

# ISO72x Single-Channel High-Speed Digital Isolators

## 1 Features

- 100 and 150Mbps signaling rate options
- Propagation delay is 12ns typical.
- Pulse skew is 0.5ns typical.
- Low-power sleep mode
- Typical 28 year life at rated working voltage (see [Isolation Lifetime Projection](#))
- High electromagnetic immunity
- Failsafe output
- Drop-in replacement for most opto and magnetic isolators
- Operates from 3.3V and 5V supplies
- $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  operating temperature range
- **Safety-related certifications:**
  - DIN EN IEC 60747-17 (VDE 0884-17)
  - UL 1577 component recognition program
  - IEC 61010-1, IEC 62368-1 certifications

## 2 Applications

- [Factory Automation](#)
  - Modbus
  - Profibus™
  - DeviceNet™ Data Buses
- [Computer Peripheral Interface](#)
- [Servo Control Interface](#)
- [Data Acquisition](#)

## 3 Description

The ISO721, ISO721M, ISO722, and ISO722M devices are digital isolators with a logic input and output buffer separated by a silicon dioxide ( $\text{SiO}_2$ ) insulation barrier. This barrier provides galvanic isolation of up to  $4000\text{V}_{\text{PK}}$  per VDE 0884-17. Used in conjunction with isolated power supplies, these devices prevent noise currents on a data bus or other circuits from entering the local ground, and interfering with or damaging sensitive circuitry.

A binary input signal is conditioned, translated to a balanced signal, then differentiated by the isolation barrier. Across the isolation barrier, a differential comparator receives the logic transition information, then sets or resets a flip-flop and the output circuit accordingly. A periodic update pulse is sent across the barrier to provide the proper dc level of the output.

If this dc-refresh pulse is not received for more than  $4\mu\text{s}$ , the input is assumed to be unpowered or not being actively driven, and the failsafe circuit drives the output to a logic-high state.

These devices require two supply voltages of 3.3V, 5V, or any combination. All inputs are 5V tolerant when supplied from a 3.3V supply and all outputs are 4mA CMOS.

The ISO722 and ISO722M devices include an active-low output enable that when driven to a high logic level, places the output in a high-impedance state and turns off internal bias circuitry to conserve power.

The ISO721 and ISO722 devices have TTL input thresholds and a noise filter at the input that prevent transient pulses of up to 2ns in duration from being passed to the output of the device.

The ISO721M and ISO722M devices have CMOS  $\text{V}_{\text{CC}}/2$  input thresholds, but do not have the noise-filter and the additional propagation delay. These features of the ISO721M device also provide for reduced-jitter operation.

The ISO721, ISO721M, ISO722, and ISO722M devices are characterized for operation over the ambient temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage	V <sub>CC1</sub> , V <sub>CC2</sub>	-0.5	6	V
V <sub>I</sub>	Input voltage	IN, OUT, or $\bar{EN}$	-0.5	V <sub>CC</sub> + 0.5 <sup>(2)</sup>	V
I <sub>O</sub>	Output current			$\pm 15$	mA
T <sub>J</sub>	Maximum junction temperature			170	°C
T <sub>stg</sub>	Storage temperature		-65	150	°C

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

(2) Maximum voltage must not exceed 6 V.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	$\pm 2000$	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	$\pm 1000$	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V <sub>CC</sub>	Supply voltage <sup>(1)</sup> , V <sub>CC1</sub> , V <sub>CC2</sub>		3	5.5		V
I <sub>OH</sub>	High-level output current				4	mA
I <sub>OL</sub>	Low-level output current			-4		mA
t <sub>ui</sub>	Input pulse duration	ISO72x	10			ns
		ISO72xM	6.67			
1 / t <sub>ui</sub>	Signaling rate	ISO72x	0	100		Mbps
		ISO72xM	0	150		
V <sub>IH</sub>	High-level input voltage (IN, $\bar{EN}$ )	ISO72x	2	5.5		V
		IOS72xM	0.7 $\times$ V <sub>CC</sub>	V <sub>CC</sub>		
V <sub>IL</sub>	Low-level input voltage (IN, $\bar{EN}$ )	ISO72x	0	0.8		V
		IOS72xM	0	0.3 $\times$ V <sub>CC</sub>		
T <sub>A</sub>	Ambient temperature		-40	25	125	°C
T <sub>J</sub>	Junction temperature, see the <a href="#">Thermal Information</a>				150	°C
H	External magnetic field intensity per IEC 61000-4-8 and IEC 61000-4-9 certification				1000	A/m

