

# 8-Channel, 24-Bit ANALOG-TO-DIGITAL CONVERTER

## FEATURES

- 24 BITS NO MISSING CODES
- INL: 0.0012% of FSR (max)
- FULL-SCALE INPUT:  $\pm 2V_{REF}$
- PGA FROM 1 TO 128
- 22 BITS EFFECTIVE RESOLUTION (PGA = 1), 19 BITS (PGA = 128)
- SINGLE CYCLE SETTLING MODE
- PROGRAMMABLE DATA OUTPUT RATES UP TO 1kHz
- ON-CHIP 1.25V/2.5V REFERENCE
- ON-CHIP CALIBRATION
- SPI COMPATIBLE
- POWER SUPPLY: 2.7V to 5.25V
- < 1mW POWER CONSUMPTION,  $V_{DD} = 3V$

## APPLICATIONS

- INDUSTRIAL PROCESS CONTROL
- LIQUID/GAS CHROMATOGRAPHY
- BLOOD ANALYSIS
- SMART TRANSMITTERS
- PORTABLE INSTRUMENTATION
- WEIGH SCALES
- PRESSURE TRANSDUCERS

## DESCRIPTION

The ADS1217 is a precision, wide dynamic range, delta-sigma, Analog-to-Digital (A/D) converter with 24-bit resolution operating from 2.7V to 5.25V supplies. The delta-sigma, A/D converter provides up to 24 bits of no missing code performance and effective resolution of 22 bits.

The eight input channels are multiplexed. Internal buffering can be selected to provide a very high input impedance for direct connection to transducers or low-level voltage signals. Burnout current sources are provided that allow for the detection of an open or shorted sensor. An 8-bit Digital-to-Analog Converter (DAC) provides an offset correction with a range of 50% of the FSR (Full-Scale Range).

The PGA (Programmable Gain Amplifier) provides selectable gains of 1 to 128 with an effective resolution of 19 bits at a gain of 128. The A/D conversion is accomplished with a 2nd-order, delta-sigma modulator and programmable sinc filter. The reference input is differential and can be used for ratiometric measurements. The onboard current DACs operate independently with the maximum current set by an external resistor.

The serial interface is SPI compatible. Eight bits of digital I/O are also provided that can be used for input or output. The ADS1217 is designed for high-resolution measurement applications in smart transmitters, industrial process control, weigh scales, chromatography, and portable instrumentation.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

All trademarks are the property of their respective owners.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

AV <sub>DD</sub> to AGND .....	-0.3V to +6V
DV <sub>DD</sub> to DGND .....	-0.3V to +6V
Input Current .....	100mA, Momentary
Input Current .....	10mA, Continuous
A <sub>IN</sub> .....	GND -0.5V to AV <sub>DD</sub> + 0.5V
AV <sub>DD</sub> to DV <sub>DD</sub> .....	-6V to +6V
AGND to DGND .....	-0.3V to +0.3V
Digital Input Voltage to GND .....	-0.3V to DV <sub>DD</sub> + 0.3V
Digital Output Voltage to GND .....	-0.3V to DV <sub>DD</sub> + 0.3V
Maximum Junction Temperature .....	+150°C
Operating Temperature Range .....	-40°C to +85°C
Storage Temperature Range .....	-60°C to +150°C
Lead Temperature (soldering, 10s) .....	+300°C

NOTE: (1) Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PACKAGE/ORDERING INFORMATION<sup>(1)</sup>

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY
ADS1217	TQFP-48	PFB	-40°C to +85°C	ADS1217	ADS1217IPFBT	Tape and Reel, 250

# OVERVIEW

## INPUT MULTIPLEXER

The input multiplexer (mux) provides for any combination of differential inputs to be selected on any of the input channels, as shown in Figure 1. If channel 1 is selected as the positive differential input channel, any other channel can be selected as the negative differential input channel. With this method, it is possible to have up to eight fully differential input channels.

In addition, current sources are supplied that will source or sink current to detect open or short circuits on the pins.

FIGURE 1. Input Multiplexer Configuration.

## TEMPERATURE SENSOR

An on-chip diode provides temperature sensing capability. When the configuration register for the input MUX is set to all 1s, the diode is connected to the input of the A/D converter. All other channels are open. The anode of the diode is connected to the positive input of the A/D converter, and the cathode of the diode is connected to negative input of the A/D converter. The output of IDAC1 is connected to the anode to bias the diode and the cathode of the diode is also connected to ground to complete the circuit.

In this mode, the output of IDAC1 is also connected to the output pin, so some current may flow into an external load from IDAC1, rather than the diode. See Application Report *Measuring Temperature with the ADS1216, ADS1217, or ADS1218* (SBAA073) for more information.

## BURNOUT CURRENT SOURCES

When the Burnout bit is set in the ACR configuration register, two current sources are enabled. The current source on the positive input channel sources approximately 2 $\mu$ A of current. The current source on the negative input channel sinks approximately 2 $\mu$ A. This allows for the detection of an open circuit (full-scale reading) or short circuit (0V differential reading) on the selected input differential pair.

## INPUT BUFFER

The input impedance of the ADS1217 without the buffer is 10M $\Omega$ /PGA. With the buffer enabled, the input voltage range is reduced and the analog power-supply current is higher. The buffer is controlled by ANDing the state of the buffer pin with the state of the BUFFER bit in the ACR register. See Application Report *Input Currents for High-Resolution ADCs* (SBAA090) for more information.

## IDAC1 AND IDAC2

The ADS1217 has two 8-bit current output DACs that can be controlled independently. The output current is set with R<sub>DAC</sub>, the range select bits in the ACR register, and the 8-bit digital value in the IDAC register. The output current = (V<sub>REF</sub>/8R<sub>DAC</sub>) (2<sup>RANGE-1</sup>) (DAC CODE). With V<sub>REFOUT</sub> = 2.5V and R<sub>DAC</sub> = 150k $\Omega$ , the full-scale output can be selected to be 0.5, 1, or 2mA. The compliance voltage range is AGND to within 1V of AV<sub>DD</sub>. When the internal voltage reference of the ADS1217 is used, it is the reference for the IDAC. An external reference may be used for the IDACs by disabling the internal reference and tying the external reference input to the V<sub>REFOUT</sub> pin.

