

DP83822 Robust, Low Power 10/100Mbps Ethernet Physical Layer Transceiver

1 Features

- Ultra-robust 10/100Mbps PHY
 - IEC 61000-4-2 ESD: $\pm 8\text{KV}$ contact discharge
 - IEC 61000-4-4 EFT: Class A at 4KV
 - CISPR 22 conducted emissions: Class B
 - CISPR 22 radiated emissions: Class B
 - Operating temperature: -40°C to 125°C
- MAC interfaces: RGMII/RMII/MII
- Programmable MII/RMII/RGMII termination impedance
- IEEE 802.3u compliant: 100BASE-FX, 100BASE-TX and 10BASE-Te
- Flexible supply options
 - Low power single supply options
 - $1.8\text{V AVD} < 120\text{mW}$
 - $3.3\text{V AVD} < 220\text{mW}$
 - Available I/O voltages: 3.3V/2.5V/1.8V
- Power saving features
 - Energy efficient Ethernet (EEE) IEEE 802.3az
 - WoL (Wake-on-LAN) support with magic packet detection
 - Programmable energy savings modes
- Start of frame detect for IEEE 1588 time stamp
- Diagnostic tools: Cable diagnostics, built-in self-test (BIST), loopback, rapid link-down detection
- Auto-crossover in force modes

2 Applications

- [Motor drives](#)
- [Factory automation, robotics and motion control](#)
- [Grid infrastructure](#)
- [Building automation](#)
- [Industrial Ethernet fieldbus](#)
- Real Time Industrial Ethernet Applications such as ProfiNET®

3 Description

Designed for harsh industrial environments, the DP83822 is an ultra-robust, low-power, single-port 10/100Mbps Ethernet PHY. The DP83822 provides all physical layer functions needed to transmit and receive data over standard twisted-pair cables, or connect to an external fiber optic transceiver. Additionally, the DP83822 provides flexibility to connect to a MAC through a standard MII, RMII, or RGMII interface.

The DP83822 offers integrated cable diagnostic tools, built-in self-test, and loopback capabilities for ease of use. The device supports multiple industrial fieldbuses with fast link-down detection as well as Auto-MDIX in forced modes.

The DP83822 offers a remarkable and robust approach for reducing power consumption through EEE, WoL, and other programmable energy saving modes.

The DP83822 is a feature-rich and pin-to-pin upgradeable option for the TLK105, TLK106, TLK105L, and TLK106L 10/100Mbps Ethernet PHYs.

The DP83822 comes in a 32-pin 5.00mm × 5.00mm VQFN package.

Device Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
DP83822HF	RHB (VQFN, 32)	5.00mm × 5.00mm
DP83822H	RHB (VQFN, 32)	5.00mm × 5.00mm
DP83822IF	RHB (VQFN, 32)	5.00mm × 5.00mm
DP83822I	RHB (VQFN, 32)	5.00mm × 5.00mm

(1) For more information, see [Section 12](#).

(2) The package size (length × width) is a nominal value and includes pins, where applicable.

4 Device Comparison Table

PART NUMBER	100BASE-FX SUPPORT	OPERATING TEMPERATURE
DP83822HF	Yes	-40°C to 125°C
DP83822H	No	-40°C to 125°C
DP83822IF	Yes	-40°C to 85°C
DP83822I	No	-40°C to 85°C

5 Pin Configuration and Functions

**Figure 5-1. RHB Package
32-Pin VQFN
Top View**

Table 5-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
MAC INTERFACE			
TX_CLK	2	O, Hi-Z	MII Transmit Clock: MII Transmit Clock provides a 25MHz reference clock for 100Mbps speed and a 2.5MHz reference clock for 10Mbps speed. Note that in MII mode, this clock has constant phase referenced to the reference clock. Applications requiring such constant phase can use this feature.
		Hi-Z	Unused in RMII Mode
		I, PD	RGMII Transmit Clock: The clock is sourced from the MAC layer to the PHY. When operating at 100Mbps speed, this clock must be 25MHz. When operating at 10Mbps speed, this clock must be 2.5MHz. Note : When in reset, TX_CLK is an output pin and low value is driven on the pin. Only once device is out of reset, TX_CLK is configured as input.
TX_EN / TX_CTRL	3	I, PD	Transmit Enable: TX_EN is presented on the rising edge of the TX_CLK. TX_EN indicates the presence of valid data inputs on TX_D[3:0] in MII mode and on TX_D[1:0] in RMII mode. TX_EN is an active high signal. RGMII Transmit Control: TX_CTRL combines transmit enable and transmit error signals. TX_EN is presented on the rising edge of TX_CLK and TX_ER on the falling edge of TX_CLK.
TX_D0	4	I, PD	Transmit Data: In MII mode, the transmit data nibble received from the MAC is synchronous to the rising edge of TX_CLK. In RMII mode, TX_D[1:0] received from the MAC is synchronous to the rising edge of the reference clock. In RGMII mode, the transmit data nibble received from the MAC is synchronous to the rising edge of TX_CLK.
TX_D1	5		
TX_D2	6		
TX_D3	7		
RX_CLK	25	O	MII Receive Clock: MII Receive Clock provides a 25MHz reference clock for 100Mbps speed and a 2.5MHz reference clock for 10Mbps speed, which is derived from the received data stream. Unused in RMII Mode RGMII Receive Clock: RGMII Receive Clock provides a 25MHz reference clock for 100Mbps speed and a 2.5MHz reference clock for 10Mbps speed, which is derived from the receive data stream.
RX_DV / RX_CTRL	26	O, S-PD	Receive Data Valid: This pin indicates valid data is present on the RX_D[3:0] for MII mode and on RX_D[1:0] in RMII mode, independent from Carrier Sense. RGMII Receive Control: RX_CTRL combines receive data valid and receive error signals. RX_DV is presented on the rising edge of RX_CLK and RX_ER on the falling edge of RX_CLK.
RX_ER	28	O, S-PU	Receive Error: This pin indicates that an error symbol has been detected within a received packet in both MII and RMII mode. In MII mode, RX_ER is asserted high synchronously to the rising edge of RX_CLK. In RMII mode, RX_ER is asserted high synchronously to the rising edge of the reference clock. This pin is not required to be used by the MAC in MII or RMII because the PHY is corrupting data on a receive error. Unused in RGMII Mode
RX_D0	30	O, S-PD	Receive Data: Symbols received on the cable are decoded and presented on these pins synchronous to the rising edge of RX_CLK. The pins contain valid data when RX_DV is asserted. A nibble RX_D[3:0] is received in MII and RGMII modes. 2-bits RX_D[1:0] is received in RMII Mode. PHY address pins PHY_AD[4:1] are multiplexed with RX_D[3:0], and are pulled down. PHY_AD[0] (LSB of the address) is multiplexed with COL on pin 29, and is pulled up. If no external pullup or pulldown is present, the default PHY address is 0x01.
RX_D1	31		
RX_D2	32		
RX_D3 / GPIO3	1		
CRS / CRS_DV	27	O, S-PU	Carrier Sense: In MII mode this pin is asserted high when the receive or transmit medium is non-idle. Carrier Sense / Receive Data Valid: In RMII mode, this pin combines the RMII Carrier and Receive Data Valid indications. Unused in RGMII Mode

Table 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
COL / GPIO2	29	I/O, S-PU	Collision Detect: For Full-Duplex mode, this pin is always LOW. In Half-Duplex mode, this pin is asserted HIGH only when both transmit and receive media are non-idle. Unused in RMII Mode
SERIAL MANAGEMENT INTERFACE			
MDC	20	I, PD	Management Data Clock: Synchronous clock to the MDIO serial management input/output data. This clock can be asynchronous to the MAC transmit and receive clocks. The maximum clock rate is 25MHz. There is no minimum clock rate.
MDIO	19	I/O	Management Data I/O: Bidirectional management data signal that can be sourced by the management station or the PHY. This pin requires a 2.2kΩ pullup resistor.
INT/PWDN_N	8	I/O, OD	Interrupt / Power Down: Register access is required for this pin to be configured either as power down or as an interrupt. The default function of this pin is power down. When this pin is configured for a power down function, an active low signal on this pin places the device in power-down mode. When this pin is configured as an interrupt pin, this pin is asserted low when an interrupt condition occurs. The pin has an open-drain output with a weak internal pullup. Some applications can require an external pullup resistor.
RESET_N	18	I, PU	RESET: This pin is an active low reset input that initializes or re-initializes all the internal registers of the PHY. Asserting this pin low for at least 10μs forces a reset process to occur.
CLOCK INTERFACE			
XI	23	I	Crystal / Oscillator Input MII reference clock: Reference clock 25MHz ±100ppm-tolerance crystal or oscillator input. The device supports either an external crystal resonator connected across pins XI and XO, or an external CMOS-level oscillator connected to pin XI only. RMII reference clock: Reference clock 50MHz ±100ppm-tolerance CMOS-level oscillator in RMII Follower mode. Reference clock 25MHz ±100ppm-tolerance crystal or oscillator in RMII Leader mode. RGII reference clock: Reference clock 25MHz ±100ppm-tolerance crystal or oscillator input. The device supports either an external crystal resonator connected across pins XI and XO, or an external CMOS-level oscillator connected to pin XI only.
XO	22	O	Crystal Output: Reference Clock output. XO pin is used for crystal only. This pin must be left floating when a CMOS-level oscillator is connected to XI.
GPIO AND LED INTERFACE			
LED_0	17	O, S-PU	Function 1 (Default): LINK Indication, LED indicates the status of the link. When the link is good, LED is ON. When the link is down, LED is OFF. Function 2: ACT Indication, LED indicates transmit and receive activity in addition to the status of the link. The LED is ON when link is good. The LED blinks when the transmitter or receiver is active.
LED_1 / GPIO1	24	I/O, S-PD	Function 1 (Default): This pin is tri-state. Function 2: SPEED Indication, LED indicates the speed of the link. If speed is 100Mbps, LED is ON. If speed is 10Mbps, LED is OFF. External Pull resistors are required when LED is connected to this pin. GPIO1: This pin can be used as a GPIO when using register access. Signal Detect: This pin acts as Signal Detect in 100BASE-FX mode and is connected with Optical Transceiver. Signal Detect high level is the VDDIO voltage level.

Table 5-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
COL / GPIO2	29	I/O, S, PU	MII Mode: COL pin can be used to drive an LED when operating in Full-Duplex mode. Register access is required for LED configuration. RMII Mode: This pin can be used as an LED when using register access. RGMII Mode: This pin can be used as an LED when using register access. GPIO2: This pin can be used as a GPIO when using register access.
RX_D3 / GPIO3	1	I/O, S-PD	MII Mode: RX_D3 remains as RX_D3 because this pin is required for MII mode. RMII Mode: RX_D3 pin can be configured to drive an LED. Register access is required for LED configuration. RGMII Mode: RX_D3 remains as RX_D3 because this pin is required for RGMII mode. GPIO3: This pin can be used as a GPIO when using register access.
MEDIA DEPENDENT INTERFACE			
TD_M	11	A	Differential Transmit Output (PMD): These differential outputs can be automatically configured to either 10BASE-Te, 100BASE-TX, or 100BASE-FX signaling or forced into a specific signaling mode.
TD_P	12		
RD_M	9	A	Differential Receive Input (PMD): These differential inputs are automatically configured to accept either 10BASE-Te, 100BASE-TX, or 100BASE-FX signaling or forced into a specific signaling mode.
RD_P	10		
POWER AND GROUND PINS			
VDDIO	21	P	I/O Supply: 3.3V, 2.5V, or 1.8V
AVD	14	P	Analog Supply: 3.3V or 1.8V
GND	Ground Pad	P	Ground
RBIAS	16	I	Bias Resistor Connection. A 4.87kΩ ±1% resistor must be connected from RBIAS to GND.
OTHER PINS			
NC	13	NC	Leave Floating
NC	15	NC	Leave Floating
LED_1 / GPIO1	24	I/O, S-PD	This pin can be left floating when not in used. External Pull resistors are required when LED is connected to this pin.

(1) The definitions below define the functionality of the I/O cells for each pin.

- Type: I - Input
- Type: O - Output
- Type: I/O - Input/Output
- Type OD - Open Drain
- Type: PD, PU - Internal Pull-down/Pull-up
- Type: S-PU, S-PD - Strapping Pin (All strap pins have weak internal pull ups or pull downs. If the default strap value is needed to be changed then an external 2.2kΩ resistor must be used)

Table 5-2. IO Pins State During Reset

PIN NAME	NO.	TYPE	PU/PD/HiZ
MDIO	19	I	Hi-Z
MDC	20	I	PD
INT_N	8	I	PU
RESET_N	18	—	—
TX_CLK ⁽¹⁾	2	O	PD
TX_EN	3	I	PD
TX_D3	7	I	PD
TX_D2	6	I	PD
TX_D1	5	I	PD
TX_D0	4	I	PD
LED_0	17	Strap	PU
LED_1	24	Strap	PD
CRS	27	Strap	PU
COL	29	Strap	PU
RX_ER	28	Strap	PU
RX_DV	26	Strap	PD
RX_D3	1	Strap	PD
RX_D2	32	Strap	PD
RX_D1	31	Strap	PD
RX_D0	30	Strap	PD
RX_CLK	25	O	PD

- (1) When in reset, TX_CLK is an output pin and low value is driven on TX_CLK. In RGMII mode, once the device is out of reset, Tx_CLK is configured as input.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Input voltage	AVD	−0.5	3.8	V
	VDDIO	−0.5	3.8	
	TD−, TD+, RD−, RD+	−0.5	6	
	Other Inputs (PHY in normal operating condition)	−0.5	VDDIO + 0.3V	
DC output voltage	All pins	−0.5	3.8	V
T _J	Operating junction temperature		135	°C
T _{stg}	Storage temperature	−65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	All pins except pins 9, 10, 11, and 12	±3000	V
		Pins 9, 10, 11, and 12	±16000	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	All pins	±1500	
		IEC 61000-4-2 ⁽³⁾	±8000	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.
 (3) IEC61000-4-2; 150pF and 330Ω, Contact Discharge, Class B.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDDIO	Supply Voltage I/O (1.8V Option)	1.71	1.8	1.89	V
	Supply Voltage I/O (2.5V Option)	2.375	2.5	2.625	
	Supply Voltage I/O (3.3V Option)	3.15	3.3	3.45	
AVD ⁽¹⁾	Supply Voltage Analog (3.3V Option)	3.15	3.3	3.45	V
	Supply Voltage Analog (1.8V Option)	1.71	1.8	1.89	
Center Tap (CT) ⁽¹⁾	Supply Voltage Center Tap (3.3V Option) <i>Magnetic Center Tap</i>	3.15	3.3	3.45	V
	Supply Voltage Analog (1.8V Option) <i>Magnetic Center Tap</i>	1.71	1.8	1.89	
T _A	Ambient Temperature: DP83822I and DP83822IF	−40		85	°C
	Ambient Temperature: DP83822H and DP83822HF	−40		125	