(1) For the 5-V operation, V<sub>CC1</sub> or V<sub>CC2</sub> is specified from 4.5 V to 5.5 V. For the 3-V operation, V<sub>CC1</sub> or V<sub>CC2</sub> is specified from 3 V to 3.6 V.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>			ISO72x	UNIT

P <sub>D</sub>	Power dissipation			159	mW
<b>ISO721M AND ISO722M IN D PACKAGE</b>					
P <sub>D</sub>	Power dissipation			195	mW

## 6.6 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>S</sub>	Safety input, output, or supply current	R <sub>θJA</sub> = 263°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 170°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 9-6</a>		100	mA
		R <sub>θJA</sub> = 263°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 170°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 9-6</a>		153	
T <sub>S</sub>	Safety temperature			150	°C

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (4) All pins on each side of the barrier tied together creating a two-terminal device

## 8 Detailed Description

### 8.1 Overview

The ISO72x family of devices transmit digital data across a silicon dioxide based isolation barrier. The digital input signal (IN) of the device is sampled by a transmitter and at every data edge the transmitter sends a corresponding differential signal across the isolation barrier. When the input signal is static, the refresh logic periodically sends the necessary differential signal from the transmitter. On the other side of the isolation barrier, the receiver converts the differential signal into a single-ended signal which is output on the OUT pin through a buffer. If the receiver does not receive a data or refresh signal, the timeout logic detects the loss of signal or power from the input side and drives the output to the default level.