## PGA

The PGA can be set to gains of 1, 2, 4, 8, 16, 32, 64, or 128. Using the PGA can improve the effective resolution of the A/D converter. For instance, with a PGA of 1 on a 10V full-scale range, the A/D converter can resolve to 2 $\mu$ V. With a PGA of 128 on a 80mV full-scale range, the A/D converter can resolve to 150nV.

## PGA OFFSET DAC

The input to the PGA can be shifted by half the full-scale input range of the PGA by using the ODAC register. The ODAC (Offset DAC) register is an 8-bit value; the MSB is the sign and the seven LSBs provide the magnitude of the offset. Using the ODAC does not reduce the performance of the A/D converter. See Application Report *The Offset DAC* (SBAA077) for more information.

## MODULATOR

The modulator is a single-loop, 2nd-order system. The modulator runs at a clock speed (f<sub>MOD</sub>) that is derived from the external clock (f<sub>OSC</sub>). The frequency division is determined by the SPEED bit in the setup register.

SPEED BIT	f <sub>MOD</sub>
0	f <sub>OSC</sub> /128
1	f <sub>OSC</sub> /256

## VOLTAGE REFERENCE INPUT

The ADS1217 uses a differential voltage reference input. The input signal is measured against the differential voltage  $V_{REF} \equiv (V_{REF+}) - (V_{REF-})$ . For  $AV_{DD} = 5V$ ,  $V_{REF}$  is typically 2.5V. For  $AV_{DD} = 3V$ ,  $V_{REF}$  is typically 1.25V. Due to the sampling nature of the modulator, the reference input current increases with higher modulator clock frequency ( $f_{MOD}$ ) and higher PGA settings.

## ON-CHIP VOLTAGE REFERENCE

A selectable voltage reference (1.25V or 2.5V) is available for supplying the voltage reference input. To use, connect  $V_{REF-}$  to AGND and  $V_{REF+}$  to  $V_{REFOUT}$ . The enabling and voltage selection are controlled through bits REF EN and REF HI in the setup register. The 2.5V reference requires  $AV_{DD} = 5V$ . When using the on-chip voltage reference, the  $V_{REFOUT}$  pin should be bypassed with a 0.1 $\mu$ F capacitor to AGND.

## $V_{RCAP}$ PIN

This pin provides a bypass cap for noise filtering on internal  $V_{REF}$  circuitry only. As this is a sensitive pin, place the capacitor as close as possible and avoid any resistive loading. The recommended capacitor is a 0.001 $\mu$ F ceramic cap. If an external  $V_{REF}$  is used, this pin can be left unconnected.

## CLOCK GENERATOR

The clock source for the ADS1217 can be provided from a crystal, oscillator, or external clock. When the clock source is a crystal, external capacitors must be provided to ensure start-up and a stable clock frequency; see Figure 2 and Table I.

FIGURE 2. Crystal Connection.

CLOCK SOURCE	FREQUENCY	C <sub>1</sub>	C <sub>2</sub>	PART NUMBER
Crystal	2.4576	0-20pF	0-20pF	ECS, ECSD 2.45 - 32
Crystal	4.9152	0-20pF	0-20pF	ECS, ECLS 4.91
Crystal	4.9152	0-20pF	0-20pF	ECS, ECSD 4.91
Crystal	4.9152	0-20pF	0-20pF	CTS, MP 042 4M9182

TABLE I. Typical Clock Sources.

## CALIBRATION

The offset and gain errors in the ADS1217, or the complete system, can be reduced with calibration. Internal calibration of the ADS1217 is called self calibration. This is handled with three commands. One command does both offset and gain calibration. There is also a gain calibration command and an offset calibration command. Each calibration process takes seven  $t_{DATA}$  periods to complete. It takes 14  $t_{DATA}$  periods to

complete both an offset and gain calibration. Self-gain calibration is optimized for PGA gains less than 8. When using higher gains, system gain calibration is recommended.

For system calibration, the appropriate signal must be applied to the inputs. The system offset command requires a "zero" differential input signal. It then computes an offset that will nullify offset in the system. The system gain command requires a positive "full-scale" differential input signal. It then computes a value to nullify gain errors in the system. Each of these calibrations will take seven  $t_{DATA}$  periods to complete.

Calibration must be performed after power on, a change in decimation ratio, or a change of the PGA. For operation with a reference voltage greater than  $(AV_{DD} - 1.5V)$ , the buffer must also be turned off during calibration.

At the completion of calibration, the  $\overline{DRDY}$  signal goes LOW, which indicates the calibration is finished and valid data is available. See Application Report *Calibration Routine and Register Value Generation for the ADS121x Series* (SBAA099) for more information.

## DIGITAL FILTER

The Digital Filter can use either the fast settling, sinc<sup>2</sup>, or sinc<sup>3</sup> filter, as shown in Figure 3. In addition, the Auto mode changes the sinc filter after the input channel or PGA is changed. When switching to a new channel, it will use the fast settling filter; It will then use the sinc<sup>2</sup> followed by the sinc<sup>3</sup> filter. This combines the low-noise advantage of the sinc<sup>3</sup> filter with the quick response of the fast settling time filter. See Figure 4 for the frequency response of each filter.

When using the fast setting filter, select a decimation value set by the DEC0 and M/DEC1 registers that is evenly divisible by four for the best gain accuracy. For example, choose 260 rather than 261.

