

Technical Reference Manual

J721E DRA829/TDA4VM/AM68P Processors Silicon Revision 1.1 Texas Instruments Families of Products

1 ECAP Registers

Table 1-2 lists the memory-mapped registers for the ECAP modules. All register offset addresses not listed in Table 1-2 should be considered as reserved locations and the register contents should not be modified.

Table 1-1. ECAP Instances

| Instance | Base Address |
|---------------|--------------|
| ECAP0_CTL_STS | 0310 0000h |
| ECAP1_CTL_STS | 0311 0000h |
| ECAP2_CTL_STS | 0312 0000h |

Table 1-2. ECAP Registers

| Offset | Acronym | Register Name | ECAP0_CTL_STS Physical Address | ECAP1_CTL_STS Physical Address | ECAP2_CTL_STS Physical Address |
|--------|------------------------------------|---|--------------------------------------|--------------------------------------|--------------------------------------|
| 0h | ECAP_TSCNT | Time Stamp Counter Register | 0310 0000h | 0311 0000h | 0312 0000h |
| 4h | ECAP_CNTPHS | Counter Phase Control Register | 0310 0004h | 0311 0004h | 0312 0004h |
| 8h | ECAP_CAP1 | Capture-1 Register | 0310 0008h | 0311 0008h | 0312 0008h |
| Ch | ECAP_CAP2 | Capture-2 Register | 0310 000Ch | 0311 000Ch | 0312 000Ch |
| 10h | ECAP_CAP3 | Capture-3 Register | 0310 0010h | 0311 0010h | 0312 0010h |
| 14h | ECAP_CAP4 | Capture-4 Register | 0310 0014h | 0311 0014h | 0312 0014h |
| 28h | ECAP_ECCTL | ECAP Control Register | 0310 0028h | 0311 0028h | 0312 0028h |
| 2Ch | ECAP_ECINT_EN_FLG | ECAP Interrupt Enable and Flag Register | 0310 002Ch | 0311 002Ch | 0312 002Ch |
| 30h | ECAP_ECINT_CLR_FRC | ECAP Interrupt Clear and Forcing Register | 0310 0030h | 0311 0030h | 0312 0030h |
| 5Ch | ECAP_PID | Peripheral ID Register | 0310 005Ch | 0311 005Ch | 0312 005Ch |

1.1 ECAP_TSCNT Register (Offset = 0h) [reset = 0h]

ECAP_TSCNT is shown in [Figure 1-1](#) and described in [Table 1-4](#).

Return to [Summary Table](#).

Time Stamp Counter register

Table 1-3. ECAP_TSCNT Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 0000h |
| ECAP1_CTL_STS | 0311 0000h |
| ECAP2_CTL_STS | 0312 0000h |

Figure 1-1. ECAP_TSCNT Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TSCNT | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 1-4. ECAP_TSCNT Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-------|------|-------|--|
| 31-0 | TSCNT | R/W | 0h | Active 32-bit counter register which is used as the capture time-base. |

1.2 ECAP_CNTPHS Register (Offset = 4h) [reset = 0h]

ECAP_CNTPHS is shown in [Figure 1-2](#) and described in [Table 1-6](#).

[Return to Summary Table.](#)

Counter Phase Control register

Table 1-5. ECAP_CNTPHS Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 0004h |
| ECAP1_CTL_STS | 0311 0004h |
| ECAP2_CTL_STS | 0312 0004h |

Figure 1-2. ECAP_CNTPHS Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CNTPHS | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 1-6. ECAP_CNTPHS Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|--------|------|-------|--|
| 31-0 | CNTPHS | R/W | 0h | Counter phase value register that can be programmed for phase Lag/Lead. This register "shadows" the ECAP_TSCNT register and is loaded into the ECAP_TSCNT register upon either a SYNCI event or software force via a control bit. Used to achieve phase control sync with respect to other ECAP and EPWM time-bases. |

1.3 ECAP_CAP1 Register (Offset = 8h) [reset = 0h]

ECAP_CAP1 is shown in [Figure 1-3](#) and described in [Table 1-8](#).

Return to [Summary Table](#).

Capture-1 register

Table 1-7. ECAP_CAP1 Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 0008h |
| ECAP1_CTL_STS | 0311 0008h |
| ECAP2_CTL_STS | 0312 0008h |

Figure 1-3. ECAP_CAP1 Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CAP1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 1-8. ECAP_CAP1 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-------|------|-------|--|
| 31-0 | CAP1 | R/W | 0h | This register can be loaded (written) by: 1. Time-Stamp (counter value) during a capture event. 2. Software - may be useful for test purposes/initialisation. 3. APRD shadow register (ECAP_CAP3) when used in APWM mode. |

1.4 ECAP_CAP2 Register (Offset = Ch) [reset = 0h]

ECAP_CAP2 is shown in [Figure 1-4](#) and described in [Table 1-10](#).

[Return to Summary Table.](#)

Capture-2 register

Table 1-9. ECAP_CAP2 Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 000Ch |
| ECAP1_CTL_STS | 0311 000Ch |
| ECAP2_CTL_STS | 0312 000Ch |

Figure 1-4. ECAP_CAP2 Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CAP2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 1-10. ECAP_CAP2 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-------|------|-------|--|
| 31-0 | CAP2 | R/W | 0h | This register can be loaded (written) by: <ol style="list-style-type: none"> 1. Time-Stamp (counter value) during a capture event. 2. Software - may be useful for test purposes. 3. ACMP shadow register (ECAP_CAP4) when used in APWM mode. |

1.5 ECAP_CAP3 Register (Offset = 10h) [reset = 0h]

ECAP_CAP3 is shown in [Figure 1-5](#) and described in [Table 1-12](#).

[Return to Summary Table.](#)

Capture-3 register

Table 1-11. ECAP_CAP3 Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 0010h |
| ECAP1_CTL_STS | 0311 0010h |
| ECAP2_CTL_STS | 0312 0010h |

Figure 1-5. ECAP_CAP3 Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CAP3 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 1-12. ECAP_CAP3 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-------|------|-------|--|
| 31-0 | CAP3 | R/W | 0h | In CMP mode this is a time-stamp capture register. In APMW mode this is the period shadow (APER) register. User updates the PWM period value via this register. In this mode the ECAP_CAP3 (APRD) register shadows the ECAP_CAP1 register. |

1.6 ECAP_CAP4 Register (Offset = 14h) [reset = 0h]

ECAP_CAP4 is shown in [Figure 1-6](#) and described in [Table 1-14](#).

[Return to Summary Table.](#)

Capture-4 register

Table 1-13. ECAP_CAP4 Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 0014h |
| ECAP1_CTL_STS | 0311 0014h |
| ECAP2_CTL_STS | 0312 0014h |

Figure 1-6. ECAP_CAP4 Register

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CAP4 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| R/W-0h | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LEGEND: R/W = Read/Write; -n = value after reset

Table 1-14. ECAP_CAP4 Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-------|------|-------|--|
| 31-0 | CAP4 | R/W | 0h | In CMP mode this is a time-stamp capture register. In APMW mode this is the compare shadow (ACMP) register. User updates the PWM Compare value via this register. In this mode the ECAP_CAP4 (ACMP) register shadows the ECAP_CAP2 register. |

1.7 ECAP_ECCTL Register (Offset = 28h) [reset = 00060000h]

ECAP_ECCTL is shown in [Figure 1-7](#) and described in [Table 1-16](#).

Return to [Summary Table](#).

ECAP Control register

Table 1-15. ECAP_ECCTL Instances

| Instance | Physical Address |
|---------------|------------------|
| ECAP0_CTL_STS | 0310 0028h |
| ECAP1_CTL_STS | 0311 0028h |
| ECAP2_CTL_STS | 0312 0028h |

LEGEND: R = Read Only; R/W = Read/Write; WCap = Write to Capture; -n = value after reset

Table 1-16. ECAP_ECCTL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|---------|------|-------|---|
| 31-27 | FILTER | R | 0h | |
| 26 | APWMPOL | R/W | 0h | APWM Output Polarity Select: 0h = Output is Active High (Compare value defines High time) 1h = Output is Active Low (Compare value defines Low time) Note: This is applicable only in APWM operating mode. |

Table 1-16. ECAP_ECCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|-----------|------|-------|---|
| 25 | CAP_APWM | R/W | 0h | <p>CAP/APWM Operating Mode Select:</p> <p>0h = ECAP module operates in Capture mode. This mode forces the following configuration:</p> <ol style="list-style-type: none"> 1. Inhibits the ECAP_TSCNT register resets via PRD event. 2. Inhibits the Shadow loads on the ECAP_CAP1 and ECAP_CAP2 registers. 3. Permits user to enable the ECAP_CAP1 to ECAP_CAP4 register load. 4. CAPx/APWMx pin operates as a Capture input. <p>1h = ECAP module operates in APWM mode. This mode forces the following configuration:</p> <ol style="list-style-type: none"> 1. Resets the ECAP_TSCNT register on PRD event (period boundary) 2. Permits Shadow loading on the ECAP_CAP1 and ECAP_CAP2 registers. 3. Disables loading of Time-stamps into the ECAP_CAP1 - ECAP_CAP4 registers 4. CAPx/APWMx pin operates as a APWM output. |
| 24 | SWSYNC | WCap | 0h | <p>Software Forced Counter (ECAP_TSCNT) Synchronizing:</p> <p>0h = Writing a zero has no effect. Reading will always return a zero.</p> <p>1h = Writing a one will force a ECAP_TSCNT shadow load of current ECAP module and any ECAP modules "down-stream" providing the SYNCO_SEL bits are 0h.</p> <p>After writing a 1h this bit returns to a zero.</p> <p>Note: This provides a convenient software method to synchronize some or all ECAP Timebases.</p> <p>In APWM mode the synchronizing can also be done via the PRD event.</p> |
| 23-22 | SYNCO_SEL | R/W | 0h | <p>SyncOut Select:</p> <p>0h = Select SyncIn event to be the SyncOut signal (pass through)</p> <p>1h = Select PRD event to be the SyncOut signal</p> <p>2h = Disable SyncOut Signal</p> <p>3h = Disable SyncOut Signal</p> <p>Note: Selection PRD is meaningful only in APWM mode, however can still be chosen in CAP mode if user believes it to be useful.</p> |
| 21 | SYNCl_EN | R/W | 0h | <p>Counter (ECAP_TSCNT) SyncIn select mode:</p> <p>0h = Disable SyncIn option</p> <p>1h = Enable Counter (ECAP_TSCNT) to be loaded from the ECAP_CNTPHS register upon either a SYNCl signal or a software force event.</p> |
| 20 | TSCNTSTP | R/W | 0h | <p>Counter Stop (freeze) Control:</p> <p>0h = Counter Stopped</p> <p>1h = Counter Free Running</p> |

Table 1-16. ECAP_ECCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|-------------|------|-------|---|
| 19 | REARM_RESET | WCap | 0h | One-Shot "Re-arming" Control Wait for stop trigger: Write 0h = Has no effect. Reading always returns a 0h. Note: The RE-ARM function is valid in ONESHT or CONTINUOUS mode. Write 1h = Arms the One-Shot sequence: 1. Resets the Mod4 counter to zero. 2. Un-freezes the Mod4 counter. 3. Enables Capture Register Loads. |
| 18-17 | STOPVALUE | R/W | 3h | Stop Value for One-Shot Mode: This is the number (between 1 and 4) of captures allowed to occur before the ECAP_CAP1 through ECAP_CAP4 registers are frozen (capture sequence is stopped). 0h = Stop after Capture Event 1 1h = Stop after Capture Event 2 2h = Stop after Capture Event 3 3h = Stop after Capture Event 4 Notes: [1] STOPVALUE is compared to Mod4 counter, when equal, two actions occur: 1. Mod4 Counter is stopped (frozen) 2. Capture register loads are inhibited [2] In one shot mode, further interrupt events are blocked until we re-arm, once the number of events captured has been reached. |
| 16 | CONT_ONESHT | R/W | 0h | Continuous or One-shot Mode Control (applicable only in Capture mode): 0h = Operate in Continuous mode 1h = Operate in One-Shot mode |
| 15-14 | FREE_SOFT | R/W | 0h | Emulation Control 0h = ECAP_TSCNT Counter stops immediately on emulation suspend 1h = ECAP_TSCNT Counter runs until = 0h 3h = ECAP_TSCNT Counter is unaffected by emulation suspend (Run Free) |
| 13-9 | EVFTLTPS | R/W | 0h | Event Filter Prescale Select: 0h = Divide by 1 (no prescale, by-pass the prescaler) 1h = Divide by 2 2h = Divide by 4 3h = Divide by 6 4h = Divide by 8 5h = Divide by 10 1Eh = Divide by 60 1Fh = Divide by 62 |

Table 1-16. ECAP_ECCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|---|
| 8 | CAPLDEN | R/W | 0h | Enable Loading of the ECAP_CAP1 to ECAP_CAP4 registers on a capture event: 0h = Disable ECAP_CAP1 to ECAP_CAP4 register loads at capture event time. 1h = Enable ECAP_CAP1 to ECAP_CAP4 register loads at capture event time. |
| 7 | CTRRST4 | R/W | 0h | Counter Reset on Capture Event 4: 0h = Do Not reset Counter on Capture Event 4 (absolute time stamp) 1h = Reset counter after Event 4 time-stamp has been captured (used in Difference mode operation) |
| 6 | CAP4POL | R/W | 0h | Capture Event 4 Polarity Select: 0h = Capture event 4 triggered on a Rising Edge (RE) 1h = Capture event 4 triggered on a Falling Edge (FE) |
| 5 | CTRRST3 | R/W | 0h | Counter Reset on Capture Event 3: 0h = Do not reset counter on Capture Event 3 (absolute time stamp) 1h = Reset counter after Event 3 time-stamp has been captured (used in difference mode operation) |
| 4 | CAP3POL | R/W | 0h | Capture Event 3 Polarity Select: 0h = Capture event 3 triggered on a Rising Edge (RE) 1h = Capture event 3 triggered on a Falling Edge (FE) |
| 3 | CTRRST2 | R/W | 0h | Counter Reset on Capture Event 2: 0h = Do not reset counter on Capture Event 2 (absolute time stamp) 1h = Reset Counter after Event 2 time-stamp has been captured (used in difference mode operation) |
| 2 | CAP2POL | R/W | 0h | Capture Event 2 Polarity Select: 0h = Capture event 2 triggered on a Rising Edge (RE) 1h = Capture event 2 triggered on a Falling Edge (FE) |
| 1 | CTRRST1 | R/W | 0h | Counter Reset on Capture Event 1: 0h = Do not reset counter on Capture Event 1 (absolute time stamp) 1h = Reset counter after Event 1 time-stamp has been captured (used in difference mode operation) |
| 0 | CAP1POL | R/W | 0h | Capture Event 1 Polarity Select: 0h = Capture event 1 triggered on a Rising Edge (RE) 1h = Capture event 1 triggered on a Falling Edge (FE) |

1.8 ECAP_ECINT_EN_FLG Register (Offset = 2Ch) [reset = X]

ECAP_ECINT_EN_FLG is shown in [Figure 1-8](#) and described in [Table 1-18](#).

Return to [Summary Table](#).

ECAP Interrupt Enable and Flag register

|-------|-----------|------|-------|--|
| 12-10 | CLKDIV | R/W | 0h | Time-base Clock Prescale Bits These bits determine part of the time-base clock prescale value. $TBCLK = SYSCLKOUT / (HSPCLKDIV \times CLKDIV)$ 0h: /1 (default on reset) 1h: /2 2h: /4 3h: /8 4h: /16 5h: /32 6h: /64 7h: /128 |
| 9-7 | HSPCLKDIV | R/W | 1h | High-Speed Time-base Clock Prescale Bits These bits determine part of the time-base clock prescale value. $TBCLK = SYSCLKOUT / (HSPCLKDIV \times CLKDIV)$. 0h: /1 1h: /2 (default on reset) 2h: /4 3h: /6 4h: /8 5h: /10 6h: /12 7h: /14 |
| 6 | SWFSYNC | R/W | 0h | Software Forced Synchronization Pulse 0h: Writing a 0h has no effect and reads always return a 0h. 1h: Writing a 1h forces a one-time synchronization pulse to be generated. This event is ORed with the EPWMxSYNCl input of the EPWM module. SWFSYNC is valid (operates) only when EPWMxSYNCl is selected by SYNCOSSEL = 0h. |
| 5-4 | SYNCOSSEL | R/W | 0h | Synchronization Output Select These bits select the source of the EPWMxSYNCO signal. 0h: EPWMxSYNCO 1h: TBCNT = 0: Time-base counter equal to zero (EPWM_TBCNT[15-0] TBCNT = 0000h) 2h: TBCNT = CMPB: Time-base counter equal to counter-compare B (EPWM_TBCNT[15-0] TBCNT = EPWM_CMPB[15-0] CMPB) 3h: Disable EPWMxSYNCO signal |
| 3 | PRDL | R/W | 0h | Active Period Register Load From Shadow Register Select 0h: The period register (EPWM_TBPRD) is loaded from its shadow register when the time-base counter, EPWM_TBCNT[15-0] TBCNT, is equal to zero. A write or read to the EPWM_TBPRD register accesses the shadow register. 1h: Load the EPWM_TBPRD register immediately without using a shadow register. A write or read to the EPWM_TBPRD register directly accesses the active register. |
| 2 | PHSEN | R/W | 0h | Counter Register Load From Phase Register Enable 0h: Do not load the time-base counter (EPWM_TBCNT) from the time-base phase register (EPWM_TBPHS) 1h: Load the time-base counter with the phase register when an EPWMxSYNCl input signal occurs or when a software synchronization is forced by the SWFSYNC bit. |

Table 2-7. EPWM_TBCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|---|
| 1-0 | CTRMODE | R/W | 3h | <p>Counter Mode</p> <p>The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows:</p> <p>0h: Up-count mode 1h: Down-count mode 2h: Up-down-count mode 3h: Stop-freeze counter operation (default on reset)</p> |

2.2 EPWM_TBSTS Register (Offset = 2h) [reset = 0h]

EPWM_TBSTS is shown in [Figure 2-2](#) and described in [Table 2-9](#).