## 9 Application and Implementation

### Note

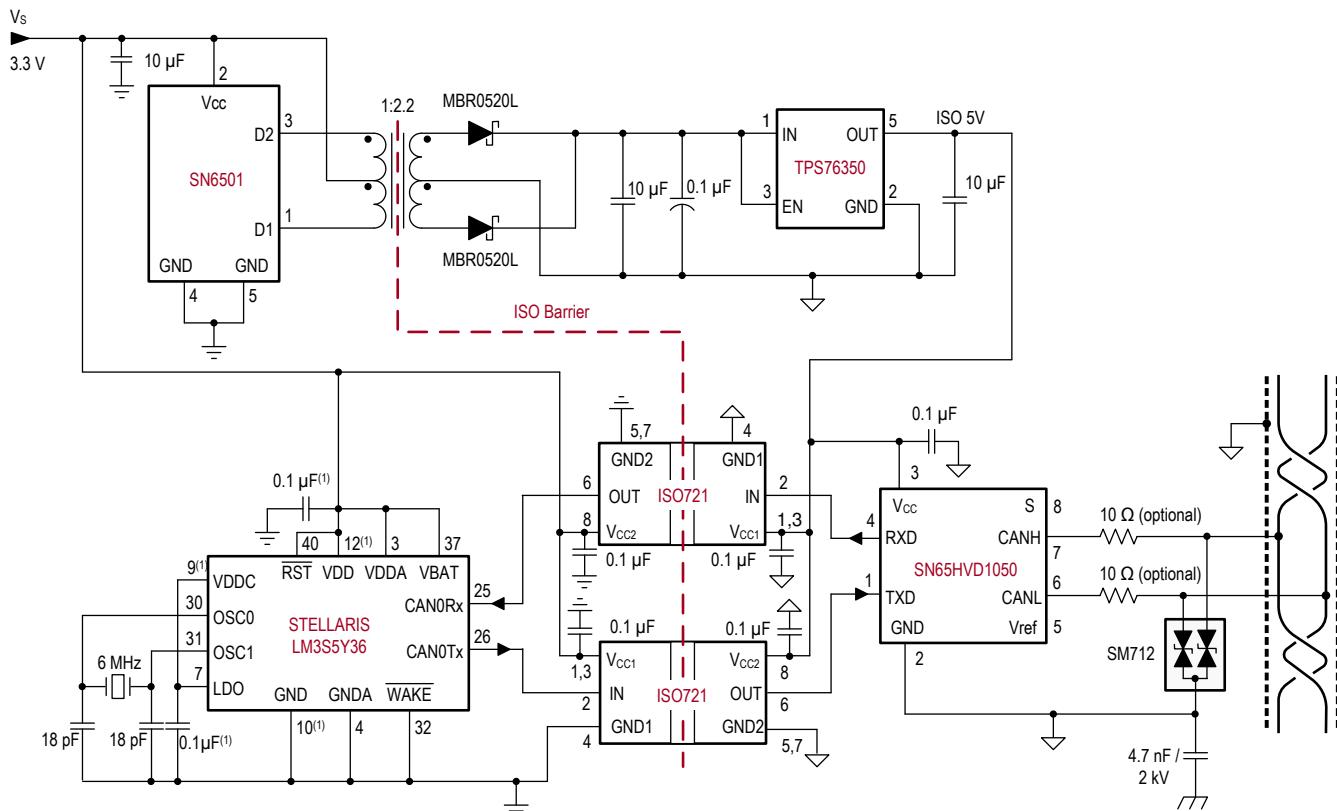

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The ISO72x devices use single-ended TTL or CMOS-logic-switching technology. The supply voltage range of the devices is from 3 V to 5.5 V for both supplies,  $V_{CC1}$  and  $V_{CC2}$ . When designing with digital isolators, because the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller ( $\mu$ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

### 9.2 Typical Application

The ISO721 device can be used with Texas Instruments' microcontroller, CAN transceiver, transformer driver, and low-dropout voltage regulator to create an Isolated CAN Interface as shown in Figure 9-1.

A. Multiple pins and capacitors omitted for clarity purpose.

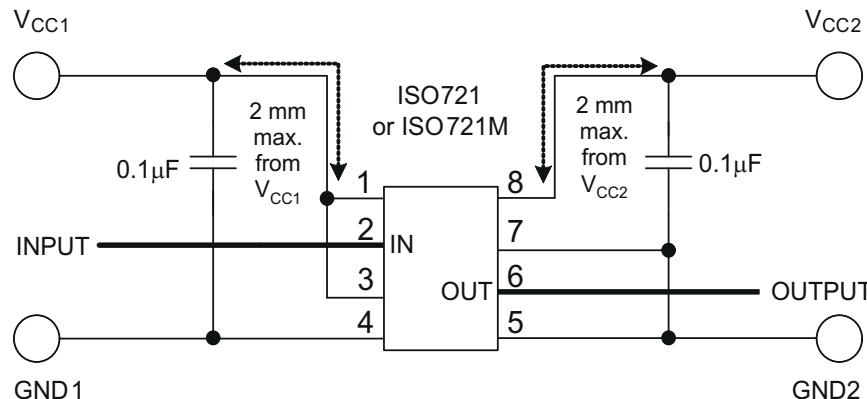

Figure 9-1. Isolated CAN Interface

### 9.2.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO72x devices only require two external bypass capacitors to operate.

### 9.2.2 Detailed Design Procedure

Figure 9-2 shows a typical circuit hook-up for the ISO721 device.

**Figure 9-2. Typical ISO721 Circuit Hook-up**

The ISO72x isolators have the same functional pinout as those of most other vendors as shown in Figure 9-3, and are often pin-for-pin drop-in replacements. The notable differences in the products are propagation delay, signaling rate, power consumption, and transient protection rating. Table 9-1 is used as a guide for replacing other isolators with the ISO72x family of single-channel isolators.

