048 Therefore, for interlaced sensors, this field should be set to the total number of lines For progressive sensors, this field should be set to twice the total number of lines *This bit field is latched by VD |

13.7 VPFE_HORZ_INFO Register (Offset = 14h) [reset = X]

VPFE_HORZ_INFO is shown in [Figure 13-6](#) and described in [Table 13-14](#).

Return to [Summary Table](#).

13.25 VPFE_IRQ_EOI Register (Offset = 110h) [reset = X]

VPFE_IRQ_EOI is shown in [Figure 13-24](#) and described in [Table 13-50](#).

Return to [Summary Table](#).

Module EOI register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 13-49. VPFE_IRQ_EOI Instances

13.49 VPFE_EOI_REG Register (Offset = 850h) [reset = X]

VPFE_EOI_REG is shown in [Figure 13-47](#) and described in [Table 13-98](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 13-97. VPFE_EOI_REG Instances

| Instance | Physical Address |
|------------|------------------|
| VPFE0_MMRS | 02F0 0850h |

14 GTC Registers

14.1 GTC0_GTC_CFG0 Registers

Table 14-2 lists the memory-mapped registers for the GTC0_GTC_CFG0. All register offset addresses not listed in Table 14-2 should be considered as reserved locations and the register contents should not be modified.

Table 14-1. GTC0_GTC_CFG0 Instances

| Instance | Base Address |
|---------------|--------------|
| GTC0_GTC_CFG0 | 00A8 0000h |

Table 14-2. GTC0_GTC_CFG0 Registers

| Offset | Acronym | Register Name | GTC0_GTC_CFG0 Physical Address |
|--------|-----------------------------|--|--------------------------------|
| 0h | GTC_PID | Generic control MMR peripheral ID register | 00A8 0000h |
| 4h | GTC_GTC_PID | GTC peripheral ID register | 00A8 0004h |
| 8h | GTC_PUSHEVT | Push event select register | 00A8 0008h |

14.1.1 GTC_PID Register (Offset = 0h) [reset = 61800209h]

GTC_PID is shown in [Figure 14-1](#) and described in [Table 14-4](#).

Return to [Summary Table](#).

This is the standard platform IP revision register which contains the ID and revision information of the MMR generator.

Table 14-3. GTC_PID Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG0 | 00A8 0000h |

Table 14-8. GTC_PUSHEVT Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|--|
| 31-6 | RESERVED | R | 0h | Reserved. Always read as 0. |
| 5-0 | EXPBIT_SEL | R/W | 0h | This field controls the mux that selects which bit [63:0] of the system counter value is exported on the <i>push event</i> output. 0h = Select CNTR[0] 1h = Select CNTR[1] ... 3Fh = Select CNTR[63] |

14.2 GTC0_GTC_CFG1 Registers

Table 14-10 lists the memory-mapped registers for the GTC0_GTC_CFG1. All register offset addresses not listed in Table 14-10 should be considered as reserved locations and the register contents should not be modified.

Table 14-9. GTC0_GTC_CFG1 Instances

| Instance | Base Address |
|---------------|--------------|
| GTC0_GTC_CFG1 | 00A9 0000h |

Table 14-10. GTC0_GTC_CFG1 Registers

| Offset | Acronym | Register Name | GTC0_GTC_CFG1 Physical Address |
|--------|------------------------------|-------------------------------------|--------------------------------|
| 0h | GTC_CNTCR | Counter control register | 00A9 0000h |
| 4h | GTC_CNTSR | Counter status register | 00A9 0004h |
| 8h | GTC_CNTCV_LO | Counter count value (low) register | 00A9 0008h |
| Ch | GTC_CNTCV_HI | Counter count value (high) register | 00A9 000Ch |
| 20h | GTC_CNTFID0 | Counter frequency ID0 register | 00A9 0020h |
| 24h | GTC_CNTFID1 | Counter frequency ID1 register | 00A9 0024h |

14.2.1 GTC_CNTCR Register (Offset = 0h) [reset = 0h]

GTC_CNTCR is shown in [Figure 14-4](#) and described in [Table 14-12](#).

Return to [Summary Table](#).

This register enables the system counter and controls counter operation during debug.

Table 14-11. GTC_CNTCR Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG1 | 00A9 0000h |

Figure 14-4. GTC_CNTCR Register

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 14-12. GTC_CNTCR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|--|
| 31-8 | FCREQ | R | 0h | Frequency change request. Indicates the number of the entry in the frequency table to select. For this device, this field is implemented as read-only, pointing to the base frequency table entry (000000h). |
| 7-2 | RESERVED | R | 0h | Reserved. Always read as 0. |
| 1 | HDBG | R/W | 0h | Halt on debug 0 = System counter ignores debug halt 1 = System counter is halted when debug halt is asserted |
| 0 | EN | R/W | 0h | Enable system counter 0 = System counter is disabled 1 = System counter is enabled |

14.2.2 GTC_CNTSR Register (Offset = 4h) [reset = X]

GTC_CNTSR is shown in [Figure 14-5](#) and described in [Table 14-14](#).

Return to [Summary Table](#).

This register provides system counter frequency status information.

Table 14-13. GTC_CNTSR Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG1 | 00A9 0004h |

LEGEND: R = Read Only; -n = value after reset

Table 14-14. GTC_CNTSR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|---|
| 31-8 | FCACK | R | 0h | Frequency change acknowledge. Indicates the currently selected entry in the frequency table. For this device, this field is tied to 0. |
| 7-2 | RESERVED | R | 0h | Reserved. Always read as 0. |
| 1 | DBGH | R | X | Debug halt. Indicates if the system counter is halted due to debug. 0 = System counter is not halted by a debug halt 1 = System counter is halted by a debug halt |
| 0 | RESERVED | R | 0h | Reserved. Always read as 0. |

14.2.3 GTC_CNTCV_LO Register (Offset = 8h) [reset = X]

GTC_CNTCV_LO is shown in [Figure 14-6](#) and described in [Table 14-16](#).

Return to [Summary Table](#).

Indicates the current system counter count value and can be used to set the system counter count value.

Table 14-15. GTC_CNTCV_LO Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG1 | 00A9 0008h |

Figure 14-6. GTC_CNTCV_LO Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 14-16. GTC_CNTCV_LO Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|---|
| 31-0 | COUNTVALUE | R/W | 0h | Indicates bits [31:0] of the system counter value. This field is only writable when the system counter is disabled. The read value is the current value of system counter count [31:0]. |

14.2.4 GTC_CNTCV_HI Register (Offset = Ch) [reset = X]

GTC_CNTCV_HI is shown in [Figure 14-7](#) and described in [Table 14-18](#).

Return to [Summary Table](#).

Indicates the current system counter count value and can be used to set the system counter count value.