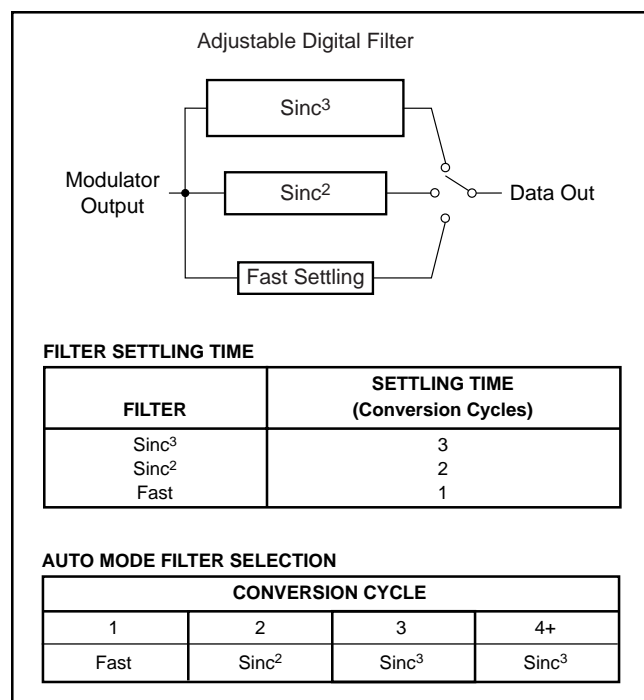

FIGURE 3. Filter Step Responses.

FIGURE 4. Filter Frequency Responses.

## DIGITAL I/O INTERFACE

The ADS1217 has eight pins dedicated for digital I/O. The default power-up condition for the digital I/O pins are as inputs. All of the digital I/O pins are individually configurable as inputs or outputs. They are configured through the DIR control register. The DIR register defines whether the pin is an input or output, and the DIO register defines the state of the digital output. When the digital I/O are configured as inputs, DIO is used to read the state of the pin. If the digital I/O are not used, either 1) configure as outputs; or, 2) leave as inputs and tie to ground, this prevents excess power dissipation.

## SERIAL PERIPHERAL INTERFACE

The Serial Peripheral Interface (SPI) allows a controller to communicate synchronously with the ADS1217. The ADS1217 operates in slave only mode.

### Chip Select ( $\overline{CS}$ )

The chip select ( $\overline{CS}$ ) input of the ADS1217 must be externally asserted before a master device can exchange data with the ADS1217.  $\overline{CS}$  must be LOW for the duration of the transaction.  $\overline{CS}$  can be tied low.

### Serial Clock (SCLK)

SCLK, a Schmitt Trigger input, clocks data transfer on the D<sub>IN</sub> input and D<sub>OUT</sub> output. When transferring data to or from the ADS1217, multiple bits of data may be transferred back-to-

back with no delay in SCLKs or toggling of  $\overline{CS}$ . Make sure to avoid glitches on SCLK as they can cause extra shifting of the data.

### Polarity (POL)

The serial clock polarity is specified by the POL input. When SCLK is active HIGH, set POL HIGH. When SCLK is active LOW, set POL LOW.

## DATA READY

The  $\overline{DRDY}$  output is used as a status signal to indicate when data is ready to be read from the ADS1217.  $\overline{DRDY}$  goes LOW when new data is available. It is reset HIGH when a read operation from the data register is complete. It also goes HIGH prior to the updating of the output register to indicate when not to read from the device to ensure that a data read is not attempted while the register is being updated.

## DSYNC OPERATION

DSYNC is used to provide for synchronization of the A/D conversion with an external event. Synchronization can be achieved either through the  $\overline{DSYNC}$  pin or the DSYNC command. When the  $\overline{DSYNC}$  pin is used, the filter counter is reset on the falling edge of  $\overline{DSYNC}$ . The modulator is held in reset until  $\overline{DSYNC}$  is taken HIGH. Synchronization occurs on the next rising edge of the system clock after  $\overline{DSYNC}$  is taken HIGH.

When the DSYNC command is sent, the filter counter is reset on the edge of the last SCLK on the DSYNC command. The modulator is held in reset until the next edge of SCLK is detected. Synchronization occurs on the next rising edge of the system clock after the first SCLK after the DSYNC command. After a DSYNC operation,  $\overline{\text{DRDY}}$  is held HIGH until valid data is ready.

## RESET

There are three methods to reset the ADS1217: the  $\overline{\text{RESET}}$  input, the RESET command, and a special SCLK input pattern. When using the  $\overline{\text{RESET}}$  input, take it LOW to force a reset. Make sure to follow the minimum pulse width timing specifications before taking the  $\overline{\text{RESET}}$  input back high. Also, avoid glitches on the  $\overline{\text{RESET}}$  input as these may cause accidental resets. The RESET command takes effect after all 8 bits have been shifted into DIN. Afterwards, the reset releases automatically. The ADS1217 can also be reset with a special pattern on SCLK, see the Timing Diagram. Reset occurs on the falling edge of the last SCLK edge in the pattern (for POL = 0). Afterwards, the reset releases automatically.

## POWER-UP—SUPPLY VOLTAGE RAMP RATE

The power-on reset circuitry was designed to accommodate digital supply ramp rates as slow as 1V/10ms. To ensure proper operation, the power supply should ramp monotonically.

## MEMORY

Two types of memory are used on the ADS1217: registers and RAM. 16 registers directly control the various functions (PGA, DAC value, Decimation Ratio, etc.) and can be directly read or written. Collectively, the registers contain all the information needed to configure the part, such as data format, mux settings, calibration settings, decimation ratio, etc. Additional registers, such as output data, are accessed through dedicated instructions.

## REGISTER BANK TOPOLOGY

The operation of the device is set up through individual registers. The set of the 16 registers required to configure the device is referred to as a Register Bank, as shown in Figure 5.

Reads and Writes to Registers and RAM occur on a byte basis. However, copies between registers and RAM occurs on a bank basis. The RAM is independent of the Registers; that is, the RAM can be used as general-purpose RAM.