Return to [Summary Table](#).

Table 2-8. EPWM_TBSTS Instances

| Instance | Physical Address |
|--------------|------------------|

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 2-35. EPWM_DBCTL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|---|
| 15-6 | RESERVED | R | 0h | Reserved |
| 5-4 | IN_MODE | R/W | 0h | <p>Dead Band Input Mode Control</p> <p>Bit 5 controls the S5 switch and bit 4 controls the S4 switch. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms, the default is EPWMxA In is the source for both falling and rising-edge delays. 0h = EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay.</p> <p>1h = EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal.</p> <p>2h = EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal.</p> <p>3h = EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.</p> |

Table 2-35. EPWM_DBCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--|
| 3-2 | POLSEL | R/W | 0h | <p>Polarity Select Control</p> <p>Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that the EPWM_DBCTL[1-0] OUT_MODE = 0b11 and EPWM_DBCTL[5-4] IN_MODE = 0b00. Other enhanced modes are also possible, but not regarded as typical usage modes.</p> <p>0h = Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default).</p> <p>1h = Active low complementary (ALC) mode. EPWMxA is inverted.</p> <p>2h = Active high complementary (AHC). EPWMxB is inverted.</p> <p>3h = Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.</p> |
| 1-0 | OUT_MODE | R/W | 0h | <p>Dead-band Output Mode Control</p> <p>Bit 1 controls the S1 switch and bit 0 controls the S0 switch. This allows you to selectively enable or bypass the dead-band generation for the falling-edge and rising-edge delay.</p> <p>0h = Dead-band generation is bypassed for both output signals. In this mode, both the EPWMxA and EPWMxB output signals from the action-qualifier are passed directly to the PWM-chopper submodule. In this mode, the POLSEL and IN_MODE bits have no effect.</p> <p>1h = Disable rising-edge delay. The EPWMxA signal from the action-qualifier is passed straight through to the EPWMxA input of the PWM-chopper submodule. The falling-edge delayed signal is seen on output EPWMxB. The input signal for the delay is determined by the EPWM_DBCTL[5-4] IN_MODE bit field.</p> <p>2h = Disable falling-edge delay. The EPWMxB signal from the action-qualifier is passed straight through to the EPWMxB input of the PWM-chopper submodule. The rising-edge delayed signal is seen on output EPWMxA. The input signal for the delay is determined by the EPWM_DBCTL[5-4] IN_MODE bit field.</p> <p>3h = Dead-band is fully enabled for both rising-edge delay on output EPWMxA and falling-edge delay on output EPWMxB. The input signal for the delay is determined by the EPWM_DBCTL[5-4] IN_MODE bit field.</p> |

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|--|
| 15-3 | RESERVED | R | 0h | Reserved |
| 2 | OST | R | 0h | Latched Status Flag for A One-Shot Trip Event 0h = No one-shot trip event has occurred 1h = Indicates a trip event has occurred on a pin selected as a one-shot trip source. This bit is cleared by writing the appropriate value to the EPWM_TZCLR register. |
| 1 | CBC | R | 0h | Latched Status Flag for Cycle-By-Cycle Trip Event 0h = No cycle-by-cycle trip event has occurred 1h = Indicates a trip event has occurred on a pin selected as a cycle-by-cycle trip source. The EPWM_TZFLG[1] CBC bit will remain set until it is manually cleared by the user. If the cycle-by-cycle trip event is still present when the CBC bit is cleared, then CBC will be immediately set again. The specified condition on the pins is automatically cleared when the EPWM time-base counter reaches zero (EPWM_TBCNT[15-0] TBCNT = 0000h) if the trip condition is no longer present. The condition on the pins is only cleared when the TBCNT = 0000h no matter where in the cycle the CBC flag is cleared. This bit is cleared by writing the appropriate value to the EPWM_TZCLR register. |
| 0 | INT | R | 0h | Latched Trip Interrupt Status Flag 0h = Indicates no interrupt has been generated 1h = Indicates an EPWMxTZINT interrupt was generated because of a trip condition. No further EPWMxTZINT interrupts will be generated until this flag is cleared. If the interrupt flag is cleared when either CBC or OST is set, then another interrupt pulse will be generated. Clearing all flag bits will prevent further interrupts. This bit is cleared by writing the appropriate value to the EPWM_TZCLR register. |

| 7-4 | RESERVED | R | 0h | Reserved |

Table 2-55. EPWM_ETPS Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|--------|------|-------|--|
| 3-2 | INTCNT | R | 0h | <p>EPWM Interrupt Event (EPWMx_INT) Counter Register</p> <p>These bits indicate how many selected EPWM_ETSEL[2-0] INTSEL events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, EPWM_ETSEL[0] INT = 0h or the interrupt flag is set, EPWM_ETFLG[0] INT = 1h, the counter will stop counting events when it reaches the period value EPWM_ETPS[3-2] INTCNT = EPWM_ETPS[1-0] INTPRD.</p> <p>0h: No events have occurred 1h: 1 event has occurred 2h: 2 events have occurred 3h: 3 events have occurred</p> |
| 1-0 | INTPRD | R/W | 0h | <p>EPWM Interrupt (EPWMx_INT) Period Select</p> <p>These bits determine how many selected EPWM_ETSEL[2-0] INTSEL events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (EPWM_ETSEL[0] INT = 1h). If the interrupt status flag is set from a previous interrupt (EPWM_ETFLG[0] INT = 1) then no interrupt will be generated until the flag is cleared via the EPWM_ETCLR[0] INT bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the EPWM_ETPS[3-2] INTCNT bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented.</p> <p>0h: Disable the interrupt event counter. No interrupt will be generated and the EPWM ETFRC[0] INT bit is ignored. 1h: Generate an interrupt on the first event INTCNT = 0b01 (first event) 2h: Generate interrupt on the EPWM_ETPS[3-2] INTCNT = 0b10 (second event) 3h: Generate interrupt on the EPWM_ETPS[3-2] INTCNT = 0b11 (third event)</p> |

| 0 | INT | R | 0h | Latched EPWM Interrupt (EPWMx_INT) Status Flag 0h: Indicates no event occurred. 1h: Indicates that an EPWMx interrupt (EPWMx_INT) was generated. No further interrupts will be generated until the flag bit is cleared. Up to one interrupt can be pending while the EPWM_ETFLG[0] INT bit is still set. If an interrupt is pending, it will not be generated until after the EPWM_ETFLG[0] INT bit is cleared. |

2.27 EPWM_ETCLR Register (Offset = 38h) [reset = 0h]

EPWM_ETCLR is shown in [Figure 2-27](#) and described in [Table 2-59](#).

Return to [Summary Table](#).

Table 2-58. EPWM_ETCLR Instances

| Instance | Physical Address |

| Bit | Field | Type | Reset | Description |
|------|-----------|------|-------|--|
| 15-4 | RESERVED | R | 0h | Reserved |
| 3 | PULSESEL | R/W | 0h | Shadow Mode Bit Selects the time event that loads the CMPAHR shadow value into the active register. Note: Load mode selection is valid only if CTLMODE = 0 has been selected. The user should select this event to match the selection of the CMPA load mode EPWM_CMPCTL[LOADMODE] bits in the EPWM module as follows. 0h: Load on CTR = 0. Time-base counter equal to zero (EPWM_TBCNT = 0000h). 1h: Load on CTR = PRD. Time-base counter equal to period (EPWM_TBCNT = TEPWM_TBPRD) 2h: Load on either CTR = 0 or CTR = PRD (should not be used with HRPWM) 3h: Freeze (No loads possible should not be used with HRPWM) 0h = CTR = PRD (counter equal period) 1h = CTR = 0 (counter equals zero) |
| 2 | DELBUSSEL | R/W | 0h | Control Mode Bits Selects the register (CMP or TBPHS) that controls the MEP. 0h = Select CMPAHR(8) register controls the edge position. This is duty control mode (default on reset). 1h = Select TBPHSHR(8) register controls the edge position (this is phase control mode). |

Table 2-65. HRPWM_HRCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 1-0 | DELMODE | R/W | 0h | <p>Edge Mode Bits</p> <p>Selects the edge of the PWM that is controlled by the micro-edge position (MEP) logic.</p> <p>0h = HRPWM capability is disabled (default on reset)</p> <p>1h = MEP control of rising edge</p> <p>2h = MEP control of falling edge</p> <p>3h = MEP control of both edges</p> |

2.31 EPWM_PID Register (Offset = 5Ch) [reset = 44D10903h]

EPWM_PID is shown in [Figure 2-31](#) and described in [Table 2-67](#).

Return to [Summary Table](#).

The revision register is used by software to track features, bugs, and compatibility.

Table 2-66. EPWM_PID Instances

| Instance | Physical Address |
|--------------|------------------|

4.1.9 MCANSS_EOI Register (Offset = 20h) [reset = 0h]

MCANSS_EOI is shown in [Figure 4-9](#) and described in [Table 4-27](#).

[Return to Summary Table.](#)

End Of Interrupt (EOI) Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 4-26. MCANSS_EOI Instances

| Instance | Physical Address |
|--------------|------------------|
| MCU_MCAN0_SS | 4052 0020h |
| MCU_MCAN1_SS | 4056 0020h |

4.2.3 MCAN_DBTP Register (Offset = Ch) [reset = A33h]

MCAN_DBTP is shown in [Figure 4-14](#) and described in [Table 4-46](#).

Return to [Summary Table](#).

Data Bit Timing & Prescaler Register

Configuration of data phase bit timing, transmitter delay compensation enable.

This register is only writable if the MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set. The CAN bit time may be programmed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 MCAN functional clock periods. $t_q = (\text{MCAN_DBTP}[20-16] \text{ DBRP} + 1) \text{ mtq}$ (minimum time quantum = CAN clock period (MCAN functional clock)).

The MCAN_DBTP[12-8] DTSEG1 field is the sum of Prop_Seg and Phase_Seg1. The MCAN_DBTP[7-4] DTSEG2 field is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [MCAN_DBTP[12-8] DTSEG1 + MCAN_DBTP[7-4] DTSEG2 + 3] t_q or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q . The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Note: With a CAN clock (MCAN functional clock) of 8 MHz, the reset value of 0000 0A33h configures the MCAN module for a data phase bit rate of 500 kbit/s.

Note: The bit rate configured for the CAN FD data phase via the MCAN_DBTP register must be higher or equal to the bit rate configured for the arbitration phase via the MCAN_DBTP register.

| 12-8 | DTSEG1 | R/W | Ah | Data time segment before sample point Valid values are 0 to 31 (0h-1Fh). The actual interpretation by the hardware of this value is such that one more than the programmed value is used. |
| 7-4 | DTSEG2 | R/W | 3h | Data time segment after sample point Valid values are 0 to 15 (0h-Fh). The actual interpretation by the hardware of this value is such that one more than the programmed value is used. |
| 3-0 | DSJW | R/W | 3h | Data (Re)Synchronization Jump Width Valid values are 0 to 15 (0h-Fh). The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. |

4.2.4 MCAN_TEST Register (Offset = 10h) [reset = 0h]

MCAN_TEST is shown in [Figure 4-15](#) and described in [Table 4-48](#).

Return to [Summary Table](#).

Test Register

Test mode selection.

Write access to the MCAN_TEST register has to be enabled by setting the MCAN_CCCR[7] TEST bit. All MCAN_TEST register functions are set to their reset values when the MCAN_CCCR[7] TEST bit is reset.

Loopback Mode and software control of the MCAN TX pin are hardware test modes. Programming of the MCAN_TEST[6-5] TX field \neq 00 may disturb the message transfer on the CAN bus.

Table 4-47. MCAN_TEST Instances

4.2.5 MCAN_RWD Register (Offset = 14h) [reset = 0h]

MCAN_RWD is shown in [Figure 4-16](#) and described in [Table 4-50](#).

RAM Watchdog

Monitors the READY output of the Message RAM.

The RAM Watchdog monitors the READY output of the Message RAM. A Message RAM access starts the Message RAM Watchdog Counter with the value configured by the MCAN_RWD[7-0] WDC field. The counter is reloaded with the MCAN_RWD[7-0] WDC field when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN_IR[26] WDI is set. The RAM Watchdog Counter is clocked by the Host clock (MCAN interface clock).

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 14 | TXP | R/W | 0h | Transmit Pause If this bit is set, the MCAN module pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see <i>Tx Handling</i>) . 0h = Transmit pause disabled 1h = Transmit pause enabled |
| 13 | EFBI | R/W | 0h | Edge Filtering during Bus Integration 0h = Edge filtering disabled 1h = Two consecutive dominant t_q required to detect an edge for hard synchronization |
| 12 | PXHD | R/W | 0h | Protocol Exception Handling Disable 0h = Protocol exception handling enabled 1h = Protocol exception handling disabled Note: When protocol exception handling is disabled, the MCAN module will transmit an error frame when it detects a protocol exception condition. |
| 11-10 | RESERVED | R | 0h | Reserved |
| 9 | BRSE | R/W | 0h | Bit Rate Switch Enable 0h = Bit rate switching for transmissions disabled 1h = Bit rate switching for transmissions enabled Note: When CAN FD operation is disabled the MCAN_CCCR[8] FDOE = 0h, the MCAN_CCCR[9] BRSE bit is not evaluated. |
| 8 | FDOE | R/W | 0h | FD Operation Enable 0h = FD operation disabled 1h = FD operation enabled |
| 7 | TEST | R/W | 0h | Test Mode Enable 0h = Normal operation. The MCAN_TEST register holds reset values. 1h = Test Mode. Write access to the MCAN_TEST register enabled. |
| 6 | DAR | R/W | 0h | Disable Automatic Retransmission 0h = Automatic retransmission of messages not transmitted successfully enabled 1h = Automatic retransmission disabled |
| 5 | MON | R/W | 0h | Bus Monitoring Mode The MCAN_CCCR[5] MON bit can only be set by the Host CPU when both MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set to 1. The bit can be reset by the Host CPU at any time. 0h = Bus Monitoring Mode is disabled 1h = Bus Monitoring Mode is enabled |
| 4 | CSR | R/W | 0h | Clock Stop Request 0h = No clock stop is requested 1h = Clock stop requested. When clock stop is requested, first the MCAN_CCCR[0] INIT bit and then the MCAN_CCCR[3] CSA bit will be set after all pending transfer requests have been completed and the CAN bus reached idle. |
| 3 | CSA | R | 0h | Clock Stop Acknowledge 0h = No clock stop acknowledged 1h = The MCAN module may be set in power down by stopping MCAN interface clock and MCAN functional clock |

Table 4-52. MCAN_CCCR Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|---|
| 2 | ASM | R/W | 0h | <p>Restricted Operation Mode</p> <p>The MCAN_CCCR[2] ASM bit can only be set by the Host CPU when both MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set to 1. The bit can be reset by the Host CPU at any time.</p> <p>For a description of the Restricted Operation Mode, see <i>Restricted Operation Mode</i>.</p> <p>0h = Normal CAN operation 1h = Restricted Operation Mode active</p> |
| 1 | CCE | R/W | 0h | <p>Configuration Change Enable</p> <p>0h = The Host CPU has no write access to the protected configuration registers 1h = The Host CPU has write access to the protected configuration registers (while the MCAN_CCCR[0] INIT = 1h)</p> |
| 0 | INIT | R/W | 1h | <p>Initialization</p> <p>0h = Normal Operation 1h = Initialization is started</p> <p>Note: Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to the MCAN_CCCR[0] INIT bit can be read back. Therefore the software has to assure that the previous value written to the MCAN_CCCR[0] INIT bit has been accepted by reading the MCAN_CCCR[0] INIT bit before setting the MCAN_CCCR[0] INIT bit to a new value.</p> |

4.2.7 MCAN_NBTP Register (Offset = 1Ch) [reset = 06000A03h]

MCAN_NBTP is shown in [Figure 4-18](#) and described in [Table 4-54](#).

Return to [Summary Table](#).

Nominal Bit Timing & Prescaler Register
Configuration of arbitration phase bit timing.

This register is only writable if the MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set. The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 MCAN functional clock periods. $t_q = (\text{MCAN_NBTP}[24-16] \text{ NBRP} + 1) \text{ mtq}$. The MCAN_NBTP[15-8] NTSEG1 field is the sum of Prop_Seg and Phase_Seg1. The MCAN_NBTP[6-0] NTSEG2 field is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [MCAN_NBTP[15-8] NTSEG1 + MCAN_NBTP[6-0] NTSEG2 + 3] t_q or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q .

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

Table 4-58. MCAN_TSCV Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-16 | RESERVED | R | 0h | Reserved |
| 15-0 | TSC | RWTC | 0h | <p>Timestamp Counter</p> <p>The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx).</p> <p>When the MCAN_TSCC[1-0] TSS = 1h, the Timestamp Counter is incremented in multiples of CAN bit times [1-16] depending on the configuration of the MCAN_TSCC[19-16] TCP field. A wrap around sets interrupt flag MCAN_IR[16] TSW.</p> <p>Write access resets the counter to zero. When the MCAN_TSCC[1-0] TSS = 2h, the MCAN_TSCV[15-0] TSC field reflects the external Timestamp Counter value. A write access has no impact.</p> <p>Note: A 'wrap around' is a change of the Timestamp Counter value from non-zero to zero not caused by write access to the MCAN_TSCV register.</p> |

4.2.10 MCAN_TOCC Register (Offset = 28h) [reset = FFFF0000h]

MCAN_TOCC is shown in [Figure 4-21](#) and described in [Table 4-60](#).

Return to [Summary Table](#).

Timeout Counter Configuration

Configuration of timeout period, selection of timeout counter operation mode.