Table 14-17. GTC_CNTCV_HI Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG1 | 00A9 000Ch |

Figure 14-7. GTC_CNTCV_HI Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| COUNTVALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 14-18. GTC_CNTCV_HI Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|---|
| 31-0 | COUNTVALUE | R/W | 0h | Indicates bits [63:32] of the system counter value. This field is only writable when the system counter is disabled. The read value is the current value of system counter count [63:32]. |

14.2.5 GTC_CNTFID0 Register (Offset = 20h) [reset = 0h]

GTC_CNTFID0 is shown in [Figure 14-8](#) and described in [Table 14-20](#).

Return to [Summary Table](#).

Indicates base frequency of the system counter. Device bootcode/firmware should write this register with the frequency of the selected GTC clock source before enabling the system counter.

Table 14-19. GTC_CNTFID0 Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG1 | 00A9 0020h |

Figure 14-8. GTC_CNTFID0 Register

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| FREQVALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 14-20. GTC_CNTFID0 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-----------|------|-------|--|
| 31-0 | FREQVALUE | R/W | 0h | Indicates the base update frequency of the system counter in Hz. |

14.2.6 GTC_CNTFID1 Register (Offset = 24h) [reset = 0h]

GTC_CNTFID1 is shown in [Figure 14-9](#) and described in [Table 14-22](#).

Return to [Summary Table](#).

Indicates the system counter increment frequency.

Table 14-21. GTC_CNTFID1 Instances

| Instance | Physical Address |
|---------------|------------------|
| GTC0_GTC_CFG1 | 00A9 0024h |

Figure 14-9. GTC_CNTFID1 Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| FREQVALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R = Read Only; -n = value after reset

Table 14-22. GTC_CNTFID1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-----------|------|-------|---|
| 31-0 | FREQVALUE | R | 0h | Frequency table end indicator. All 0s value marks the end of the frequency table. |

14.3 GTC0_GTC_CFG2 Registers

Table 14-24 lists the memory-mapped registers for the GTC0_GTC_CFG2. All register offset addresses not listed in Table 14-24 should be considered as reserved locations and the register contents should not be modified.

Table 14-23. GTC0_GTC_CFG2 Instances

| Instance | Base Address |
|---------------|--------------|
| GTC0_GTC_CFG2 | 00AA 0000h |

Table 14-24. GTC0_GTC_CFG2 Registers

| Offset | Acronym | Register Name | GTC0_GTC_CFG2 Physical Address |
|--------|-------------------------------|--|--------------------------------|
| 0h | GTC_CNTCVS_LO | Counter count value (low) status register | 00AA 0000h |
| 4h | GTC_CNTCVS_HI | Counter count value (high) status register | 00AA 0004h |

14.3.1 GTC_CNTCVS_LO Register (Offset = 0h) [reset = 0h]

GTC_CNTCVS_LO is shown in [Figure 14-10](#) and described in [Table 14-26](#).

Return to [Summary Table](#).

Indicates the current system counter count value. It reflects the same value as the CNTCV_LO register.

Table 14-25. GTC_CNTCVS_LO Instances

| Instance | Physical Address |
|--------------|------------------|
| GTC_R10_CFG1 | 00AA 0000h |

Figure 14-10. GTC_CNTCVS_LO Register

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| COUNTVALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R = Read Only; -n = value after reset

Table 14-26. GTC_CNTCVS_LO Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|--|
| 31-0 | COUNTVALUE | R | 0h | Indicates bits [31:0] of the system counter value. |

14.3.2 GTC_CNTCVS_HI Register (Offset = 4h) [reset = 0h]

GTC_CNTCVS_HI is shown in [Figure 14-11](#) and described in [Table 14-28](#).

Return to [Summary Table](#).

Indicates the current system counter count value. It reflects the same value as the CNTCV_HI register.

Table 14-27. GTC_CNTCVS_HI Instances

| Instance | Physical Address |
|--------------|------------------|
| GTC_R10_CFG1 | 00AA 0004h |

Figure 14-11. GTC_CNTCVS_HI Register

LEGEND: R = Read Only; -n = value after reset

Table 14-28. GTC_CNTCVS_HI Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|---|
| 31-0 | COUNTVALUE | R | 0h | Indicates bits [63:32] of the system counter value. |

14.4 GTC0_GTC_CFG3 Registers

Table 14-30 lists the memory-mapped registers for the GTC0_GTC_CFG3. All register offset addresses not listed in Table 14-30 should be considered as reserved locations and the register contents should not be modified.

Table 14-29. GTC0_GTC_CFG3 Instances

| Instance | Base Address |
|---------------|--------------|
| GTC0_GTC_CFG3 | 00AB 0000h |

Table 14-30. GTC0_GTC_CFG3 Registers

| Offset | Acronym | Register Name | GTC0_GTC_CFG3 Physical Address |
|--------|-----------------------------|---------------------------|--------------------------------|
| 8h | GTC_CNTTIDR | Counter-timer ID register | 00AB 0000h |

14.4.1 GTC_CNTTIDR Register (Offset = 8h) [reset = 0h]

GTC_CNTTIDR is shown in [Figure 14-12](#) and described in [Table 14-32](#).

Return to [Summary Table](#).

Indicates the implemented timers in the memory map and their features. Because the platform does not implement memory-mapped timers, this register is set to all 0s.

Table 14-31. GTC_CNTTIDR Instances

| Instance | Physical Address |
|--------------|------------------|
| GTC_R10_CFG1 | 00AB 0000h |

LEGEND: R = Read Only; -n = value after reset

Table 14-32. GTC_CNTTIDR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|--------|------|-------|---|
| 31-28 | FRAME7 | R | 0h | Indicates the features of timer frame 7 |
| 27-24 | FRAME6 | R | 0h | Indicates the features of timer frame 6 |
| 23-20 | FRAME5 | R | 0h | Indicates the features of timer frame 5 |
| 19-16 | FRAME4 | R | 0h | Indicates the features of timer frame 4 |
| 15-12 | FRAME3 | R | 0h | Indicates the features of timer frame 3 |
| 11-8 | FRAME2 | R | 0h | Indicates the features of timer frame 2 |
| 7-4 | FRAME1 | R | 0h | Indicates the features of timer frame 1 |
| 3-0 | FRAME0 | R | 0h | Indicates the features of timer frame 0 |

15 RTI Registers

Note

Some of the RTI features described in this section may not be supported on this family of devices. For more information, see *RTI Not Supported Features*.

Table 15-2 lists the memory-mapped registers for the RTI. All register offset addresses not listed in Table 15-2 should be considered as reserved locations and the register contents should not be modified.

Table 15-1. RTI Instances

| Instance | Base Address |
|--------------|--------------|
| RTI0_CFG | 0220 0000h |
| RTI1_CFG | 0221 0000h |
| RTI15_CFG | 022F 0000h |

15.26 RTI_CLEARINT Register (Offset = 84h) [reset = 0h]

RTI_CLEARINT is shown in [Figure 15-26](#) and described in [Table 15-59](#).