The ADS1217 supports any combination of eight analog inputs. With this flexibility, the device could easily support eight unique configurations—one per input channel. In order to facilitate this type of usage, eight separate register banks are available. Therefore, each configuration could be written once and recalled as needed without having to serially retransmit all the configuration data. Checksum commands are also included, which can be used to verify the integrity of RAM.

FIGURE 5. Memory Organization.

The RAM provides eight “banks”, with a bank consisting of 16 bytes. The total size of the RAM is 128 bytes. Copies between the registers and RAM are performed on a bank basis. Also, the RAM can be directly read or written through the serial interface on power-up. The banks allow separate storage of settings for each input.

The RAM address space is linear, therefore accessing RAM is done using an auto-incrementing pointer. Access to RAM in the entire memory map can be done consecutively without having to address each bank individually. For example, if you were currently accessing bank 0 at offset  $0F_H$  (the last location of bank 0), the next access would be bank 1 and offset  $00_H$ . Any access after bank 7 and offset  $0F_H$  will wrap around to bank 0 and Offset  $00_H$ .

Although the Register Bank memory is linear, the concept of addressing the device can also be thought of in terms of bank and offset addressing. Looking at linear and bank addressing syntax, we have the following comparison: in the linear memory map, the address  $14_H$  is equivalent to bank 1 and offset  $04_H$ . Simply stated, the most significant four bits represent the bank, and the least significant four bits represent the offset. The offset is equivalent to the register address for that bank of memory.

# REGISTER MAP

TABLE II. Registers.

## DETAILED REGISTER DEFINITIONS

### SETUP (Address 00<sub>H</sub>) Setup Register

Reset Value = iii01110

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
ID	ID	ID	SPEED	REF EN	REF HI	BUF EN	BIT ORDER

bit 7-5 Factory Programmed Bits

bit 4 SPEED: Modulator Clock Speed

0 :  $f_{MOD} = f_{OSC}/128$  (default)

1 :  $f_{MOD} = f_{OSC}/256$

bit 3 REF EN: Internal Voltage Reference Enable

0 = Internal Voltage Reference Disabled

1 = Internal Voltage Reference Enabled (default)

bit 2 REF HI: Internal Reference Voltage Select

0 = Internal Reference Voltage = 1.25V

1 = Internal Reference Voltage = 2.5V (default)

bit 1 BUF EN: Buffer Enable

0 = Buffer Disabled

1 = Buffer Enabled (default)

bit 0 BIT ORDER: Set Order Bits are Transmitted

0 = Most Significant Bit Transmitted First (default)

1 = Least Significant Bit Transmitted First

Data is always shifted into the part most significant bit first. Data is always shifted out of the part most significant byte first. This configuration bit only controls the bit order within the byte of data that is shifted out.

### MUX (Address 01<sub>H</sub>) Multiplexer Control Register

Reset Value = 01<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
PSEL3	PSEL2	PSEL1	PSEL0	NSEL3	NSEL2	NSEL1	NSEL0

bit 7-4 PSEL3: PSEL2: PSEL1: PSEL0: Positive Channel Select

0000 = AIN0 (default)

0001 = AIN1

0010 = AIN2

0011 = AIN3

0100 = AIN4

0101 = AIN5

0110 = AIN6

0111 = AIN7

1xxx = AINCOM (except when all bits are 1s)

1111 = Temperature Sensor Diode

bit 3-0 NSEL3: NSEL2: NSEL1: NSEL0: Negative Channel Select

0000 = AIN0

0001 = AIN1 (default)

0010 = AIN2

0011 = AIN3

0100 = AIN4

0101 = AIN5

0110 = AIN6

0111 = AIN7

1xxx = AINCOM (except when all bits are 1s)

1111 = Temperature Sensor Diode

**ACR** (Address 02<sub>H</sub>) Analog Control RegisterReset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
BOCS	IDAC2R1	IDAC2R0	IDAC1R1	IDAC1R0	PGA2	PGA1	PGA0

bit 7 BOCS: Burnout Current Source  
0 = Disabled (default)  
1 = Enabled

$$\text{IDAC Current} = \left( \frac{V_{\text{REF}}}{8R_{\text{DAC}}} \right) \left( 2^{\text{RANGE}-1} \right) (\text{DAC Code})$$

bit 6-5 IDAC2R1: IDAC2R0: Full-Scale Range Select for IDAC2

00 = Off (default)  
01 = Range 1  
10 = Range 2  
11 = Range 3

bit 4-3 IDAC1R1: IDAC1R0: Full-Scale Range Select for IDAC1

00 = Off (default)  
01 = Range 1  
10 = Range 2  
11 = Range 3

bit 2-0 PGA2: PGA1: PGA0: Programmable Gain Amplifier Gain Selection

000 = 1 (default)  
001 = 2  
010 = 4  
011 = 8  
100 = 16  
101 = 32  
110 = 64  
111 = 128

**IDAC1** (Address 03<sub>H</sub>) Current DAC 1Reset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
IDAC1_7	IDAC1_6	IDAC1_5	IDAC1_4	IDAC1_3	IDAC1_2	IDAC1_1	IDAC1_0

The DAC code bits set the output of DAC1 from 0 to full-scale. The value of the full-scale current is set by this Byte,  $V_{\text{REF}}$ ,  $R_{\text{DAC}}$ , and the DAC1 range bits in the ACR register.

**IDAC2** (Address 04<sub>H</sub>) Current DAC 2Reset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
IDAC2_7	IDAC2_6	IDAC2_5	IDAC2_4	IDAC1_3	IDAC1_2	IDAC1_1	IDAC1_0

The DAC code bits set the output of DAC2 from 0 to full-scale. The value of the full-scale current is set by this Byte,  $V_{\text{REF}}$ ,  $R_{\text{DAC}}$ , and the DAC2 range bits in the ACR register.