- (1) Analog supply (AVD) and magnetic center tap must be at the same potential.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DP83822	UNIT
		RHB (VQFN)	
		32 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	41.0	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	35.5	°C/W
R _{θJB}	Junction-to-board thermal resistance	14.1	°C/W
ψ _{JT}	Junction-to-top characterization parameter	0.9	°C/W
ψ _{JB}	Junction-to-board characterization parameter	14.0	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	5.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
3.3V VDDIO						
V _{OH}	High level output voltage	I _{OH} = –4mA VDDIO = 3.3V ±5%	2.4			V
V _{OL}	low level output voltage	I _{OL} = 4mA VDDIO = 3.3V ±5%			0.4	V
V _{IH}	High level input voltage	VDDIO = 3.3V ±5%	1.7			V
V _{IL}	Low level input voltage	VDDIO = 3.3V ±5%			0.8	V
2.5V VDDIO						
V _{OH}	High level output voltage	I _{OH} = –4mA VDDIO = 2.5V ±5%	VDDIO × 0.8			V
V _{OL}	Low level output voltage	I _{OL} = 4mA VDDIO = 2.5V ±5%			0.4	V
V _{IH}	High level input voltage	VDDIO = 2.5V ±5%	1.5			V
V _{IL}	Low level input voltage	VDDIO = 2.5V ±5%			0.7	V
1.8V VDDIO						
V _{OH}	High level output voltage	I _{OH} = –2mA VDDIO = 1.8V ±5%	VDDIO – 0.4			V
V _{OL}	Low level output voltage	I _{OL} = 2mA VDDIO = 1.8V ±5%			0.4	V
V _{IH}	High level input voltage	VDDIO = 1.8V ±5%	1.3			V
V _{IL}	Low level input voltage	VDDIO = 1.8V ±5%			0.5	V
DC CHARACTERISTICS						
I _{IH}	Input high current (VIN = VCC)	–40°C to 85°C	–10		10	µA
		85°C to 125°C	–20		20	
I _{IL}	Input low current (VIN = GND)	–40°C to 125°C	–10		10	µA
I _{OZ}	TRI-STATE output current (VOUT = VCC, VOUT = GND)	–40°C to 85°C	–10		10	µA
		85°C to 125°C	–20		20	
C _{XI/XO}	XO and XI capacitance ⁽¹⁾			0.8		pF
C _{IN}	Input capacitance ⁽¹⁾			5		pF
C _{OUT}	Output capacitance ⁽¹⁾			5		pF

6.5 Electrical Characteristics (continued)

over operating free-air temperature range (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
R _{PU-POR}	Integrated pullup resistance during latch-in (RESET and Power-Up)	37.5	50	62.5	kΩ
R _{Pull-Up}	Integrated pullup resistance	6.75	9	11.25	kΩ
R _{Pull-Down}	Integrated pulldown resistance	6.75	9	11.25	kΩ
PMD OUTPUTS					
V _{OD}	MDI 10BASE-Te swing	1.54	1.75	1.96	V _{peak}
V _{OD}	MDI 100BASE-TX swing	0.95	1	1.05	V _{peak}
V _{ODsym}	MDI 100BASE-TX voltage symmetry	98%	100%	102%	
V _{OD}	MDI 100BASE-FX transmitter swing ⁽¹⁾	0.9	1	1.1	V _{pk-pk}
Tr/f	MDI 100BASE-FX transmitter rise/fall time ⁽¹⁾	0.5	1	1.5	ns
T _{j_out}	MDI 100BASE-FX transmitter total jitter ⁽¹⁾			1.4	ns
V _{in}	MDI 100BASE-FX receiver input swing requirement ⁽¹⁾	0.22		1.8	V _{pk-pk}
T _{j_in}	MDI 100BASE-FX receiver input jitter requirement ⁽¹⁾			0.45	UI

(1) Specified by production test, characterization or design.

(2) Configurable through register 0x0403. Output variance is in range of ±10%

6.6 Timing Requirements, Power-Up Timing

See (1) (2).

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
T1	AVD (analog supply) ramp delay post VDDIO (digital supply) ramp. AVD and VDDIO potential must not exceed 0.3V prior to supply ramp. ⁽³⁾	–100		100	ms
	VDDIO ramp time			100	ms
	AVD ramp time			100	ms
T2	Post power-up stabilization time prior to MDC preamble for register accesses. MDC preamble coming in any time after this max wait time is valid.			200	ms
T3	Hardware configuration latch-in time for power up			200	ms
T4	Hardware configuration pins transition to output drivers		64		ns
T5	Fast Link Pulse transmission delay post power up		1.5		s

(1) Specified by production test, characterization, or design.

(2) See Figure 6-1.

(3) AVD ramping up after VDDIO ramp completion is preferred to avoid false detection of lower level of VDDIO in any corner case.

6.7 Timing Requirements, Power-Up With Unstable XI Clock

See (1).

PARAMETER		MIN	NOM	MAX	UNIT
T1	Reset application after XI stabilization	1			us
T2	Reset pulse width	10			us

(1) See [Figure 6-2](#)

6.8 Timing Requirements, Reset Timing

See (1) (2).

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
T1	RESET pulse width	XI clock must be stable for a minimum of 1μs during RESET pulse low time		10			μs
T2	Post RESET stabilization time prior to MDC preamble for register accesses	MDIO is pulled high for 32-bit serial management initialization				2	ms
T3	Hardware configuration latch-in time for RESET				120		ns
T4	Hardware configuration pins transition to output drivers				64		ns
T5	Fast Link Pulse transmission delay post RESET				1.5		s

(1) Specified by production test, characterization, or design.

(2) See [Figure 6-3](#).

6.9 Timing Requirements, Serial Management Timing

See (1) (2).

PARAMETER		MIN	TYP	MAX	UNIT
T1	MDC to MDIO (Output) Delay Time	0		10	ns
T2	MDIO (Input) to MDC Setup Time	10			ns
T3	MDIO (Input) to MDC Hold Time	10			ns
T4	MDC Frequency		2.5	25	MHz

(1) Specified by production test, characterization, or design.

(2) See [Figure 6-4](#).

6.10 Timing Requirements, 100Mbps MII Transmit Timing

See (1) (2).

PARAMETER		MIN	TYP	MAX	UNIT
T1	TX_CLK High / Low Time	16	20	24	ns
T2	TX_D[3:0], TX_EN Data Setup to TX_CLK	10			ns
T3	TX_D[3:0], TX_EN Data Hold from TX_CLK	0			ns

(1) Specified by production test, characterization, or design.

(2) See [Figure 6-5](#).

6.11 Timing Requirements, 100Mbps MII Receive Timing

See (1) (2).

PARAMETER		MIN	TYP	MAX	UNIT
T1	RX_CLK High / Low Time	16	20	24	ns
T2	RX_D[3:0], RX_DV and RX_ER Delay from RX_CLK rising	10		30	ns

- (1) Specified by production test, characterization, or design.
(2) See [Figure 6-6](#).

6.12 Timing Requirements, 10Mbps MII Transmit Timing

See (1) (2).

PARAMETER		MIN	TYP	MAX	UNIT

Figure 6-10. RMII Receive Timing

Figure 6-11. RGMII Transmit Timing

Figure 6-12. RGMII Receive Timing

The diagram illustrates the timing of Fast Link Pulse (s) and FLP Bursts. The top waveform, labeled "Fast Link Pulse(s)", shows a sequence of pulses. The first two pulses are labeled "Clock Pulse" and "Data Pulse" respectively. The time interval between the start of the first clock pulse and the start of the first data pulse is labeled T_1 . The time interval between the end of the first data pulse and the start of the second clock pulse is labeled T_2 . The time interval between the end of the second data pulse and the start of the third clock pulse is labeled T_3 . The bottom waveform, labeled "FLP Bursts", shows two bursts of pulses. The time interval between the start of the first burst and the start of the second burst is labeled T_4 . The time interval between the end of the first burst and the start of the second burst is labeled T_5 .

The diagram shows three signals over time:

- TX_EN**: A signal that transitions from low to high and then back to low.
- PMD Output Pair**: A signal that transitions from low to high when TX_EN goes high and back to low when TX_EN goes low. The duration of the high pulse is labeled **T1**.
- COL**: A signal that transitions from low to high after TX_EN returns to low. The time interval between the falling edge of TX_EN and the rising edge of COL is labeled **T2**.

7 Detailed Description

7.1 Overview

The DP83822 is a fully-featured, single-port Physical Layer transceiver for 10BASE-Te, 100BASE-TX and 100BASE-FX signaling. The device supports the standard Media Independent Interface (MII), Reduced Media Independent Interface (RMII), and Reduced Gigabit Media Independent Interface (RGMI) for direct connection to a Media Access Controller (MAC).

The device is designed for power supply flexibility by allowing for a range of I/O voltage interfaces (3.3V, 2.5V, or 1.8V) and options for analog voltage (1.8V or 3.3V) to reduce power consumption. Automatic supply configuration within the DP83822 allows for any combination of VDDIO supply and AVD supply without the need for additional configuration settings. The DP83822 uses mixed-signal processing to perform equalization, data recovery, and error correction to achieve robust operation over CAT5 twisted-pair cable. The DP83822 not only meets the requirements of IEEE 802.3u, but maintains high margins in terms of crosstalk and unwanted noise.

The DP83822 is also a pin-to-pin upgradeable option for the TLK105, TLK106, TLK105L, and TLK106L 10/100Mbps Ethernet PHYs.

7.2 Functional Block Diagram

Figure 7-1. DP83822 Functional Block Diagram

7.3 Feature Description

7.3.1 Energy Efficient Ethernet

7.3.1.1 EEE Overview

Energy Efficient Ethernet (EEE), defined by IEEE 802.3az, is a capability integrated into Layer 1 (Physical Layer) and Layer 2 (Data Link Layer) to operate in Low Power Idle (LPI) mode. In LPI mode, power is saved during periods of low packet utilization. EEE defines the protocol to enter and exit LPI mode without dropping the link or corrupting packets. The transition time into and out of LPI mode is short enough to be transparent to the upper layers within the OSI model.

The DP83822 EEE supports 100Mbps and 10Mbps speeds. In 10BASE-T_e operation, EEE operates with a reduced transmit amplitude that is fully interoperable with a 10BASE-T PHY.

7.3.1.2 EEE Negotiation

EEE is advertised during Auto-Negotiation. Auto-Negotiation is performed at power up, on management command, after link failure, or due to user intervention. EEE is supported if and only if both link partners advertise EEE capabilities. If EEE is not supported, all EEE functions are disabled and the MAC must not assert LPI. To advertise EEE capabilities, the PHY needs to exchange an additional formatted next page and unformatted next page in sequence.

EEE Negotiation can be activated in two ways:

- Hardware Bootstrapping
- Register Access

EEE Negotiation Advertisements can be activated using RX_D1 pin bootstrap. When RX_D1 is set to strap mode 2 or mode 3, EEE capabilities can be advertised during the Auto-Negotiation process. EEE Negotiation Advertisements can also be activated using register access through the SMI. The DP83822 offers two different ways of accessing EEE control registers within the PHY register set. IEEE 802.3az defines MMD3 and MMD7 as the locations for EEE control and status registers. The MMD3 and MMD7 registers 0x3000, 0x3001, 0x3016, 0x703C, and 0x703D contain all the required controls and status indications for operating EEE. Additionally, the DP83822 supports an EEE configuration bypass option that enables EEE control registers within Texas Instruments' Vendor Specific DEVAD. This helps simplify configuration by allowing for a single DEVAD to be used. The Energy Efficient Ethernet Configuration Register #2 (EEECFG2, address 0x04D0) contains controls for enabling and selecting the pin allocation for TX_ER, which is part of the MAC transmit LPI command. The Energy Efficient Ethernet Configuration Register #3 (EEECFG3, address 0x04D1) contains controls for EEE configuration bypass.

7.3.2 Wake-on-LAN Packet Detection

Wake-on-LAN provides a mechanism to detect specific frames and notify the connected controller through either register status change, GPIO indication or an interrupt flag. The WoL feature within the DP83822 allows for connected devices residing above the Physical Layer to remain in a low power state until frames with the qualifying credentials are detected. Supported WoL frame types include: Magic Packet, Magic Packet with Secure-ON and Custom Pattern Match. When a qualifying WoL frame is received, the DP83822 WoL logic circuit is able to generate a user defined event (either pulses or level change) through any of the GPIO pins or a status interrupt flag to inform a connected controller that a wake event has occurred. Additionally, the DP83822 includes a CRC Gate to prevent invalid packets from triggering a wake-up event.

The Wake-on-LAN feature set includes:

- Identification of WoL frames in all supported speeds (100BASE-FX, 100BASE-TX and 10BASE-T_e).
- Wakeup interrupt generation upon reception of a WoL frame.
- CRC error checking of WoL frames to prevent interrupt generation from invalid frames.
- Magic Packets with Secure-ON password and 64-byte Custom Pattern Match for security.

7.3.2.1 Magic Packet Structure

When configured for Magic Packet detection, the DP83822 scans all incoming frames addressed to the node for a specific data sequence. This sequence identifies the frame as a Magic Packet frame.

A Magic Packet frame must also meet the basic requirements for the LAN technology chosen, such as SOURCE ADDRESS, DESTINATION ADDRESS (which can be the receiving station's IEEE address or a BROADCAST ADDRESS), and CRC.

The specific Magic Packet sequence consists of 16 duplications of the MAC address of this node, with no breaks or interruptions, followed by Secure-ON password if security is enabled. This sequence can be located anywhere within the packet, but must be preceded by a synchronization stream. The synchronization stream is defined as 6 bytes of 0xFF.