Return to [Summary Table](#).

This register prevents the necessity of a read-modify-write operation if a particular interrupt should be disabled.

Note

Some of the RTI features described in this section may not be supported on this family of devices. For more information, see *RTI Not Supported Features*.

15.28 RTI_DWDCTRL Register (Offset = 90h) [reset = 5312ACEDh]

RTI_DWDCTRL is shown in [Figure 15-28](#) and described in [Table 15-63](#).

Return to [Summary Table](#).

Note

Some of the RTI features described in this section may not be supported on this family of devices. For more information, see *RTI Not Supported Features*.

This register's functionality is dependent on whether the DWD is implemented to be always enabled or not. If the DWD is always enabled, then the DWD is automatically enabled after system reset is released and cannot be disabled by software. In that case, this register is redundant and any writes to this register have no effect on the DWD functionality. If, however, the DWD is not enabled upon release of system reset, then the software has to write to the DWDCTRL field in order to enable the DWD, as described below. Once enabled, the watchdog can only be disabled by a system reset. The application cannot disable the watchdog. The RTI_DWDCTRL register also implements a one-time-write constraint. That is, once the application writes to this register to enable the watchdog, all further writes are ignored.

RTI_COMP3CLR is shown in [Figure 15-39](#) and described in [Table 15-85](#).

Return to [Summary Table](#).

Table 15-84. RTI_COMP3CLR Instances

| Instance | Physical Address |
|--------------|------------------|
| RTI0_CFG | 0220 00BCh |
| RTI1_CFG | 0221 00BCh |
| RTI15_CFG | 022F 00BCh |
| RTI16_CFG | 0230 00BCh |
| RTI24_CFG | 0238 00BCh |
| RTI25_CFG | 0239 00BCh |
| RTI28_CFG | 023C 00BCh |
| RTI29_CFG | 023D 00BCh |
| RTI30_CFG | 023E 00BCh |
| RTI31_CFG | 023F 00BCh |
| MCU_RTI0_CFG | 4060 00BCh |
| MCU_RTI1_CFG | 4061 00BCh |

LEGEND: R/W = Read/Write; -n = value after reset

Table 15-85. RTI_COMP3CLR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|--|
| 31-0 | COMP3CLR | R/W | 0h | <p>Compare 3 Clear. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, the compare 3 interrupt or DMA request line is cleared.</p> <p>User and privilege mode (read): Current compare value</p> <p>Privilege mode (write): Update of the compare register with a new compare value</p> <p>Reset behavior:</p> <p>A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.</p> |

16 Timers Registers

Table 16-2 lists the memory-mapped registers for the TIMER. All register offset addresses not listed in Table 16-2 should be considered as reserved locations and the register contents should not be modified.

Table 16-1. Timers Instances

| Instance | Base Address |
|----------------|--------------|
| TIMER0_CFG | 0240 0000h |
| TIMER1_CFG | 0241 0000h |
| TIMER2_CFG | 0242 0000h |
| TIMER3_CFG | 0243 0000h |
| TIMER4_CFG | 0244 0000h |
| TIMER5_CFG | 0245 0000h |
| TIMER6_CFG | 0246 0000h |
| TIMER7_CFG | 0247 0000h |
| TIMER8_CFG | 0248 0000h |
| TIMER9_CFG | 0249 0000h |
| TIMER10_CFG | 024A 0000h |
| TIMER11_CFG | 024B 0000h |
| TIMER12_CFG | 024C 0000h |
| TIMER13_CFG | 024D 0000h |
| TIMER14_CFG | 024E 0000h |
| TIMER15_CFG | 024F 0000h |
| TIMER16_CFG | 0250 0000h |
| TIMER17_CFG | 0251 0000h |
| TIMER18_CFG | 0252 0000h |
| TIMER19_CFG | 0253 0000h |
| MCU_TIMER0_CFG | 4040 0000h |
| MCU_TIMER1_CFG | 4041 0000h |

16.1 TIMER_TIDR Register (Offset = 0h) [reset = 5000 3900h]

TIMER_TIDR is shown in [Figure 16-1](#) and described in [Table 16-14](#).

Return to [Summary Table](#).

This read-only register contains the revision number of the module. A write to this register has no effect. This register is used by software to track features, bugs, and compatibility.

Table 16-13. TIMER_TIDR Instances

| Instance | Physical Address |
|----------------|------------------|
| TIMER0_CFG | 0240 0000h |

16.2 TIMER_TIOCP_CFG Register (Offset = 10h) [reset = 8h]

TIMER_TIOCP_CFG is shown in [Figure 16-2](#) and described in [Table 16-16](#).

Return to [Summary Table](#).

This register controls the various parameters of the CBASS0/MCU_CBASS0 interface.

Note

Some of the timers features described in this section may not be supported on this family of devices. For more information, see *Timers Not Supported Features*.

Table 16-15. TIMER_TIOCP_CFG Instances

| Instance | Physical Address |
|----------------|------------------|
| TIMER0_CFG | 0240 0010h |
| TIMER1_CFG | 0241 0010h |
| TIMER2_CFG | 0242 0010h |

Table 16-16. TIMER_TIOCP_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-----------|------|-------|---|
| 31-4 | RESERVED | R | 0h | Reserved |
| 3-2 | IDLEMODE | R/W | 2h | Power management, req/ack control 0h = Force-idle mode: local target idle state follows (acknowledges) the system clock stop requests unconditionally, that is, regardless of the IP module internal requirements. Back-up mode, for debug only. 1h = No-idle mode: local target never enters idle state. Back-up mode, for debug only. 2h = Smart-idle mode: local target idle state eventually follows (acknowledges) the system clock stop requests, depending on the IP module internal requirements. IP module should not generate (IRQ-request-related) wake-up events. 3h = Smart-idle wake-up-capable mode: local target idle state eventually follows (acknowledges) the system clock stop requests, depending on the IP module internal requirements. IP module may generate (IRQ-request-related) wake-up events when in IDLE state. Mode is relevant only if the appropriate IP modules wake-up output(s) is (are) implemented. |
| 1 | EMUFREE | R/W | 0h | Emulation mode 0h = The timer is frozen in emulation mode (PINSUSPENDN signal active). 1h = The timer runs free, regardless of PINSUSPENDN value. |
| 0 | SOFTRESET | R/W | 0h | Software reset Read 0h = Reset done, no pending action Write 0h = No action Read 1h = Initiate software reset Write 1h = Reset ongoing. |

16.3 TIMER_IRQ_EOI Register (Offset = 20h) [reset = 0h]

TIMER_IRQ_EOI is shown in [Figure 16-3](#) and described in [Table 16-18](#).

Return to [Summary Table](#).