**ODAC** (Address 05<sub>H</sub>) Offset DAC SettingReset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
SIGN	OSET6	OSET5	OSET4	OSET3	OSET2	OSET1	OSET0

bit 7 Offset Sign  
0 = Positive  
1 = Negative

$$\text{bit 6-0 Offset} = \frac{V_{\text{REF}}}{\text{PGA}} \cdot \left( \frac{\text{Code}}{127} \right)$$

NOTE: The offset must be used after calibration or the calibration will notify the effects.

**DIO** (Address 06<sub>H</sub>) Digital I/OReset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DIO7	DIO6	DIO5	DIO4	DIO3	DIO2	DIO1	DIO0

A value written to this register will appear on the digital I/O pins if the pin is configured as an output in the DIR register. Reading this register will return the value of the digital I/O pins.

**DIR** (Address 07<sub>H</sub>) Direction control for digital I/OReset Value = FF<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DIR7	DIR6	DIR5	DIR4	DIR3	DIR2	DIR1	DIR0

Each bit controls whether the Digital I/O pin is an output (= 0) or input (= 1). The default power-up state is as inputs.

**DEC0** (Address 08<sub>H</sub>) Decimation Register  
(Least Significant 8 bits)Reset Value = 80<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DEC07	DEC06	DEC05	DEC04	DEC03	DEC02	DEC01	DEC00

The decimation value is defined with 11 bits for a range of 20 to 2047. This register is the least significant 8 bits. The 3 most significant bits are contained in the M/DEC1 register. The default data rate is 10Hz with a 2.4576MHz crystal.

**M/DEC1** (Address 09<sub>H</sub>) Mode and Decimation RegisterReset Value = 07<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
DRDY	U/B	SMODE1	SMODE0	Reserved	DEC10	DEC09	DEC08

bit 7 DRDY: Data Ready (Read Only) \_\_\_\_\_  
This bit duplicates the state of the DRDY pin.

bit 6 U/B: Data Format  
0 = Bipolar (default)  
1 = Unipolar

U/B	ANALOG INPUT	DIGITAL OUTPUT
0	+FS	0x7FFFFFFF
	Zero	0x000000
	-FS	0x800000
1	+FS	0xFFFFFFFF
	Zero	0x000000
	-FS	0x000000

bit 5-4 SMODE1: SMODE0: Settling Mode  
00 = Auto (default)  
01 = Fast Settling filter  
10 = Sinc<sup>2</sup> filter  
11 = Sinc<sup>3</sup> filter

bit 2-0 DEC10: DEC09: DEC08: Most Significant Bits of the Decimation Value

**OCR0** (Address 0A<sub>H</sub>) Offset Calibration Coefficient (Least Significant Byte)Reset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
OCR07	OCR06	OCR05	OCR04	OCR03	OCR02	OCR01	OCR00

**OCR1** (Address 0B<sub>H</sub>) Offset Calibration Coefficient (Middle Byte)Reset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
OCR15	OCR14	OCR13	OCR12	OCR11	OCR10	OCR09	OCR08

**OCR2** (Address 0C<sub>H</sub>) Offset Calibration Coefficient

(Most Significant Byte)

Reset Value = 00<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
OCR23	OCR22	OCR21	OCR20	OCR19	OCR18	OCR17	OCR16

**FSR0** (Address 0D<sub>H</sub>) Full-Scale Register

(Least Significant Byte)

Reset Value = 24<sub>H</sub>

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
FSR07	FSR06	FSR05	FSR04	FSR03	FSR02	FSR01	FSR00

**FSR1** (Address 0E<sub>H</sub>) Full-Scale Register

(Middle Byte)

FSR23	FSR22	FSR21	FSR20	FSR19	FSR18	FSR17	FSR16

# COMMAND DEFINITIONS

The commands listed below control the operation of the ADS1217. Some of the commands are stand-alone commands (e.g., RESET) while others require additional bytes (e.g., WREG requires command, count, and the data bytes). Commands that output data require a minimum of four  $f_{OSC}$  cycles before the data is ready (e.g., RDATA).

Operands:

n = count (0 to 127)

r = register (0 to 15)

x = don't care

a = RAM bank address (0 to 7)

COMMANDS	DESCRIPTION	COMMAND BYTE	2ND COMMAND BYTE
RDATA	Read Data	0000 0001 (01 <sub>H</sub> )	—
RDATA C	Read Data Continuously	0000 0011 (03 <sub>H</sub> )	—
STOPC	Stop Read Data Continuously	0000 1111 (0F <sub>H</sub> )	—
RREG	Read from REG Bank <i>rrrr</i>	0001 <i>rrrr</i> (1x <sub>H</sub> )	xxxx_nnnn (# of reg-1)
RRAM	Read from RAM Bank <i>aaa</i>	0010 0aaa (2x <sub>H</sub> )	xnnn_nnnn (# of bytes-1)
CREG	Copy REGs to RAM Bank <i>aaa</i>	0100 0aaa (4x <sub>H</sub> )	—
CREGA	Copy REGS to all RAM Banks	0100 1000 (48 <sub>H</sub> )	—
WREG	Write to REG <i>rrrr</i>	0101 <i>rrrr</i> (5x <sub>H</sub> )	xxxx_nnnn (# of reg-1)
WRAM	Write to RAM Bank <i>aaa</i>	0110 0aaa (6x <sub>H</sub> )	xnnn_nnnn (# of bytes-1)
CRAM	Copy RAM Bank <i>aaa</i> to REG	1100 0aaa (Cx <sub>H</sub> )	—
CSRAMX	Calc RAM Bank <i>aaa</i> Checksum	1101 0aaa (Dx <sub>H</sub> )	—
CSARAMX	Calc all RAM Bank Checksum	1101 1000 (D8 <sub>H</sub> )	—
CSREG	Calc REG Checksum	1101 1111 (DF <sub>H</sub> )	—
CSRAM	Calc RAM Bank <i>aaa</i> Checksum	1110 0aaa (Ex <sub>H</sub> )	—
CSARAM	Calc all RAM Banks Checksum	1110 1000 (E8 <sub>H</sub> )	—
SELF CAL	Self Cal Offset and Gain	1111 0000 (F0 <sub>H</sub> )	—
SELF CAL	Self Cal Offset	1111 0001 (F1 <sub>H</sub> )	—
SELF CAL	Self Cal Gain	1111 0010 (F2 <sub>H</sub> )	—
SYS CAL	Sys Cal Offset	1111 0011 (F3 <sub>H</sub> )	—
SYS CAL	Sys Cal Gain	1111 0100 (F4 <sub>H</sub> )	—
WAKEUP	Wake Up From Sleep Mode	1111 1011 (FB <sub>H</sub> )	—
DSYNC	Sync DRDY	1111 1100 (FC <sub>H</sub> )	—
SLEEP	Put in Sleep Mode	1111 1101 (FD <sub>H</sub> )	—
RESET	Reset to Power-Up Values	1111 1110 (FE <sub>H</sub> )	—