For a description of the Timeout Counter, see , *Timeout Counter*.

|-------|----------|------|-------|-------------|
| 31-23 | RESERVED | R | 0h | Reserved |

Table 4-66. MCAN_PSR Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|--|
| 22-16 | TDCV | R | 0h | Transmitter Delay Compensation Value Position of the secondary sample point, defined by the sum of the measured delay from the MCAN TX to MCAN RX pins and the MCAN_TDCR[14-8] TDCO field. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point. Valid values are 0 to 127 mtq (0h-7Fh). |
| 15 | RESERVED | R | 0h | Reserved |
| 14 | PXE | R | 0h | Protocol Exception Event 0h = No protocol exception event occurred since last read access 1h = Protocol exception event occurred |
| 13 | RFDF | R | 0h | Received a CAN FD Message This bit is set independent of acceptance filtering. 0h = Since this bit was reset by the Host CPU, no CAN FD message has been received 1h = Message in CAN FD format with FDF flag set has been received |
| 12 | RBRS | R | 0h | BRS flag of last received CAN FD Message This bit is set together with the MCAN_PSR[13] RFDF bit, independent of acceptance filtering. 0h = Last received CAN FD message did not have its BRS flag set 1h = Last received CAN FD message had its BRS flag set |
| 11 | RESI | R | 0h | ESI flag of last received CAN FD Message This bit is set together with the MCAN_PSR[13] RFDF bit, independent of acceptance filtering. 0h = Last received CAN FD message did not have its ESI flag set 1h = Last received CAN FD message had its ESI flag set |
| 10-8 | DLEC | R | 7h | Data Phase Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for the MCAN_PSR[2-0] LEC field. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error. |
| 7 | BO | R | 0h | Bus_Off Status 0h = The MCAN module is not Bus_Off 1h = The MCAN module is in Bus_Off state |
| 6 | EW | R | 0h | Warning Status 0h = Both error counters are below the Error_Warning limit of 96 1h = At least one of error counter has reached the Error_Warning limit of 96 |
| 5 | EP | R | 0h | Error Passive 0h = The MCAN module is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1h = The MCAN module is in the Error_Passive state |

Table 4-66. MCAN_PSR Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|---|
| 4-3 | ACT | R | 0h | <p>Activity</p> <p>Monitors the module's CAN communication state.</p> <p>0h = Synchronizing - node is synchronizing on CAN communication</p> <p>1h = Idle - node is neither receiver nor transmitter</p> <p>2h = Receiver - node is operating as receiver</p> <p>3h = Transmitter - node is operating as transmitter</p> <p>Note: ACT is set to 0h by a Protocol Exception Event.</p> |
| 2-0 | LEC | R | 7h | <p>Last Error Code</p> <p>The MCAN_PSR[2-0] LEC field indicates the type of the last error to occur on the CAN bus. This field will be cleared to 0h when a message has been transferred (reception or transmission) without error.</p> <p>0h = No Error: No error occurred since the MCAN_PSR[2-0] LEC field has been reset by successful reception or transmission.</p> <p>1h = Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.</p> <p>2h = Form Error: A fixed format part of a received frame has the wrong format.</p> <p>3h = AckError: The message transmitted by the MCAN module was not acknowledged by another node.</p> <p>4h = Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.</p> <p>5h = Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the Host CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).</p> <p>6h = CRCErrror: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.</p> <p>7h = NoChange: Any read access to the Protocol Status Register re-initializes the MCAN_PSR[2-0] LEC field to 7h. When the MCAN_PSR[2-0] LEC field shows the value 7h, no CAN bus event was detected since the last Host CPU read access to the Protocol Status Register.</p> <p>Note: When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in the MCAN_PSR[10-8] DLEC field instead of the MCAN_PSR[2-0] LEC field. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.</p> |

4.2.14 MCAN_TDCR Register (Offset = 48h) [reset = 0h]

MCAN_TDCR is shown in [Figure 4-25](#) and described in [Table 4-68](#).

Return to [Summary Table](#).

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|--|
| 6-0 | TDCF | R/W | 0h | Transmitter Delay Compensation Filter Window Length Defines the minimum value for the SSP position, dominant edges on the MCAN RX pin that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when the MCAN_TDCR[6-0] TDCF field is configured to a value greater than the MCAN_TDCR[14-8] TDCO field. Valid values are 0 to 127 mtq (0h-7Fh). |

4.2.15 MCAN_IR Register (Offset = 50h) [reset = 0h]

MCAN_IR is shown in [Figure 4-26](#) and described in [Table 4-70](#).

[Return to Summary Table.](#)

Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host CPU clears them. A flag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect. A hard reset will clear the register. The configuration of the MCAN_IE register controls whether an interrupt is generated. The configuration of the MCAN_ILS register controls on which interrupt line an interrupt is signalled.

| 28-0 | EIDM | R/W | 1FFFFFFFh | Extended ID Mask For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active. |

4.2.23 MCAN_HPMS Register (Offset = 94h) [reset = 0h]

MCAN_HPMS is shown in [Figure 4-34](#) and described in [Table 4-86](#).

Return to [Summary Table](#).

High Priority Message Status

Status monitoring of incoming high priority messages.

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Table 4-85. MCAN_HPMS Instances

| Instance | Physical Address |

4.2.24 MCAN_NDAT1 Register (Offset = 98h) [reset = 0h]

MCAN_NDAT1 is shown in [Figure 4-35](#) and described in [Table 4-88](#).

Return to [Summary Table](#).

New Data 1

NewDat flags of dedicated Rx buffers 0-31.

The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host CPU clears them. Aflag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect. A hard reset will clear the register.

Table 4-87. MCAN_NDAT1 Instances

4.2.37 MCAN_TXBRP Register (Offset = CCh) [reset = 0h]

MCAN_TXBRP is shown in [Figure 4-48](#) and described in [Table 4-114](#).

Return to [Summary Table](#).

Tx Buffer Request Pending

Tx buffers with pending transmission request.

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via the MCAN_TXBAR register. The bits are reset after a requested transmission has completed or has been cancelled via the MCAN_TXBCR register.

The MCAN_TXBRP bits are set only for those Tx Buffers configured via the MCAN_TXBC register. After a MCAN_TXBRP bit has been set, a Tx scan (see , *Tx Handling*) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

A cancellation request resets the corresponding transmission request pending bit of register the MCAN_TXBRP register. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding MCAN_TXBRP bit has been reset.

After a cancellation has been requested, a finished cancellation is signalled via the MCAN_TXBCF flag

- after successful transmission together with the corresponding MCAN_TXBTO bit
- when the transmission has not yet been started at the point of cancellation
- when the transmission has been aborted due to lost arbitration
- when an error occurred during frame transmission In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding MCAN_TXBCF bit is set for all unsuccessful transmissions.

Note: The MCAN_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN_TXBRP bit is reset.

4.2.38 MCAN_TXBAR Register (Offset = D0h) [reset = 0h]

MCAN_TXBAR is shown in [Figure 4-49](#) and described in [Table 4-116](#).

Return to [Summary Table](#).

Tx Buffer Add Request
Add transmission requests.

Each Tx Buffer has its own Add Request bit. Writing 1h will set the corresponding Add Request bit; writing a 0h has no impact. This enables the Host CPU to set transmission requests for multiple Tx Buffers with one write to the MCAN_TXBAR register. The MCAN_TXBAR bits are set only for those Tx Buffers configured via the MCAN_TXBC register. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed.

Note: If an add request is applied for a Tx Buffer with pending transmission request (corresponding MCAN_TXBRP bit already set), this add request is ignored.

4.2.39 MCAN_TXBCR Register (Offset = D4h) [reset = 0h]

MCAN_TXBCR is shown in [Figure 4-50](#) and described in [Table 4-118](#).

Return to [Summary Table](#).

Tx Buffer Cancellation Request

Request cancellation of pending transmissions.

Each Tx Buffer has its own Cancellation Request bit. Writing a 1h will set the corresponding Cancellation Request bit; writing a 0h has no impact. This enables the Host CPU to set cancellation requests for multiple Tx Buffers with one write to the MCAN_TXBCR register. The MCAN_TXBCR bits are set only for those Tx Buffers configured via the MCAN_TXBC register. The bits remain set until the corresponding bit of the MCAN_TXBRP register is reset.

4.2.40 MCAN_TXBTO Register (Offset = D8h) [reset = 0h]

MCAN_TXBTO is shown in [Figure 4-51](#) and described in [Table 4-120](#).

Return to [Summary Table](#).

Tx Buffer Transmission Occurred

Signals successful transmissions, set when corresponding MCAN_TXBRP flag is cleared.

Each Tx Buffer has its own Transmission Occurred bit. The bits are set when the corresponding MCAN_TXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a 1h to the corresponding bit of register the MCAN_TXBAR register.

4.2.41 MCAN_TXBCF Register (Offset = DCh) [reset = 0h]

MCAN_TXBCF is shown in [Figure 4-52](#) and described in [Table 4-122](#).

Return to [Summary Table](#).

Tx Buffer Cancellation Finished

Signals successful transmit cancellation, set when corresponding MCAN_TXBRP flag is cleared after cancellation request.

Each Tx Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN_TXBRP bit is cleared after a cancellation was requested via the MCAN_TXBCR register. In case the corresponding MCAN_TXBRP bit was not set at the point of cancellation, MCAN_TXBCF[n] CF bit is set immediately. The bits are reset when a new transmission is requested by writing a 1h to the corresponding bit of the MCAN_TXBAR register.

4.3.4 MCANSS_ECC_SEC_EOI_REG Register (Offset = 3Ch) [reset = 0h]

MCANSS_ECC_SEC_EOI_REG is shown in [Figure 4-61](#) and described in [Table 4-149](#).

Return to [Summary Table](#).

SEC EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

**Table 4-148. MCANSS_ECC_SEC_EOI_REG

4.3.8 MCANSS_ECC_DED_EOI_REG Register (Offset = 13Ch) [reset = 0h]

MCANSS_ECC_DED_EOI_REG is shown in [Figure 4-65](#) and described in [Table 4-157](#).

Return to [Summary Table](#).

DED EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

5 ATL Registers

Table 5-2 lists the ATL registers. All register locations not listed in Table 5-2 should be considered as reserved locations and the register contents should not be modified.

The ATL Control Registers region is accessed by setting the req signal to 1 during the access. The address map for this region is as follows:

Table 5-1. ATL Instances

| Instance | Base Address |
|----------|--------------|
| ATL0_REG | 031F 0000h |

Table 5-2. ATL Registers

| Offset | Acronym | Register Name | ATL0_REG Physical Address |

5.2 ATL0_PPMR Register (Offset = 200h) [reset = X]

ATL0_PPMR is shown in [Figure 5-2](#) and described in [Table 5-6](#).

Return to the [Summary Table](#).

The PPM register is used by the Audio re-timing code. The DAC over-sampling clock will slow down or speed up by the PPM written to bits [8:0].

5.3 ATL0_BBSR Register (Offset = 204h) [reset = X]

ATL0_BBSR is shown in [Figure 5-3](#) and described in [Table 5-8](#).

Return to the [Summary Table](#).

The measuring circuit produces a 16-bit Sample Count. Its inputs are the Audio IIS Word Select (AWS) and the Baseband IIS Word Select (BWS) from their respective MCASP pins. The sample count is a read-only register.

Table 5-7. ATL0_BBSR Instances

| Instance | Physical Address |

5.4 ATL0_ATLCR Register (Offset = 208h) [reset = X]

ATL0_ATLCR is shown in [Figure 5-4](#) and described in [Table 5-10](#).

Return to the [Summary Table](#).

The modem Clock Divide Select bit is used during factory calibration of the radio to match latency between the analog and digital signal paths. The ATL Internal Divider divides down the ATL master clock to make ATCLK.

5.23 ATL3_PPMR Register (Offset = 380h) [reset = X]

ATL3_PPMR is shown in [Figure 5-23](#) and described in [Table 5-48](#).

Return to the [Summary Table](#).

The PPM register is used by the Audio re-timing code. The DAC over-sampling clock will slow down or speed up by the PPM written to bits [8:0].

Table 5-47. ATL3_PPMR Instances

| Instance | Physical Address |
|----------|------------------|

5.24 ATL3_BBSR Register (Offset = 384h) [reset = X]

ATL3_BBSR is shown in [Figure 5-24](#) and described in [Table 5-50](#).

Return to the [Summary Table](#).

The measuring circuit produces a 16-bit Sample Count. Its inputs are the Audio IIS Word Select (AWS) and the Baseband IIS Word Select (BWS) from their respective MCASP pins. The sample count is a read-only register.

Table 5-49. ATL3_BBSR Instances

| Instance | Physical Address |

5.25 ATL3_ATLCR Register (Offset = 388h) [reset = X]

ATL3_ATLCR is shown in [Figure 5-25](#) and described in [Table 5-52](#).

Return to the [Summary Table](#).

The modem Clock Divide Select bit is used during factory calibration of the radio to match latency between the analog and digital signal paths. The ATL Internal Divider divides down the ATL master clock to make ATCLK.

Table 5-51. ATL3_ATLCR Instances

| Instance | Physical Address |

| Bit | Field | Type | Reset | Description |
|------|-----------|------|-------|---|
| 31-6 | RESERVED | R | 0h | Reserved |
| 5-2 | OTHER | R/W | 0h | Reserved for future programming. |
| 1-0 | IDLE_MODE | R/W | 2h | Power management Configuration of the local target state management mode. By definition, target can handle read/write transaction as long as it is out of IDLE state. 0h = Force-idle mode: local target's idle state follows (acknowledges) the system's idle requests unconditionally, i.e. regardless of the IP module's internal requirements. Backup mode, for debug only. 1h = No-idle mode: local target never enters idle state. Backup mode, for debug only. 2h = Smart-idle mode: local target's idle state eventually follows (acknowledges) the system's idle requests, depending on the IP module's internal requirements. IP module shall not generate (IRQor DMA-request-related) wakeup events. 3h = Reserved. |

6.4 MCASP_PFUNC Register (Offset = 10h) [reset = 0h]

MCASP_PFUNC is shown in [Figure 6-3](#) and described in [Table 6-8](#).

Return to [Summary Table](#).

LEGEND: R/W = Read/Write; -n = value after reset

Table 6-26. MCASP_GBLCTL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|--|
| 31-13 | RESERVED | R | 0h | Reserved |
| 12 | XFRST | R/W | 0h | Transmit frame sync generator reset enable bit. 0h = Transmit frame sync generator is reset. 1h = Transmit frame sync generator is active. When released from reset, the transmit frame sync generator begins counting serial clocks and generating frame sync as programmed. |
| 11 | XSMRST | R/W | 0h | Transmit state machine reset enable bit. 0h = Transmit state machine is held in reset. AXRn pin state: If MCASP_PFUNC[n] = 0 and MCASP_PDIR[n] = 1; then the serializer drives the AXRn pin to the state specified for inactive time slot (as determined by DISMOD bits in SRCTL). 1h = Transmit state machine is released from reset. When released from reset, the transmit state machine immediately transfers data from XRBUF[n] to XRSR[n]. The transmit state machine sets the underrun flag (XUNDRN) in MCASP_XSTAT, if XRBUF[n] have not been preloaded with data before reset is released. The transmit state machine also immediately begins detecting frame sync and is ready to transmit. Transmit TDM time slot begins at slot 0 after reset is released. |

Table 6-26. MCASP_GBLCTL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|---|
| 10 | XSRCLR | R/W | 0h | Transmit serializer clear enable bit. By clearing then setting this bit, the transmit buffer is flushed to an empty state [XDATA = 1]. If XSMRST = 1, XSRCLR = 1, XDATA = 1, and XBUF is not loaded with new data before the start of the next active time slot, an underrun will occur. 0h = Transmit serializers are cleared. 1h = Transmit serializers are active. When the transmit serializers are first taken out of reset (XSRCLR changes from 0 to 1), the transmit data ready bit (XDATA) in MCASP_XSTAT is set to indicate XBUF is ready to be written. |
| 9 | XHCLKRST | R/W | 0h | Transmit high-frequency clock divider reset enable bit. 0h = Transmit high-frequency clock divider is held in reset and passes through its input as divide-by-1. 1h = Transmit high-frequency clock divider is running. |
| 8 | XCLKRST | R/W | 0h | Transmit clock divider reset enable bit. 0h = Transmit clock divider is held in reset. When the clock divider is in reset, it passes through a divide-by-1 of its input. 1h = Transmit clock divider is running. |
| 7-5 | RESERVED | R | 0h | Reserved |
| 4 | RFRST | R/W | 0h | Receive frame sync generator reset enable bit. 0h = Receive frame sync generator is reset. 1h = Receive frame sync generator is active. When released from reset, the receive frame sync generator begins counting serial clocks and generating frame sync as programmed. |
| 3 | RSMRST | R/W | 0h | Receive state machine reset enable bit. 0h = Receive state machine is held in reset. 1h = Receive state machine is released from reset. When released from reset, the receive state machine immediately begins detecting frame sync and is ready to receive. Receive TDM time slot begins at slot 0 after reset is released. |
| 2 | RSRCLR | R/W | 0h | Receive serializer clear enable bit. By clearing then setting this bit, the receive buffer is flushed. 0h = Receive serializers are cleared. 1h = Receive serializers are active. |
| 1 | RHCLKRST | R/W | 0h | Receive high-frequency clock divider reset enable bit. 0h = Receive high-frequency clock divider is held in reset and passes through its input as divide-by-1. 1h = Receive high-frequency clock divider is running. |
| 0 | RCLKRST | R/W | 0h | Receive high-frequency clock divider reset enable bit. 0h = Receive clock divider is held in reset. When the clock divider is in reset, it passes through a divide-by-1 of its input. 1h = Receive clock divider is running. |