Software End-Of-Interrupt: Allows the generation of further pulses on the interrupt line, if a new interrupt event is pending, when using the pulsed output. Unused when using the level interrupt line (depending on module integration).

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 16-17. TIMER_IRQ_EOI Instances

| Instance | Physical Address |
|----------------|------------------|
| TIMER0_CFG | 0240 0020h |

16.8 TIMER_IRQWAKEEN Register (Offset = 34h) [reset = 0h]

TIMER_IRQWAKEEN is shown in [Figure 16-8](#) and described in [Table 16-28](#).

Return to [Summary Table](#).

Wake-up-enabled events taking place when module is idle should generate an asynchronous wake-up.

Table 16-27. TIMER_IRQWAKEEN Instances

| Instance | Physical Address |
|----------------|------------------|

Table 16-30. TIMER_TCLR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|-----------|------|-------|---|
| 31-15 | RESERVED | R | 0h | Reserved |
| 14 | GPO_CFG | R/W | 0h | General-purpose output - this bit is used to as an output enable for the TIMER IO pin. 0h = TIMER IO pin functions as PWM output. 1h = TIMER IO pin functions as TRIGGER input. |
| 13 | CAPT_MODE | R/W | 0h | Capture mode select bit (first/second) 0h = Single capture: Capture the first enabled capture event in TIMER_TCAR1. 1h = Capture on second event: Capture the second enabled capture event in TIMER_TCAR1 and the second enabled capture event in TIMER_TCAR2. |
| 12 | PT | R/W | 0h | Pulse or toggle mode on POTIMERPWM output pin 0h = Pulse modulation 1h = Toggle modulation. |
| 11-10 | TRG | R/W | 0h | Trigger output mode on POTIMERPWM output pin 0h = No trigger 1h = Trigger on overflow. 2h = Trigger on overflow and match 3h = Reserved. |
| 9-8 | TCM | R/W | 0h | Transition capture mode on EVENT_CAPTURE input pin (When the TCM field passed from (00) to any other combination, the TCAR_IT_FLAG and the edge detection logic are cleared.) 0h = No capture 1h = Capture on rising edges of EVENT_CAPTURE pin 2h = Capture on falling edges of EVENT_CAPTURE pin 3h = Capture on both edges of EVENT_CAPTURE pin. |
| 7 | SCPWM | R/W | 0h | Pulse width modulation output pin default setting This bit must be set or clear while the timer is stopped or the trigger is off. 0h = Clear the POTIMERPWM output pin and select positive pulse for pulse mode. 1h = Set the POTIMERPWM output pin and select negative pulse for pulse mode. |
| 6 | CE | R/W | 0h | Compare enable 0h = Compare mode is disable. 1h = Compare mode is enable. |
| 5 | PRE | R/W | 0h | Prescaler enable 0h = The timer clock input pin clocks the counter. 1h = The divided input pin clocks the counter. |
| 4-2 | PTV | R/W | 0h | Prescale clock timer value The timer counter is prescaled with the value $2^{(PTV+1)}$. Example: PTV = 3, counter increases value (if started) after 16 functional clock periods. |

Table 16-30. TIMER_TCLR Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|---|
| 1 | AR | R/W | 0h | Autoreload mode 0h = One shot timer 1h = Autoreload timer |
| 0 | ST | R/W | 0h | Start/stop timer control 0h = Stop timer: Only the counter is frozen. If one-shot mode selected (AR = 0), this bit is automatically reset by internal logic when the counter is overflowed. 1h = Start timer. |

16.10 TIMER_TCR Register (Offset = 3Ch) [reset = 0h]

TIMER_TCR is shown in [Figure 16-10](#) and described in [Table 16-32](#).

Return to [Summary Table](#).

This register holds the value of the internal counter.

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|---|
| 31-0 | LOAD_VALUE | R/W | 0h | Timer counter value loaded on overflow in autoreload mode or on TIMER_TTGR write access. LOAD_VALUE must be different than the timer overflow value (FFFF FFFFh). |

16.12 TIMER_TTGR Register (Offset = 44h) [reset = Fh]

TIMER_TTGR is shown in [Figure 16-12](#) and described in [Table 16-36](#).

Return to [Summary Table](#).

This register triggers a counter reload of timer by writing any value in it. The read value of this register is always FFFF FFFFh.

Table 16-35. TIMER_TTGR Instances

| Instance | Physical Address |
|----------------|------------------|

16.14 TIMER_TMAR Register (Offset = 4Ch) [reset = 0h]

TIMER_TMAR is shown in [Figure 16-14](#) and described in [Table 16-40](#).

Return to [Summary Table](#).

The TIMER_TMAR register holds the match value to be compared with the counter's value.

Table 16-39. TIMER_TMAR Instances

16.18 TIMER_TPIR Register (Offset = 5Ch) [reset = 0h]

TIMER_TPIR is shown in [Figure 16-18](#) and described in [Table 16-48](#).

Return to [Summary Table](#).

This register is used for 1-ms tick generation. The TIMER_TPIR register holds the value of the positive increment. The value of this register is added to the value of TIMER_TCVR to determine whether next value loaded in TIMER_TCRR is the subperiod value or the overperiod value.

Table 16-47. TIMER_TPIR Instances

| Instance | Physical Address |
|----------------|------------------|

16.19 TIMER_TNIR Register (Offset = 60h) [reset = 0h]

TIMER_TNIR is shown in [Figure 16-19](#) and described in [Table 16-50](#).

Return to [Summary Table](#).

This register is used for 1-ms tick generation. The TIMER_TNIR register holds the value of the negative increment. The value of this register is added to the value of the TIMER_TCVR to determine whether next value loaded in TIMER_TCRR is the subperiod value or the overperiod value.

16.20 TIMER_TCVR Register (Offset = 64h) [reset = 0h]

TIMER_TCVR is shown in [Figure 16-20](#) and described in [Table 16-52](#).

Return to [Summary Table](#).

This register is used for 1-ms tick generation. The TIMER_TCVR register determines whether next value loaded in TIMER_TCRR is the subperiod value or the overperiod value.

Table 16-51. TIMER_TCVR Instances

Table 16-52. TIMER_TCVR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|---------------|------|-------|----------------------|
| 31-0 | COUNTER_VALUE | R/W | 0h | Value of CVR counter |

16.21 TIMER_TOCR Register (Offset = 68h) [reset = 0h]

TIMER_TOCR is shown in [Figure 16-21](#) and described in [Table 16-54](#).

[Return to Summary Table.](#)

This register is used to mask the tick interrupt for a selected number of ticks.

Table 16-53. TIMER_TOCR Instances

| Instance | Physical Address |
|----------------|------------------|
| TIMER0_CFG | 0240 0068h |

17 DCC Registers

Table 17-2 lists the memory-mapped registers for the DCC registers. All register offset addresses not listed in Table 17-2 through Table 17-7 should be considered as reserved locations and the register contents should not be modified.