Figure 7-2. Magic Packet Structure

7.3.2.2 Magic Packet Example

The following is an example Magic Packet for a Destination Address of 11h 22h 33h 44h 55h 66h and a secure-on password 2Ah 2Bh 2Ch 2Dh 2Eh 2Fh:

DESTINATION						SOURCE	MISC	FF	FF	FF	FF	FF	FF	FF	FF	FF	FF
11	22	33	44	55	66	11	22	33	44	55	66	11	22	33	44	55	66
11	22	33	44	55	66	11	22	33	44	55	66	11	22	33	44	55	66
11	22	33	44	55	66	11	22	33	44	55	66	11	22	33	44	55	66
11	22	33	44	55	66	11	22	33	44	55	66	11	22	33	44	55	66
11	22	33	44	55	66	11	22	33	44	55	66	11	22	33	44	55	66
11	22	33	44	55	66	2A	2B	2C	2D	2E	2F	MISC CRC					

7.3.2.3 Wake-on-LAN Configuration and Status

Wake-on-LAN functionality is configured through the Receive Configuration Register (RXFCFG, address 0x04A0). Wake-on-LAN status is reported in the Receive Status Register (RXFS, address 0x04A1). Wake-on-LAN interrupt flag configuration and status is located in the MII Interrupt Status Register #2 (MISR2, address 0x0013).

7.3.3 Start of Frame Detect for IEEE 1588 Time Stamp

The DP83822 supports an IEEE 1588 indication pulse at the SFD (start frame delimiter) for receive and transmit paths. The pulse can be delivered to any of the following pins: LED_0, LED_1 (GPIO1), COL (GPIO2), RX_D3 (GPIO3), INT/PWDN_N and CRS. The 1588 Time Stamp pulse indicates the actual time the symbol is presented on the lines (for transmit), or the first symbol received (for receive). The exact timing of the pulse can be adjusted through the IEEE 1588 PTP Configuration Register (PTPCFG, address 0x003F). Each increment of phase value is an 8ns step.

Figure 7-3. IEEE 1588 Message Timestamp Point

There are three registers that are able to control the routing of the IEEE 1588 transmit and receive indications. The IEEE 1588 PTP Pin Select Register (PTPPSEL, address 0x003E) is able to route both transmit and receive indications to LED_0 (GPIO1), COL (GPIO2), CRS and INT/PWDN_N, which is also found in the TLK105L and TLK106L PHYs. Two additional registers in the DP83822 allow for additional pin selections and a centralized location for GPIO controls through the use of the IO MUX GPIO Control Register #1 and #2 (IOCTRL1 and IOCTRL2, address 0x0462 and address 0x0463). After enabling/setting the RX_SFD and TX_SFD pins in register IOCTRLx, please write the following two registers:

- Program (Register 0x0456 = value 0x000A)
- Program (Register 0x04A0 = value 0x1080)
 - Please note register 0x04A0 is enabling "bit 7: WOL". This helps improve the accuracy of SFD detection and is not a must change. This does not cause PHY to detect WoL packets, as WoL function needs additional register configurations.

Note: A software reset has to be performed to load these register values (Register 0x001F = value 0x4000)

7.3.4 Clock Output

The DP83822 has several clock configuration options. An external crystal or CMOS-level oscillator provides the stimulus for the internal PHY reference clock. The local reference clock acts as the central source for all clocking within the device, excluding the pass-through clock option.

All clock configuration options are enabled using the DP83822 IO MUX GPIO Control Register #1 and #2 (IOCTRL1 IOCTRL2, address 0x0462 bits[14:12] for RX_D3 (GPIO3), address 0x0462 bits[6:4] for LED_1 (GPIO1), address 0x0463 bits[6:4] for COL (GPIO2)).

Clock options supported by the DP83822 include:

- MAC IF Clock
- XI Clock
- Free-Running Clock
- Recovered Clock

MAC IF Clock operates at the same rate as the MAC interface selected. For MII operation, MAC IF Clock frequency is 25MHz. For RMII operation, MAC IF Clock frequency is 50MHz. For RGMII operation, MAC IF Clock frequency is 25MHz. XI Clock is a pass-through option, which allows for the XI pin clock to be passed to a GPIO pin. Please note that the clock is buffered prior to transmission out of the GPIOs, and output clock

amplitude is at the selected VDDIO level. Free-Running Clock is an internally generated 125MHz free-running clock. Recovered Clock is a 125MHz recovered clock from a connected link partner.

7.4 Device Functional Modes

7.4.1 MAC Interfaces

7.4.1.1 Media Independent Interface (MII)

The Media Independent Interface is a synchronous 4-bit wide nibble data interface that connects the PHY to the MAC in 100BASE-FX, 100BASE-TX and 10BASE-T_e modes. The MII is fully compliant with IEEE 802.3-2002 clause 22.

Table 7-1 summarizes MII signals.

Table 7-1. MII Signals

FUNCTION	PINS
Data Signals	TX_D[3:0]
	RX_D[3:0]
Transmit and Receive Signals	TX_EN
	RX_DV
Line-Status Signals	CRS
	COL

Figure 7-4. MII Signaling

Additionally, the MII interface includes the carrier sense signal (CRS), as well as a collision detect signal (COL). The CRS signal asserts to indicate the reception or transmission of data. The COL signal asserts as an indication of a collision which can occur during Half-Duplex mode when both transmit and receive operations occur simultaneously.

7.4.1.2 Reduced Media Independent Interface (RMII)

The DP83822 incorporates the Reduced Media Independent Interface (RMII) as specified in the RMII specification from the RMII consortium. The purpose of this interface is to provide a reduced pin count alternative to the IEEE 802.3u MII as specified in Clause 22. Architecturally, the RMII specification provides an additional reconciliation layer on either side of the MII, but can be implemented in the absence of an MII. The DP83822 offers two types of RMII operations: RMII Follower and RMII Leader. In RMII Follower operation, the DP83822 operates off of a 50MHz CMOS-level oscillator connected to the XI pin and shares the same clock as the MAC. In RMII Leader operation, the DP83822 operates off of either a 25MHz CMOS-level oscillator connected to XI pin or a 25MHz crystal connected across XI and XO pins. A 50MHz output clock referenced from any of the three DP83822 GPIOs is connected to the MAC.

Note

If RMII Leader mode is configured through bootstraps, a 50MHz output clock is automatically enabled on RX_D3 (GPIO3).

The RMII specification has the following characteristics:

- Supports 100BASE-FX, 100BASE-TX and 10BASE-Te.
- Single clock reference sourced from the MAC to PHY (or from an external source)
- Provides independent 2-bit wide transmit and receive data paths
- Uses CMOS signal levels, the same levels as the MII interface

In this mode, data transfers are two bits for every clock cycle using the internal 50MHz reference clock for both transmit and receive paths.

Table 7-2 summarizes the RMII signals.

Table 7-2. RMII Signals

FUNCTION	PINS
Data Signals	TX_D[1:0]
	RX_D[1:0]
Transmit and Receive Signals	TX_EN
	CRS_DV

Figure 7-5. RMII Follower Signaling

Figure 7-6. RMII Leader Signaling

Data on TX_D[1:0] are latched at the PHY with reference to the clock edges on the XI pin. Data on RX_D[1:0] are latched at the MAC with reference to the same clock edges on the XI pin. RMII operates at the same speed in 10BASE-T_e, 100BASE-TX and 100BASE-FX. In 10BASE-T_e the data is 10 times slower than the reference

clock, so transmit data is sampled every 10 clock cycles. Likewise, receive data is generated on every 10th clock so that an attached MAC device can sample the data every 10 clock cycles.

In addition, RMII mode supplies an RX_DV signal that allows a simpler method of recovering receive data without the need to separate RX_DV from the CRS_DV indication. RX_ER is also supported even though RX_ER is not required by the RMII specification.

RMII includes a programmable elastic buffer to adjust for the frequency differences between the reference clock and the recovered receive clock. The programmable elastic buffer minimizes internal propagation delay based on expected maximum packet size and clock accuracy.

Table 7-3 indicates how to program the buffer FIFO based on the expected maximum packet size and clock accuracy, assuming that the RMII reference clock and the far-end transmitter clock have the same accuracy.

Table 7-3. Recommended RMII Packet Sizes

START THRESHOLD RBR[1:0]	LATENCY TOLERANCE	RECOMMENDED PACKET SIZE AT ± 50 ppm	RECOMMENDED PACKET SIZE AT ± 100 ppm
1 (4 bits)	2 bits	2400 bytes	1200 bytes
2 (8 bits)	6 bits	7200 bytes	3600 bytes
3 (12 bits)	10 bits	12000 bytes	6000 bytes
4 (16 bits)	14 bits	16800 bytes	8400 bytes

7.4.1.3 RMII Repeater Mode

The DP83822 device provides the option to enable RMII back-to-back repeater mode functionality to extend cable reach. Two DP83822 devices can be connected in RMII repeater mode without need of any external configuration. Figure 7-7 and Figure 7-8 show the RMII pin connections that enables the device to operate in repeater mode.

Figure 7-7. RMII Repeater Mode: Leader-Follower

Figure 7-8. RMI Repeater Mode: Follower-Follower

7.4.1.4 Reduced Gigabit Media Independent Interface (RGMII)

The DP83822 also supports Reduced Gigabit Media Independent Interface (RGMII) as specified by RGMII version 2.0. RGMII is designed to reduce the number of pins required to connect the MAC and PHY. To accomplish this goal, the control signals are multiplexed. Both rising and falling edges of the clock are used to sample the control signal pin on the transmit and receive paths. For 10Mbps operation, RX_CLK and TX_CLK operate at 2.5MHz. For 100Mbps operation, RX_CLK and TX_CLK operate at 25MHz.

Table 7-4 summarizes the RGMII signals.

Table 7-4. RGMII Signals

FUNCTION	PINS
Data Signals	TX_D[3:0]
	RX_D[3:0]
Transmit and Receive Signals	TX_CTRL
	RX_CTRL

Figure 7-9. RGMII Signaling

During packet reception, RX_CLK can be stretched on either the positive or negative pulse to accommodate the transition from the internal free running clock to a recovered clock (data synchronous). Additionally, when the speed of the PHY changes, a similar clock stretching of the positive or negative pulses is allowed to prevent clock glitches. Data can be duplicated on the falling edge of the clock because double data rate (DDR) is only required for 1Gbps operation, which is not supported by the DP83822.

The DP83822 supports in-band status indication. To help simplify detection of link status, speed and duplex, the DP83822 provides inter-frame signals on RX_D[3:0] pins as specified in Table 7-5.

Table 7-5. RGMII In-Band Status

RX_DV	RX_D3	RX_D[2:1]	RX_D0
0 Note: In-band status only valid when RX_DV is low	Duplex Status: 1 = Full-Duplex 0 = Half-Duplex	RX_CLK Clock Speed: 00 = 2.5MHz (10Mbps) 01 = 25MHz (100Mbps) 10 = Reserved 11 = Reserved	Link Status: 1 = Valid link established 0 = Link not established

7.4.2 Serial Management Interface

The Serial Management Interface provides access to the DP83822 internal register space for status information and configuration. The SMI is compatible with IEEE 802.3 clause 22 and clause 45. The implemented register set consists of the registers required by the IEEE 802.3 plus several others to provide additional visibility and controllability of the DP83822.

The SMI includes the management clock (MDC) and the management input/output data pin (MDIO). MDC is sourced by the external management entity, also called Station (STA), and can run at a maximum clock rate of 25MHz. MDC is not expected to be continuous, and can be turned off by the external management entity when the bus is idle.

MDIO is sourced by the external management entity and by the PHY. The data on the MDIO pin is latched on the rising edge of the MDC. MDIO pin requires a pullup resistor (2.2K Ω), which pulls MDIO high during IDLE and turnaround.

Up to 32 PHYs can share a common SMI bus. To distinguish between the PHYs, a 5-bit address is used. During power up or hardware reset, the DP83822 latches the PHY_AD[4:0] configuration pins to determine the address.

The management entity must not start an SMI transaction in the first cycle after power up or hardware reset. To maintain valid operation, the SMI bus must remain inactive at least one MDC cycle after reset is deasserted. In typical MDIO transactions, the register address is taken directly from the management-frame reg_addr field, thus allowing direct access to 32 16-bit registers (including those defined in IEEE 802.3 and vendor specific). The data field is used for both reading and writing. The Start code is indicated by a <01> pattern. This pattern makes sure that the MDIO line transitions from the default idle line state. Turnaround is defined as an idle bit time inserted between the Register Address field and the Data field. To avoid contention during a read transaction, no device can actively drive the MDIO signal during the first bit of Turnaround. The addressed DP83822 drives the MDIO with a zero for the second bit of turnaround and follows this with the required data.

For write transactions, the station-management entity writes data to the addressed DP83822, thus eliminating the requirement for MDIO Turnaround. The Turnaround time is filled by the management entity by inserting <10>.

Table 7-6. SMI Protocol

SMI PROTOCOL	<idle><start><op code><device addr><reg addr><turnaround><data><idle>
Read Operation	<idle><01><10><AAAA><RRRRR><Z0><XXXX XXXX XXXX XXXX><idle>
Write Operation	<idle><01><01><AAAA><RRRRR><10><XXXX XXXX XXXX XXXX><idle>

7.4.2.1 Extended Register Space Access

The DP83822 SMI function supports read and write access to the extended register set using the Register Control Register (REGCR, address 0x000D), the Data Register (ADDAR, address 0x000E), and the MDIO Manageable Device (MMD) indirect method defined in IEEE 802.3ah Draft for Clause 22 for accessing the Clause 45 extended register set.

The standard register set, MDIO registers 0 to 31, is accessed using the normal direct-MDIO access or the indirect method, except for register REGCR and register ADDAR, which are accessed only using the normal MDIO transaction. The SMI function ignores indirect access to these registers.

REGCR is the MMD access control. In general, register REGCR[4:0] is the device address DEVAD that directs any accesses of the ADDAR register to the appropriate MMD.