Table 6-30. MCASP_LBCTL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|--|
| 31-5 | RESERVED | R/W | 0h | |
| 4 | IOLBEN | R/W | 0h | I/O loopback enable. Chip-level loopback; looped back through I/O buffers. 0h = I/O loopback disabled 1h = I/O loopback enabled Note: These are only valid if LBEN = 1. If LBEN = 0, neither internal nor I/O loopback will be selected. |
| 3-2 | MODE | R/W | 0h | Loopback generator mode bits. Applies only when loopback mode is enabled [DLBEN = 1]. 0h = Default and reserved on loopback mode (DLBEN = 1). When in non-loopback mode (DLBEN = 0), MODE should be left at default (00). When in loopback mode (DLBEN = 1), MODE = 00 is reserved and is not applicable. 1h = Transmit clock and frame sync generators used by both transmit and receive sections. When in loopback mode (DLBEN = 1), MODE must be 01. 2h = Reserved. 3h = Reserved. |
| 1 | ORD | R/W | 0h | Loopback order bit when loopback mode is enabled [DLBEN = 1]. 0h = Odd serializers N + 1 transmit to even serializers N that receive. The corresponding serializers must be programmed properly. 1h = Even serializers N transmit to odd serializers N + 1 that receive. The corresponding serializers must be programmed properly. |

LEGEND: R = Read Only; R/W = Read/Write; -n = value after reset

Table 6-34. MCASP_GBLCTLR Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-13 | RESERVED | R/W | 0h | Reserved |
| 12 | XFRST | R | 0h | Transmit frame sync generator reset enable bit. A read of this bit returns the XFRST bit value of MCASP_GBLCTL. Writes have no effect. |
| 11 | XSMRST | R | 0h | Transmit state machine reset enable bit. A read of this bit returns the XSMRST bit value of MCASP_GBLCTL. Writes have no effect. |
| 10 | XSRCLR | R | 0h | Transmit serializer clear enable bit. A read of this bit returns the XSRCLR bit value of MCASP_GBLCTL. Writes have no effect. |
| 9 | XHCLKRST | R | 0h | Transmit high-frequency clock divider reset enable bit. A read of this bit returns the XHCLKRST bit value of MCASP_GBLCTL. Writes have no effect. |
| 8 | XCLKRST | R | 0h | Transmit clock divider reset enable bit. A read of this bit returns the XCLKRST bit value of MCASP_GBLCTL. Writes have no effect. |
| 7-5 | RESERVED | R/W | 0h | Reserved |
| 4 | RFRST | R/W | 0h | Receive frame sync generator reset enable bit. A write to this bit affects the RFRST bit of MCASP_GBLCTL. 0h = Receive frame sync generator is reset. 1h = Receive frame sync generator is active. |

Table 6-34. MCASP_GBLCTLR Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|---|
| 3 | RSMRST | R/W | 0h | Receive state machine reset enable bit. A write to this bit affects the RSMRST bit of MCASP_GBLCTL. 0h = Receive state machine is held in reset. 1h = Receive state machine is released from reset. |
| 2 | RSRCLR | R/W | 0h | Receive serializer clear enable bit. A write to this bit affects the RSRCLR bit of MCASP_GBLCTL. 0h = Receive serializers are cleared. 1h = Receive serializers are active. |
| 1 | RHCLKRST | R/W | 0h | Receive high-frequency clock divider reset enable bit. A write to this bit affects the RHCLKRST bit of MCASP_GBLCTL. 0h = Receive high-frequency clock divider is held in reset and passes through its input as divide-by-1. 1h = Receive high-frequency clock divider is running. |
| 0 | RCLKRST | R/W | 0h | Receive clock divider reset enable bit. A write to this bit affects the RCLKRST bit of MCASP_GBLCTL. 0h = Receive clock divider is held in reset. 1h = Receive clock divider is running. |

6.18 MCASP_RXMASK Register (Offset = 64h) [reset = 0h]

Table 6-36. MCASP_RXMASK Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 31 | RMASK31 | R/W | 0h | Receive data mask 31 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 30 | RMASK30 | R/W | 0h | Receive data mask 30 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 29 | RMASK29 | R/W | 0h | Receive data mask 29 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 28 | RMASK28 | R/W | 0h | Receive data mask 28 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |

Table 6-36. MCASP_RXMASK Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 27 | RMASK27 | R/W | 0h | Receive data mask 27 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 26 | RMASK26 | R/W | 0h | Receive data mask 26 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 25 | RMASK25 | R/W | 0h | Receive data mask 25 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 24 | RMASK24 | R/W | 0h | Receive data mask 24 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 23 | RMASK23 | R/W | 0h | Receive data mask 23 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 22 | RMASK22 | R/W | 0h | Receive data mask 22 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 21 | RMASK21 | R/W | 0h | Receive data mask 21 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 20 | RMASK20 | R/W | 0h | Receive data mask 20 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |

Table 6-36. MCASP_RXMASK Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 19 | RMASK19 | R/W | 0h | Receive data mask 19 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 18 | RMASK18 | R/W | 0h | Receive data mask 18 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 17 | RMASK17 | R/W | 0h | Receive data mask 17 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 16 | RMASK16 | R/W | 0h | Receive data mask 16 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 15 | RMASK15 | R/W | 0h | Receive data mask 15 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 14 | RMASK14 | R/W | 0h | Receive data mask 14 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 13 | RMASK13 | R/W | 0h | Receive data mask 13 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 12 | RMASK12 | R/W | 0h | Receive data mask 12 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |

Table 6-36. MCASP_RXMASK Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 11 | RMASK11 | R/W | 0h | Receive data mask 11 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 10 | RMASK10 | R/W | 0h | Receive data mask 10 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 9 | RMASK9 | R/W | 0h | Receive data mask 9 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 8 | RMASK8 | R/W | 0h | Receive data mask 8 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 7 | RMASK7 | R/W | 0h | Receive data mask 7 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 6 | RMASK6 | R/W | 0h | Receive data mask 6 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 5 | RMASK5 | R/W | 0h | Receive data mask 5 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 4 | RMASK4 | R/W | 0h | Receive data mask 4 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |

Table 6-36. MCASP_RXMASK Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|--------|------|-------|---|
| 3 | RMASK3 | R/W | 0h | Receive data mask 3 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 2 | RMASK2 | R/W | 0h | Receive data mask 2 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 1 | RMASK1 | R/W | 0h | Receive data mask 1 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |
| 0 | RMASK0 | R/W | 0h | Receive data mask 0 enable bit. 0h = Corresponding bit of receive data (after passing through reverse and rotate units) is masked out and then padded with the selected bit pad value (RPAD and RPBIT bits in MCASP_RFMT). 1h = Corresponding bit of receive data (after passing through reverse and rotate units) is returned to CPU or DMA. |

6.19 MCASP_RXFMT Register (Offset = 68h) [reset = 0h]

MCASP_RXFMT is shown in [Figure 6-18](#) and described in [Table 6-38](#).

Return to [Summary Table](#).

| Bit | Field | Type | Reset | Description |
|------|--------|------|-------|---|
| 12-8 | RPBIT | R/W | 0h | RPBIT value determines which bit [as read by the CPU or DMA from RBUF[n]] is used to pad the extra bits. This field only applies when RPAD = 2h. 0h = Pad with bit 0 value. 1h = Pad with bit 1 to bit 31 value from 1h to 1Fh. |
| 7-4 | RSSZ | R/W | 0h | Receive slot size. 0h = Reserved. 1h = Reserved. 2h = Reserved. 3h = Slot size is 8 bits. 4h = Reserved 5h = Slot size is 12 bits. 6h = Reserved 7h = Slot size is 16 bits. 8h = Reserved 9h = Slot size is 20 bits. Ah = Reserved Bh = Slot size is 24 bits Ch = Reserved Dh = Slot size is 28 bits. Eh = Reserved Fh = Slot size is 32 bits. |
| 3 | RBUSEL | R/W | 0h | Selects whether reads from serializer buffer XRBUF[n] originate from the configuration bus [CFG] or the data [DAT] port. 0h = Reads from XRBUF[n] originate on data port. Reads from XRBUF[n] on configuration bus are ignored. 1h = Reads from XRBUF[n] originate on configuration bus. Reads from XRBUF[n] on data port are ignored. |
| 2-0 | RROT | R/W | 0h | Right-rotation value for receive rotate right format unit. 0h = Rotate right by 0 (no rotation). 1h = Rotate right by 4 bit positions. 2h = Rotate right by 8 bit positions. 3h = Rotate right by 12 bit positions. 4h = Rotate right by 16 bit positions. 5h = Rotate right by 20 bit positions. 6h = Rotate right by 24 bit positions. 7h = Rotate right by 28 bit positions. |

LEGEND: R/W = Read/Write; -n = value after reset

Table 6-50. MCASP_RXSTAT Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|---|
| 31-9 | RESERVED | R/W | 0h | Reserved |
| 8 | RERR | R/W | 0h | RERR bit always returns a logic-OR of: ROVRN OR RSYNCERR OR RCKFAIL OR RDMAERR. Allows a single bit to be checked to determine if a receiver error interrupt has occurred. 0h = No errors have occurred. 1h = An error has occurred. |
| 7 | RDMAERR | R/W | 0h | Receive DMA error flag. RDMAERR is set when the CPU or DMA reads more serializers through the data port in a given time slot than were programmed as receivers. Causes a receive interrupt [RINT], if this bit is set and RDMAERR in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = Receive DMA error did not occur. 1h = Receive DMA error did occur. |
| 6 | RSTAFRM | R/W | 0h | Receive start of frame flag. Causes a receive interrupt [RINT], if this bit is set and RSTAFRM in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = No new receive frame sync (AFSR) is detected. 1h = A new receive frame sync (AFSR) is detected. |

Table 6-50. MCASP_RXSTAT Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--|
| 5 | RDATA | R/W | 0h | Receive data ready flag. Causes a receive interrupt [RINT], if this bit is set and RDATA in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = No new data in RBUF. 1h = Data is transferred from XRSR to RBUF and ready to be serviced by the CPU or DMA. When RDATA is set, it always causes a DMA event (AREVT). |
| 4 | RLAST | R/W | 0h | Receive last slot flag. RLAST is set along with RDATA, if the current slot is the last slot in a frame. Causes a receive interrupt [RINT], if this bit is set and RLAST in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = Current slot is not the last slot in a frame. 1h = Current slot is the last slot in a frame. RDATA is also set. |
| 3 | RTDMSLOT | R/W | 0h | Returns the LSB of MCASP_RSLOT. Allows a single read of MCASP_RSTAT to determine whether the current TDM time slot is even or odd. 0h = Current TDM time slot is odd. 1h = Current TDM time slot is even. |
| 2 | RCKFAIL | R/W | 0h | Receive clock failure flag. RCKFAIL is set when the receive clock failure detection circuit reports an error. Causes a receive interrupt [RINT], if this bit is set and RCKFAIL in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = Receive clock failure did not occur. 1h = Receive clock failure did occur. |
| 1 | RSYNCERR | R/W | 0h | Unexpected receive frame sync flag. RSYNCERR is set when a new receive frame sync [AFSR] occurs before it is expected. Causes a receive interrupt [RINT], if this bit is set and RSYNCERR in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = Unexpected receive frame sync did not occur. 1h = Unexpected receive frame sync did occur. |
| 0 | ROVRN | R/W | 0h | Receiver overrun flag. ROVRN is set when the receive serializer is instructed to transfer data from XRSR to RBUF, but the former data in RBUF has not yet been read by the CPU or DMA. Causes a receive interrupt [RINT], if this bit is set and ROVRN in MCASP_RINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 to this bit has no effect. 0h = Receiver overrun did not occur. 1h = Receiver overrun did occur. |

6.26 MCASP_RXTDMSLOT Register (Offset = 84h) [reset = 0h]

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|--|
| 31-24 | RCNT | R | 0h | Receive clock count value [from previous measurement]. The clock circuit continually counts the number of system clocks for every 32 receive high-frequency master clock [AHCLKR] signals, and stores the count in RCNT until the next measurement is taken. |
| 23-16 | RMAX | R/W | 0h | Receive clock maximum boundary. This 8 bit unsigned value sets the maximum allowed boundary for the clock check counter after 32 receive high-frequency master clock [AHCLKR] signals have been received. If the current counter value is greater than RMAX after counting 32 AHCLKR signals, RCKFAIL in MCASP_RSTAT is set. The comparison is performed using unsigned arithmetic. |
| 15-8 | RMIN | R/W | 0h | Receive clock minimum boundary. This 8 bit unsigned value sets the minimum allowed boundary for the clock check counter after 32 receive high-frequency master clock [AHCLKR] signals have been received. If RCNT is less than RMIN after counting 32 AHCLKR signals, RCKFAIL in MCASP_RSTAT is set. The comparison is performed using unsigned arithmetic. |
| 7-4 | RESERVED | R/W | 0h | Reserved |
| 3-0 | RPS | R/W | 0h | Receive clock check prescaler value. 0h = MCASP system clock divided by 1. 1h = MCASP system clock divided by 2. 2h = MCASP system clock divided by 4. 3h = MCASP system clock divided by 8. 4h = MCASP system clock divided by 16. 5h = MCASP system clock divided by 32. 6h = MCASP system clock divided by 64. 7h = MCASP system clock divided by 128. 8h = MCASP system clock divided by 256. 9h = Reserved from 9h to Fh. |

Table 6-62. MCASP_TXFMT Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|---|
| 31-18 | RESERVED | R/W | 0h | Reserved |
| 17-16 | XDATDLY | R/W | 0h | Transmit sync bit delay. 0h = 0-bit delay. The first transmit data bit, AXRn, occurs in same ACLKX cycle as the transmit frame sync (AFSX). 1h = 1-bit delay. The first transmit data bit, AXRn, occurs one ACLKX cycle after the transmit frame sync (AFSX). 2h = 2-bit delay. The first transmit data bit, AXRn, occurs two ACLKX cycles after the transmit frame sync (AFSX). 3h = Reserved. |
| 15 | XRVRS | R/W | 0h | Transmit serial bitstream order. 0h = Bitstream is LSB first. No bit reversal is performed in transmit format bit reverse unit. 1h = Bitstream is MSB first. Bit reversal is performed in transmit format bit reverse unit. |
| 14-13 | XPAD | R/W | 0h | Pad value for extra bits in slot not belonging to word defined by MCASP_XMASK. This field only applies to bits when MCASP_XMASK[n] = 0. 0h = Pad extra bits with 0. 1h = Pad extra bits with 1. 2h = Pad extra bits with one of the bits from the word as specified by XPBIT bits. 3h = Reserved. |

Table 6-62. MCASP_TXFMT Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|------|--------|------|-------|--|
| 12-8 | XPBIT | R/W | 0h | XPBIT value determines which bit [as written by the CPU or DMA to XBUF[n]] is used to pad the extra bits before shifting. This field only applies when XPAD = 2h. 0h = Pad with bit 0 value. 1h = Pad with bit 1 to bit 31 value from 1h to 1Fh. |
| 7-4 | XSSZ | R/W | 0h | Transmit slot size. 0h = Reserved. 1h = Reserved. 2h = Reserved. 3h = Slot size is 8 bits. 4h = Reserved. 5h = Slot size is 12 bits. 6h = Reserved. 7h = Slot size is 16 bits. 8h = Reserved. 9h = Slot size is 20 bits. Ah = Reserved. Bh = Slot size is 24 bits. Ch = Reserved. Dh = Slot size is 28 bits. Eh = Reserved. Fh = Slot size is 32 bits. |
| 3 | XBUSEL | R/W | 0h | Selects whether writes to serializer buffer XRBUFF[n] originate from the configuration bus [CFG] or the data [DAT] port. 0h = Writes to XRBUFF[n] originate from the data port. Writes to XRBUFF[n] from the configuration bus are ignored with no effect to the McASP. 1h = Writes to XRBUFF[n] originate from the configuration bus. Writes to XRBUFF[n] from the data port are ignored with no effect to the McASP. |
| 2-0 | XROT | R/W | 0h | Right-rotation value for transmit rotate right format unit. 0h = Rotate right by 0 (no rotation). 1h = Rotate right by 4 bit positions. 2h = Rotate right by 8 bit positions. 3h = Rotate right by 12 bit positions. 4h = Rotate right by 16 bit positions. 5h = Rotate right by 20 bit positions. 6h = Rotate right by 24 bit positions. 7h = Rotate right by 28 bit positions. |

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 31 | XTDMS31 | R/W | 0h | Transmitter mode during TDM time slot 31. 0h = Transmit TDM time slot 31 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 31 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 30 | XTDMS30 | R/W | 0h | Transmitter mode during TDM time slot 30. 0h = Transmit TDM time slot 30 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 30 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 29 | XTDMS29 | R/W | 0h | Transmitter mode during TDM time slot 29. 0h = Transmit TDM time slot 29 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 29 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 28 | XTDMS28 | R/W | 0h | Transmitter mode during TDM time slot 28. 0h = Transmit TDM time slot 28 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 28 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |

Table 6-70. MCASP_TXTDM Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 27 | XTDMS27 | R/W | 0h | Transmitter mode during TDM time slot 27. 0h = Transmit TDM time slot 27 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 27 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 26 | XTDMS26 | R/W | 0h | Transmitter mode during TDM time slot 26. 0h = Transmit TDM time slot 26 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 26 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 25 | XTDMS25 | R/W | 0h | Transmitter mode during TDM time slot 25. 0h = Transmit TDM time slot 25 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 25 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 24 | XTDMS24 | R/W | 0h | Transmitter mode during TDM time slot 24. 0h = Transmit TDM time slot 24 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 24 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 23 | XTDMS23 | R/W | 0h | Transmitter mode during TDM time slot 23. 0h = Transmit TDM time slot 23 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 23 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 22 | XTDMS22 | R/W | 0h | Transmitter mode during TDM time slot 22. 0h = Transmit TDM time slot 22 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 22 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 21 | XTDMS21 | R/W | 0h | Transmitter mode during TDM time slot 21. 0h = Transmit TDM time slot 21 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 21 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 20 | XTDMS20 | R/W | 0h | Transmitter mode during TDM time slot 20. 0h = Transmit TDM time slot 20 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 20 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |

The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 15 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 14 | XTDMS14 | R/W | 0h | Transmitter mode during TDM time slot 14. 0h = Transmit TDM time slot 14 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 14 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 13 | XTDMS13 | R/W | 0h | Transmitter mode during TDM time slot 13. 0h = Transmit TDM time slot 13 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 13 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 12 | XTDMS12 | R/W | 0h | Transmitter mode during TDM time slot 12. 0h = Transmit TDM time slot 12 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 12 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |

Table 6-70. MCASP_TXTDM Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------|------|-------|--|
| 11 | XTDMS11 | R/W | 0h | Transmitter mode during TDM time slot 11. 0h = Transmit TDM time slot 11 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 11 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 10 | XTDMS10 | R/W | 0h | Transmitter mode during TDM time slot 10. 0h = Transmit TDM time slot 10 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 10 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 9 | XTDMS9 | R/W | 0h | Transmitter mode during TDM time slot 9. 0h = Transmit TDM time slot 9 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 9 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 8 | XTDMS8 | R/W | 0h | Transmitter mode during TDM time slot 8. 0h = Transmit TDM time slot 8 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 8 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 7 | XTDMS7 | R/W | 0h | Transmitter mode during TDM time slot 7. 0h = Transmit TDM time slot 7 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 7 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 6 | XTDMS6 | R/W | 0h | Transmitter mode during TDM time slot 6. 0h = Transmit TDM time slot 6 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 6 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 5 | XTDMS5 | R/W | 0h | Transmitter mode during TDM time slot 5. 0h = Transmit TDM time slot 5 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 5 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 4 | XTDMS4 | R/W | 0h | Transmitter mode during TDM time slot 4. 0h = Transmit TDM time slot 4 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 4 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |

Table 6-70. MCASP_TXTDM Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|--------|------|-------|---|
| 3 | XTDMS3 | R/W | 0h | Transmitter mode during TDM time slot 3. 0h = Transmit TDM time slot 3 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 3 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 2 | XTDMS2 | R/W | 0h | Transmitter mode during TDM time slot 2. 0h = Transmit TDM time slot 2 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 2 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 1 | XTDMS1 | R/W | 0h | Transmitter mode during TDM time slot 1. 0h = Transmit TDM time slot 1 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 1 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |
| 0 | XTDMS0 | R/W | 0h | Transmitter mode during TDM time slot 0. 0h = Transmit TDM time slot 0 is inactive. The transmit serializer does not shift out data during this slot. 1h = Transmit TDM time slot 0 is active. The transmit serializer shifts out data during this slot according to the serializer control register (SRCTL). |

6.36 MCASP_EVTCTLX Register (Offset = BCh) [reset = 0h]

MCASP_EVTCTLX is shown in [Figure 6-35](#) and described in [Table 6-72](#).