NOTE: (1) The data received by the A/D converter is always MSB First, the data out format is set by the BIT ORDER bit in ACR reg.

TABLE III. Command Summary.

## RDATA

### Read Data

**Description:** Read a single 24-bit ADC conversion result. On completion of read back, DRDY goes HIGH.

**Operands:** None

**Bytes:** 1

**Encoding:** 0000 0001

**Data Transfer Sequence:**

## RDATA C

### Read Data Continuous

**Description:** Read Data Continuous mode enables the continuous output of new data on each DRDY. This command eliminates the need to send the Read Data Command on each DRDY. This mode may be terminated by either the STOP Read Continuous command or the RESET command.

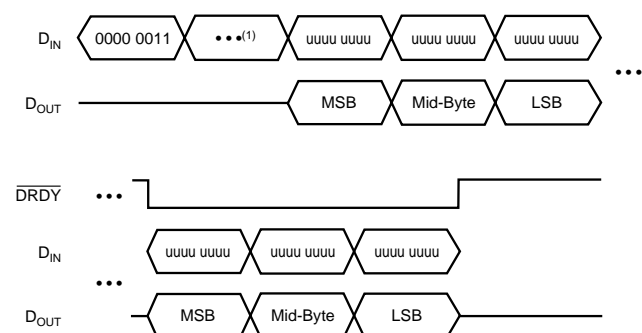

**Operands:** None

**Bytes:** 1

**Encoding:** 0000 0011

**Data Transfer Sequence:**

Command terminated when *uuuu uuuu* equals STOPC or RESET.

NOTE: (1) For wait time, refer to timing specification.

## STOPC

## Stop Continuous

**Description:** Ends the continuous data output mode.

**Operands:** None

**Bytes:** 1

**Encoding:** 0000 1111

**Data Transfer Sequence:**

## RREG

## Read from Registers

**Description:** Output the data from up to 16 registers starting with the register address specified as part of the instruction. The number of registers read will be one plus the second byte. If the count exceeds the remaining registers, the addresses will wrap back to the beginning.

**Operands:** r, n

**Bytes:** 2

**Encoding:** 0001 rrrr xxxx nnnn

**Data Transfer Sequence:**

Read Two Registers Starting from Register 01<sub>H</sub> (MUX)

## RRAM

## Read from RAM

**Description:** Up to 128 bytes can be read from RAM starting at the bank specified in the op code. All reads start at the address for the beginning of the RAM bank. The number of bytes to read will be one plus the value of the second byte.

**Operands:** a, n

**Bytes:** 2

**Encoding:** 0010 0aaa xnnn nnnn

**Data Transfer Sequence:**

Read Two RAM Locations Starting from 20<sub>H</sub>

## CREG

## Copy Registers to RAM Bank

**Description:** Copy the 16 control registers to the RAM bank specified in the op code. Refer to timing specifications for command execution time.

**Operands:** a

**Bytes:** 1

**Encoding:** 0100 0aaa

**Data Transfer Sequence:**

Copy Register Values to RAM Bank 3

## CREGA

## Copy Registers to All RAM Banks

**Description:** Duplicate the 16 control registers to all the RAM banks. Refer to timing specifications for command execution time.

**Operands:** None

**Bytes:** 1

**Encoding:** 0100 1000

**Data Transfer Sequence:**

## WREG

## Write to Register

**Description:** Write to the registers starting with the register specified as part of the instruction. The number of registers that will be written is one plus the value of the second byte.

**Operands:** r, n

**Bytes:** 2

**Encoding:** 0101 rrrr xxxx nnnn

**Data Transfer Sequence:**

Write Two Registers Starting from 06<sub>H</sub> (DIO)

NOTE: (1) For wait time, refer to timing specification.

## WRAM

## Write to RAM

**Description:** Write up to 128 RAM locations starting at the beginning of the RAM bank specified as part of the instruction. The number of bytes written to RAM is one plus the value of the second byte.

**Operands:** a, n

**Bytes:** 2

**Encoding:** 0110 0aaa xnnn nnnn

**Data Transfer Sequence:**

Write to Two RAM Locations starting from 10<sub>H</sub>

## CRAM

## Copy RAM Bank to Registers

**Description:** Copy the selected RAM Bank to the Configuration Registers. This will overwrite all of the registers with the data from the RAM bank.

**Operands:** a

**Bytes:** 1

**Encoding:** 1100 0aaa

**Data Transfer Sequence:**

Copy RAM Bank 0 to the Registers

## CSRAMX

## Calculate RAM Bank Checksum

**Description:** Calculate the checksum of the selected RAM Bank. The checksum is calculated as a sum of all the bytes with the carry ignored. The ID,  $\overline{\text{DRDY}}$ , and DIO bits are masked so they are not included in the checksum.