Table 17-1. DCC Instances

| Instance | Base Address |
|----------|--------------|
| DCC0 | 0080 0000h |
| DCC1 | 0080 4000h |
| DCC2 | 0080 8000h |
| DCC3 | 0080 C000h |
| DCC4 | 0081 0000h |
| DCC5 | 0081 4000h |
| DCC6 | 0081 8000h |
| DCC7 | 0081 C000h |
| DCC8 | 0082 0000h |
| DCC9 | 0082 4000h |
| DCC10 | 0082 8000h |
| DCC11 | 0082 C000h |
| DCC12 | 0083 0000h |
| MCU_DCC0 | 4010 0000h |
| MCU_DCC1 | 4011 0000h |
| MCU_DCC2 | 4012 0000h |

17.1 DCC_GCTRL Register (Offset = 0h) [reset = X]

DCC_GCTRL is shown in [Figure 17-1](#) and described in [Table 17-9](#).

Return to [Summary Table](#).

Starts / stops the counters. Clears the error signal.

LEGEND: R/W = Read/Write; -n = value after reset

Table 17-9. DCC_GCTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-16 | RESERVED | R/W | X | |
| 15-12 | DONEENA | R/W | 5h | The DONEENA bit enables/disables the done interrupt signal, but has no effect on the done status flag in DCC_STAT register. User, privilege, and debug mode (read): 0101 = the done signal is disabled others = the done signal is enabled Privilege and debug mode (write): 0101 = disable done signal generation others = enable done signal generation |

Table 17-9. DCC_GCTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|------|------------|------|-------|---|
| 11-8 | SINGLESHOT | R/W | 5h | <p>The SINGLESHOT bit enables/disables repetitive operation of the DCC.</p> <p>User, privilege, and debug mode (read):</p> <p>1010 = stop counting when counter0 and valid0 both reach zero</p> <p>1011 = stop counting when counter1 reaches zero</p> <p>others = continuously repeat (until error)</p> <p>Privilege and debug mode (write):</p> <p>1010 = stop counting when counter0 and valid0 both reach zero</p> <p>1011 = stop counting when counter1 reaches zero</p> <p>others = continuously repeat (until error)</p> |
| 7-4 | ERRENA | R/W | 5h | <p>The ERRENA bit enables/disables the error signal.</p> <p>User, privilege, and debug mode (read):</p> <p>0101 = the error signal is disabled</p> <p>others = the error signal is enabled</p> <p>Privilege and debug mode (write):</p> <p>0101 = disable error signal generation</p> <p>others = enable error signal generation</p> |
| 3-0 | DCCENA | R/W | 5h | <p>The DCCENA bit starts and stops the operation of the dcc.</p> <p>User, privilege, and debug mode (read):</p> <p>0101 = counters are stopped</p> <p>others = counters are running</p> <p>Privilege and debug mode (write):</p> <p>0101 = stop counters and error-checking</p> <p>others = load the counters with their seed values and begin counting</p> |

17.2 DCC_REV Register (Offset = 4h) [reset = X]

DCC_REV is shown in [Figure 17-2](#) and described in [Table 17-11](#).

Return to [Summary Table](#).

Specifies the module version.

Table 17-10. DCC_REV Instances

| Instance | Physical Address |
|----------|------------------|
| DCC0 | 0080 0004h |
| DCC1 | 0080 4004h |
| DCC2 | 0080 8004h |
| DCC3 | 0080 C004h |
| DCC4 | 0081 0004h |
| DCC5 | 0081 4004h |
| DCC6 | 0081 8004h |
| DCC7 | 0081 C004h |
| DCC8 | 0082 0004h |
| DCC9 | 0082 4004h |

LEGEND: R = Read Only; -n = value after reset

Table 17-11. DCC_REV Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-30 | SCHEME | R | 1h | User, privilege, and debug mode (read): Returns 01. Privilege and debug mode (write): Writes have no effect. |
| 29-28 | RESERVED | R | X | |

Table 17-11. DCC_REV Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|--------|------|-------|---|
| 27-16 | FUNC | R | 0h | Reflects software-compatibility. If there is no level of software compatibility, a unique func number is assigned for compatible modules, the same number is maintained. User, privilege, and debug mode (read): 0x0 Privilege and debug mode (write): Writes have no effect. |
| 15-11 | RTL | R | 0h | Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented. User, privilege, and debug mode (read): 0x0 Privilege and debug mode (write): Writes have no effect. |
| 10-8 | MAJOR | R | 2h | Represents major changes to the module (e.g. entirely new features are added/changed). The major revision number for this module. User, privilege, and debug mode (read): 0x2 Privilege and debug mode (write): Writes have no effect. |
| 7-6 | CUSTOM | R | 0h | Indicates a special version of the module. May not be supported by standard software. User, privilege, and debug mode (read): 0x0 Privilege and debug mode (write): Writes have no effect. |
| 5-0 | MINOR | R | 4h | Represents minor changes to the module (e.g. enhancements to existing features). The minor revision number for this module. User, privilege, and debug mode (read): 0x4 Privilege and debug mode (write): Writes have no effect. |

17.3 DCC_CNTSEED0 Register (Offset = 8h) [reset = X]

DCC_CNTSEED0 is shown in [Figure 17-3](#) and described in [Table 17-13](#).

Return to [Summary Table](#).

Seed value for the counter attached to clock source 0

Table 17-12. DCC_CNTSEED0 Instances

| Instance | Physical Address |
|----------|------------------|
| DCC0 | 0080 0008h |

18.13 ESM_EOI Register (Offset = 30h) [reset = X]

ESM_EOI is shown in [Figure 18-13](#) and described in [Table 18-28](#).

Return to [Summary Table](#).

End of Interrupt Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 18-27. ESM_EOI Instances

| Instance | Physical Address |
|---------------|------------------|
| ESM0_CFG | 0070 0030h |

Table 18-28. ESM_EOI Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-11 | RESERVED | W | X | Always read as 0h. Writes have no affect. |
| 10-0 | KEY | W | 0h | <p>This is the interrupt being serviced. Writing the corresponding vector to this field will cause a re-evaluation of interrupts. If, when the vector is written, there are still pending interrupts, a new pulse will be generated. Reads always return 0.</p> <p>0h (W) = Configuration error interrupt</p> <p>1h (W) = Low priority error interrupt</p> <p>2h (W) = High priority error interrupt</p> <p>3h – 2047h (W) = Reserved (writes have no effect)</p> |

18.14 ESM_PIN_CTRL Register (Offset = 40h) [reset = X]

ESM_PIN_CTRL is shown in [Figure 18-14](#) and described in [Table 18-30](#).

Return to [Summary Table](#).