Return to [Summary Table](#).

LEGEND: R/W = Read/Write; -n = value after reset

Table 6-74. MCASP_TXSTAT Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|---|
| 31-9 | RESERVED | R/W | 0h | Reserved |
| 8 | XERR | R/W | 0h | XERR bit always returns a logic-OR of: XUNDRN OR XSYNCERR OR XCKFAIL OR XDMAERR. Allows a single bit to be checked to determine if a transmitter error interrupt has occurred. 0h = No errors have occurred. 1h = An error has occurred. |
| 7 | XDMAERR | R/W | 0h | Transmit DMA error flag. XDMAERR is set when the CPU or DMA writes more serializers through the data port in a given time slot than were programmed as transmitters. Causes a transmit interrupt [XINT], if this bit is set and XDMAERR in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = Transmit DMA error did not occur. 1h = Transmit DMA error did occur. |
| 6 | XSTAFRM | R/W | 0h | Transmit start of frame flag. Causes a transmit interrupt [XINT], if this bit is set and XSTAFRM in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = No new transmit frame sync (AFSX) is detected. 1h = A new transmit frame sync (AFSX) is detected. |

Table 6-74. MCASP_TXSTAT Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--|
| 5 | XDATA | R/W | 0h | Transmit data ready flag. Causes a transmit interrupt [XINT], if this bit is set and XDATA in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = XBUF is written and is full. 1h = Data is copied from XBUF to XRSR. XBUF is empty and ready to be written. XDATA is also set when the transmit serializers are taken out of reset. When XDATA is set, it always causes a DMA event (AXEVT). |
| 4 | XLAST | R/W | 0h | Transmit last slot flag. XLAST is set along with XDATA, if the current slot is the last slot in a frame. Causes a transmit interrupt [XINT], if this bit is set and XLAST in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = Current slot is not the last slot in a frame. 1h = Current slot is the last slot in a frame. XDATA is also set. |
| 3 | XTDMSLOT | R/W | 0h | Returns the LSB of MCASP_XSLOT. Allows a single read of MCASP_XSTAT to determine whether the current TDM time slot is even or odd. 0h = Current TDM time slot is odd. 1h = Current TDM time slot is even. |
| 2 | XCKFAIL | R/W | 0h | Transmit clock failure flag. XCKFAIL is set when the transmit clock failure detection circuit reports an error. Causes a transmit interrupt [XINT], if this bit is set and XCKFAIL in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = Transmit clock failure did not occur. 1h = Transmit clock failure did occur. |
| 1 | XSYNCERR | R/W | 0h | Unexpected transmit frame sync flag. XSYNCERR is set when a new transmit frame sync [AFSX] occurs before it is expected. Causes a transmit interrupt [XINT], if this bit is set and XSYNCERR in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = Unexpected transmit frame sync did not occur. 1h = Unexpected transmit frame sync did occur. |
| 0 | XUNDRN | R/W | 0h | Transmitter underrun flag. XUNDRN is set when the transmit serializer is instructed to transfer data from XBUF to XRSR, but XBUF has not yet been serviced with new data since the last transfer. Causes a transmit interrupt [XINT], if this bit is set and XUNDRN in MCASP_XINTCTL is set. This bit is cleared by writing a 1 to this bit. Writing a 0 has no effect. 0h = Transmitter underrun did not occur. 1h = Transmitter underrun did occur. For details on McASP action upon underrun conditions, see Buffer Underrun Error - Transmitter. |

6.38 MCASP_TXTDMSLOT Register (Offset = C4h) [reset = 0h]

MCASP_TXTDMSLOT is shown in [Figure 6-37](#) and described in [Table 6-76](#).

Return to [Summary Table](#).

Table 6-78. MCASP_TXCLKCHK Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|----------|------|-------|--|
| 31-24 | XCNT | R | 0h | Transmit clock count value [from previous measurement]. The clock circuit continually counts the number of system clocks for every 32 transmit high-frequency master clock [AHCLKX] signals, and stores the count in XCNT until the next measurement is taken. |
| 23-16 | XMAX | R/W | 0h | Transmit clock maximum boundary. This 8 bit unsigned value sets the maximum allowed boundary for the clock check counter after 32 transmit high-frequency master clock [AHCLKX] signals have been received. If the current counter value is greater than XMAX after counting 32 AHCLKX signals, XCKFAIL in MCASP_XSTAT is set. The comparison is performed using unsigned arithmetic. |
| 15-8 | XMIN | R/W | 0h | Transmit clock minimum boundary. This 8 bit unsigned value sets the minimum allowed boundary for the clock check counter after 32 transmit high-frequency master clock [AHCLKX] signals have been received. If XCNT is less than XMIN after counting 32 AHCLKX signals, XCKFAIL in MCASP_XSTAT is set. The comparison is performed using unsigned arithmetic. |

| Bit | Field | Type | Reset | Description |
|------|----------|------|-------|--|
| 31-6 | RESERVED | R/W | 0h | Reserved |
| 5 | RRDY | R | 0h | Receive buffer ready bit. RRDY indicates the current receive buffer state. Always reads 0 when programmed as a transmitter or as inactive. If SRMOD bit is set to receive [2h], RRDY switches from 0 to 1 whenever data is transferred from XRSR to RBUF. 0h = Receive buffer (RBUF) is empty. 1h = Receive buffer (RBUF) contains data and needs to be read before the start of the next time slot or a receiver overrun occurs. |
| 4 | XRDY | R | 0h | Transmit buffer ready bit. XRDY indicates the current transmit buffer state. Always reads 0 when programmed as a receiver or as inactive. If SRMOD bit is set to transmit [1h], XRDY switches from 0 to 1 when XSRCLR in MCASP_GBLCTL is switched from 0 to 1 to indicate an empty transmitter. XRDY remains set until XSRCLR is forced to 0, data is written to the corresponding transmit buffer, or SRMOD bit is changed to receive [2h] or inactive [0]. 0h = Transmit buffer (XBUF) contains data. 1h = Transmit buffer (XBUF) is empty and needs to be written before the start of the next time slot or a transmit underrun occurs. |

6.114 MCASP_DMA Registers

lists the memory-mapped registers for the MCASP_DMA. All register offset addresses not listed in should be considered as reserved locations and the register contents should not be modified.

Table 6-227. MCASP_DMA Instances

| Instance | Base Address |
|------------|--------------|
| MCASP0_DMA | 02B0 8000h |
| MCASP1_DMA | 02B1 8000h |
| MCASP2_DMA | 02B2 8000h |

Table 6-228. MCASP_DMA Registers

| Offset | Acronym | Register Name | MCASP0_DM A Physical Address | MCASP1_DM A Physical Address | MCASP2_DM A Physical Address |
|--------------------|-----------------------------|----------------|------------------------------------|------------------------------------|------------------------------------|
| N/A ⁽¹⁾ | MCASP_TXBUF | Tx Buffer Data | 02B0 8000h | 02B1 8000h | 02B2 8000h |
| N/A ⁽¹⁾ | MCASP_RXBUF | Rx Buffer Data | 02B0 8000h | 02B1 8000h | 02B2 8000h |

- (1) N/A denotes an example for DATA port offset value. Actually, whatever the offset value is added to base address, it is ignored (don't care) when Arm performs accesses to XRBUFFn RX/TX buffers through the McASP DATA port.

Note

For MCASP_TXBUF and MCASP_RXBUF buffer accesses through the MCASP DATA port, the destination physical address is always the same regardless of current channel index or transfer direction. The MCASP_TXFMT[3] XBUSEL bit must be set to 0b0, to allow write transfers through the DATA port. The MCASP_RXFMT[3] RBUSEL bit must be set to 0b0, to allow read transfers through the DATA port.

Note

The MCASP DATA port is exclusively assigned for DMAs / device CPUs accesses to the MCASP channels transmit and receive buffer registers. All other MCASP module registers must be accessed through the MCASP CFG (peripheral) port.

6.115 MCASP_TXBUF Register (Offset = 0h) [reset = 0h]

MCASP_TXBUF is shown in [Figure 6-113](#) and described in [Table 6-230](#).

Through the DATA port, the Host can service all serializers through a single address and the MCASP automatically cycles through the appropriate serializers. For transmit operations through the DATA port, the Host should write to the same DATA port address to service all of the active transmit serializers upon each transmit data ready event. To enable accesses from the Host to the MCASP_TXBUF_n registers through the DATA port, one must clear the XBUSEL bits to 0 in the respective MCASP_TXFMT registers.

Table 6-229. MCASP_TXBUF Instances

| Instance | Physical Address |
|------------|------------------|
| MCASP0_DMA | 02B0 8000h |
| MCASP1_DMA | 02B1 8000h |
| MCASP2_DMA | 02B2 8000h |

| Bit | Field | Type | Reset | Description |
|------|-------|------|-------|-----------------|
| 31-0 | TXBUF | W | 0h | Tx buffer data. |

6.116 MCASP_RXBUF Register (Offset = 0h) [reset = 0h]

MCASP_RXBUF is shown in [Figure 6-114](#) and described in [Table 6-232](#).

Through the DATA port, the Host can service all serializers through a single address and the MCASP automatically cycles through the appropriate serializers. For receive operations through the DATA port, the Host should read from the same MCASP_RXBUF DATA port address to service all of the active receive serializers upon each receive data ready event. To enable accesses from the Host to the MCASP_RXBUF_n registers through the DATA port, one must clear the RBUSEL bits to 0 in the respective MCASP_RXFMT registers.

Table 6-231. MCASP_RXBUF Instances

| Instance | Physical Address |
|------------|------------------|
| MCASP0_DMA | 02B0 8000h |
| MCASP1_DMA | 02B1 8000h |

7.1.5 DSI_ECC_SEC_EOI_REG Register (Offset = 3Ch) [reset = X]

DSI_ECC_SEC_EOI_REG is shown in Figure 7-5 and described in Table 7-16.

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

Table 7-15. DSI_ECC_SEC_EOI_REG Instances

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

7.2.15 DSI_DSC_PPS_WRDAT Register (Offset = 38h) [reset = 0h]

DSI_DSC_PPS_WRDAT is shown in [Figure 7-31](#) and described in [Table 7-82](#).

Return to [Summary Table](#).

DSC PPS Write data to outgoing FIFO Buffer, byte 0 to 3; applicable to either Write or Read commands.

Note that any writes to this register that exceed the programmed command payload size or the configured FIFO depth (whichever is smaller) will be ignored.

Conversely, if the writes to this register are less than the programmed command payload size when the instruction to send the payload is given, the command payload

will contain data from the previous contents of the FIFO for all unwritten bytes, and will therefore be corrupt.

Table 7-81. DSI_DSC_PPS_WRDAT Instances

7.2.21 DSI_DIRECT_CMD_SEND Register (Offset = 80h) [reset = 0h]

DSI_DIRECT_CMD_SEND is shown in [Figure 7-37](#) and described in [Table 7-94](#).

Return to [Summary Table](#).

DSI_DIRECT_CMD_SEND is not a real register. When this address is written (whatever its value is), it signals to the link that a direct command has to be sent.

It is then a write only register. No specific mechanism is implemented to prevent the application sending two direct commands back-to-back. It is then applications responsibility to verify the completion of a first direct command before starting another direct command. Interlacing of command or video with direct command is managed by the DSI link using the different arbiters (see Command and register arbiter (CRA) and Video/command arbiter (VCA))

Table 7-93. DSI_DIRECT_CMD_SEND Instances

| Instance | Physical Address |
|--|------------------|
| DSS_DSI0_DSI_TOP_VBUSP_CFG_D SI_0_DSI | 0480 0080h |

7.2.23 DSI_DIRECT_CMD_STS Register (Offset = 88h) [reset = X]

DSI_DIRECT_CMD_STS is shown in [Figure 7-39](#) and described in [Table 7-98](#).

Return to [Summary Table](#).

Direct Command Status: To ensure that the observed status bits are coherent and applicable to the last command message sent, it is recommended to clear this register between accesses by writing to direct_cmd_clr, otherwise the status of the different commands is logically ORed, making it difficult to differentiate between the status of each message.

Table 7-97. DSI_DIRECT_CMD_STS Instances

| Instance | Physical Address |

| 0 | CMD_TRANSMISSION | R | 0h | CMD_TRANSMISSION: a command is being sent |

7.2.24 DSI_DIRECT_CMD_RD_INIT Register (Offset = 8Ch) [reset = 0h]

DSI_DIRECT_CMD_RD_INIT is shown in [Figure 7-40](#) and described in [Table 7-100](#).

Return to [Summary Table](#).

This register is not a real register - when written it stops the read command process by emptying the FIFO and by stopping the reception of the data (RP does not consider the data that it receives and the system waits for the D-PHY to return to Tx STOP state).

Table 7-99. DSI_DIRECT_CMD_RD_INIT Instances

| Instance | Physical Address |
|--------------------------------------|------------------|
| DSS_DSI0_DSI_TOP_VBUSP_CFG_DSI_0_DSI | 0480 008Ch |

| 31-0 | STOP_READ_OPERATION | W | 0h | Stop Read Operation |

7.2.25 DSI_DIRECT_CMD_WRDAT Register (Offset = 90h) [reset = 0h]

DSI_DIRECT_CMD_WRDAT is shown in [Figure 7-41](#) and described in [Table 7-102](#).

Return to [Summary Table](#).

Write data to outgoing Direct Command FIFO, byte 0 to 3; applicable to either Write or Read commands. Note that any writes to this register that exceed the programmed command payload size or the configured FIFO depth (whichever is smaller) will be ignored. Conversely, if the writes to this register are less than the programmed command payload size when the instruction to send the payload is given, the command payload will contain data from the previous contents of the FIFO for all unwritten bytes, and will therefore be corrupt. Note also that values written to the FIFO which are intended for transmission of single parameter write transaction must set the MS bytes to zero to comply with DSI standard requirements.

Table 7-101. DSI_DIRECT_CMD_WRDAT Instances

| Instance | Physical Address |
|--|------------------|
| DSS_DSI0_DSI_TOP_VBUSP_CFG_D SI_0_DSI | 0480 0090h |

7.2.81 DSI_ASF_INT_STATUS Register (Offset = 200h) [reset = 0h]

DSI_ASF_INT_STATUS is shown in [Figure 7-97](#) and described in [Table 7-214](#).

Return to [Summary Table](#).

ASF Interrupt Status Register. This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_int_fatal or asf_int_nonfatal signal will be asserted. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register.

Table 7-213. DSI_ASF_INT_STATUS Instances

| Instance | Physical Address |
|--------------------------------------|------------------|
| DSS_DSI0_DSI_TOP_VBUSP_CFG_DSI_0_DSI | 0480 0200h |

7.2.85 DSI_ASF_FATAL_NONFATAL_SELECT Register (Offset = 210h) [reset = 7Fh]

DSI_ASF_FATAL_NONFATAL_SELECT is shown in [Figure 7-101](#) and described in [Table 7-222](#).

Return to [Summary Table](#).

The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered.

Table 7-221. DSI_ASF_FATAL_NONFATAL_SELECT Instances

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

8.2.5 EDP_ECC_DSC_SEC_EOI_REG Register (Offset = 203Ch) [reset = X]

EDP_ECC_DSC_SEC_EOI_REG is shown in [Figure 8-21](#) and described in [Table 8-46](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

8.2.9 EDP_ECC_DSC_DED_EOI_REG Register (Offset = 213Ch) [reset = X]

EDP_ECC_DSC_DED_EOI_REG is shown in [Figure 8-25](#) and described in [Table 8-54](#).

Return to [Summary Table](#).