The DP83822 supports three MMD device addresses:

1. The Vendor-Specific device address DEVAD[4:0] = 11111 is used for general MMD register accesses.
2. DEVAD[4:0] = 00011 is used for Energy Efficient Ethernet MMD register accesses. Register names for registers accessible at this device address are preceded by MMD3.
3. DEVAD[4:0] = 00111 is used for Energy Efficient Ethernet MMD registers accesses. Register names for registers accessible at this device address are preceded by MMD7.

All accesses through register REGCR and ADDAR must use the correct DEVAD. Transactions with other DEVAD are ignored. REGCR[15:14] holds the access function: address (00), data with no post increment (01), data with post increment on writes only (11). Address (10) is not valid.

- ADDAR is the address/data MMD register. ADDAR is used in conjunction with REGCR to provide the access to the extended register set. If register REGCR[15:14] is (00), then ADDAR holds the address of the extended address space register. Otherwise, ADDAR holds the data as indicated by the contents of the address register. When REGCR[15:14] is set to (00), accesses to register ADDAR modify the extended register set address register. This address register must always be initialized to access any of the registers within the extended register set.
- When REGCR[15:14] is set to (01), accesses to register ADDAR access the register within the extended register set selected by the value in the address register.
- When REGCR[15:14] set to (10) is not a valid option.
- When REGCR[15:14] is set to (11), access to register ADDAR access the register within the extended register set selected by the value in the address register. After that access is complete, for write access only, the value in the address register is incremented. For read accesses, the value of the address register remains unchanged.

The following sections describe how to perform operations on the extended register set using register REGCR and ADDAR. The descriptions use the device address for general MMD register accesses (DEVAD[4:0] = 11111). For register accesses to the MMD3 or MMD7 registers, the corresponding device address are used.

7.4.2.2 Write Address Operation

To set the address register:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the register address to register ADDAR.

Subsequent writes to register ADDAR (step 2) continue to write the address register.

7.4.2.3 Read Address Operation

To read the address register:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Read the register address from register ADDAR.

Subsequent reads to register ADDAR (step 2) continue to read the address register.

7.4.2.4 Write (No Post Increment) Operation

To write a register in the extended register set:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = 31) to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

Subsequent writes to register ADDAR (step 4) continue to rewrite the register selected by the value in the address register.

Note

Steps (1) and (2) can be skipped if the address register has been previously configured.

7.4.2.5 Read (No Post Increment) Operation

To read a register in the extended register set:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x401F (data, no post increment function field = 01, DEVAD = 31) to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

Subsequent reads to register ADDAR (step 4) continue to reading the register selected by the value in the address register.

Note

Steps (1) and (2) can be skipped if the address register has been previously configured.

7.4.2.6 Write (Post Increment) Operation

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x801F (data, post increment function field = 10, DEVAD = 31) or the value 0xC01F (data, post increment on writes function field = 11, DEVAD = 31) to register REGCR.
4. Write the content of the desired extended register set to register ADDAR.

Subsequent writes to register ADDAR (step 4) write the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.

7.4.2.7 Read (Post Increment) Operation

To read a register in the extended register set and automatically increment the address register to the next higher value following the write operation:

1. Write the value 0x001F (address function field = 00, DEVAD = 31) to register REGCR.
2. Write the desired register address to register ADDAR.
3. Write the value 0x801F (data, post increment function field = 10, DEVAD = 31) to register REGCR.
4. Read the content of the desired extended register set in register ADDAR.

Subsequent reads to register ADDAR (step 4) read the next higher addressed data register selected by the value of the address register; the address register is incremented after each access.

7.4.2.8 Example Write Operation (No Post Increment)

The following example demonstrates a write operation with no post increment. In this example, the MAC impedance is adjusted to 99.25Ω using the IO MUX GPIO Control Register (IOCTRL, address 0x0461).

1. Write the value 0x001F to register 0x000D.
2. Write the value 0x0461 to register 0x000E. (Sets desired register to the IOCTRL)
3. Write the value 0x401F to register 0x000D.
4. Write the value 0x0400 to register 0x000E. (Sets MAC impedance to 99.25Ω)

7.4.2.9 Example Read Operation (No Post Increment)

The following example demonstrates a read operation with no post increment. In this example, the MMD7 Energy Efficient Ethernet Link Partner Ability Register (MMD7_EEE_LP_ABILITY, address 0x703D) is read.

1. Write the value 0x0007 to register 0x000D.
2. Write the value 0x003D to register 0x000E. (Sets desired register to the MMD7_EEE_LP_ABILITY)
3. Write the value 0x4007 to register 0x000D.
4. Read the value of register 0x000E. (Data read is the value contained within the MMD7_EEE_LP_ABILITY)

7.4.3 100BASE-TX

7.4.3.1 100BASE-TX Transmitter

The 100BASE-TX transmitter consists of several functional blocks which convert synchronous 4-bit nibble data, as provided by the MII, to a scrambled MLT-3 125Mbps serial data stream on the MDI. 4B5B encoding and decoding is detailed in [Table 7-7](#).

The transmitter section consists of the following functional blocks:

1. Code-Group Encoder and Injection Block
2. Scrambler Block with Bypass Option
3. NRZ to NRZI Encoder Block
4. Binary to MLT-3 Converter / Common Driver Block

The bypass option for the functional blocks within the 100BASE-TX transmitter provides flexibility for applications where data conversion is not always required. The DP83822 implements the 100BASE-TX transmit state machine diagram as specified in the IEEE 802.3u Standard, Clause 24.

Table 7-7. 4B5B Code-Group Encoding / Decoding

NAME	PCS 5B CODE-GROUP	MII 4B NIBBLE CODE
DATA CODES		
0	11110	0000
1	01001	0001
2	10100	0010
3	10101	0011
4	01010	0100
5	01011	0101
6	01110	0110
7	01111	0111
8	10010	1000
9	10011	1001
A	10110	1010
B	10111	1011
C	11010	1100
D	11011	1101
E	11100	1110
F	11101	1111
IDLE AND CONTROL CODES⁽¹⁾		
H	00100	HALT code-group - Error code
I	11111	Inter-Packet IDLE - 0000
J	11000	First Start of Packet - 0101
K	10001	Second Start of Packet - 0101
T	01101	First End of Packet - 0000
R	00111	Second End of Packet - 0000
P	00000	EEE LPI - 0001 ⁽²⁾
INVALID CODES		
V	00001	
V	00010	
V	00011	
V	00101	
V	00110	
V	01000	
V	01100	
V	10000	
V	11001	

(1) Control code-groups I, J, K, T and R in data fields are mapped as invalid codes, together with RX_ER asserted.

(2) Energy Efficient Ethernet LPI must also have TX_ER / RX_ER asserted and TX_EN / RX_DV deasserted.

7.4.3.1.1 Code-Group Encoding and Injection

The code-group encoder converts 4-bit (4B) nibble data generated by the MAC into 5-bit (5B) code-groups for transmission. This conversion is required to allow control data to be combined with packet data code-groups. Refer to [Table 7-7](#) for 4B to 5B code-group mapping details.

The code-group encoder substitutes the first 8-bits of the MAC preamble with a J/K code-group pair (11000 10001) upon transmission. The code-group encoder continues to replace subsequent 4B preamble and data nibbles with corresponding 5B code-groups. At the end of the transmit packet, upon the deassertion of transmit enable (TX_EN) signal from the MAC, the code-group encoder injects the T/R code-group pair (01101 00111) indicating the end of the frame.

After the T/R code-group pair, the code-group encoder continuously injects IDLEs into the transmit data stream until the next transmit packet is detected (reassertion of transmit enable).

7.4.3.1.2 Scrambler

The scrambler is required to control the radiated emissions at the media connector and on the twisted-pair cable. By scrambling the data, the total energy launched onto the cable is randomly distributed over a wide frequency range. Without the scrambler, energy levels at the MDI and on the cable can peak beyond FCC limitations at frequencies related to repeating 5B sequences (that is, continuous transmission of IDLEs).

The scrambler is configured as a closed loop linear feedback shift register (LFSR) with an 11-bit polynomial. The output of the closed loop LFSR is X-ORd with the serial NRZ data from the code-group encoder. The result is a scrambled data stream with sufficient randomization to decrease radiated emissions at certain frequencies by as much as 20dB.

A serial descrambler is used to descramble the received MLT3 decoded data. The descrambler must generate an identical data scrambling sequence (N) to recover the original unscrambled data (UD) from the scrambled data (SD) as represented in the equations:

$$SD = (UD \oplus N) \quad (1)$$

$$UD = (SD \oplus N) \quad (2)$$

Synchronization of the descrambler to the original scrambling sequence (N) is achieved based on the knowledge that the incoming scrambled data stream consists of scrambled IDLE data (which is continuous stream of 1s). After the descrambler has recognized 88 consecutive IDLE symbols (or approximately 18 5-bit IDLE codes) where an IDLE symbol is bit decoded as 'b1 after descrambling, the descrambler synchronizes to the receive data stream and generate unscrambled data in the form of unaligned 5B code-groups. To maintain synchronization, the descrambler must continuously monitor the validity of the generated unscrambled data. To verify this, the received symbols are continuously monitored to check for any non-IDLE symbols received before start of packet (that is, /J/K/). If 3 consecutive errors occur (for example, if descrambled bits are received as 'b0 but don't represent /J/ symbol), the scrambler is forced to unlock state and reset to reacquire a synchronization. Similarly, if the symbol following /J/ doesn't match /K/ (the 2nd SSD symbol), the scrambler is forced to unlock state and reset to reacquire a synchronization.

7.4.3.1.3 NRZ to NRZI Encoder

After the transmit data stream has been serialized and scrambled, the data must be NRZI encoded to comply with the TP-PMD standard for 100BASE-TX transmission over Category-5 Unshielded twisted pair cable. There is no ability to bypass this block within the DP83822. The NRZI data is sent to the 100Mbps Driver.

7.4.3.1.4 Binary to MLT-3 Converter

The Binary to MLT-3 conversion is accomplished by converting the serial binary data stream output from the NRZI encoder into two binary data streams with alternately phased logic one events. These two binary streams are then fed to the twisted pair output driver which converts the voltage to current and alternately drives either side of the transmit transformer primary winding, resulting in a minimal current MLT-3 signal.

The 100BASE-TX MLT-3 signal sourced by the PMD Output Pair common driver is slew rate controlled. This must be considered when selecting AC coupling magnetics to maintain TP-PMD Standard compliant transition times ($3\text{ns} < \text{Trise/fall} < 5\text{ns}$).

The 100BASE-TX transmit TP-PMD function within the DP83822 is capable of sourcing only MLT-3 encoded data. Binary output from the PMD Output Pair is not possible in 100Mbps mode. Fully encoded MLT-3 on both Tx+ and Tx- and can be configured by configuring Register 0x0404h (for example, in transformer-less designs).

7.4.3.2 100BASE-TX Receiver

The 100BASE-TX receiver consists of several functional blocks which convert the scrambled MLT-3 125Mbps serial data stream to synchronous 4-bit nibble data that is provided to the MII.

The receive section consists of the following functional blocks:

1. Input and BLW Compensation
2. Signal Detect
3. Digital Adaptive Equalization
4. MLT-3 to Binary Decoder
5. Clock Recovery Module
6. NRZI to NRZ Decoder
7. Serial to Parallel
8. Descrambler
9. Code-Group Alignment
10. 4B/5B Decoder
11. Link Integrity Monitor
12. Bad SSD Detection

7.4.4 100BASE-FX

The DP83822 provides IEEE 802.3 compliant 100BASE-FX operation. Hardware bootstrap or register configuration can be used to enable 100BASE-FX operation.

7.4.4.1 100BASE-FX Transmit

In 100BASE-FX mode, the DP83822 transmit pins connect to an industry standard fiber transceiver through a capacitively coupled circuit. During 100BASE-FX operation, the DP83822 transmit path bypass the scrambler and MLT-3 encoder so that only serialized 4B5B encoded NRZI data is transmitted at 125MHz.

7.4.4.2 100BASE-FX Receive

In 100BASE-FX mode, the DP83822 receive pins connect to an industry standard fiber transceiver through a capacitively coupled circuit. During 100BASE-FX operation, the DP83822 receive path bypasses the MLT-3 decoder and scrambler. This allows for reception of serialized 4B5B encoded NRZI data at 125MHz.

The DP83822 also has the added feature of a signal detection pin for direct connection to an industry standard fiber transceiver. When enabling 100BASE-FX operation using the FX_EN bootstrap, AMDIX_EN bootstrap turns into SD_EN bootstrap. If 100BASE-FX operation is enabled by setting FX_EN to either bootstrap mode 2 or 3, SD_EN enables the signal detection pin, LED_1, when SD_EN is set to either bootstrap mode 3 or 4. Please see [Table 7-10](#) for mode information regarding hardware bootstraps.

Note

100BASE-FX signal detect pin (LED_1) polarity is controlled by bit[0] in the Fiber General Configuration Register (FIBER_GENCFG, address 0x0465). By default, signal detect is an active HIGH polarity.

Note

TI recommends connecting Signal Detect pin from the Optical Transceiver to the LED_1 pin and enable the pin using SD_EN bootstrap pin in 100BASE-FX mode. The LED_1 pin is not used in design and that, if the electrical link between the fiber module and the DP83822 is broken, disconnected or otherwise disrupted, the link only recovers by initiating a soft reset through MDIO/MDC interface.

7.4.5 10BASE-Te

The 10BASE-Te transceiver module is IEEE 802.3 compliant. The module includes the receiver, transmitter, collision, heartbeat, loopback, jabber, and link integrity functions, as defined in the standard.

7.4.5.1 Squelch

Squelch is responsible for determining when valid data is present on the differential receive inputs. The squelch circuitry employs a combination of amplitude and timing measurements (as specified in the IEEE 802.3 10BASE-Te standard) to determine the validity of data on the twisted-pair inputs.

The signal at the start of a packet is checked by the squelch, and any pulses not exceeding the squelch level (either positive or negative, depending upon polarity) are rejected. When this first squelch level is exceeded correctly, the opposite squelch level must then be exceeded no earlier than 50ns. Finally, the signal must again exceed the original squelch level no earlier than 50ns to qualify as a valid input waveform, and not be rejected. This checking procedure results in the typical loss of three preamble bits at the beginning of each packet. When the transmitter is operating, five consecutive transitions are checked before indicating that valid data is present. At this time, the squelch circuitry is reset.