This register controls the SAFETY_ERRORn pin output

Table 18-29. ESM_PIN_CTRL Instances

| Instance | Physical Address |
|---------------|------------------|
| ESM0_CFG | 0070 0040h |
| MCU_ESM0_CFG | 4080 0040h |
| WKUP_ESM0_CFG | 4208 0040h |

Figure 18-14. ESM_PIN_CTRL Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|--------|---|---|---|

| R/W-X | | | | | | | | | | | | | | | | | | | | | | | | | | | | R/W-0h | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 18-30. ESM_PIN_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|---|
| 31-4 | RESERVED | R/W | X | Always read as 0h. Writes have no affect. |
| 3-0 | KEY | R/W | 0h | <p>Pin control key. This field controls behavior of the error pin. Note, during reset the field is 0h, but the error pin is asserted (active low). Immediately after reset, the error pin de-asserts. This field is only reset by a Power-On-Reset (not warm reset). A global soft reset will set this field to 0. A global soft reset will also CLEAR all pending faults.</p> <p>0h = Normal Mode: Error pin will activate when an enabled Error Event occurs.</p> <p>5h = CLEAR Event: generates a CLEAR event to the ESM state machine. Key will return to Normal Mode (0h) on the next cycle.</p> <p>Ah = Force Error Mode: Forces the error pin to active. To clear the error pin (return to the ESM_IDLE state) write this field back to Normal Mode (writing a CLEAR event will also work). Software may only write to Force Error Mode while in IDLE. Attempting Force Error while in another state will have no effect</p> <p>All Other Values = Normal Mode: Writing any of these values will have no effect. Reading any of these values indicate that one or more bits have experienced a single event upset and software should write the field back to 0h. The ESM will continue to operate in Normal Mode.</p> |

18.15 ESM_PIN_STS Register (Offset = 44h) [reset = X]

ESM_PIN_STS is shown in [Figure 18-15](#) and described in [Table 18-32](#).

Return to [Summary Table](#).

This register reflects the status of the error_pin_n output

Table 18-31. ESM_PIN_STS Instances

| Instance | Physical Address |
|---------------|------------------|
| ESM0_CFG | 0070 0044h |
| MCU_ESM0_CFG | 4080 0044h |
| WKUP_ESM0_CFG | 4208 0044h |

Table 18-34. ESM_PIN_CNTR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-24 | RESERVED | R | X | Always read as 0h. Writes have no affect. |
| 23-0 | COUNT | R | 0h | This field indicates the current value of the time interval counter. See ESM_PIN_CNTR_PRE register for a description. This register is reloaded to the counter_preload value on entry to the ESM_ERROR state from ESM_IDLE and counts down by one per clock cycle. Once the counter has reached 0, the minimum time interval has expired. This field is only reset by a Power-On-Reset (not warm reset). A global soft reset will set this field to 0h. |

18.17 ESM_PIN_CNTR_PRE Register (Offset = 4Ch) [reset = X]

ESM_PIN_CNTR_PRE is shown in [Figure 18-17](#) and described in [Table 18-36](#).

Return to [Summary Table](#).

This register contains the value that is loaded in to the Error Counter

Table 18-35. ESM_PIN_CNTR_PRE Instances

| Instance | Physical Address |
|---------------|------------------|
| ESM0_CFG | 0070 004Ch |
| MCU_ESM0_CFG | 4080 004Ch |

| Bit | Field | Type | Reset | Description |
|------|-------|-------|-------|--|
| 31-0 | MSK | R/W1S | 0h | <p>This field is used to enable the mask of events in group N. Each bit corresponds to event Q where $Q = N * 32 + \text{Bit}$ (Example: bit 0 is event $N * 32 + 0$, bit 1 is $N * 32 + 1$ etc...) This field is only reset by a Power-On-Reset (not warm reset). A global soft reset will set this field to 0.</p> <p>0h (R) = Disabled 1h (R) = Enabled 0h (W) = No effect 1h (W) = Set Enable. Corresponding event, when set, will count as a pending error event for the ESM state machine.</p> |

18.24 ESM_PIN_EN_CLR_j Register (Offset = 418h + formula) [reset = 0h]

ESM_PIN_EN_CLR_j is shown in [Figure 18-24](#) and described in [Table 18-50](#).

Return to [Summary Table](#).

Level Error Interrupt Enabled Clear register

Offset = 418h + (j * 20h); where

j = 0h to 2h for WKUP_ESM0_CFG

j = 0h to 3h for MCU_ESM0_CFG

j = 0h to 7h for ESM0_CFG

Table 18-49. ESM_PIN_EN_CLR_j Instances

19 MCRC Registers

Table 19-2 lists the memory-mapped registers for the NAVSS0_MCRC. All register offset addresses not listed in Table 19-2 should be considered as reserved locations and the register contents should not be modified.

This is the MMR register region for the mcrc64_regs component

Table 19-1. NAVSS0_MCRC Instances

| Instance | Base Address |
|-----------------|--------------|
| NAVSS0_MCRC | 31F7 0000h |
| MCU_NAVSS0_MCRC | 2A26 4000h |

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|--|
| 31-26 | RESERVED | R/W | X | |
| 25-24 | CH4_MODE | R/W | 0h | Channel 4 Mode. 00 = Data Capture mode. In this mode, the PSA Signature Register does not compress data when it is written. Any data written to PSA Signature Register is simply captured by PSA Signature Register without any compression. This mode can be used to plant seed value into the PSA register. 01 = AUTO mode 10 = Semi-CPU mode 11 = Full-CPU mode For all four channels the seed value can be first planted into PSA register before the Channel Mode is switched to Full-CPU mode since host CPU controls the amount of data for compression. During AUTO mode, the PSA register is automatically reset to zero at the end of each sector compression. |
| 23-18 | RESERVED | R/W | X | |
| 17-16 | CH3_MODE | R/W | 0h | Channel 3 Mode. 00 = Data Capture mode. In this mode, the PSA Signature Register does not compress data when it is written. Any data written to PSA Signature Register is simply captured by PSA Signature Register without any compression. This mode can be used to plant seed value into the PSA register. 01 = AUTO mode 10 = Semi-CPU mode 11 = Full-CPU mode |

Table 19-8. MCRC_CRC_CTRL2 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|-------------|------|-------|---|
| 15-10 | RESERVED | R/W | X | |
| 9-8 | CH2_MODE | R/W | 0h | Channel 2 Mode. 00 = Data Capture mode. In this mode, the PSA Signature Register does not compress data when it is written. Any data written to PSA Signature Register is simply captured by PSA Signature Register without any compression. This mode can be used to plant seed value into the PSA register. 01 = AUTO mode 10 = Semi-CPU mode 11 = Full-CPU mode |
| 7-5 | RESERVED | R/W | X | |
| 4 | CH1_TRACEEN | R/W | 0h | Channel 1 Data Trace Enable When set, the channel is put into data trace mode. The channel snoops on the CPU VBUSM, ITCM, DTCM buses for any read transaction. Any read data on these buses is compressed by the PSA Signature Register. When suspend is on, the PSA Signature Register does not compress any read data on these buses. 0 = Data Trace disable 1 = Data Trace enable |
| 3-2 | RESERVED | R/W | X | |
| 1-0 | CH1_MODE | R/W | 0h | Channel 1 Mode. 00 = Data Capture mode. In this mode, the PSA Signature Register does not compress data when it is written. Any data written to PSA Signature Register is simply captured by PSA Signature Register without any compression. This mode can be used to plant seed value into the PSA register. 01 = AUTO mode 10 = Semi-CPU mode 11 = Full-CPU mode |

20 ECC Aggregator Registers

Table 20-1 lists the memory-mapped registers for an ECC Aggregator (ECC_AGGR). All register offset addresses not listed in Table 20-1 should be considered as reserved locations and the register contents should not be modified.