**Figure 9-3. Pin Cross Reference**

**Table 9-1. Cross Reference**

ISOLATOR	PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7		PIN 8
							ISO721 OR ISO721M	ISO722 OR ISO722M	
ISO721 <sup>(1)</sup> <sup>(2)</sup>	V <sub>CC1</sub>	IN	V <sub>CC1</sub>	GND1	GND2	OUT	GND2	EN	V <sub>CC2</sub>
ADuM1100 <sup>(1)</sup> <sup>(2)</sup>	V <sub>DD1</sub>	V <sub>I</sub>	V <sub>DD1</sub>	GND1	GND2	V <sub>O</sub>	GND2		V <sub>DD2</sub>

IL710	V <sub>DD1</sub>	V <sub>I</sub>	NC <sup>(4)</sup>	GND1	GND2	V <sub>O</sub>	V <sub>OE</sub>		V <sub>DD2</sub>

- (1) Pin 1 must be used as V<sub>CC1</sub>. Pin 3 can also be used as V<sub>CC1</sub> or left open, as long as pin 1 is connected to V<sub>CC1</sub>.
- (2) Pin 5 must be used as GND2. Pin 7 can also be used as GND2 or left open, as long as pin 5 is connected to GND2.
- (3) Pin 3 of the HCPL devices must be left open. This is not a problem when substituting an ISO72x device, because the extra V<sub>CC1</sub> on pin 3 can be left an open circuit as well.
- (4) Pin 3 of the IL710 must not be tied to ground on the circuit board because this shorts the ISO72x V<sub>CC1</sub> to ground. The IL710 pin 3 can only be tied to V<sub>CC</sub> or left open to drop in an ISO72x device.
- (5) An HCPL device pin 7 must be left floating (open) or grounded when an ISO722 or ISO722M device is to be used as a drop-in replacement. If pin 7 of the ISO722 or ISO722M device is placed in a high logic state, the output of the device is disabled.

At maximum working voltage, the insulation barrier of the ISO72x and ISO72xM family of devices has more than 28 years of life.

**Figure 9-7. Insulation Lifetime Projection**

### 9.3 Power Supply Recommendations

To help provide reliable operation at data rates and supply voltages, a  $0.1\text{-}\mu\text{F}$  bypass capacitor must be placed at input and output supply pins ( $V_{CC1}$  and  $V_{CC2}$ ). The capacitors must be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments [SN6501](#) device. For such applications, detailed power supply design and transformer selection recommendations are available in the [SN6501 Transformer Driver for Isolated Power Supplies](#) data sheet.

### 9.4 Layout

#### 9.4.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 9-8](#)). Layer stacking must be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of the inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately  $100\text{ pF/in}^2$ .
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep the planes symmetrical. This makes the stack mechanically stable and prevents warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to the [Digital Isolator Design Guide](#).

##### 9.4.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

### 10.6 Electrostatic Discharge Caution

 This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision N (February 2025) to Revision O (October 2025)	Page
• Fixed typos and errors in <i>Insulation Specifications</i> table.....	5

- Changed 'Plan to certify' with 'Certified' in all 3 places in the 2nd row in the *Self-Related Certifications* section. .... 5
- Changed 'Certificate planned' with 'Basic certificate: 40047657' in VDE column, 'Master contract number: 220991' in CSA column, and 'File number: E181974' in UL column in the *Self-Related Certifications* section. .... 5

<b>Changes from Revision M (July 2021) to Revision N (February 2025)</b>	<b>Page</b>
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Updated VDE V 0884-11 to DIN VDE 0884-17 throughout the document.....	1
• Updated Thermal Characteristics, Safety Limiting Values, and Thermal Derating Curves to provide more accurate system-level thermal calculations.....	6
• Updated electrical and switching characteristics to match device performance.....	8