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

| R-8h | | | | | R-1h | | | R-0h | | R-0h | | | | | |

LEGEND: R = Read Only; -n = value after reset

Table 8-106. EDP_REVISION Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|--------|------|-------|---|
| 31-30 | SCHEME | R | 1h | Used to distinguish between old scheme and new scheme. Spare bit to encode future schemes |
| 29-28 | BU | R | 2h | BU indicator DSPS ==> 0x0 WTBU ==> 0x1 Processors ==> 0x2 |
| 27-16 | FUNC | R | 40Ch | Function indicates a software compatible module family. If there is no level of software compatibility a new FUNC number, and hence PID, should be assigned. |
| 15-11 | RTL | R | 8h | RTL Version. R as described in PDR with additional clarifications and definitions below. Must be easily ECO-able or controlled during fabrication. Ideally through a top level metal mask or e-fuse. This number is maintained/owned by IP design owner. RTL follows a numbering such as X.Y.R.Z which are explained in this table. R changes ONLY when : (1) PDS uploads occur which may have been due to spec changes (2) Bug fixes occur (3) Resets to '0' when X or Y changes. Design team has an internal 'Z' (customer invisible) number which increments on every drop that happens due to DV and RTL updates. Z resets to 0 when R increments. |

Table 8-106. EDP_REVISION Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|------|--------|------|-------|--|
| 10-8 | MAJOR | R | 1h | <p>Major EDP_REVISION.</p> <p>X as described in PDR with additional clarifications/definitions below.</p> <p>This number is owned/maintained by IP specification owner.</p> <p>X is part of IP numbering X.Y.R.Z. X changes ONLY when:</p> <p>(1) There is a major feature addition.</p> <p>An example would be adding Master Mode to Utopia Level2.</p> <p>The Func field (or Class/Type in old PID format) will remain the same.</p> <p>X does NOT change due to:</p> <p>(1) Bug fixes</p> <p>(2) Change in feature parameters.\n</p> |
| 7-6 | CUSTOM | R | 0h | <p>Indicates a special version for a particular device.</p> <p>Consequence of use may avoid use of standard Chip Support Library (CSL) / Drivers.</p> <p>0 if non-c ustom.</p> |
| 5-0 | MINOR | R | 0h | <p>Minor EDP_REVISION.</p> <p>Y as described in PDR with additional clarifications/definitions below.</p> <p>This number is owned/maintained by IP specification owner.</p> <p>Y changes ONLY when:</p> <p>(1) Features are scaled (up or down).</p> <p>Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available.</p> <p>(2) When feature creeps from Is-Not list to Is list.</p> <p>But this may not be the case once it sees silicon - in which case X will change.</p> <p>Y does NOT change due to :</p> <p>(1) Bug fixes</p> <p>(2) Typos or clarifications</p> <p>(3) major functional/feature change/addition/deletion.</p> <p>Instead these changes may be reflected via R, S, X as applicable.</p> <p>Spec owner maintains a customer-invisible number 'S' which changes due to:</p> <p>(1) Typos/clarifications</p> <p>(2) Bug documentation.</p> <p>Note that this bug is not due to a spec change but due to implementation.</p> <p>Nevertheless, the spec tracks the IP bugs.</p> <p>An RTL release (say for silicon PG1.1) that occurs due to bug fix should document the corresponding spec number (X.Y.S) in its release notes.</p> |

8.4.2 EDP_DPTX_IPCFG Register (Offset = 4h) [reset = X]

EDP_DPTX_IPCFG is shown in [Figure 8-50](#) and described in [Table 8-108](#).

Return to [Summary Table](#).

The EDP_DPTX_IPCFG Register - Configures DPTX Core security mode and fw memory clock enable.

Table 8-107. EDP_DPTX_IPCFG Instances

| Instance | Physical Address |
|----------------------|------------------|
| DSS_EDP0_INTG_CFG_VP | 04F4 0004h |

Table 8-108. EDP_DPTX_IPCFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|-------------------------|------|-------|---|
| 31-2 | RESERVED | R/W | X | |
| 1 | FW_MEM_CLK_EN | R/W | 1h | DPTX firmware memory (I/Dram) clock enable (set to 1 by default after a reset) 0: Disable Clock (can be set to 0 when not in use for power saving) 1: Enable Clock (must for normal operation) |
| 0 | APB_SECURE_REG_BLOCK_EN | R/W | 0h | DPTX - APB secure region access block enable mode 0: Not Enabled (full access to DPTX memory space including uCPU FW memory regions are permitted) 1: Enabled (only Mailbox and non-secure APB region accesses are permitted via APB). On reset, this bit is set 0 to allow FW to be loaded during the initial configuration. To prevent any tempering of the FW and other secure regions, this bit should be set to 1 (if the configuration firewall setting allows access by a non-secure host) to limit the access only to the mailbox and general cfg space by APB accesses |

8.4.3 EDP_ECC_MEM_CFG Register (Offset = 8h) [reset = X]

EDP_ECC_MEM_CFG is shown in [Figure 8-51](#) and described in [Table 8-110](#).

Return to [Summary Table](#).

The EDP_ECC_MEM_CFG Register - Enables clocks to the ECC-aggregator/memories for ECC logic access. The setting of 1 forces the functional clock gating to be bypassed during memory ECC CTRL/Aggregator accesses during ECC diagnostic mode.

Table 8-109. EDP_ECC_MEM_CFG Instances

| Instance | Physical Address |

|------|----------|------|-------|--|
| 31-1 | RESERVED | R/W | X | |
| 0 | CLK_EN | R/W | 0h | Clk Force Enable for ECC access 0: Disable 1: Enable (all clock gatings for the ECC memories/aggregator are bypassed). PHY/IO clocks may not be running during the ECC access. These clocks will still be off even when this parameter is set to 1 |

8.4.4 EDP_DPTX_DSC_CFG Register (Offset = Ch) [reset = X]

EDP_DPTX_DSC_CFG is shown in [Figure 8-52](#) and described in [Table 8-112](#).

Return to [Summary Table](#).

The EDP_DPTX_DSC_CFG Register - Configures DSC usaged of the DPTX Core. The settings are used by the wrapper to control the source clock gating for DSC sub-module and also to force enable vif memory clocks as necessary.

Table 8-111. EDP_DPTX_DSC_CFG Instances

| Instance | Physical Address |
|----------------------|------------------|

Table 8-112. EDP_DPTX_DSC_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------------|------|-------|---|
| 31-7 | RESERVED | R/W | X | |
| 6 | DSC_1_10BPC | R/W | 0h | DPTX - DSC encoder 1 - 10-bit input enable 0: 8-bit (default) 1: 10-bit This setting must match the DSC_ENC1 input_bpc[0] configuration |
| 5 | DSC_0_10BPC | R/W | 0h | DPTX - DSC encoder 0 - 10-bit input enable 0: 8-bit (default)\n 1: 10-bit This setting must match the DSC_ENC0 input_bpc[0] configuration |
| 4 | BOTH_CLK_EN | R/W | 0h | DPTX - DSC force both clock on whenever DSC is active 0: Disabled (Normal setting - DSC clock enable is controlled based on mode_sel) 1: Enabled (Reserved) |
| 3 | RESERVED | R/W | X | |
| 2 | SPLIT_PANEL_EN | R/W | 0h | DPTX - DSC encoder mode select 0: Dual Panel (two independent streams) 1: Split Panel (L/R channels of a single source In Split Panel mode, the selected vif_0 and vif_1 stream must be "video timing" synchronized. Both split/dual panel modes require clocks to be in sync/phase.) |

Table 8-112. EDP_DPTX_DSC_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------|------|-------|--|
| 1-0 | MODE_SEL | R/W | 0h | DPTX - DSC encoder mode select 2'b00: Both encoders Disabled (not used) 2'b01: Single Encoder (only enc0 is used) 2'b1x: Both Encoders Enabled When both Encoders are enabled, it can either be in split panel or dual panel mode. |

8.4.5 EDP_DPTX_SRC_CFG Register (Offset = 10h) [reset = X]

EDP_DPTX_SRC_CFG is shown in [Figure 8-53](#) and described in [Table 8-114](#).

Return to [Summary Table](#).

The EDP_DPTX_SRC_CFG Register - Configures VIF and AIF port channel enables (for memory clock gating) and VIF source mux selection (for mapping DPI to VIF ports). \n\nThe VIF_#_en also enables the clock for the # channel PIF memory. If a PIF channel is enabled, the vif_#_en must be set regardless of whether the associated video channel has the video enabled or not.\n\nNote that these settings are only used in the K3_DSS_eDP wrapper level (for controlling the memory clocks). The DPTX core requires separate configuration for enabling the video/audio streams for transmission. The enable settings between the core and wrapper should match for proper operation.

Table 8-113. EDP_DPTX_SRC_CFG Instances

| Instance | Physical Address |

8.4.6 EDP_DPTX_VIF_SECURE_MODE_CFG Register (Offset = 14h) [reset = X]

EDP_DPTX_VIF_SECURE_MODE_CFG is shown in [Figure 8-54](#) and described in [Table 8-116](#).

Return to [Summary Table](#).

The EDP_DPTX_VIF_SECURE_MODE_CFG Register - Configures the security level of the VIF channel (for protecting secure content from going to a non-protected display interface). \nWhen a VIF channel is configured as "non-secure", the K3_DSS_eDP wrapper prevents secure DPI source data to be mapped to the VIF input. When this condition is detected, the wrapper forces the VIF source input to be 0x0. Therefore, if the DPI source from DSS is "secure", then the mapped VIF channel must also be configured as "secure".

8.4.7 EDP_DPTX_VIF_CONN_STATUS Register (Offset = 18h) [reset = X]

EDP_DPTX_VIF_CONN_STATUS is shown in [Figure 8-55](#) and described in [Table 8-118](#).

Return to [Summary Table](#).

The EDP_DPTX_VIF_CONN_STATUS Register - Returns the status of DPI-VIF connection based on the security mode check.
 0 indicates that the connection is allowed
 1 indicates that the connection is not allowed due to security setting mismatch
 When a security mode mismatch is found on a VIF input channel, the source data signals for the channel are forced to 0 - resulting in black color output

Table 8-117. EDP_DPTX_VIF_CONN_STATUS Instances

8.5.18 EDP_CORE_SW_EVENTS0_P Register (Offset = 44h) [reset = 0h]

EDP_CORE_SW_EVENTS0_P is shown in [Figure 8-74](#) and described in [Table 8-158](#).

Return to [Summary Table](#).

Bits [7:0] of the software events status vector. This register is used to report internal events that have been detected by the firmware to the host processor. Register is written by the internal uCPU. It is cleared upon read by the Host processor. Reported events can be source of interrupt reported in APB_INT_STATUS[1] register if this interrupt is enabled.

Detailed description of the currently supported events can be found in HD Display TX Controller Programming Interface document.

| Bit | Field | Type | Reset | Description |
|------|---------------------------------|------|-------|--|
| 31-3 | RESERVED | R | 0h | Reserved. Writes are ignored. 0x0 when read. |
| 2 | AUX_HOST_TRANSMIT_I MMEDIATE | R/W | 1h | This bit is used only in DP_OUT mode. If SET, a transaction that comes from the adapter will be sent immediately without waiting for send_external_transaction pulse. If CLEAR, the MC controls the traffic to/from the adapter. |
| 1 | AUX_HOST_PRECHARG E_ENABLE | R/W | 0h | According to the current standard the tx precharge is done by sending 10 to 16 data_0 on the line before the SYNC. Old standard define the precharge by forcing the AFE to be in precharge mode before transmitting the SYNC. |
| 0 | AUX_HOST_ALWAYS_RE AD | R/W | 0h | Normally, the aux_rx is disabled during transmit. Setting this bit allow loopback operation and all transmit transactions will go to the receiver. Used for debug purpose. |

8.5.108 EDP_CORE_DP_AUX_INTERRUPT_SOURCE_P Register (Offset = 2804h) [reset = 0h]

Table 8-512. EDP_CORE_DP_BLOCK_SDP_P_j Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|--------------------|------|-------|---|
| 31 | BS_SDP_STOP_OVR_EN | R/W | 0h | Enable override settings. If this bit is not set, the hardware will not automatically block SDP transmission during video lines, this may result in shifting of video timing. |
| 30-16 | BS_SDP_STOP_ACTIVE | R/W | 0h | Block SDP scheduling after specified cycles after BS during horizontal blank lines. Maximum is 32767. If set to 0, no SDPs will be transmitted during hblank. Only used when bs_sdp_stop_ovr_en is set to 1. |
| 15-0 | BS_SDP_STOP_BLANK | R/W | 0h | Block SDP scheduling after specified cycles after BS during vertical blank lines. Maximum is 65535. If set to 0, no SDPs will be transmitted during vblank. Only used when bs_sdp_stop_ovr_en is set to 1. |

8.5.196 EDP_CORE_DP_MST_SLOT_ALLOCATE_P_J Register (Offset = 3044h + formula) [reset = 0h]

EDP_CORE_DP_MST_SLOT_ALLOCATE_P_J is shown in [Figure 8-252](#) and described in [Table 8-514](#).

Return to [Summary Table](#).

Stream slots allocation in MST mode. This register defines slots in the MTP assigned to a given stream. All slots between start and end are assigned to the stream. Assignment of noncontiguous slots to a single stream is not supported.

Offset = 3044h + (j * 80h); where j = 0h to 3h

8.5.226 EDP_CORE_ASF_FATAL_NONFATAL_SELECT Register (Offset = 00030B10h) [reset = 7Fh]

EDP_CORE_ASF_FATAL_NONFATAL_SELECT is shown in [Figure 8-282](#) and described in [Table 8-574](#).

Return to [Summary Table](#).

The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered.

Table 8-592. EDP_CORE_COM_MAIN_CONF_P Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|---------------------------|------|-------|--|
| 31-7 | RESERVED | R | 0h | Reserved. Writes are ignored. 0x0 when read |
| 6 | AUTO_REGS_DB_UPDATE | R/W | 0h | Active-High to enable auto update double buffer regs on vsync falling edge. Only available when input_mode=1 [DPI mode] |
| 5 | MULTIPLEX_MODE_EOC_ENABLE | R/W | 0h | When split_panel and multiplex_mode are set, indicates that multiplexer output separated chunks [inserts zeros on partial words at each end of chunk] and signal end of chunks. Active high |
| 4 | INPUT_MODE | R/W | 0h | Video input interface mode: 0: Native 1: DPI. Input mode set to DPI automatically enable the internal Auto Start Of Frame |
| 3 | REGS_DE_RASTER_ENABLE | R/W | 0h | Indicates if the De-Rasterization Buffer is used or bypassed: '1' Active '0' Bypassed |
| 2 | REGS_MULTIPLEX_SEL_OUT | R/W | 0h | When split_panel and multiplex_mode are set, indicates to which output the multiplexed stream is sent: '0': enc0_data_out '1': enc1_data_out |

Table 8-592. EDP_CORE_COM_MAIN_CONF_P Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|---------------------|------|-------|---|
| 1 | REGS_MULTIPLEX_MODE | R/W | 0h | Active-High, indicates that both encoders are used to produce a multiplex stream on a single Transport link. When set, split_panel must also be set. |
| 0 | REGS_SPLIT_PANEL | R/W | 0h | Active-High, indicates that both encoders are used in parallel for one video stream [L and R split]. When set, the effective width of each encoder is halved [as each encoder is operating on half of the encx_picture_width]. In addition, the ICH is cleared at the end of each line. |

EOI Register

The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. The software interrupt handler must write to the EOI register at the end of the current interrupt processing routine, so that new events can re-trigger the pulse interrupt signal again. For level interrupt signals the EOI register is not functional and must not be used.

9.26 CSI_RX_IF_VBUS2APB Registers

Table 9-53 lists the memory-mapped registers for the CSI_RX_IF_VBUS2APB registers. All register offset addresses not listed in Table 9-53 should be considered as reserved locations and the register contents should not be modified.