Note

This section shows all possible registers and bits which an ECC aggregator may have. For specific physical addresses and particular ECC aggregator registers associated with each ECC protected module or subsystem, see the corresponding *Registers* section.

Table 20-1. ECC_AGGR Registers

| Offset | Acronym | Register Name |
|--------------------------------------|---|---|
| 0h | ECC_REV | Aggregator Revision Register |
| 8h | ECC_VECTOR | ECC Vector Register |
| Ch | ECC_STAT | Misc Status Register |
| ECC Wrapper Registers | | |

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 20-6. ECC_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|---------------------|------|-------|---|
| 31-9 | RESERVED | R | 0 | Reserved |
| 8 | CHECK_SVBUS_TIMEOUT | R/W | 1h | Enable ECC serial interface timeout mechanism 0h - Timeout mechanism disabled 1h - Timeout mechanism enabled |
| 7 | CHECK_PARITY | R/W | 1h | Enables parity checking on internal data 0h - Parity checking disabled 1h - Parity checking enabled |
| 6 | ERROR_ONCE | R/W | 0h | Force error only once. If this bit is set to 1h, the FORCE_SEC/FORCE_DED injects an error to the specified row only once. The FORCE_SEC bit is cleared the cycle after the error is generated. For double-bit errors, the FORCE_DED bit is cleared the cycle following the double-bit error. Any subsequent reads do not force an error. |
| 5 | FORCE_N_ROW | R/W | 0h | Force error on any RAM read Force single or double-bit error on the next RAM access. For write through mode this applies to writes as well as reads. |
| 4 | FORCE_DED | R/W | 0h | Force double-bit error. Cleared the cycle following the error if ERROR_ONCE is 1h. For write through mode this applies to writes as well as reads. |
| 3 | FORCE_SEC | R/W | 0h | Force single-bit error. Cleared the cycle following the error if ERROR_ONCE is 1h. For write through mode this applies to writes as well as reads. |

Table 20-6. ECC_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|------------|------|-------|--|
| 2 | ENABLE_RMW | R/W | 1h | <p>Enable read-modify-write on partial word writes.</p> <p>0h - Read-modify-write disabled</p> <p>1h - Read-modify-write enabled</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: If disabled, ECC detection and correction does no longer work and if re-enabled the RAM contents must all be rewritten to correct ECC codes. The reset value of this bit is 0h in inject only mode and 1h in ECC mode.</p> <hr/> |
| 1 | ECC_CHECK | R/W | 1h | <p>Enable ECC check.</p> <p>0h - ECC check disabled</p> <p>1h - ECC check enabled</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: ECC is completely bypassed if both ECC_ENABLE and ECC_CHECK are 0h. The reset value of this bit is 0h in inject only mode and 1h in ECC mode.</p> <hr/> |
| 0 | ECC_ENABLE | R/W | 1h | <p>Enable ECC generation.</p> <p>0h - ECC generation disabled</p> <p>1h - ECC generation enabled</p> |

LEGEND: R = Read Only; R/W = Read/Write; R/W1C = Read/Write 1 to Clear Bit; R/W1S = Read/Write 1 to Set Bit; -n = value after reset

Table 20-9. ECC_ERR_STAT1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|------------------|-------|-------|---|
| 31-16 | ECC_BIT1 | R | 0h | Indicates the bit position in the RAM data that is in error. For example, a value of 1h indicates that bit [1] in the RAM data is in error. This is valid only for single-bit errors. Note NOTE: Not used in inject only mode. Always read as 0h. |
| 15 | CLR_CTRL_REG_ERR | R/W1C | 0h | Clear the CTR_REG_ERR bit. A write of 1h clears this bit and the CTR_REG_ERR bit, but if the redundancy protected bits in the ECC_CTRL register have not been written to a known state to correct the error, this flag is immediately set again. |
| 14-13 | CLR_PARITY_ERR | R/W | 0h | A write of a non-zero value to this field decrements the CLR_ECC_DED and ECC_DED fields by that value. If the value written is less than the current one, the non-correctable interrupt (ECC_DED_INT) stays asserted. If the value to decrement is more than the current value, the result is 0. 0h - No parity errors have occurred 1h - 1 parity error has occurred 2h - 2 parity errors have occurred 3h - 3 or more parity errors have occurred |
| 12 | CLR_ECC_OTHER | R/W1C | 0h | Clear other error status. 1h indicates a successive single-bit error. Writing 1h clears the status bit. |

Table 20-9. ECC_ERR_STAT1 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|-------------|-------|-------|--|
| 11-10 | CLR_ECC_DED | R/W | 0h | <p>A write of a non-zero value to this field decrements it and the ECC_DED field by that value. If the value written is less than the current one, the non-correctable interrupt (ECC_DED_INT) stays asserted. If the value to decrement is more than the current value, the result is 0.</p> <p>0h - No double-bit errors have occurred 1h - 1 double-bit has error occurred 2h - 2 double-bit have errors occurred 3h - 3 or more double-bit errors have occurred</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: Not used in inject only mode. Always read as 0h.</p> <hr/> |
| 9-8 | CLR_ECC_SEC | R/W | 0h | <p>A write of a non-zero value to this field decrements it and the ECC_SEC field by that value. If the value written is less than the current one, the correctable interrupt (ECC_SEC_INT) stays asserted. If the value to decrement is more than the current value, the result is 0.</p> <p>0h - No single-bit errors have occurred 1h - 1 single-bit has occurred 2h - 2 single-bit have occurred 3h - 3 or more single-bit have occurred</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: Not used in inject only mode. Always read as 0h.</p> <hr/> |
| 7 | CTR_REG_ERR | R/W1S | 0h | <p>Indicates that a redundancy protected bit in the ECC_CTRL register has been flipped. This means that the redundancy logic have detected a state where not all values are the same and has defaulted to the reset state. Software needs to re-write these registers to a known state. A write of 1h sets this bit.</p> <p>0h - Bit not flipped 1h - Bit flipped</p> |
| 6-5 | PARITY_ERR | R/W1S | 0h | <p>2-bit saturating counter for the number of parity errors that have occurred since last cleared. This is also a status set register and a non-zero value sets the level interrupt. Software can also write a value to the CLR_PARITY_ERR field to decrement this counter.</p> <p>0h - No parity errors have occurred 1h - 1 parity error has occurred 2h - 2 parity errors have occurred 3h - 3 or more parity errors have occurred</p> |
| 4 | ECC_OTHER | R/W1S | 0h | <p>1h - Indicates that successive single-bit errors have occurred while a write-back is still pending. Software can also write 1h to set the pending status and write 1h to the corresponding clear bit to clear the status.</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: Not used in inject only mode. Always read as 0h.</p> <hr/> |