7.4.5.2 Normal Link Pulse Detection and Generation

The link pulse generator produces pulses as defined in the IEEE 802.3 10BASE-Te standard. Each link pulse is nominally 100ns in duration and transmitted every 16ms in the absence of transmit data. Link pulses are used to check the integrity of the connection with the remote end.

7.4.5.3 Jabber

Jabber is a condition in which a station transmits for a period of time longer than the maximum permissible packet length, typically due to a fault condition. The jabber function monitors the DP83822 output and disables the transmitter upon any attempt to transmit a packet of longer than legal size. A jabber timer monitors the transmitter and disables the transmission if the transmitter is active for approximately 100ms. When disabled by the Jabber function, the transmitter stays disabled for the entire time that the internal transmit enable of the module is asserted. This signal must be deasserted for approximately 500ms (unjab time) before the Jabber function re-enables the transmit outputs. The Jabber function is only available and active in 10BASE-Te mode.

7.4.5.4 Active Link Polarity Detection and Correction

Swapping the wires within the twisted-pair causes polarity errors. Wrong polarity affects 10BASE-Te connections. 100BASE-TX is immune to polarity problems because 100BASE-TX uses MLT-3 encoding. 10BASE-Te receive block automatically detects reversed polarity.

7.4.6 Auto-Negotiation (Speed / Duplex Selection)

Auto-Negotiation provides a mechanism for exchanging configuration information between the two ends of a link segment. This mechanism is implemented by exchanging Fast Link Pulses (FLP). FLPs are burst pulses that provide the information used to communicate the abilities between two devices at each end of a link segment. The DP83822 supports 100BASE-TX and 10BASE-Te modes of operation for Auto-Negotiation. 100BASE-FX is not included in the Auto-Negotiation process. Auto-Negotiation makes sure that the highest performance protocol is selected based on the advertised abilities of the Link Partner and the local device. Auto-Negotiation can be enabled or disabled in hardware, using the AN_EN bootstrap, or by register configuration, using bit[12] in the Basic Mode Control Register (BMCR, address 0x0000). For further details regarding Auto-Negotiation, refer to Clause 28 of the IEEE 802.3 specification.

7.4.7 Auto-MDIX Resolution

The DP83822 can determine if a “straight” or “crossover” cable is used to connect to the Link Partner. The DP83822 can automatically reassign channel A and channel B to establish link with the Link Partner. Auto-MDIX resolution precedes the actual Auto-Negotiation process that involves exchange of FLPs to advertise capabilities. Automatic MDI/MDIX is described in IEEE 802.3 Clause 40, section 40.8.2. Automatic MDI/MDIX is not a required implementation for 10BASE-T_e and 100BASE-TX. Auto-MDIX can also be used when operating the PHY in Forced modes.

Auto-MDIX can be enabled or disabled in hardware, using the AMDIX bootstrap, or by register configuration, using bit[15] of the PHY Control Register (PHYCR, address 0x0019). When Auto-MDIX is disabled, the PMA is forced to either MDI (“straight”) or MDIX (“crossover”). Manual configuration of MDI or MDIX can also be accomplished in hardware, using the AMDIX bootstrap, or by register configuration, using bit[14] of the PHYCR. Additionally, the DP83822 supports Fast Auto-MDIX configuration through register configuration to enable faster MDIX resolution for link establishment. Fast Auto-MDIX can be enabled using bit[6] in the Control Register #1 (CR1, address 0x0009).

7.4.8 Loopback Modes

There are several loopback options within the DP83822 that test and verify various functional blocks within the PHY. Enabling loopback modes allow for in-circuit testing of the digital and analog data paths. The DP83822 can be configured to any one of the Near-End Loopback modes or to the Far-End (reverse) Loopback mode. MII Loopback is configured using the Basic Mode Control Register (BMCR, address 0x0000). All other loopback modes are enabled using the BIST Control Register (BISCR, address 0x0016). Except where otherwise noted, loopback modes are supported for all speeds (10/100Mbps and all MAC interfaces).

Figure 7-10. Loopback Test Modes

7.4.8.1 Near-End Loopback

Near-End Loopback provides the ability to loop the transmitted data back to the receiver through the digital or analog circuitry. The point at which the signal is looped back is selected using loopback control bits[3:0] in the BISCR register. Auto-Negotiation and Auto-MDIX must be disabled before selecting the Near-End Loopback modes. This constraint does not apply for external-loopback mode.

7.4.8.2 MII Loopback

MI Loopback is the shallowest loop through the PHY. MI Loopback is a useful test mode to validate communications between the MAC and the PHY. When in MI Loopback, data transmitted from a connected MAC on the TX path is internally looped back in the DP83822 to the RX pins, where the data can be checked by the MAC.

MI Loopback is enabled by setting bit[14] in the BMCR.

7.4.8.3 PCS Loopback

PCS Loopback occurs in the PCS layer of the PHY. No signal processing is performed when using PCS Loopback.

PCS Input Loopback is enabled by setting bit[0] in the BISCR.

PCS Output Loopback is enabled by setting bit[1] in the BISCR.

7.4.8.4 Digital Loopback

Digital Loopback includes the entire digital transmit and receive paths. Data is looped back prior to the analog circuitry.

Digital Loopback is enabled by setting bit[2] in the BISCR.

7.4.8.5 Analog Loopback

When operating in 10BASE-T_e or 100BASE-TX mode, signals can be looped back after the analog front-end. Analog Loopback requires 100Ω terminations across pins #1 and #2, as well as 100Ω terminations across pins #3 and #6 at the RJ45.

Analog Loopback is enabled by setting bit[3] in the BISCR.

7.4.8.6 Far-End (Reverse) Loopback

Far-End (Reverse) loopback is a special test mode to allow PHY testing with a link partner. In this mode, data that is received from the Link Partner passes through the receiver of the PHY, is looped back at the MAC interface and then transmitted back to the Link Partner. While in Reverse Loopback mode, all data signals that come from the MAC are ignored.

Reverse Loopback is enabled by setting bit[4] in the BISCRCR.

7.4.9 BIST Configurations

The DP83822 incorporates an internal PRBS Built-in Self-Test (BIST) circuit to accommodate in-circuit testing and diagnostics. The BIST circuit can be used to test the integrity of transmit and receive data paths. The BIST can be performed using both internal loopbacks (digital or analog) or external loopback using a cable fixture. The BIST simulates pseudo-random data transfer scenarios in the form of real packets and Inter-Packet Gap (IPG) on the lines. The BIST allows full control of the packet lengths and the IPG.

The BIST Packet Length is controlled using bits[10:0] in the BIST Control and Status Register #2 (BICSR2, address 0x001C). The BIST IPG Length is controlled using bits[7:0] in the BIST Control and Status Register #1 (BICSR1, address 0x001B).

The BIST is implemented with independent transmit and receive paths, with the transmit clock generating a continuous stream of a pseudo-random sequence. The device generates a 15-bit pseudo-random sequence for BIST. Received data is compared to the generated pseudo-random data to determine pass/fail status. The number of error bytes that the PRBS checker received is stored in bits[15:8] of the BICSR1. PRBS lock status and sync can be read from the BIST Control Register (BISCRCR, address 0x0016).

The PRBS test can be put in a continuous mode by using bit[14] in the BISCRCR. In continuous mode, when the BIST error counter reaches the maximum value, the counter starts counting from zero again. To read the BIST error count, bit[15] in the BICSR1 must be set to '1'. This locks the current value of the BIST errors for reading. Please note that setting bit[15] also clears the BIST Error Counter.

7.4.10 Cable Diagnostics

With the vast deployment of Ethernet devices, the need for a reliable, comprehensive and user-friendly cable diagnostic tool is more important than ever. The wide variety of cables, topologies and connectors deployed results in the need to non-intrusively identify and report cable faults. The TI cable-diagnostic unit provides extensive information about cable integrity. The DP83822 offers the following capabilities in the Cable Diagnostic tool kit:

- Time Domain Reflectometry (TDR)

7.4.10.1 TDR

The DP83822 uses Time Domain Reflectometry (TDR) to determine the quality of the cables, connectors, and terminations in addition to estimating the cable length. Some of the possible problems that can be diagnosed include opens, shorts, cable impedance mismatch, bad connectors, termination mismatches, cross faults, cross shorts, and any other discontinuities along the cable.

The DP83822 transmits a test pulse of known amplitude (1V) down each of the two pairs of an attached cable. The transmitted signal continues down the cable and reflects from each cable imperfection, fault, connector, and from the end of the cable. After the pulse transmission, the DP83822 measures the return time and amplitude of all these reflected pulses. This technique enables measuring the distance and magnitude (impedance) of non-terminated cables (open or short), discontinuities (bad connectors) and improperly terminated cables with $\pm 1\text{m}$ accuracy.

For all TDR measurements, the transformation between time of arrival and physical distance is done by the external host using minor computations (such as multiplication, addition and look-up tables). The host must know the expected propagation delay of the cable, which depends, among other things, on the cable category (for example, CAT5, CAT5e, or CAT6).

TDR measurement is allowed in the following scenarios:

- While the Link Partner is disconnected – cable is unplugged at the other side
- Link Partner is connected but remains “quiet” (for example, in power down mode)
- TDR can be automatically activated when the link fails or is dropped

TDR Auto-Run can be enabled by using bit[8] in the Control Register #1 (CR1, address 0x0009). When a link drops, TDR automatically executes and stores the results in the respective TDR Cable Diagnostic Location Result Registers #1 - #5 (CDLRR, addresses 0x0180 to 0x0184) and the Cable Diagnostic Amplitude Result Registers #1 - #5 (CDLAR, addresses 0x0185 to 0x0189). TDR can also be run manually using bit[15] in the Cable Diagnostic Control Register (CDCR, address 0x001E). Cable diagnostic status is obtained by reading bits[1:0] in the CDCR. Additional TDR functions including cycle averaging, bypass channel, and crossover disable can be found in the Cable Diagnostic Specific Control Register (CDSCR, address 0x0170).

7.4.11 Fast Link Down Functionality

The DP83822 includes advanced link-down capabilities that support various real-time applications. The link-down mechanism is configurable and includes enhanced modes that allow extremely fast link-drop reaction times.

The DP83822 supports an enhanced link drop mechanism, also called Fast Link Drop (FLD), which shortens the observation window for determining link. There are multiple ways of determining link status, which can be enabled or disabled based on user preference. Fast Link Drop can be enabled in hardware with bootstrapping or in software using register configuration. RX_D2, when strapped to either mode 2 or mode 3, enables FLD at power up or hardware reset. Additionally, FLD can be configured using the Control Register #3 (CR3, address 0x000B). Bits[3:0] and bit[10] allow for various FLD conditions to be enabled. When link drop occurs, indication of a particular fault condition can be read from the Fast Link Down Status Register (FLDS, address 0x000F).

Figure 7-11. Fast Link Down

Fast Link Down criteria include:

- RX Error Count: when a predefined number of 32 RX_ERs occur in a 10μs window, the link is dropped.
- MLT3 Error Count: when a predefined number of 20 MLT3 errors occur in a 10μs window, the link is dropped.
- Low SNR Threshold: when a predefined number of 20 threshold crossings occur in a 10μs window, the link is dropped.
- Signal/Energy Loss: when the energy detector indicates energy loss, the link is dropped.

The Fast Link Down functionality allows the use of each of these options separately or in any combination.

Note

Because this mode enables extremely quick reaction time, the mode is more exposed to temporary bad link-quality scenarios.

7.5 Programming

7.5.1 Hardware Bootstrap Configurations

The DP83822 uses the receive path functional pins as bootstrap options to place the device into specific modes of operation. The values of these pins are sampled at power up or hardware reset, through either the RESET_N pin or bit[15] in the PHY Reset Control Register (PHYRCR, address 0x001F).

The DP83822 bootstrap pins are 4-level, which are described in greater detail below.

Note

Because bootstrap pins can have alternate functions after reset is deasserted, these pins must not be connected directly to VCC or GND. Pullup and pulldown resistors are required for proper operation.

Pins: COL, LED_0, CRS and RX_ER have internal pullup resistors. All other pins with bootstraps have internal pulldown resistors. To account for the difference between the internal pullup and pulldown, please reference [Table 7-8](#) and [Table 7-9](#) below for proper implementation.

LED_0 and LED_1 require parallel pullup or pulldown resistors when using the pin in conjunction with an LED and current limiting resistor.

Configuration of the device can be done through 4-level strapping or through serial management interface. A pullup resistor and a pulldown resistor of suggested values must be used to set the voltage ratio of the bootstrap pin input and the supply to select one of the possible modes.

Figure 7-12. Bootstrap Circuits

Table 7-8. Recommended 4-Level Strap Resistor Ratios ⁽¹⁾

MODE	IDEAL R _H (kΩ)	IDEAL R _L (kΩ)
PULLDOWN PINS (9kΩ)		
1 (Default)	OPEN	OPEN
2	10	2.49
3	5.76	2.49
4	2.49	OPEN
PULLUP PINS (50kΩ)		
1	OPEN	1.96
2	13	1.96
3	6.2	1.96
4 (Default)	OPEN	OPEN

(1) Strap resistors with 1% tolerance are recommended.

Table 7-9. 4-Level Strap Voltage Ratios ⁽¹⁾

TARGET VOLTAGE	MODE 1	MODE 2	MODE 3	MODE 4
V _{max} (V)	0.098 x VDDIO	0.181 x VDDIO	0.277 x VDDIO	VDDIO
V _{typ} (V)	0	0.165 x VDDIO	0.252 x VDDIO	VDDIO
V _{min} (V)	0	0.148 x VDDIO	0.227 x VDDIO	0.694 x VDDIO

(1) Specified by production test, characterization or design.

7.5.2 LED Configuration

The DP83822 supports up to three configurable Light Emitting Diode (LED) pins: LED_0, LED_1 (GPIO1), COL (GPIO2) and RX_D3 (GPIO3). Several functions can be multiplexed onto the LEDs for different modes of operation. The LED configuration modes are selected using the LEDs Configuration Register (LEDCFG1, register 0x0460) and the Multi-LED Control Register (MLEDCR, register 0x0025). LED_0 and COL (GPIO2) use the MLED function found in register 0x0025. MLED can be routed to only one of these two pins at a time. MLED routing is determined by bits[1:0] in register 0x0025.