Table 9-52. CSI_RX_IF_VBUS2APB Instances

| Instance | Base Address |
|---------------------|--------------|
| CSI_RX_IF_VBUS2APB0 | 0450 4000h |
| CSI_RX_IF_VBUS2APB1 | 0451 4000h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|---|---|---|
| 0h | CSI_RX_IF_VBUS2APB_DEVICE_CONFIG | This register provides information related to the current configuration. This should be read by FW to determine the number of streams available and other associated parameters that will influence how the device should be controlled. | 0450 4000h | 0451 4000h |
| 4h | CSI_RX_IF_VBUS2APB_SOFT_RESET | CSI2 Slave Controller Individual Soft Reset for Front and Protocol blocks. Writing to these registers will cause a single cycle pulse to be applied to the soft reset signals. Soft reset must only be applied when the associated clocks are running. These are used to recover from error conditions and should not be required during normal operation. | 0450 4004h | 0451 4004h |
| 8h | CSI_RX_IF_VBUS2APB_STATIC_CFG | Configuration register to set the physical/logical DPHY lane mapping, the number of lanes being used, external DPHY selection and ECC support for CSI2RX v2.0. This register should be set prior to enabling the streams and must not be updated when the stream is running. | 0450 4008h | 0451 4008h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|---|---|---|
| 10h | CSI_RX_IF_VBUS2APB_ERROR_BYPASS_CFG | Error detection event flag configuration. This allows various error conditions to be masked that would normally prevent data being applied to the pixel interface. This applies to ALL streams that are enabled. This register should only be modified while the datapath is disabled. In case this register is modified while the datapath is enabled, the behavior on the current frame is unpredictable. Hard reset value is 0x00000000, meaning all error masking is disabled. | 0450 4010h | 0451 4010h |
| 18h | CSI_RX_IF_VBUS2APB_MONITOR_IRQS | Information type Interrupt status (non-error conditions) | 0450 4018h | 0451 4018h |
| 1Ch | CSI_RX_IF_VBUS2APB_MONITOR_IRQS_MASK_CFG | Monitor interrupt mask. Bit addressable mask register in order to independently enable each event to trigger the monitor_irq line. Only events whose corresponding bit is set to 1 can trigger the interruption line. Hard reset is 0x00000000, i.e. interrupt line disabled | 0450 401Ch | 0451 401Ch |
| 20h | CSI_RX_IF_VBUS2APB_INFO_IRQS | Information type Interrupt status (non-error conditions) | 0450 4020h | 0451 4020h |
| 24h | CSI_RX_IF_VBUS2APB_INFO_IRQS_MASK_CFG | Information interrupt mask. Bit addressable mask register in order to independently enable each event to trigger the info_irq line. Only events whose corresponding bit is set to 1 can trigger the interruption line. Hard reset is 0x00000000, i.e. interrupt line disabled | 0450 4024h | 0451 4024h |
| 28h | CSI_RX_IF_VBUS2APB_ERROR_IRQS | Datapath error interrupt status. Provides information about data path errors. The host processor can read the interrupt status register to identify the root cause of the event, typically after that the csi2rx_err_irq interrupt line is raised | 0450 4028h | 0451 4028h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 2Ch | CSI_RX_IF_VBUS2APB_ERROR_IRQS_MASK_CFG | Datapath error interrupt enable Bits. This register is used to independently enable each event to trigger the err_irq interrupt line. Only events whose corresponding enable bit is set to 1 can trigger the interrupt line. Hard reset is 0x00000000, i.e. all interrupt lines are disabled | 0450 402Ch | 0451 402Ch |
| 40h | CSI_RX_IF_VBUS2APB_DPHY_LANE_CONTROL | DPHY lane control for data and clock lanes enables and resets | 0450 4040h | 0451 4040h |
| 48h | CSI_RX_IF_VBUS2APB_DPHY_STATUS | DPHY Clock and Data Lane mode status | 0450 4048h | 0451 4048h |
| 4Ch | CSI_RX_IF_VBUS2APB_DPHY_ERR_STATUS_IRQ | DPHY error interrupt status | 0450 404Ch | 0451 404Ch |
| 50h | CSI_RX_IF_VBUS2APB_DPHY_ERR_IRQ_MASK_CFG | DPHY error interrupt status | 0450 4050h | 0451 4050h |
| 60h | CSI_RX_IF_VBUS2APB_INTEGRATION_DEBUG | Used to observe the current data field, extracted by the protocol block from the last short packet data field and FSM state. FSM states are one-hot. It also indicates what data type and virtual channels were used for that short packet. This is primarily used during error condition debug. Since the data can come from asynchronous domains the data coherency cannot be relied upon. | 0450 4060h | 0451 4060h |
| 74h | CSI_RX_IF_VBUS2APB_ERROR_DEBUG | Error condition debug. After an error is detected by the CSI2RX, this register indicates which virtual channel, datatype and data field is impacted. | 0450 4074h | 0451 4074h |
| 80h | CSI_RX_IF_VBUS2APB_TEST_GENERIC | Generic test control and status register that controls and reads primary I/O. | 0450 4080h | 0451 4080h |
| 100h | CSI_RX_IF_VBUS2APB_STREAM0_CTRL | CSI2RX Stream Data output datapath control. Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started. | 0450 4100h | 0451 4100h |
| 104h | CSI_RX_IF_VBUS2APB_STREAM0_STATUS | CSI2 Slave Controller Status. Contains useful debug information such as FSM states. | 0450 4104h | 0451 4104h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 108h | CSI_RX_IF_VBUS2APB_STREAM0_DATA_CFG | Secondary CSI2 Slave Controller Data outputs configuration. This register is used to configure the data types and virtual channels are processed and output by this stream. | 0450 4108h | 0451 4108h |
| 10Ch | CSI_RX_IF_VBUS2APB_STREAM0_CFG | Primary CSI2 Slave Controller Data pixel outputs configuration. This register is used to configure the output mode. It is also used to set up some Stream FIFO related settings. | 0450 410Ch | 0451 410Ch |
| 110h | CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_CTRL | Stream Monitor configuration. This register is used to configure the CSI2RX Monitors: Programmable Frame monitor to trigger an event if a truncated frame is detected, Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end, Programmable line/byte counters to trigger an event at a specific byte in a line. This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event. This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled. In these cases, the behaviour is unpredictable. Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0. | 0450 4110h | 0451 4110h |
| 114h | CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_FRAME | Stream Monitor Frame. Used to observe the current frame number and packet size on monitored virtual channels. These values are extracted by the CSI2RX from the last frame start short packet data field. | 0450 4114h | 0451 4114h |
| 118h | CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_LB | Stream Monitor Line. Used to specify the byte and line numbers that will generate an interrupt. This register must only be modified when the corresponding line/byte enable is disabled. | 0450 4118h | 0451 4118h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 11Ch | CSI_RX_IF_VBUS2APB_STREAM0_TIMER | Stream Timer. Used to specify the number of clock cycles until the interrupt is triggered after frame start or frame end. This register must only be modified when the corresponding timer enable is disabled. | 0450 411Ch | 0451 411Ch |
| 120h | CSI_RX_IF_VBUS2APB_STREAM0_FCC_CFG | Stream Frame Capture Control configuration. Used to specify the frame count value when the CSI2RX must generate interrupts FCC_START and FCC_STOP. This register must only be modified when the corresponding frame count enable is disabled. | 0450 4120h | 0451 4120h |
| 124h | CSI_RX_IF_VBUS2APB_STREAM0_FCC_CTRL | Stream Frame Capture Counter control. Used to enable / disable the FCC and specify which virtual channel it should operate on. | 0450 4124h | 0451 4124h |
| 128h | CSI_RX_IF_VBUS2APB_STREAM0_FIFO_FILL_LVL | Stream FIFO fill level monitor. This can operate in 2 modes: 1 - Monitor peak fill level until the stream is stopped. 2 - Monitor peak fill level when the first FIFO read is made during a frame. | 0450 4128h | 0451 4128h |
| 200h | CSI_RX_IF_VBUS2APB_STREAM1_CTRL | CSI2RX Stream Data output datapath control. Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started. | 0450 4200h | 0451 4200h |
| 204h | CSI_RX_IF_VBUS2APB_STREAM1_STATUS | CSI2 Slave Controller Status. Contains useful debug information such as FSM states. | 0450 4204h | 0451 4204h |
| 208h | CSI_RX_IF_VBUS2APB_STREAM1_DATA_CFG | Secondary CSI2 Slave Controller Data outputs configuration. This register is used to configure the data types and virtual channels are processed and output by this stream. | 0450 4208h | 0451 4208h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 20Ch | CSI_RX_IF_VBUS2APB_STREAM1_CFG | Primary CSI2 Slave Controller Data pixel outputs configuration. This register is used to configure the output mode. It is also used to set up some Stream FIFO related settings. | 0450 420Ch | 0451 420Ch |
| 210h | CSI_RX_IF_VBUS2APB_STREAM1_MONITOR_CTRL | Stream Monitor configuration. This register is used to configure the CSI2RX Monitors: Programmable Frame monitor to trigger an event if a truncated frame is detected, Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end, Programmable line/byte counters to trigger an event at a specific byte in a line. This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event. This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled. In these cases, the behaviour is unpredictable. Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0. | 0450 4210h | 0451 4210h |
| 214h | CSI_RX_IF_VBUS2APB_STREAM1_MONITOR_FRAME | Stream Monitor Frame. Used to observe the current frame number and packet size on monitored virtual channels. These values are extracted by the CSI2RX from the last frame start short packet data field. | 0450 4214h | 0451 4214h |
| 218h | CSI_RX_IF_VBUS2APB_STREAM1_MONITOR_LB | Stream Monitor Line. Used to specify the byte and line numbers that will generate an interrupt. This register must only be modified when the corresponding line/byte enable is disabled. | 0450 4218h | 0451 4218h |
| 21Ch | CSI_RX_IF_VBUS2APB_STREAM1_TIMER | Stream Timer. Used to specify the number of clock cycles until the interrupt is triggered after frame start or frame end. This register must only be modified when the corresponding timer enable is disabled. | 0450 421Ch | 0451 421Ch |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 220h | CSI_RX_IF_VBUS2APB_STREAM1_FCC_CFG | Stream Frame Capture Control configuration. Used to specify the frame count value when the CSI2RX must generate interrupts FCC_START and FCC_STOP. This register must only be modified when the corresponding frame count enable is disabled. | 0450 4220h | 0451 4220h |
| 224h | CSI_RX_IF_VBUS2APB_STREAM1_FCC_CTRL | Stream Frame Capture Counter control. Used to enable / disable the FCC and specify which virtual channel it should operate on. | 0450 4224h | 0451 4224h |
| 228h | CSI_RX_IF_VBUS2APB_STREAM1_FIFO_FILL_LVL | Stream FIFO fill level monitor. This can operate in 2 modes: 1 - Monitor peak fill level until the stream is stopped. 2 - Monitor peak fill level when the first FIFO read is made during a frame. | 0450 4228h | 0451 4228h |
| 300h | CSI_RX_IF_VBUS2APB_STREAM2_CTRL | CSI2RX Stream Data output datapath control. Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started. | 0450 4300h | 0451 4300h |
| 304h | CSI_RX_IF_VBUS2APB_STREAM2_STATUS | CSI2 Slave Controller Status. Contains useful debug information such as FSM states. | 0450 4304h | 0451 4304h |
| 308h | CSI_RX_IF_VBUS2APB_STREAM2_DATA_CFG | Secondary CSI2 Slave Controller Data outputs configuration. This register is used to configure the data types and virtual channels are processed and output by this stream. | 0450 4308h | 0451 4308h |
| 30Ch | CSI_RX_IF_VBUS2APB_STREAM2_CFG | Primary CSI2 Slave Controller Data pixel outputs configuration. This register is used to configure the output mode. It is also used to set up some Stream FIFO related settings. | 0450 430Ch | 0451 430Ch |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|---|---|---|
| 310h | CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_CTRL | Stream Monitor configuration. This register is used to configure the CSI2RX Monitors: Programmable Frame monitor to trigger an event if a truncated frame is detected, Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end, Programmable line/byte counters to trigger an event at a specific byte in a line. This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event. This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled. In these cases, the behaviour is unpredictable. Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0. | 0450 4310h | 0451 4310h |
| 314h | CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_FRAME | Stream Monitor Frame. Used to observe the current frame number and packet size on monitored virtual channels. These values are extracted by the CSI2RX from the last frame start short packet data field. | 0450 4314h | 0451 4314h |
| 318h | CSI_RX_IF_VBUS2APB_STREAM2_MONITOR_LB | Stream Monitor Line. Used to specify the byte and line numbers that will generate an interrupt. This register must only be modified when the corresponding line/byte enable is disabled. | 0450 4318h | 0451 4318h |
| 31Ch | CSI_RX_IF_VBUS2APB_STREAM2_TIMER | Stream Timer. Used to specify the number of clock cycles until the interrupt is triggered after frame start or frame end. This register must only be modified when the corresponding timer enable is disabled. | 0450 431Ch | 0451 431Ch |
| 320h | CSI_RX_IF_VBUS2APB_STREAM2_FCC_CFG | Stream Frame Capture Control configuration. Used to specify the frame count value when the CSI2RX must generate interrupts FCC_START and FCC_STOP. This register must only be modified when the corresponding frame count enable is disabled. | 0450 4320h | 0451 4320h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 324h | CSI_RX_IF_VBUS2APB_STREAM2_FCC_CTRL | Stream Frame Capture Counter control. Used to enable / disable the FCC and specify which virtual channel it should operate on. | 0450 4324h | 0451 4324h |
| 328h | CSI_RX_IF_VBUS2APB_STREAM2_FIFO_FILL_LVL | Stream FIFO fill level monitor. This can operate in 2 modes: 1 - Monitor peak fill level until the stream is stopped. 2 - Monitor peak fill level when the first FIFO read is made during a frame. | 0450 4328h | 0451 4328h |
| 400h | CSI_RX_IF_VBUS2APB_STREAM3_CTRL | CSI2RX Stream Data output datapath control. Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started. | 0450 4400h | 0451 4400h |

In these cases, the behaviour is unpredictable. Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0. | 0450 4410h | 0451 4410h |
| 414h | CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_FRAME | Stream Monitor Frame. Used to observe the current frame number and packet size on monitored virtual channels. These values are extracted by the CSI2RX from the last frame start short packet data field. | 0450 4414h | 0451 4414h |
| 418h | CSI_RX_IF_VBUS2APB_STREAM3_MONITOR_LB | Stream Monitor Line. Used to specify the byte and line numbers that will generate an interrupt. This register must only be modified when the corresponding line/byte enable is disabled. | 0450 4418h | 0451 4418h |
| 41Ch | CSI_RX_IF_VBUS2APB_STREAM3_TIMER | Stream Timer. Used to specify the number of clock cycles until the interrupt is triggered after frame start or frame end. This register must only be modified when the corresponding timer enable is disabled. | 0450 441Ch | 0451 441Ch |
| 420h | CSI_RX_IF_VBUS2APB_STREAM3_FCC_CFG | Stream Frame Capture Control configuration. Used to specify the frame count value when the CSI2RX must generate interrupts FCC_START and FCC_STOP. This register must only be modified when the corresponding frame count enable is disabled. | 0450 4420h | 0451 4420h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|--|---|---|
| 424h | CSI_RX_IF_VBUS2APB_STREAM3_FCC_CTRL | Stream Frame Capture Counter control. Used to enable / disable the FCC and specify which virtual channel it should operate on. | 0450 4424h | 0451 4424h |
| 428h | CSI_RX_IF_VBUS2APB_STREAM3_FIFO_FILL_LVL | Stream FIFO fill level monitor. This can operate in 2 modes: 1 - Monitor peak fill level until the stream is stopped. 2 - Monitor peak fill level when the first FIFO read is made during a frame. | 0450 4428h | 0451 4428h |
| 900h | CSI_RX_IF_VBUS2APB_ASF_INT_STATUS | ASF Interrupt Status Register. This register indicates the source of ASF interrupts. The corresponding bit in the mask register must be clear for a bit to be set. If any bit is set in this register the asf_int_fatal or asf_int_nonfatal signal will be asserted. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register. | 0450 4900h | 0451 4900h |
| 904h | CSI_RX_IF_VBUS2APB_ASF_INT_RAW_STATUS | ASF Interrupt Raw Status Register. A bit set in this raw register indicates a source of ASF fault in the corresponding feature. Writing to either raw or masked status registers, clear both registers. For test purposes, trigger signal interrupt event by writing to the ASF interrupt status test register. | 0450 4904h | 0451 4904h |
| 908h | CSI_RX_IF_VBUS2APB_ASF_INT_MASK | The ASF interrupt mask register indicating which interrupt bits in the ASF interrupt status register are masked. All bits are set at reset. Clear the individual bit to enable the corresponding interrupt. | 0450 4908h | 0451 4908h |
| 90Ch | CSI_RX_IF_VBUS2APB_ASF_INT_TEST | The ASF interrupt test register emulate hardware even. Write one to individual bit to trigger single event in (masked and raw) status registers according to mask and will generate interrupt accordingly. | 0450 490Ch | 0451 490Ch |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|---|---|---|
| 910h | CSI_RX_IF_VBUS2APB_ASF_FATAL_NONFATAL_SELECT | The fatal or non-fatal interrupt register selects whether a fatal (asf_int_fatal) or non-fatal (asf_int_nonfatal) interrupt is triggered. If the bit of the event will be set to one then fatal interrupt (asf_int_fatal) will be triggered. Otherwise the non-fatal interrupt (asf_int_nonfatal) will be triggered. | 0450 4910h | 0451 4910h |
| 920h | CSI_RX_IF_VBUS2APB_ASF_SRAM_CORR_FAULT_STATU S | Status register for SRAM correctable fault. These fields are updated whenever asf_sram_corr_fault input is active. | 0450 4920h | 0451 4920h |
| 924h | CSI_RX_IF_VBUS2APB_ASF_SRAM_UNCORR_FAULT_ST ATUS | Status register for SRAM uncorrectable fault. These fields are updated whenever asf_sram_uncorr_fault input is active. | 0450 4924h | 0451 4924h |
| 928h | CSI_RX_IF_VBUS2APB_ASF_SRAM_FAULT_STATS | Statistics register for SRAM faults. Note that this register clears when software writes to any field. | 0450 4928h | 0451 4928h |
| 930h | CSI_RX_IF_VBUS2APB_ASF_TRANS_TO_CTRL | Control register to configure the ASF transaction timeout monitors. | 0450 4930h | 0451 4930h |
| 934h | CSI_RX_IF_VBUS2APB_ASF_TRANS_TO_FAULT_MASK | Control register to mask out ASF transaction timeout faults from triggering interrupts. On reset, all bits are set to mask out all sources. Clear the corresponding bit to enable the interrupt source. The width of this field is parameterisable and the bit definitions are implementation specific. | 0450 4934h | 0451 4934h |
| 938h | CSI_RX_IF_VBUS2APB_ASF_TRANS_TO_FAULT_STATUS | Status register for transaction timeouts fault. If a fault occurs the revelant status bit will be set to 1. Each bit can be cleared by software writing 1 to each bit. | 0450 4938h | 0451 4938h |
| 940h | CSI_RX_IF_VBUS2APB_ASF_PROTOCOL_FAULT_MASK | Control register to mask out ASF Protocol faults from triggering interrupts. On reset, all bits are set to mask out all sources. Clear the corresponding bit to enable the interrupt source. The width of this field is parameterisable and the bit definitions are implementation specific. | 0450 4940h | 0451 4940h |
| 944h | CSI_RX_IF_VBUS2APB_ASF_PROTOCOL_FAULT_STATUS | Status register for protocol faults. If a fault occurs the revelant status bit will be set to 1. Each bit can be cleared by software writing 1 to each bit | 0450 4944h | 0451 4944h |

Table 9-53. CSI_RX_IF_VBUS2APB Registers (continued)

| Offset | Acronym | Register Name | CSI_RX_IF_VBUS2APB 0 Physical Address | CSI_RX_IF_VBUS2APB 1 Physical Address |
|--------|--|---|---|---|
| FFCh | CSI_RX_IF_VBUS2APB_ID_PROD_VER | <p>This register is hard-coded in order to allow software to identify the product and its release version.</p> <p>The product ID will be fixed for all versions, while the version will be updated as new releases for the CSI2RX product are made.</p> | 0450 4FFCh | 0451 4FFCh |

9.27 CSI_RX_IF_VBUS2APB_DEVICE_CONFIG Register (Offset = 0h) [reset = X]

CSI_RX_IF_VBUS2APB_DEVICE_CONFIG is shown in [Figure 9-24](#) and described in [Table 9-55](#).