Table 20-9. ECC_ERR_STAT1 Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|---|
| 3-2 | ECC_DED | R/W | 0h | <p>2-bit saturating counter for the number of double-bit errors that have occurred since last cleared. This is also a status set register and a non-zero value sets the level interrupt. Software can also write a value to the CLR_ECC_SEC field to decrement this counter.</p> <p>0h - No double-bit errors have occurred 1h - 1 double-bit has error occurred 2h - 2 double-bit have errors occurred 3h - 3 or more double-bit errors have occurred</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: Not used in inject only mode. Always read as 0h.</p> <hr/> |
| 1-0 | ECC_SEC | R/W | 0h | <p>2-bit saturating counter for the number of single-bit errors that have occurred since last cleared. This is also a status set register and a non-zero value sets the level interrupt. Software can also write a value to the CLR_ECC_SEC field to decrement this counter.</p> <p>0h - No single-bit errors have occurred 1h - 1 single-bit has occurred 2h - 2 single-bit have occurred 3h - 3 or more single-bit have occurred</p> <hr/> <p style="text-align: center;">Note</p> <p>NOTE: Not used in inject only mode. Always read as 0h.</p> <hr/> |

Table 20-17. ECC_CBASS_ERR_STAT2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-16 | ERR_TYPE | R | 0h | This field is not supported and can read any value and be ignored. |
| 15-0 | ERR_BIT | R | 0h | Bit that caused the error. Always valid for EDC single bit corrected errors or redundant errors. Identifies parity segment number (but not the exact bit) with a parity error. This field is not valid for EDC double bit errors. |

20.17 ECC_SEC_EOI_REG Register (Offset = 3Ch) [reset = 0h]

ECC_SEC_EOI_REG is shown in [Figure 20-17](#) and described in [Table 20-18](#).

Return to [Summary Table](#).

SEC EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Figure 20-17. ECC_SEC_EOI_REG Register

20.21 ECC_SEC_STATUS_REG3 Register (Offset = 4Ch) [reset = 0h]

ECC_SEC_STATUS_REG3 is shown in [Figure 20-21](#) and described in [Table 20-22](#).

Return to [Summary Table](#).

Interrupt status register for correctable error. Each bit corresponds to the status from an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.26 ECC_SEC_ENABLE_SET_REG0 Register (Offset = 80h) [reset = 0h]

ECC_SEC_ENABLE_SET_REG0 is shown in [Figure 20-26](#) and described in [Table 20-27](#).

Return to [Summary Table](#).

Interrupt enable register for correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.29 ECC_SEC_ENABLE_SET_REG3 Register (Offset = 8Ch) [reset = 0h]

ECC_SEC_ENABLE_SET_REG3 is shown in [Figure 20-29](#) and described in [Table 20-30](#).

Return to [Summary Table](#).

Interrupt enable register for correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.32 ECC_SEC_ENABLE_SET_REG6 Register (Offset = 98h) [reset = 0h]

ECC_SEC_ENABLE_SET_REG6 is shown in [Figure 20-32](#) and described in [Table 20-33](#).

Return to [Summary Table](#).

Interrupt enable register for correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.35 ECC_SEC_ENABLE_CLR_REG1 Register (Offset = C4h) [reset = 0h]

ECC_SEC_ENABLE_CLR_REG1 is shown in [Figure 20-35](#) and described in [Table 20-36](#).

Return to [Summary Table](#).

Interrupt disable register for correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.38 ECC_SEC_ENABLE_CLR_REG4 Register (Offset = D0h) [reset = 0h]

ECC_SEC_ENABLE_CLR_REG4 is shown in [Figure 20-38](#) and described in [Table 20-39](#).

Return to [Summary Table](#).

Interrupt disable register for correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.42 ECC_DED_EOI_REG Register (Offset = 13Ch) [reset = 0h]

ECC_DED_EOI_REG is shown in [Figure 20-42](#) and described in [Table 20-43](#).

Return to [Summary Table](#).

DED EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

20.50 ECC_DED_STATUS_REG7 Register (Offset = 15Ch) [reset = 0h]

ECC_DED_STATUS_REG7 is shown in [Figure 20-50](#) and described in [Table 20-51](#).

Return to [Summary Table](#).

Interrupt status register for non-correctable error. Each bit corresponds to the status from an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.52 ECC_DED_ENABLE_SET_REG1 Register (Offset = 184h) [reset = 0h]

ECC_DED_ENABLE_SET_REG1 is shown in [Figure 20-52](#) and described in [Table 20-53](#).

Return to [Summary Table](#).

Interrupt enable register for non-correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.55 ECC_DED_ENABLE_SET_REG4 Register (Offset = 190h) [reset = 0h]

ECC_DED_ENABLE_SET_REG4 is shown in [Figure 20-55](#) and described in [Table 20-56](#).

Return to [Summary Table](#).

Interrupt enable register for non-correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.58 ECC_DED_ENABLE_SET_REG7 Register (Offset = 19Ch) [reset = 0h]

ECC_DED_ENABLE_SET_REG7 is shown in [Figure 20-58](#) and described in [Table 20-59](#).

Return to [Summary Table](#).

Interrupt enable register for non-correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.61 ECC_DED_ENABLE_CLR_REG2 Register (Offset = 1C8h) [reset = 0h]

ECC_DED_ENABLE_CLR_REG2 is shown in [Figure 20-61](#) and described in [Table 20-62](#).

Return to [Summary Table](#).

Interrupt disable register for non-correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.

20.64 ECC_DED_ENABLE_CLR_REG5 Register (Offset = 1D4h) [reset = 0h]

ECC_DED_ENABLE_CLR_REG5 is shown in [Figure 20-64](#) and described in [Table 20-65](#).

Return to [Summary Table](#).

Interrupt disable register for non-correctable error. Each bit corresponds to an ECC endpoint. Depending on the number of ECC endpoints associated with a module or subsystem some of the bits may not be used.