Because LED pins are also used as bootstrap pins, external components must be considered to avoid contention. LED pins are automatically configured for the proper polarity based on the bootstrap configuration at power up or hardware reset. If an LED pin is resistively pulled low, the corresponding output is configured as an active high driver. Conversely, if a given bootstrap input is resistively pulled high, the corresponding output is configured as an active low driver.

Figure 7-13 shows proper bootstrap connections for LED pins using either pullup or pulldown configurations.

Note: LED_0 and LED_1 require parallel pullup or pulldown resistors when using the pin in conjunction with an LED and current limiting resistor. An R_p of 1.96k Ω to 2.49k Ω resistor must be used as the parallel pull resistor. When LED pins are not used, the pins can be left floating.

Figure 7-13. Example Strap Connections

7.5.3 PHY Address Configuration

The DP83822 can be configured for any of the 32 possible PHY addresses available through bootstrap configuration. The PHY address is latched into the device upon power up or hardware reset. Each DP83822 or port sharing PHY on the serial management bus in the system must have a unique PHY address. The DP83822 supports PHY address strapping values 0x0000 (0b00000) through 0x001F (0b11111).

By default, the DP83822 latches in PHY address 0x0001 (0b00001). This address can be changed by adding the required pullup or pulldown resistors defined in the bootstrap section above.

8 Register Maps

In the register definitions under the “TYPE” heading, the following definitions apply:

RC	Clear on Read
Strap	Default value loads from bootstrap pin after reset
RC	Latched high and held until read
RC	Latched low and held until read
R	Read Only Access
R, RC	Read Only, Clear on Read
R	Read Only, Permanently set to a default value
R/W	Read Write access
R/W, W1S	Read Write access, Self Clearing bit
RH/W1S	Register sets on event occurrence and Self-Clears when event ends

Table 8-1. 0x0000 Basic Mode Control Register (BMCR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	Reset	R/W, W1S	0	PHY Software Reset: 1 = Initiate software Reset / Reset in Progress 0 = Normal Operation Writing a 1 to this bit resets the PHY PCS registers. When the reset operation is done, this bit is cleared to 0 automatically. PHY Vendor Specific registers (with MMD = 1F) is not cleared. Straps are not re-latched with this reset. Straps are re-latched only during power up and pin RESET_N
14	MII Loopback	R/W	0	MII Loopback: 1 = MII Loopback enabled 0 = Normal Operation When MII loopback mode is activated, the transmitted data presented on MII TXD is looped back to MII RXD internally.
13	Speed Selection	R/W, RH	1	Speed Select: 1 = 100Mbps 0 = 10Mbps When Auto-Negotiation is disabled (bit[12] = 0 in Register 0x0000), writing to this bit allows the port speed to be selected.
12	Auto-Negotiation Enable	R/W, RH	1	Auto-Negotiation Enable: 1 = Enable Auto-Negotiation 0 = Disable Auto-Negotiation If Auto-Negotiation is disabled, bit[8] and bit[13] of this register determine the port speed and duplex mode.
11	IEEE Power Down	R/W	0	Power Down: 1 = IEEE Power Down 0 = Normal Operation The PHY is powered down after this bit is set. Only register access is enabled during this power down condition. To control the power down mechanism, this bit is Read with the input from the INT/PWDN_N pin. When the active low INT/PWDN_N is asserted, this bit is set. Programmed register are not reset to default in power down. All state machines undergo reset so status bits (R) can show a change in value.

Table 8-1. 0x0000 Basic Mode Control Register (BMCR) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
10	Isolate	R/W	0	Isolate: 1 = Isolates the port from the MII with the exception of the SMI 0 = Normal Operation
9	Restart Auto-Negotiation	R/W, W1S	0	Restart Auto-Negotiation: 1 = Restarts Auto-Negotiation 0 = Normal Operation If Auto-Negotiation is disabled (bit[12] = 0), bit[9] is ignored. This bit is self-clearing and returns a value of 1 until Auto-Negotiation is initiated, whereupon the bit self-clears. Operation of the Auto-Negotiation process is not affected by the management entity clearing this bit.
8	Duplex Mode	R/W, RH	1	Duplex Mode: 1 = Full-Duplex 0 = Half-Duplex When Auto-Negotiation is disabled, writing to this bit allows the port Duplex capability to be selected.
7	Collision Test	R/W	0	Collision Test: 1 = Enable COL Signal Test 0 = Normal Operation When set, this bit causes the COL signal to be asserted in response to the assertion of TX_EN within 512 bit times. The COL signal is deasserted within 4 bit times in response to the deassertion to TX_EN.
6:0	Reserved	R	0	Reserved

Table 8-2. 0x0001 Basic Mode Status Register (BMSR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	100Base-T4	R	0	100Base-T4 Capable: This protocol is not available. Always reads as 0.
14	100Base-TX Full-Duplex	R	1	100Base-TX Full-Duplex Capable: 1 = Device able to perform Full-Duplex 100Base-TX 0 = Device not able to perform Full-Duplex 100Base-TX
13	100Base-TX Half-Duplex	R	1	100Base-TX Half-Duplex Capable: 1 = Device able to perform Half-Duplex 100Base-TX 0 = Device not able to perform Half-Duplex 100Base-TX
12	10Base-Te Full-Duplex	R	1	10Base-Te Full-Duplex Capable: 1 = Device able to perform Full-Duplex 10Base-Te 0 = Device not able to perform Full-Duplex 10Base-Te
11	10Base-Te Half-Duplex	R	1	10Base-Te Half-Duplex Capable: 1 = Device able to perform Half-Duplex 10Base-Te 0 = Device not able to perform Half-Duplex 10Base-Te
10:7	Reserved	R	0	Reserved
6	SMI Preamble Suppression	R	1	Preamble Suppression Capable: 1 = Device able to perform SMI transaction with preamble suppressed 0 = Device not able to perform SMI transaction with preamble suppressed If this bit is set to 1, 32-bits of preamble needed only once after reset, invalid opcode or invalid turnaround.

Table 8-2. 0x0001 Basic Mode Status Register (BMSR) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
5	Auto-Negotiation Complete	R	0	Auto-Negotiation Complete: 1 = Auto-Negotiation process completed 0 = Auto Negotiation process not completed (either still in process, disabled or reset)
4	Remote Fault	R, RC	0	Remote Fault: 1 = Remote fault condition detected 0 = No remote fault condition detected Far End Fault indication or notification from Link Partner of Remote Fault. This bit is cleared on read or reset.
3	Auto-Negotiation Ability	R	1	Auto-Negotiation Ability: 1 = Device is able to perform Auto-Negotiation 0 = Device is not able to perform Auto-Negotiation
2	Link Status	R, RC	0	Link Status: 1 = Valid link established (for either 10Mbps or 100Mbps operation) 0 = Link not established If link goes low anytime, this bit value reads 0 on first read after link down event. Gets cleared to 1 only if status is read second time after link-up.
1	Jabber Detect	R, RC	0	Jabber Detect: 1 = Jabber condition detected 0 = No jabber condition detected This bit only has meaning for 10Base-T operation.
0	Extended Capability	R	1	Extended Capability: 1 = Extended register capabilities 0 = Basic register set capabilities only

15:10	Reserved	R	0	Reserved
9	RMII Enhanced Mode	R/W	0	RMII Enhanced Mode: 1 = Enable RMII Enhanced Mode 0 = RMII operated in normal mode In normal RMII mode, if the line is not idle, CRS_DV goes high. As soon as the False Carrier is detected, RX_ER is asserted and RXD is set to "2" (0010). This situation remains for the duration of the receive event. While in enhanced mode, CRS_DV is disqualified and deasserted when the False Carrier is detected. This status also remains for the duration of the receive event. In addition, in normal mode, the start of the packet is intact. Each symbol error is indicated by setting RX_ER high. The data on RXD is replaced with "1" starting with the first symbol error. While in enhanced mode, the CRS_DV is deasserted with the first symbol error.
8	TDR Auto-Run	R/W	0	TDR Auto-Run at Link Down: 1 = Enable execution of TDR procedure after link down event 0 = Disable automatic execution of TDR
7	Link Loss Recovery	R/W	0	Link Loss Recovery: 1 = Enable Link Loss Recovery mechanism 0 = Normal Link Loss operation This mode allows recovery from short interference and continue to hold the link up for a few additional mSec until the short interference is gone and the signal is OK. Under Normal Link Loss operation, Link status goes down approximately 250µs from signal loss.
6	Fast Auto MDIX	R/W	0	Fast Auto-MDIX: 1 = Enable Fast Auto-MDIX 0 = Normal Auto-MDIX If both link partners are configured to work in Force 100Base-TX mode (Auto-Negotiation disabled), this mode enables Automatic MDI/MDIX resolution in a shortened time.
5	Robust Auto MDIX	R/W	0	Robust Auto-MDIX: 1 = Enable Robust Auto-MDIX 0 = Disable Auto-MDIX If link partners are configured for operational modes that are not supported by normal Auto-MDIX, Robust Auto-MDIX allows MDI/MDIX resolution and prevents deadlock. When the DP83822 is strapped for 100Mbps operation with Auto-MDIX capabilities, Robust Auto-MDIX is automatically set to aid in MDI/MDIX resolution and deadlock prevention.

Table 8-10. 0x0009 Control Register #1 (CR1) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION			
4	Fast Auto-Negotiation Enable	R/W	0	Fast Auto-Negotiation Enable: 1 = Enable Fast Auto-Negotiation 0 = Disable Fast Auto-Negotiation The PHY Auto-Negotiates using timer setting according to Fast Auto-Negotiation Select bits (bits[3:2] in this register).			
3:2	Fast Auto-Negotiation Select	R/W	0	Fast Auto-Negotiation Select Bits: Adjusting these bits reduces the time to Auto-Negotiate between two PHYs. In Fast Auto-Negotiation, both PHYs must be set to the same configuration. These two bits define the duration for each state of the Auto-Negotiation process according to the table below. The new duration time must be enabled by setting "Fast Auto Negotiation Enable" (bit [4] of this register). Note: Using this mode in cases where both link partners are not configured to the same Fast Auto-Negotiation configuration can produce scenarios with unexpected behavior.			
				Fast Auto-Negotiation Select	Break Link Timer	Link Fail Inhibit Timer	Auto-Negotiation Wait Timer
				<00>	80	50	35
				<01>	120	75	50
				<10>	240	150	100
				<11>	NA	NA	NA
1	Fast RX_DV Detection	R/W	0	Fast RX_DV Detection: 1 = Enable Fast RX_DV detection 0 = Disable Fast RX_DV detection When Fast RX_DV is enabled, RX_DV asserts high on receive packet due to detection of the /J/ symbol only. If a consecutive /K/ does not appear, RX_ER is generated. In normal mode, RX_DV is only asserted after detection of /JK/.			
0	Reserved	R	0	Reserved			

Table 8-11. 0x000A Control Register #2 (CR2)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	100Base-TX Force Far-End Link drop	R/W	0	100Base-TX Force Far-End Link Drop: Writing a 1 asserts the 100Base-TX Force Far-End link drop mode. In this mode (only valid for 100Mbps), the PHY disables the TX upon link drop to allow the far-end peer to drop the link as well, thus allowing both link partners to be aware of the system link failure. This mode exceeds the standard definition of force 100Mbps.
14	100Base-FX Enable	R/W, RH	0	100Base-FX Enable: 1 = 100Base-FX mode enabled 0 = 100Base-FX mode disabled
13:7	Reserved	R/W	00 0001 0	Reserved
6	Fast Link-Up in Parallel Detect	R/W	0	Fast Link-Up in Parallel Detect Mode: 1 = Enable Fast Link-Up time during Parallel Detection 0 = Normal Parallel Detection Link establishment In Fast Auto MDIX and in Robust Auto-MDIX modes (bit[6] and bit[5] in register CR1), this bit is automatically set.

Table 8-11. 0x000A Control Register #2 (CR2) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
5	Extended Full-Duplex Ability	R/W	0	Extended Full-Duplex Ability: 1 = Enable Extended Full-Duplex Ability 0 = Disable Extended Full-Duplex Ability In Extended Full-Duplex ability, when the PHY is set to Auto-Negotiation or Force 100Base-TX and the link partner is operated in Force 100Base-TX, the link is always Full-Duplex. When disabled, the decision to work in Full-Duplex or Half-Duplex mode follows IEEE specification.
4	Enhanced LED Link	R/W	0	Enhanced LED Link: 1 = LED ON only when link is 100Base-TX Full-Duplex mode 0 = LED ON when link is established In Enhanced LED Link mode, TX/RX BLINK on activity is disabled for this LED pin. LED only indicates LINK for established 100Base-TX Full-Duplex links.
3	Isolate MII in 100Base-TX Half-Duplex or 10Base-Te	R/W	0	Isolate MII: 1 = Isolate MII Enabled 0 = Normal MII output operation In Isolate MII, MII outputs are isolated when Half-Duplex link established for 100Base-TX or when Half-Duplex or Full-Duplex link established for 10Base-Te.
2	RX_ER During IDLE	R/W	0	Detection of Receive Symbol Error During IDLE State: 1 = Enable detection of Receive symbol error during IDLE state 0 = Disable detection of Receive symbol error during IDLE state
1	Odd-Nibble Detection Disable	R/W	0	Detection of Transmit Error: 1 = Disable detection of transmit error in odd-nibble boundary 0 = Enable detection of transmit error in odd-nibble boundary Detection of odd-nibble extends TX_EN by one additional TX_CLK cycle and behaves as if TX_ER is asserted during that additional cycle
0	RMII Receive Clock	R/W	0	RMII Receive Clock: 1 = RMII Data (RXD[1:0]) is sampled and referenced to RX_CLK 0 = RMII Data (RXD[1:0]) is sampled and referenced to XI

Table 8-12. 0x000B Control Register #3 (CR3)

12	Bypass Digital Equalizer Error	R/W	1	1 = Ignores the intermittent error output of digital equalizer
10	Descrambler Fast Link Down Mode	R/W	0	Descrambler Fast Link Drop: 1 = Drop the link on descrambler link loss 0 = Do not drop the link on descrambler link loss This option can be enabled in parallel to the other fast link down modes in bits[3:0].
9	Bypass Digital Equalizer Coefficient	R/W	0	1 = Bypass 0th coefficient of digital equalizer
8:7	Reserved	R/W	00	Reserved

Table 8-12. 0x000B Control Register #3 (CR3) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
6	Polarity Swap	R/W	0	Polarity Swap: 1 = Inverted polarity on both pairs: TD+ and TD-, RD+ and RD- 0 = Normal polarity Port Mirror Function: To enable port mirroring, set this bit and bit [5] high.
5	MDI/MDIX Swap	R/W	0	MDI/MDIX Swap: 1 = Swap MDI pairs (Receive on TD pair, Transmit on RD pair) 0 = MDI pairs normal (Receive on RD pair, Transmit on TD pair) Port Mirror Function: To enable port mirroring, set this bit and bit[6] high.
4	Reserved	R/W	0	Reserved
3:0	Fast Link Down Mode	R/W	0000	Fast Link Down Modes: Bit 3 Drop the link based on RX Error count of the MII interface. When a predefined number of 32 RX Error occurrences in a 10μs interval is reached, the link is dropped. Bit 2 Drop the link based on MLT3 Error count (Violation of the MLT3 coding in the DSP output). When a predefined number of 20 MLT3 Error occurrences in a 10μs interval is reached, the link is dropped. Bit 1 Drop the link based on Low SNR Threshold . When a predefined number of 20 Threshold crossing occurrences in a 10μs interval is reached, the link is dropped. Bit 0 Drop the link based on Signal/Energy Loss indication. When the Energy detector indicates Energy Loss, the link is dropped. Typical reaction time is 10μs. The Fast Link Down function is an OR of all five options (bit[10] and bits[3:0]), the designer can enable any combination of these conditions.