<b>Changes from Revision L (October 2015) to Revision M (October 2024)</b>	<b>Page</b>
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• Updated reference from capacitive isolation to isolation barrier throughout the document.....	1
• Changed the <i>Power Dissipation</i> table to <i>Power Ratings</i> . Combined the <i>Package Insulation Characteristics</i> table, <i>IEC 60664-1 Ratings Table</i> table, and <i>Insulation Characteristics</i> table in the <i>Insulation Specifications</i> table. Changed the <i>Regulatory Information</i> table to the <i>Safety-Related Certifications</i> table.....	6
• Changed the L(101) parameter name to external clearance (CLR) and L(102) to external creepage (CPG). Also changed the input-to-output test voltage ( $V_{PR}$ ) parameter name to apparent charge ( $q_{pd}$ ).....	7
• Changed $V_{peak}$ to $V_{PK}$ throughout the data sheet.....	7
• Changed the CSA information in the <i>Safety-Related Certifications</i> table.....	7
• Moved the <i>Insulation Characteristics Curves</i> section to the <i>Application Curves</i> section.....	24
• Changed the name of the <i>Application Curve</i> section to <i>Insulation Lifetime</i> and moved to the <i>Application Curves</i> section.....	24

<b>Changes from Revision K (February 2012) to Revision L (September 2015)</b>	<b>Page</b>
• Moved Power Dissipation metric into new table, called <i>Power Dissipation</i> .....	6
• Added header row above " $V_{IORM}$ " row with the text "DIN VDE V 0884-10 (VDE V 0884-10):2006-12" in the <i>Insulation Characteristics</i> table.....	7
• Deleted "per UL" in "Isolation voltage" in the <i>Insulation Characteristics</i> table.....	7
• Changed Test Condition "DIN IEC 60112/VDE 0303 Part 1" to "DIN EN 60112 (VDE 0303-11); IEC 60112" in the <i>Package Insulation Characteristics</i> table.....	7
• Changed the D-8 MIN value of L(102) from "4.3" to "4" in the <i>Package Insulation Characteristics</i> table.....	7
• Deleted bottom row of the <i>Package Insulation Characteristics</i> table.....	7
• Moved " $V_{ISO}$ " row to the bottom of the <i>Insulation Characteristics</i> table.....	7
• Changed the D-8 MIN value of L(101) from "4.8" to "4" in the <i>Package Insulation Characteristics</i> table.....	7
• Added "UL 1577" header row over " $V_{ISO}$ " row in the <i>Insulation Characteristics</i> table.....	7

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

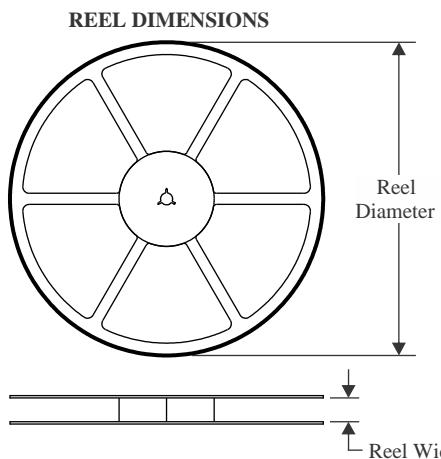

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

SMALL OUTLINE INTEGRATED CIRCUIT

## NOTES:

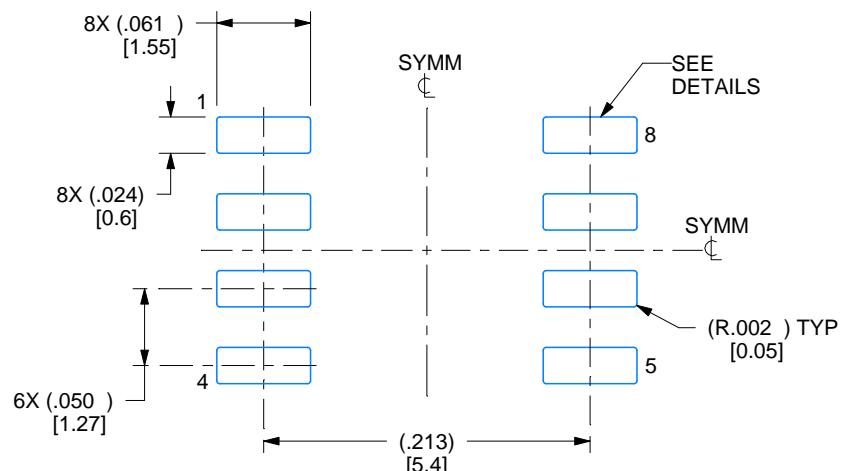

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.