**Operands:** a

**Bytes:** 1

**Encoding:** 1101 0aaa

**Data Transfer Sequence:**

Calculate Checksum for RAM Bank 3

## CSARAMX

## Calculate the Checksum for all RAM Banks

**Description:** Calculate the checksum of all RAM Banks. The checksum is calculated as a sum of all the bytes with the carry ignored. The ID,  $\overline{\text{DRDY}}$ , and DIO bits are masked so they are not included in the checksum.

**Operands:** None

**Bytes:** 1

**Encoding:** 1101 1000

**Data Transfer Sequence:**

## CSREG

## Calculate the Checksum of Registers

**Description:** Calculate the checksum of all the registers. The checksum is calculated as a sum of all the bytes with the carry ignored. The ID,  $\overline{\text{DRDY}}$  and DIO bits are masked so they are not included in the checksum.

**Operands:** None

**Bytes:** 1

**Encoding:** 1101 1111

**Data Transfer Sequence:**

## CSRAM

## Calculate RAM Bank Checksum

**Description:** Calculate the checksum of the selected RAM Bank. The checksum is calculated as a sum of all the bytes with the carry ignored. All bits are included in the checksum calculation, there is no masking of bits.

**Operands:** a

**Bytes:** 1

**Encoding:** 1110 0aaa

**Data Transfer Sequence:**

Calculate Checksum for RAM Bank 2

NOTE: (1) For wait time, refer to timing specification.

## CSARAM

## Calculate Checksum for all RAM Banks

**Description:** Calculate the checksum of all RAM Banks. The checksum is calculated as a sum of all the bytes with the carry ignored. All bits are included in the checksum calculation, there is no masking of bits.

**Operands:** None

**Bytes:** 1

**Encoding:** 1110 1000

**Data Transfer Sequence:**

## SELFAL Offset and Gain Self Calibration

**Description:** Starts the process of self calibration. The Offset Control Register (OCR) and the Full-Scale Register (FSR) are updated with new values after this operation.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 0000

**Data Transfer Sequence:**

## SELFOCAL Offset Self Calibration

**Description:** Starts the process of self-calibration for offset. The Offset Control Register (OCR) is updated after this operation.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 0001

**Data Transfer Sequence:**

## SELFGCAL

## Gain Self Calibration

**Description:** Starts the process of self-calibration for gain. The Full-Scale Register (FSR) is updated with new values after this operation.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 0010

**Data Transfer Sequence:**

## SYSOCL System Offset Calibration

**Description:** Starts the system offset calibration process. For a system offset calibration the input should be set to 0V differential, and the ADS1217 computes the OCR register value that will compensate for offset errors. The Offset Control Register (OCR) is updated after this operation.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 0011

**Data Transfer Sequence:**

## SYSGCAL System Gain Calibration

**Description:** Starts the system gain calibration process. For a system gain calibration, the differential input should be set to the reference voltage and the ADS1217 computes the FSR register value that will compensate for gain errors. The FSR is updated after this operation.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 0100

**Data Transfer Sequence:**

NOTE: (1) For wait time, refer to timing specification.

## DSYNC

## Sync DRDY

**Description:** Synchronizes the ADS1217 to the serial clock edge.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 1100

**Data Transfer Sequence:**

## SLEEP

## Sleep Mode

**Description:** Puts the ADS1217 into a low power sleep mode. SCLK must be inactive while in sleep mode. To exit this mode, issue the WAKEUP command.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 1101

**Data Transfer Sequence:**

## WAKEUP Wakeup From Sleep Mode

**Description:** Use this command to wake up from sleep mode.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 1011

**Data Transfer Sequence:**

## RESET Reset to Power-Up Values

**Description:** Restore the registers to their power-up values. This command will also stop the Read Continuous mode. It does not affect the contents of RAM.

**Operands:** None

**Bytes:** 1

**Encoding:** 1111 1110

**Data Transfer Sequence:**

TABLE IV. Command Map.

## DEFINITION OF TERMS

**Analog Input Voltage**—the voltage at any one analog input relative to AGND.

**Analog Input Differential Voltage**—given by the following equation:  $(A_{IN+}) - (A_{IN-})$ . Thus, a positive digital output is produced whenever the analog input differential voltage is positive, while a negative digital output is produced whenever the differential is negative.

For example, when the converter is configured with a 2.5V reference and placed in a gain setting of 1, the positive full-scale output is produced when the analog input differential is  $2 \cdot 2.5V$ . The negative full-scale output is produced when the differential is  $2 \cdot (-2.5V)$ . In each case, the actual input voltages must remain within the AGND to  $AV_{DD}$  range.

**Conversion Cycle**—the term *conversion cycle* usually refers to a discrete A/D conversion operation, such as that performed by a successive approximation converter. As used here, a conversion cycle refers to the  $t_{DATA}$  time period. However, each digital output is actually based on the modulator results from several  $t_{DATA}$  time periods.

FILTER SETTING	MODULATOR RESULTS
Fast Settling	1 $t_{DATA}$ Time Period
Sinc <sup>2</sup>	2 $t_{DATA}$ Time Period
Sinc <sup>3</sup>	3 $t_{DATA}$ Time Period

**Data Rate**—the rate at which conversions are completed. See definition for  $f_{DATA}$ .

**Decimation Ratio**—defines the ratio between the output of the modulator and the output Data Rate. Valid values for the Decimation Ratio are from 20 to 2047. Larger Decimation Ratios will have lower noise.

**Effective Resolution**—the effective resolution of the ADS1217 in a particular configuration can be expressed in two different units: bits rms (referenced to output) and Vrms (referenced to input). Computed directly from the converter's output data, each is a statistical calculation. The conversion from one to the other is shown below.

*Effective number of bits (ENOB) or effective resolution* is commonly used to define the usable resolution of the A/D converter. It is calculated from empirical data taken directly from the device. It is typically determined by applying a fixed known signal source to the analog input and computing the standard deviation of the data sample set. The rms noise defines the  $\pm\sigma$  interval about the sample mean.