Table 8-13. 0x000D Register Control Register (REGCR)

Table 8-20. 0x0014 False Carrier Sense Counter Register (FCSCR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:8	Reserved	R	0	Reserved
7:0	False Carrier Event Counter	R, RC	0	False Carrier Event Counter: This 8-bit counter increments on every false carrier event. This counter stops when the maximum count (FFh) is reached. When the counter exceeds half-full (7Fh), an interrupt event is generated. This register is cleared on read.

Table 8-21. 0x0015 Receive Error Count Register (RECR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:0	Receive Error Counter	R, RC	0	RX_ER Counter: When a valid carrier is presented (only while RXDV is set), and there is at least one occurrence of an invalid data symbol, this 16-bit counter increments for each receive error detected. The RX_ER counter does not count in MII loopback mode. The counter stops when the maximum count (FFFFh) is reached. When the counter exceeds half-full (7Fh), an interrupt is generated. This register is cleared on read.

Table 8-22. 0x0016 BIST Control Register (BISCR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15	Reserved	R	0	Reserved
14	BIST Error Counter Mode	R/W	0	BIST Error Counter Mode: 1 = Continuous mode 0 = Single mode Continuous mode, when the BIST Error counter reaches the maximum value, a pulse is generated and the counter starts counting from zero again. When in Single mode, if the BIST Error Counter reaches the maximum value, PRBS checker stops counting.
13	PRBS Checker	R/W	0	PRBS Checker: 1 = PRBS Checker Enabled 0 = PRBS Checker Disabled When PRBS checker is enabled, DP83822 checks PRBS data received.
12	Packet Generation Enable	R/W	0	Packet Generation Enable: 1 = Enable packet generator with PRBS data 0 = Disable packet generator
11	PRBS Checker Lock/Sync	R	0	PRBS Checker Lock/Sync Indication: 1 = PRBS checker is locked and synced on received bit stream 0 = PRBS checker is not locked
10	PRBS Checker Sync Loss	R, RC	0	PRBS Checker Sync Loss Indication: 1 = PRBS checker has lost sync 0 = PRBS checker has not lost sync
9	Packet Generator Status	R	0	Packet Generation Status Indication: 1 = Packet Generator is active and generating packets 0 = Packet Generator is off

Table 8-22. 0x0016 BIST Control Register (BISCR) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
8	Power Mode	R	1	Sleep Mode Indication: 1 = Indicates that the PHY is in normal power mode 0 = Indicates that the PHY is in one of the sleep modes
7	Reserved	R	0	Reserved
6	Transmit in MII Loopback	R/W	0	Transmit Data in MII Loopback Mode (valid only at 100Mbps): 1 = Enable transmission 0 = Disable transmission When enabled, data received from the MAC on the TX pins is routed to the MDI in parallel to the MII loopback (to RX pins). This bit can be set only in MII Loopback mode - setting bit[14] in BMCR register (address 0x0000). When disabled, data from the MAC is not transmitted to the MDI.
5	Reserved	R	0	Reserved
4:0	Loopback Mode	R/W	0	Loopback Mode Select: The PHY provides several options for loopback that test and verify various functional blocks within the PHY. Enabling loopback mode allows in-circuit testing of the DP83822 digital and analog data paths Near-end Loopback 00001 = PCS Input Loopback 00010 = PCS Output Loopback 00100 = Digital Loopback 01000 = Analog Loopback (requires 100Ω termination) Far-end Loopback 10000 = Reverse Loopback

Table 8-23. 0x0017 RMII and Status Register (RCSR)

BIT	NAME	TYPE	DEFAULT	FUNCTION
15:13	Reserved	R	0	Reserved
12	RGMII RX Clock Shift	R/W	0	RGMII RX Clock Shift: 1 = Receive path internal clock shift is enabled 0 = Receive path internal clock shift is disabled When enabled, receive path internal clock (RX_CLK) is delayed by 3.5ns relative to receive data. When disabled, data and clock are in align mode.
11	RGMII TX Clock Shift	R/W	0	RGMII TX Clock Shift: 1 = Transmit path internal clock shift is disabled 0 = Transmit path internal clock shift is enabled When enabled, transmit path internal clock (TX_CLK) is delayed by 3.5ns relative to transmit data.
10	RGMII TX Synced	R/W	0	RGMII TX Clock Sync: 1 = PHY and MAC share same clock reference 0 = PHY operates from same or independent clock source as MAC This mode, when enabled, reduces latency since both MAC and PHY are synchronized to the same clock source. This mode can also be used when enabling the PHY Clock Output by connecting the MAC to the PHY Output Clock.
9	RGMII Mode	R/W, RH	0	RGMII Mode Enable: 1 = Enable RGMII mode of operation 0 = Mode determined by bit[5]

Table 8-23. 0x0017 RMII and Status Register (RCSR) (continued)

BIT	NAME	TYPE	DEFAULT	FUNCTION
8	RMII TX Clock Shift	R/W	0	RMII TX Clock Shift: 1 = Transmit path internal clock shift is enabled 0 = Transmit path internal clock shift is disabled
7	RMII Clock Select	R/W, RH	0	RMII Reference Clock Select: RH XI_50 determines the clock reference requirement. 1 = 50MHz clock reference, CMOS-level oscillator 0 = 25MHz clock reference, crystal or CMOS-level oscillator
6	RMII Recovered Clock Async FIFO Bypass	R/W	1	RMII Recovered Clock Async FIFO Bypass: 0 = Bypass Asynchronous FIFO 1 = Normal operation When in RMII Recovered Clock mode, the asynchronous FIFO can be bypassed to reduce the receive path latency within the DP83822. 50MHz clock is outputted on RX_CLK when in Async fifo bypass
5	RMII Mode	R/W, RH	0	RMII Mode Enable: 1 = Enable RMII mode of operation 0 = Enable MII mode of operation Note when enabling RMII mode of operation after changing bit 5 to 1 run these two commands next: • Write 0x4300 to register 0x0462 • Write 0x4000 to register 0x001F
4	RMII Revision Select	R/W	0	RMII Revision Select: 1 = RMII revision 1.0 0 = RMII revision 1.2 RMII revision 1.0, CRS_DV remains asserted until final data is transferred. CRS_DV does not toggle at the end of a packet. RMII revision 1.2, CRS_DV toggles at the end of a packet to indicate deassertion of CRS.
3	RMII Overflow Status	R, RC	0	RX FIFO Overflow Status: 1 = Overflow detected 0 = Normal
2	RMII Underflow Status	R, RC	0	RX FIFO Underflow Status: 1 = Underflow detected 0 = Normal
1:0	Receive Elasticity Buffer Size	R/W	01	Receive Elasticity Buffer Size: This field controls the Receive Elasticity Buffer which allows for frequency variation tolerance between the 50MHz RMII clock and the recovered data. The following values indicate the tolerance in bits for a single packet. The minimum setting allows for standard Ethernet frame sizes at ± 50 ppm accuracy. For greater frequency tolerance, the packet lengths can be scaled (for ± 100 ppm), divide the packet lengths by 2). 00 = 14 bit tolerance (up to 16800 byte packets) 01 = 2 bit tolerance (up to 2400 byte packets) 10 = 6 bit tolerance (up to 7200 byte packets) 11 = 10 bit tolerance (up to 12000 byte packets)

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The DP83822 is a single-port 10/100Mbps Ethernet PHY that supports connections to an Ethernet MAC through MII, RMII, or RGMII. Connections to the Ethernet media are made through the IEEE 802.3 defined Media Dependent Interface.

When using the device for Ethernet applications, certain requirements must be met to maintain normal operation. The following subsections are intended to assist in appropriate component selection and required circuit connections.

9.2 Typical Applications

Figure 9-1 shows a typical application for the DP83822. More typical application examples are given in this section.

Copyright © 2016, Texas Instruments Incorporated

Figure 9-1. Typical DP83822 Application

9.2.1 TPI Network Circuit

Figure 9-2 shows the recommended twisted-pair interface network circuit for 10/100Mbps. Variations with PCB and component characteristics require that the application be tested to verify that the circuit meets the requirements of the intended application.

Center tap of the transformer must be connected to analog supply rail (AVD) with decoupling capacitors close to the transformer. All resistors and capacitors must be placed as close to the device as possible.

Figure 9-2. TPI Network Circuit

9.2.1.1 Design Requirements

The design requirements for the DP83822 in TPI operation (100BASE-TX or 10BASE-Te) are:

1. AVD Supply = 3.3V or 1.8V
2. Center Tap Supply = AVD Supply
3. VDDIO Supply = 3.3V, 2.5V, or 1.8V
4. Reference Clock Input = 25MHz or 50MHz (RMII Follower)

9.2.1.2 Detailed Design Procedure

For the detailed design procedure of the TPI network circuit, see [Section 9.2.2.2](#).

9.2.1.3 Application Curves

For expected TPI network MDI curves, see [Figure 6-18](#), [Figure 6-19](#), and [Figure 6-21](#).

9.2.2 Fiber Network Circuit

Figure 9-3 shows the recommended circuit for a 100Mbps fiber network. Variations with PCB and component characteristics require that the application be tested to verify that the circuit meets the requirements of the intended application. Please note when design DP83822 with fiber transceiver that supports LVPECL signaling, external termination network is required. The external termination network example is included in the DP8322 EVM schematic.

All resistors and capacitors must be placed as close to the fiber transceiver as possible.

Copyright © 2016, Texas Instruments Incorporated

Figure 9-3. Fiber Network Circuit

9.2.2.1 Design Requirements

9.2.2.1.1 Clock Requirements

The DP83822 supports an external CMOS-level oscillator source or an internal oscillator with an external crystal.

9.2.2.1.1.1 Oscillator

If an external clock source is used, XI must be tied to the clock source and XO must be left floating. The amplitude of the oscillator must be a nominal voltage of VDDIO.

Note

The DP83822 requires Clock to be present at PoR. In case clock is delayed, pulldown on XI is recommended to avoid spurious signal latch-up.

9.2.2.1.1.2 Crystal

The use of a 25MHz, parallel, 20pF load crystal is recommended if operating with a crystal. [Figure 9-4](#) shows a typical connection diagram for a crystal resonator circuit. The load capacitor values can vary with the crystal vendors; check with the vendor for the recommended loads.

Figure 9-4. Crystal Oscillator Circuit

Table 9-1. 25MHz Oscillator Specification

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Frequency			25		MHz
Frequency Tolerance	Including operational temperature, aging and other factors	-100		100	ppm
Rise / Fall Time	10% - 90%			8	nsec
Jitter (Short Term)	Cycle-to-cycle		50	100	psec
Jitter (Long Term)	Accumulative over 10ms			1	nsec
Symmetry	Duty Cycle	40		60	%
Load Capacitance			15	30	pF

Table 9-2. 50MHz Oscillator Specification

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Frequency			50		MHz
Frequency Tolerance	Including operational temperature, aging and other factors	-100		100	ppm
Rise / Fall Time	10% - 90%			8	nsec
Jitter (Short Term)	Cycle-to-cycle		50		psec
Jitter (Long Term)	Accumulative over 10ms			1	nsec
Symmetry	Duty Cycle	40		60	%
Load Capacitance			15	30	pF

Table 9-3. 25MHz Crystal Specification

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Frequency			25		MHz
Frequency Tolerance	Including operational temperature, aging, and other factors	-100		100	ppm
Load Capacitance		10		40	pF

9.2.2.2 Detailed Design Procedure

The Media Independent Interface (MII / RMII / RGMII) connects the DP83822 to the Media Access Controller (MAC). The MAC can in-fact be a discrete device or integrated into a microprocessor, CPU, FPGA, or ASIC. The Media Dependent Interface (MDI) connects the DP83822 to the transformer of the Ethernet network or to AC isolation capacitors when interfacing with a fiber transceiver.

9.2.2.2.1 MII Layout Guidelines

1. MII signals are single-ended signals
2. Traces must be routed with 50Ω impedance to ground
3. Keep trace lengths as short as possible, less than two inches is recommended and less than six inches maximum

9.2.2.2.2 RMII Layout Guidelines

1. RMII signals are single-ended signals
2. Traces must be routed with 50Ω impedance to ground
3. Keep trace lengths as short as possible, less than two inches is recommended and less than six inches maximum

9.2.2.2.3 RGMII Layout Guidelines

1. RGMII signals are single-ended signals
2. Traces must be routed with 50Ω impedance to ground
3. Keep trace lengths as short as possible, less than two inches is recommended and less than six inches maximum
4. Internal Clock Delay can be enabled on the transmit and receive path independently within the DP83822 using register access

9.2.2.2.4 MDI Layout Guidelines

1. MDI signals are differential.
2. Traces must be routed with 50Ω impedance to ground and 100Ω differential controlled impedance.
3. Route MDI traces to the transformer on the same layer.
4. Use a metal shielded RJ-45 connector and electrically connect the shield to chassis ground.
5. Avoid supplies and ground beneath the magnetics.
6. Do not overlap the circuit ground and chassis ground planes. Keep chassis ground and circuit ground isolated by turning chassis ground into an isolated island by leaving a gap between the planes. Connecting a 1206 (size) capacitor between chassis ground and circuit ground is recommended to avoid floating metal. Capacitors less than 805 (size) can create an arching path for ESD due to a small air-gap.