Return to [Summary Table](#).

This register provides information related to the current configuration.

This should be read by FW to determine the number of streams available and other associated parameters that will influence how the device should be controlled.

Table 9-54.
CSI_RX_IF_VBUS2APB_DEVICE_CONFIG Instances

9.28 CSI_RX_IF_VBUS2APB_SOFT_RESET Register (Offset = 4h) [reset = X]

CSI_RX_IF_VBUS2APB_SOFT_RESET is shown in [Figure 9-25](#) and described in [Table 9-57](#).

Return to [Summary Table](#).

CSI2 Slave Controller Individual Soft Reset for Front and Protocol blocks.

Writing to these registers will cause a single cycle pulse to be applied to the soft reset signals.

Soft reset must only be applied when the associated clocks are running.

These are used to recover from error conditions and should not be required during normal operation.

Table 9-56. CSI_RX_IF_VBUS2APB_SOFT_RESET Instances

| Instance | Physical Address |
|---------------------|------------------|

9.30 CSI_RX_IF_VBUS2APB_ERROR_BYPASS_CFG Register (Offset = 10h) [reset = X]

CSI_RX_IF_VBUS2APB_ERROR_BYPASS_CFG is shown in [Figure 9-27](#) and described in [Table 9-61](#).

Return to [Summary Table](#).

Error detection event flag configuration.

This allows various error conditions to be masked that would normally prevent data being applied to the pixel interface.

This applies to ALL streams that are enabled.

This register should only be modified while the datapath is disabled.

In case this register is modified while the datapath is enabled, the behavior on the current frame is unpredictable.

Hard reset value is 0x00000000, meaning all error masking is disabled.

Table 9-60.

9.41 CSI_RX_IF_VBUS2APB_INTEGRATION_DEBUG Register (Offset = 60h) [reset = X]

CSI_RX_IF_VBUS2APB_INTEGRATION_DEBUG is shown in [Figure 9-38](#) and described in [Table 9-83](#).

Return to [Summary Table](#).

Used to observe the current data field, extracted by the protocol block from the last short packet data field and FSM state.

FSM states are one-hot.

It also indicates what data type and virtual channels were used for that short packet.

This is primarily used during error condition debug.

Since the data can come from asynchronous domains the data coherency cannot be relied upon.

| 31-16 | STATUS | R | 0h | Test status - Directly reflects, after resynchronisation into the pclk domain, the state of 'test_generic_status' primary inputs. |
| 15-0 | CTRL | R/W | 0h | Test control - Directly controls primary outputs 'test_generic_ctrl' |

9.44 CSI_RX_IF_VBUS2APB_STREAM0_CTRL Register (Offset = 100h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM0_CTRL is shown in [Figure 9-41](#) and described in [Table 9-89](#).

Return to [Summary Table](#).

CSI2RX Stream Data output datapath control.

Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started.

Table 9-88.
CSI_RX_IF_VBUS2APB_STREAM0_CTRL Instances

| Instance | Physical Address |
|---------------------|------------------|
| CSI_RX_IF_VBUS2APB0 | 0450 4100h |

LEGEND: R/W = Read/Write; R/W1C = Read/Write 1 to Clear Bit; W = Write Only; -n = value after reset

Table 9-89. CSI_RX_IF_VBUS2APB_STREAM0_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|-------|-------|--|
| 31-5 | RESERVED | R/W | X | |
| 4 | SOFT_RST | R/W1C | 0h | Writing 1'b1 will apply a synchronous soft reset of this stream registers/FIFO |
| 3 | RESERVED | R/W | X | |
| 2 | ABORT | W | 0h | Writing 1 this register will cause the csi2rx to stop streaming on the corresponding output immediately. This may corrupt the output protocol. stream_abort_irq is generated on completion of the abort operation. |
| 1 | STOP | W | 0h | Writing 1 in this register will cause csi2rx to stop streaming on the corresponding output at the end of the current frame. If the command is issued during frame blanking, then the datapath will immediately stop streaming data on that output. stream_stop_irq is generated on completion of the stop operation. |

Table 9-89. CSI_RX_IF_VBUS2APB_STREAM0_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|--|
| 0 | START | W | 0h | Writing 1 in this register enables the corresponding datapath output. It will start streaming data at the start of the next frame that complies with the output configuration. stream_status[31] running indicates when data stream is enabled. |

9.45 CSI_RX_IF_VBUS2APB_STREAM0_STATUS Register (Offset = 104h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM0_STATUS is shown in [Figure 9-42](#) and described in [Table 9-91](#).

Return to [Summary Table](#).

CSI2 Slave Controller Status. Contains useful debug information such as FSM states.

Table 9-95. CSI_RX_IF_VBUS2APB_STREAM0_CFG Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|------------|------|-------|---|
| 31-16 | FIFO_FILL | R/W | 0h | Set the FIFO_FILL_LEVEL which is used to hold data in the FIFO until this level is reached before allow data to be pulled. This setting is only used when fifo_mode is set for Large Buffer operation |
| 15 | RESERVED | R/W | X | |
| 14-12 | BPP_BYPASS | R/W | 0h | Force unpacking of any Data type as selected RAW type. 0 - No bypass 1 - unpack as RAW6 2 - unpack as RAW7 3 - unpack as RAW8 4 - unpack as RAW10 5 - unpack as RAW12 6 - unpack as RAW14 7 - unpack as RAW16 |
| 11-10 | RESERVED | R/W | X | |

Table 9-95. CSI_RX_IF_VBUS2APB_STREAM0_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-------|--|
| 9-8 | FIFO_MODE | R/W | 0h | Stream FIFO configuration, which must be set in accordance to FIFO sizing, flow control and the relationship between the link and pixel interface data rates. Refer to Use Case descriptions for further guidance on FIFO sizing and valid stream configuration options. 00: Full Line Buffer. Hold data in FIFO until CRC check completes. 01: Large Buffer [Fill Level Controlled]. Hold data in FIFO until FIFO_FILL_LEVEL is reached. 1x: Short Buffer. When pixel output data rate can match link data rate, a small buffer can be used to accommodate CDC, pixel data packing, and data rate matching |
| 7-6 | RESERVED | R/W | X | |
| 5-4 | NUM_PIXELS | R/W | 0h | Number of pixels to output from the stream. Valid values are 1, 2, 4 and 8. The width of the pixel interface and the bits per pixel for the selected datatype will determine how many pixels can be output in a single cycle. Default will be 1 pixel per clock. 00 -> 1 pixel per clock 01 -> 2 pixels per clock 10 -> 4 pixels per clock 11 -> 8 pixels per clock [Reserved] |
| 3-2 | RESERVED | R/W | X | |
| 1 | LS_LE_MODE | R/W | 0h | Enable LS/LE control of HYSNC_VALID output. By default, LS and LE short packets are not required and HYSC_VALID will be generated from the start and end of payload data. |
| 0 | INTERFACE_MODE | R/W | 0h | Select the output configuration. Pixel = 0 [default] Packed = 1 |

9.48 CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_CTRL Register (Offset = 110h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_CTRL is shown in [Figure 9-45](#) and described in [Table 9-97](#).

Return to [Summary Table](#).

Stream Monitor configuration.

This register is used to configure the CSI2RX Monitors:

Programmable Frame monitor to trigger an event if a truncated frame is detected,

Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end,

Programmable line/byte counters to trigger an event at a specific byte in a line.

This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event.

This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled.

In these cases, the behaviour is unpredictable.

Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0.

Table 9-97. CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|-------|--------------|------|-------|---|
| 31-16 | FRAME_LENGTH | R/W | 0h | Indicates the frame length in lines to detect truncated frames. This value must not change while monitor is enabled, i.e. it must only be changed when the frame_mon_en bit is low. 0x0000 means truncated frame detection feature disabled |
| 15 | FRAME_MON_EN | R/W | 0h | Enables monitor. This bit must only be set high after the frame_mon_vc and frame_length have been set. |

Table 9-97. CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-------|--------------|------|-------|--|
| 14-11 | FRAME_MON_VC | R/W | 0h | Indicates virtual channel for monitor. This value must not change while monitor is enabled, i.e. it must only be changed when the frame_mon_en bit is low. |
| 10 | TIMER_EOF | R/W | 0h | Select the starting point of the timer: 0x 0: Start of Frame event on selected virtual channel 0x 1: End of Frame event on selected virtual channel. This value must not change while timer_en is enabled |
| 9 | TIMER_EN | R/W | 0h | Enables timer based interrupt. This bit must only be set high after the timer_eof and timer_vc have been set. |
| 8-5 | TIMER_VC | R/W | 0h | Indicates which VC should be used to generate timer based interrupt. This value must not change while timer_en is enabled. |
| 4 | LB_EN | R/W | 0h | Enables line/byte counter. This bit must only be set high after the lb_vc, line_count and byte_count have been set. |
| 3-0 | LB_VC | R/W | 0h | Indicates which VC should be used to generate line/byte counter interrupt. This value must not change while lb_en is enabled |

9.49 CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_FRAME Register (Offset = 114h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM0_MONITOR_FRAME is shown in [Figure 9-46](#) and described in [Table 9-99](#).

Return to [Summary Table](#).

Stream Monitor Frame.

Used to observe the current frame number and packet size on monitored virtual channels.

These values are extracted by the CSI2RX from the last frame start short packet data field.

9.55 CSI_RX_IF_VBUS2APB_STREAM1_CTRL Register (Offset = 200h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM1_CTRL is shown in [Figure 9-52](#) and described in [Table 9-111](#).

Return to [Summary Table](#).

CSI2RX Stream Data output datapath control.

Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started.

Table 9-110.

| Bit | Field | Type | Reset | Description |
|-------|------------|------|-------|---|
| 31-16 | FIFO_FILL | R/W | 0h | Set the FIFO_FILL_LEVEL which is used to hold data in the FIFO until this level is reached before allow data to be pulled. This setting is only used when fifo_mode is set for Large Buffer operation |
| 15 | RESERVED | R/W | X | |
| 14-12 | BPP_BYPASS | R/W | 0h | Force unpacking of any Data type as selected RAW type. 0 - No bypass 1 - unpack as RAW6 2 - unpack as RAW7 3 - unpack as RAW8 4 - unpack as RAW10 5 - unpack as RAW12 6 - unpack as RAW14 7 - unpack as RAW16 |
| 11-10 | RESERVED | R/W | X | |

Table 9-117. CSI_RX_IF_VBUS2APB_STREAM1_CFG Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|----------------|------|-------|--|
| 9-8 | FIFO_MODE | R/W | 0h | Stream FIFO configuration, which must be set in accordance to FIFO sizing, flow control and the relationship between the link and pixel interface data rates. Refer to Use Case descriptions for further guidance on FIFO sizing and valid stream configuration options. 00: Full Line Buffer. Hold data in FIFO until CRC check completes. 01: Large Buffer [Fill Level Controlled]. Hold data in FIFO until FIFO_FILL_LEVEL is reached. 1x: Short Buffer. When pixel output data rate can match link data rate, a small buffer can be used to accommodate CDC, pixel data packing, and data rate matching |
| 7-6 | RESERVED | R/W | X | |
| 5-4 | NUM_PIXELS | R/W | 0h | Number of pixels to output from the stream. Valid values are 1, 2, 4 and 8. The width of the pixel interface and the bits per pixel for the selected datatype will determine how many pixels can be output in a single cycle. Default will be 1 pixel per clock. 00 -> 1 pixel per clock 01 -> 2 pixels per clock 10 -> 4 pixels per clock 11 -> 8 pixels per clock [Reserved] |
| 3-2 | RESERVED | R/W | X | |
| 1 | LS_LE_MODE | R/W | 0h | Enable LS/LE control of HYSNC_VALID output. By default, LS and LE short packets are not required and HYSC_VALID will be generated from the start and end of payload data. |
| 0 | INTERFACE_MODE | R/W | 0h | Select the output configuration. Pixel = 0 [default] Packed = 1 |

9.59 CSI_RX_IF_VBUS2APB_STREAM1_MONITOR_CTRL Register (Offset = 210h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM1_MONITOR_CTRL is shown in [Figure 9-56](#) and described in [Table 9-119](#).

Return to [Summary Table](#).

Stream Monitor configuration.

This register is used to configure the CSI2RX Monitors:

Programmable Frame monitor to trigger an event if a truncated frame is detected,

Programmable Timer to trigger an event based on a clock cycle counter after a frame start or frame end,

Programmable line/byte counters to trigger an event at a specific byte in a line.

This register is used to enable/disable CSI2RX programmable interrupt, select the virtual channel for each programmable IT and select the point which will trigger the event.

This register should not be modified while the data path is enabled, nor should any of settings be changed when the respective monitor/counter/timer is enabled.

In these cases, the behaviour is unpredictable.

Hard reset value is 0x00000000, all interrupt generators disabled on Virtual Channel 0.

| Bit | Field | Type | Reset | Description |
|-------|------------|------|-------|--|
| 31-16 | LINE_COUNT | R/W | 0h | Indicates the line number to generate an interrupt. [First line of a Frame is line number 0] |
| 15-0 | BYTE_COUNT | R/W | 0h | Indicates the byte number of the line to generate an interrupt. [First byte of a line is byte number 0] |

9.62 CSI_RX_IF_VBUS2APB_STREAM1_TIMER Register (Offset = 21Ch) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM1_TIMER is shown in [Figure 9-59](#) and described in [Table 9-125](#).

Return to [Summary Table](#).

Stream Timer.

Used to specify the number of clock cycles until the interrupt is triggered after frame start or frame end.

This register must only be modified when the corresponding timer enable is disabled.

Table 9-124.

9.63 CSI_RX_IF_VBUS2APB_STREAM1_FCC_CFG Register (Offset = 220h) [reset = 0h]

CSI_RX_IF_VBUS2APB_STREAM1_FCC_CFG is shown in [Figure 9-60](#) and described in [Table 9-127](#).

Return to [Summary Table](#).

Stream Frame Capture Control configuration.

Used to specify the frame count value when the CSI2RX must generate interrupts

FCC_START and FCC_STOP.

This register must only be modified when the corresponding frame count enable is disabled.

Table 9-126.
CSI_RX_IF_VBUS2APB_STREAM1_FCC_CFG
Instances

| Instance | Physical Address |

| 31-16 | FRAME_COUNTER | R | 0h | Current Frame number being processed |
| 15-5 | RESERVED | R/W | X | |
| 4-1 | FCC_VC | R/W | 0h | Indicates which VC should be used to generate FCC interrupts. This value must not change while fcc_en is enabled |
| 0 | FCC_EN | R/W | 0h | Frame Capture Counter enable. |

9.65 CSI_RX_IF_VBUS2APB_STREAM1_FIFO_FILL_LVL Register (Offset = 228h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM1_FIFO_FILL_LVL is shown in [Figure 9-62](#) and described in [Table 9-131](#).

Return to [Summary Table](#).

Stream FIFO fill level monitor. This can operate in 2 modes:

- 1 - Monitor peak fill level until the stream is stopped.
- 2 - Monitor peak fill level when the first FIFO read is made during a frame.

9.66 CSI_RX_IF_VBUS2APB_STREAM2_CTRL Register (Offset = 300h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM2_CTRL is shown in [Figure 9-63](#) and described in [Table 9-133](#).

Return to [Summary Table](#).

CSI2RX Stream Data output datapath control.

Start and Stop commands are independent for each output with the exception of pixel outputs that can never be enabled together. If a pixel output is started while the other is already running, the start command will be ignored. If both pixel outputs are enabled in a single register access, then both start commands are ignored and no pixel output is started.

Table 9-132.
CSI_RX_IF_VBUS2APB_STREAM2_CTRL Instances

| Instance | Physical Address |
|---------------------|------------------|
| CSI_RX_IF_VBUS2APB0 | 0450 4300h |
| CSI_RX_IF_VBUS2APB1 | 0451 4300h |

LEGEND: R/W = Read/Write; R/W1C = Read/Write 1 to Clear Bit; W = Write Only; -n = value after reset

Table 9-133. CSI_RX_IF_VBUS2APB_STREAM2_CTRL Register Field Descriptions

| Bit | Field | Type | Reset | Description |
|------|----------|-------|-------|--|
| 31-5 | RESERVED | R/W | X | |
| 4 | SOFT_RST | R/W1C | 0h | Writing 1'b1 will apply a synchronous soft reset of this stream registers/FIFO |
| 3 | RESERVED | R/W | X | |
| 2 | ABORT | W | 0h | Writing 1 this register will cause the csi2rx to stop streaming on the corresponding output immediately. This may corrupt the output protocol. stream_abort_irq is generated on completion of the abort operation. |
| 1 | STOP | W | 0h | Writing 1 in this register will cause csi2rx to stop streaming on the corresponding output at the end of the current frame. If the command is issued during frame blanking, then the datapath will immediately stop streaming data on that output. stream_stop_irq is generated on completion of the stop operation. |

Table 9-133. CSI_RX_IF_VBUS2APB_STREAM2_CTRL Register Field Descriptions (continued)

| Bit | Field | Type | Reset | Description |
|-----|-------|------|-------|--|
| 0 | START | W | 0h | Writing 1 in this register enables the corresponding datapath output. It will start streaming data at the start of the next frame that complies with the output configuration. stream_status[31] running indicates when data stream is enabled. |

9.67 CSI_RX_IF_VBUS2APB_STREAM2_STATUS Register (Offset = 304h) [reset = X]

CSI_RX_IF_VBUS2APB_STREAM2_STATUS is shown in [Figure 9-64](#) and described in [Table 9-135](#).

Return to [Summary Table](#).

CSI2 Slave Controller Status. Contains useful debug information such as FSM states.