The data from the A/D converter is output as codes, which then can be easily converted to other units, such as ppm or volts. The equations and table below show the relationship between bits or codes, ppm, and volts.

$$ENOB = \frac{-20 \log(\text{ppm})}{6.02}$$

BITS rms	BIPOLAR Vrms	UNIPOLAR Vrms
	$\frac{\left(\frac{4V_{REF}}{PGA}\right)}{10^{\left(\frac{6.02 \cdot ENOB}{20}\right)}}$	$\frac{\left(\frac{2V_{REF}}{PGA}\right)}{10^{\left(\frac{6.02 \cdot ENOB}{20}\right)}}$
24	596nV	298nV
22	2.38 $\mu$ V	1.19 $\mu$ V
20	9.54 $\mu$ V	4.77 $\mu$ V
18	38.1 $\mu$ V	19.1 $\mu$ V
16	153 $\mu$ V	76.4 $\mu$ V
14	610 $\mu$ V	305 $\mu$ V
12	2.44mV	1.22mV

**$f_{DATA}$** —the frequency of the digital output data produced by the ADS1217,  $f_{DATA}$  is also referred to as the Data Rate.

$$f_{DATA} = \left(\frac{f_{MOD}}{\text{Decimation Ratio}}\right) = \left(\frac{f_{OSC}}{\text{mfactor} \cdot \text{Decimation Ratio}}\right)$$

**$f_{MOD}$** —the frequency or speed at which the modulator of the ADS1217 is running. This depends on the SPEED bit as shown below:

SPEED BIT	$f_{MOD}$
0	$f_{OSC}/128$
1	$f_{OSC}/256$

**$f_{OSC}$** —the frequency of the crystal input signal at the  $X_{IN}$  input of the ADS1217.

**$f_{SAMP}$** —the frequency, or switching speed, of the input sampling capacitor. The value is given by one of the following equations:

PGA SETTING	SAMPLING FREQUENCY
1, 2, 4, 8	$f_{SAMP} = \frac{f_{OSC}}{\text{mfactor}}$
8	$f_{SAMP} = \frac{2f_{OSC}}{\text{mfactor}}$
16	$f_{SAMP} = \frac{8f_{OSC}}{\text{mfactor}}$
32	$f_{SAMP} = \frac{16f_{OSC}}{\text{mfactor}}$
64, 128	$f_{SAMP} = \frac{16f_{OSC}}{\text{mfactor}}$

**Filter Selection**—the ADS1217 uses a  $(\text{sinc}/x)$  filter or *sinc* filter. There are three different sinc filters that can be selected. A fast settling filter will settle in one  $t_{DATA}$  cycle. The sinc<sup>2</sup> filter will settle in two cycles and have lower noise. The sinc<sup>3</sup> will achieve lowest noise and higher number of effective bits, but requires three cycles to settle. The ADS1217 will operate with any one of these filters, or it can operate in an auto mode, where it will first select the fast settling filter after a new channel is selected and will then switch to sinc<sup>2</sup> for one reading, followed by sinc<sup>3</sup> from then on.

**Full-Scale Range (FSR)**—as with most A/D converters, the full-scale range of the ADS1217 is defined as the “input”, which produces the positive full-scale digital output minus the “input”, which produces the negative full-scale digital output. The full-scale range changes with gain setting, see Table V.

For example, when the converter is configured with a 2.5V reference and is placed in a gain setting of 2, the full-scale range is:  $2 \cdot [1.25\text{V (positive full-scale) minus } -1.25\text{V (negative full-scale)}] = 5\text{V}$ .

**Least Significant Bit (LSB) Weight**—this is the theoretical amount of voltage that the differential voltage at the analog input would have to change in order to observe a change in the output data of one least significant bit. It is computed as follows:

$$\text{LSB Weight} = \frac{\text{Full - Scale Range}}{2^N}$$

where N is the number of bits in the digital output.

$t_{\text{DATA}}$ —the inverse of  $f_{\text{DATA}}$ , or the period between each data output.

GAIN SETTING	5V SUPPLY ANALOG INPUT <sup>(1)</sup>			GENERAL EQUATIONS		
	FULL-SCALE RANGE	DIFFERENTIAL INPUT VOLTAGES <sup>(2)</sup>	PGA OFFSET RANGE	FULL-SCALE RANGE	DIFFERENTIAL INPUT VOLTAGES <sup>(2)</sup>	PGA SHIFT RANGE
1	10V	±5V	±2.5	$\frac{4V_{\text{REF}}}{\text{PGA}}$	$\frac{\pm 2V_{\text{REF}}}{\text{PGA}}$	$\frac{\pm V_{\text{REF}}}{\text{PGA}}$
2	5V	±2.5V	±1.25V			
4	2.5V	±1.25V	±0.625V			
8	1.25V	±0.625V	±312.5mV			
16	0.625V	±312.5mV	±156.25mV			
32	312.5mV	±156.25mV	±78.125mV			
64	156.25mV	±78.125mV	±39.0625mV			
128	78.125mV	±39.0625mV	±19.531mV			

NOTES: (1) With a 2.5V reference. (2) The ADS1217 allows common-mode voltage as long as the absolute input voltage on  $A_{\text{IN}+}$  or  $A_{\text{IN}-}$  does not go below AGND or above  $AV_{\text{DD}}$ .

TABLE V. Full-Scale Range versus PGA Setting.

## Revision History

DATE	REVISION	PAGE	SECTION	DESCRIPTION
2/07	C	2,4	Electrical Characteristics	Changed Gain Error condition from "Before Calibration" to "After Calibration"

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

**PACKAGING INFORMATION**

ADS1217IPFBT.B	Active	Production	TQFP (PFB)   48	250   SMALL T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ADS1217
ADS1217IPFBTG4	Active	Production	TQFP (PFB)   48	250   SMALL T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ADS1217

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