9.2.2.3 Application Curves

For expected Fiber network MDI curve, see [Figure 6-20](#).

9.3 Power Supply Recommendations

The DP83822 is capable of operating with a wide range of I/O supply voltages (3.3V, 2.5V, or 1.8V) along with any of the two analog supply options (3.3V or 1.8V). Please note that input pins must not be driven until VDDIO and AVD are stable.

[Figure 9-4](#) shows the recommended power supply decoupling network.

A. The smallest value is placed closest to the pin

Figure 9-5. Power Connections

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.3.1 Power Supply Characteristics

The following data has been measured using a DP83822 evaluation module. All the power dissipation numbers are measured at nominal voltage under typical temperature of 25°C. Center tap must be connected to the same potential as the analog supply rail (AVD).

Table 9-4. Power Supply Characteristics ⁽¹⁾

PARAMETER	TEST CONDITIONS	MAGNETIC SUPPLY (mA)	AVD SUPPLY (mA)	VDDIO SUPPLY (mA)	TOTAL POWER (mW)
3.3V AVD/CT AND 3.3V VDDIO					
100BASE-TX	MII, Link-Up, No Traffic	22	36	15	241
	MII, Link-Up, 960ns IPG (100% Utilization), 1514-byte Packets, 25°C	22	36	21	261
	MII, Link-Up, 960ns IPG (100% Utilization), 1514-byte Packets, -40°C	22	25	20	221
	MII, Link-Up, 960ns IPG (100% Utilization), 1514-byte Packets, 125°C	22	52	22	317
	RMII, Link-Up, No Traffic	22	36	6	211
	RMII, Link-Up, 960ns IPG (100% Utilization), 1514-byte Packets	22	36	7	215
	RGMII, Link-Up, No Traffic	22	36	8	218
	RGMII, Link-Up, 960ns IPG (100% Utilization), 1514-byte Packets	22	36	9	221

Table 9-4. Power Supply Characteristics ⁽¹⁾ (continued)

PARAMETER	TEST CONDITIONS	MAGNETIC SUPPLY (mA)	AVD SUPPLY (mA)	VDDIO SUPPLY (mA)	TOTAL POWER (mW)

(1) Specified by production test, characterization, or design.

9.4 Layout

9.4.1 Layout Guidelines

9.4.1.1 Signal Traces

PCB traces are lossy and long traces can degrade signal quality. Traces must be kept short as possible. Unless mentioned otherwise, all signal traces must be 50Ω single-ended impedance. Differential traces must be 50Ω single-ended and 100Ω differential. Take care to verify impedance is controlled throughout. Impedance discontinuities can cause reflections leading to emissions and signal integrity issues. Stubs must be avoided on all signal traces, especially differential signal pairs.

Figure 9-6. Differential Signal Traces

Within the differential pairs, trace lengths must be run parallel to each other and matched in length. Matched lengths minimize delay differences, avoiding an increase in common mode noise and emissions. Length matching is also important for MAC interface connections. All transmit signal traces must be length matched to each other and all receive signal traces must be length matched to each other.

Preferably, there must be no crossover or vias on signal path traces. Vias present impedance discontinuities and must be minimized when possible. Route trace pairs on the same layer. Signals on different layers must not cross each other without at least one return path plane between them. Differential pairs must always have a constant coupling distance between them. For convenience and efficiency, TI recommends routing critical signals first (that is, MDI differential pairs, reference clock, and MAC IF traces).

9.4.1.2 Return Path

A general best practice is to have a solid return path beneath all signal traces. This return path can be a continuous ground or DC power plane. Reducing the width of the return path can potentially affect the impedance of the signal trace. This effect is more prominent when the width of the return path is comparable to the width of the signal trace. Breaks in return path between the signal traces must be avoided at all cost. A signal crossing a split plane can cause unpredictable return path currents and can impact signal quality and result in emissions issues.

Figure 9-7. Differential Signal Pair and Plane Crossing

9.4.1.3 Transformer Layout

There must be no metal layer running beneath the transformer. Transformers can inject noise into metal beneath them, which can affect the performance of the system. Because the DP83822 is a current mode line driver design, the center tap pin on the device side of the transformer must be tied to the analog supply rail (AVD). Decoupling capacitors must be placed near the center tap pin of the transformer as shown in [Figure 9-2](#).

9.4.1.3.1 Transformer Recommendations

The following magnetics have been tested with the DP83822 using the DP83822EVM.

Table 9-5. Recommended Transformers

MANUFACTURER	PART NUMBER
Pulse Electronics	HX1198FNL
	HX1188NL
	HX1188FNL
	H2019NL
	H1102NL
Abracon	ALAN101
Bel Fuse	S5585999J1F
Sumida	CLP0612
Würth Elektronik™	7490120110
	733330
	7490100111a

Table 9-6. Transformer Electrical Specifications

PARAMETER	TEST CONDITIONS	TYP	UNIT
Turn Ratio	±2%	1:1	-
Insertion Loss	1 - 100MHz	-1	dB
Return Loss	1 - 30MHz	-16	dB
	30 - 60MHz	-12	dB
	60 - 80MHz	-10	dB
Differential to Common Rejection Ratio	1 - 50MHz	-30	dB
	50 - 150MHz	-20	dB
Crosstalk	30MHz	-35	dB
	60MHz	-30	dB
Isolation	HPOT	1500	Vrms

9.4.1.4 Metal Pour

All metal pours that are not signals or power must be tied to ground. There must be no floating metal in the system, and there must be no metal between differential traces.

9.4.1.5 PCB Layer Stacking

To meet signal integrity and performance requirements, a minimum four-layer PCB is recommended. However, a six-layer PCB must be used when possible.

Figure 9-8. Recommended Layer Stack-Up

9.4.2 Layout Example

See the DP83822EVM for more information regarding layout.

Figure 9-9. Layout Example

10 Device and Documentation Support

10.1 Documentation Support

10.1.1 Related Documentation

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

Table 10-1. Related Links

Note

These devices can not be differentiated by register reads. These devices are distinguished by production tests of the corresponding functionalities.

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.4 Trademarks

Würth Elektronik™ is a trademark of Würth Elektronik GmbH & Co. KG.

TI E2E™ is a trademark of Texas Instruments.

ProfiNET® is a registered trademark of PROFIBUS and PROFINET International (PI)..

All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision G (August 2023) to Revision H (July 2026)	Page
• Add Programmable MII/RMII/RGMII impedance control to the feature list	1
• Changed all instances of legacy terminology to <i>Leader</i> and <i>Follower</i> throughout the document	1
• Fixed the RX_D1 pin number in Table 5-1 and Table 5-2	3
• Changed RESET to RESET_N to keep the naming consistent.....	3
• Changed INT/PWDN to INT/PWDN_N to keep the naming consistent.....	3
• Added text (<i>PHY in normal operating condition</i>) to <i>Input voltage -Other Inputs</i>	8
• Updated the VOD reference for the PMD outputs to point to register 0x403.....	9
• Changed the <i>Power-Up With Unstable XI Input</i> graphic	15
• Added Note with text "Clock in external clock mode external clock is stable."	15
• Updated "alien" to "unwanted".....	23
• Added RMII Repeater Mode section.....	31
• Update Table 8-13 for clarity, add RMII Leader and Follower.....	47
• Change from RESET to RESET_N for consistency.....	47
• Added Rp for clarification.....	52
• Changed TYPE definition list in Section 8	53
• Changed details of <i>Register 0x0000, bit 15</i>	53
• Changed TYPE of <i>Register 0x0012 and Register 0x0013</i>	53
• Updated TYPE and added details of <i>Register 0x17 bit 5</i>	53
• Changed details of <i>Register 0x0428, bit 2</i>	53
• Changed details of <i>Register 0x0461, bit [4:1]</i>	53
• Changed details of <i>Register 0x4D0, bit [6:5]</i>	53
• Changed TPI network diagram termination voltage from 3.3V to be AVD.....	104
• Added a note that input pins must not be driven until VDDIO/AVD are stable.....	105
• Add that input pins must not be driven until VDDID and AVD are stable.....	108
• Added <i>Documentation Support</i> section.....	117
• Updated section title from "Related Links" to "Related Documentation".....	117

Changes from Revision F (June 2021) to Revision G (August 2023)	Page
• Corrected IEC 6100 to IEC 61000.....	1
• Changed Language in LED pins from 'Mode' to 'Function'.....	3
• Changed 'Other Inputs' Max rating from 3.8 to 'VDDIO + 0.3V'.....	8
• Added last sentence and register write list. "After enabling/setting the RX_SFD..." etc.....	27
• Third & fourth paragraph added.	39
• Added LED_1	47
• Changed details of register 0x0018 to say LED instead of LED_0 for bits 10:9	53
• Changed the details of register 0x0027 to include Harmonics Compliance Test note.....	53
• Updated details of register 0x0040; added bit 13 description.....	53

Changes from Revision E (March 2019) to Revision F (June 2021)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Feature section updated to highlight key features.....	1
• Added trademark.....	1
• Added clarification on Tx_CLK state in reset in pin function table.....	3
• Added clarification on TX_CLK state in reset in IO Pins State During Reset table.....	3
• Added 100BASE-FX output parameters	9
• Added AVO footnote.....	10
• Added timing requirement for reset after stabilization of XI clock.	11
• Added RMII transmit latency number	14
• Added RGMII transmit latency number	14

• Added RMII receive latency number.....	14
• Added RGMII receive latency number.....	14
• Updated details of earlier "reserved" bits of register 0x000B and 0x003F.....	53
• Updated description for register 0x0015 and 0x001C.....	53
• Added register description of following registers: 0x101,0x0106,0x0107,0x0126,0x04D4,0x0121,0x0122,0x0124,0x010F,0x0111,0x0129,0x0130,0x0410,0x0416,0x0418,0x0450,0x040D,0x041F,0x0421.....	53
• Added further information to registers 0x0000,0x0001,0x0469,0x0703C.....	53
• Updated default values for registers :0x0008,0x000A,0x0010,0x0017,0x001E,0x0155,0x0215,0x0462,0x3000,0x3001,0x3014,0x3016.....	53
• Changed TPI network diagram to include optional ferrite bead for EMC improvement.....	104

Changes from Revision D (March 2019) to Revision E (March 2019)	Page
• Changed to fix typos on Table 1	3

Changes from Revision C (April 2018) to Revision D (March 2019)	Page
• Changed the description for LED_1 in Pin Functions table.....	3
• Changed reset pin state for RX_D[3:0] and LED_1 pins in IO Pins State During Reset.....	3
• Added XO and XI capacitance.....	9
• Added Test Conditions to PMD OUTPUT section of the Electrical Characteristics Table.....	9
• Changed Parameter descriptions and units in Reset Timing Requirements table to match device performance.....	11
• Changed NOTE for 100BASE-FX Signal Detect pin polarity from Active LOW to Active HIGH.....	40
• Changed LED_0 strap modes to remove Mode 2 and Mode 3.	47
• Changed strap description for SD_EN pin from Active LOW to Active HIGH.....	47
• Deleted LED_0 configuration table.....	47
• Changed LED_1 Configuration table to merge LED_0 and LED_1 configuration into a single table for clarity.....	47
• Changed note in Section 7.5.2 section to clarify LED connections.....	52
• Added registers 0x0106, 0x0107, 0x010F, 0x0114, 0x0116, 0x0126, 0x04D4, 0x04D5, and 0x04D6	53
• Added 100Base-TX MII power consumption data for -40°C and 125°C.....	109

Changes from Revision B (March 2018) to Revision C (April 2018)	Page
• Changed TX_D[1:0] back to TX_D[3:0].....	28
• Changed RX_D[1:0] back to RX_D[3:0].....	28

Changes from Revision A (August 2016) to Revision B (March 2018)	Page
• Updated data sheet text and format to the latest TI documentation and translations standards	1
• Updated description of pin 24 and changed pin type from: I/O, PD to: I/O	3
• Added <i>MII: 100BASE-TX Transmit Latency Timing</i> table	14
• Added <i>MII: 100BASE-TX Receive Latency Timing</i> table	14
• Device Power-Up Timing diagram modified to include start voltage limits.....	15
• Added the <i>100BASE-TX Transmit Latency Timing</i> graphic	15
• Added the <i>100BASE-TX Receive Latency Timing</i> graphic	15
• Changed the <i>Functional Block Diagram</i>	24
• Changed TX_D[3:0] to TX_D[1:0].....	28
• Changed RX_D[3:0] to RX_D[1:0].....	28

• Added note to the <i>100BASE-FX Receive</i> section and changed the SD_DIS pin to SD_EN.....	40
• Changed RX_ER strap function from: AMDIX_EN (SD_DIS) to: AMDIX_EN (SD_EN).....	47
• Added the <i>Detailed Design Procedure</i> section for the TPI Network Circuit typical application.....	104
• Switched the order of the typical applications.....	105
• Added note to the <i>Oscillator</i> section	106
• Changed the <i>Power Connections</i> graphic	108

Changes from Revision * (August 2016) to Revision A (August 2016)	Page
• Changed Product Preview to Production Data release	1

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

GENERIC PACKAGE VIEW

RHB 32

VQFN - 1 mm max height

5 x 5, 0.5 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4224745/A

4223216/A 08/2016

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

RHB0032B

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

LAND PATTERN EXAMPLE
SCALE:15X

SOLDER MASK DETAILS

4223216/A 08/2016

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

EXAMPLE STENCIL DESIGN

RHB0032B

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

SOLDER PASTE EXAMPLE
 BASED ON 0.125 mm THICK STENCIL
 EXPOSED PAD 33
 76.7% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE
 SCALE:20X

4223216/A 08/2016

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER
